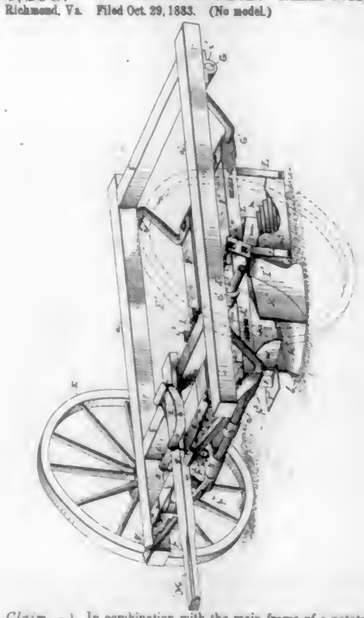
4. In a machine for making sand molds for casting metal, the combination of a pattern, a flask having sides converging toward the parting thereof, a sand-supplying vessel provided with a plunger, having projections conforming to the shape of the pattern, a gate-former, plates for separating the sand in the flask from the sand in the supply-vessel, a mechanism for raising and lowering the plunger, and a mechanism for

supporting and lowering the flask, substantially as and for the purpose set forth.

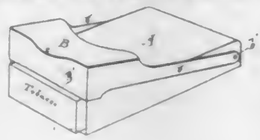
5. In a machine for molding in sand, the flask shown and described, having sides converging toward the parting or joint between the cope and drag, for the purpose of permitting lateral compression of the sand against the pattern and of better retaining the sand, as and for the purpose set forth.



6. In a machine for molding in sand, the combination of a flask having sides converging toward the parting thereof, and a false cope for measuring the quantity of sand placed in the mold, with a pressing mechanism and plunger adapted to press sand in said false cope and flask, substantially as and for the purpose set forth.

293,402. THREAD-GUIDE FOR SEWING-MACHINES. JOHN H. H. BENNETT, Springfield, Ill. Filed June 28, 1883. (No model.)

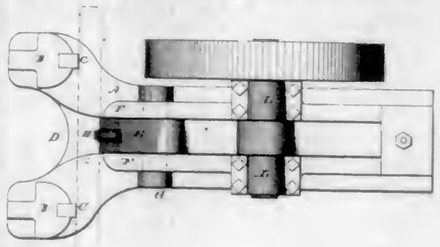
Claim.—In a sewing-machine, the check-lever or needle-bar used as a thread-carrier, in combination with the slot A, the check C, the flanges F F, and the thread-groove B, under the check C, substantially as described, and for the purpose set forth.



293,403. POTATO DIGGER AND RIDGER. BALLARD W. BENFORD, Richmond, Va. Filed Oct. 29, 1883. (No model.)

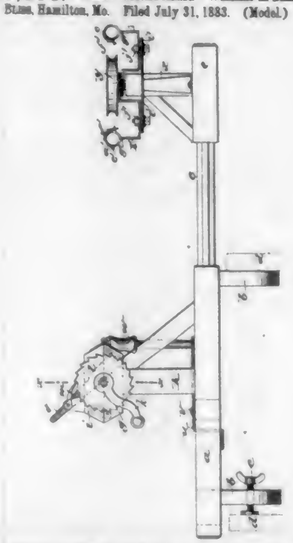
Claim.—1. In combination with the main frame of a potato-digging machine, the axle *d* and shaft G, having offsets or cranks, and a frame carrying the digging apparatus and grating, said frame connected with the aforesaid cranks, as described, so as to permit of its being raised by the backing of the machine, as set forth.

2. In combination with the main frame of a potato-digging machine, the axle *d* and shaft G, provided with offsets or cranks, the frame carrying the digging apparatus, said frame connected with the aforesaid offsets or cranks, so as to be raised by the backing of the machine, and the levers *p p'*, with locking means, substantially as described, and for the purpose set forth.



293,404. COMBINED TOBACCO BOX AND CUTTER. CHARLES S. BIRD, Elyria, Ohio. Filed Feb. 12, 1883. (No model.)

Claim.—1. As a new article of manufacture, the tobacco-box herein described, consisting of the body or box A, having an open end, and the frame B, carrying knife B', and pivoted at *b'* to said box A, as set forth.



2. The tobacco-box described, consisting of the box A, having an open end, the frame B, pivoted to the box A at *b'*, the knife B, the inclosed follower *a*, and spring *z*, as and for the purposes specified.

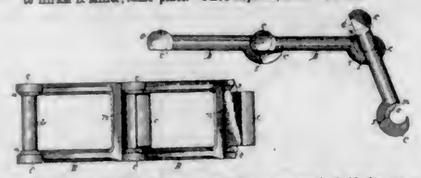
293,405. PIG-IRON BREAKER. THEODORE A. BLAKE, New Haven, Conn. Filed Sept. 3, 1883. (No model.)

Claim.—In a pig-iron breaker consisting of two vertical jaws, stationary on the frame, and a vibrating jaw hung to swing in a plane between said stationary jaws, and in which the plane of the face of the stationary jaws and the plane of the vibrating jaw converge from their lower end upward, the frame constructed with a recess, D, at the front end, between the said stationary jaws, substantially as and for the purpose described.

293,406. WIRE-STRETCHER. WILLIAM H. BLISS and JEREMIAH W. BLISS, Hamilton, Mo. Filed July 31, 1883. (Model.)

Claim.—1. The combination, in a wire-stretching apparatus, of the reel-shaft *f*, guide-eyes *a'* and *c'*, and the guide-pulley *y*, the said reel-shaft being provided with a friction-lever, *o*, and a ratchet and pawl, *l m*, substantially as described.

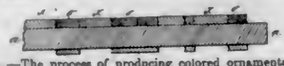
2. The combination, in a wire-stretching apparatus, of the reel-shaft *f*, guide-eyes *a'* and *c'*, and the guide-pulley *y*, the said reel-shaft having hinged and hooked bearing-caps, and the guide-eyes being arranged to open and close for the removal of the reel and wire and the replacing of the same, substantially as described.



3. The combination, in a wire-stretching apparatus, of the guide-pulley *y* and the guide-eyes *a'* and *c'*, said guide-eyes being swiveled to their bearing-arms *h'*, and said arms pivoted in the axis of the guide-pulley *y*, for shifting around the same, substantially as described.

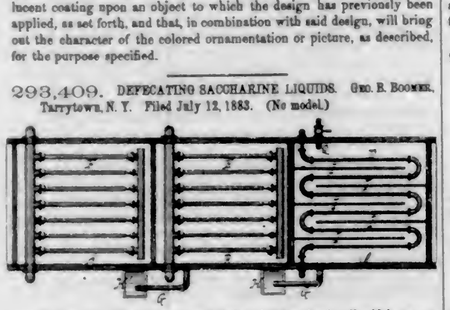
4. The combination, in a wire-stretching attachment, of the guide-pulley *y* and guide-eyes *a' c'*, stand *x*, circularly-slotted table *i'*, and the supporting-arms *h'* of the guide-eyes, said arms being pivoted to the stand, and resting on and connected to the table, substantially as described.

5. In a wire-stretching attachment to be secured to a wagon-box, the combination of the bed-frame *a*, having ears or lugs *b*, and a binding-screw, the wire-reel mounted on said bed-frame, the extension *e* of said bed-frame, and the guide-eyes *a'* and *c'*, mounted on said extension, substantially as described.



6. The combination of the spool-guide *w*, mounted on the elbow-lever *u*, with the wire-reel *t*, and the guide-eyes *a'* and *c'*, and the guide-pulley *y*, substantially as described.

293,407. DRIVE-CHAIN. JOHN C. BLOOM, Kalamazoo, Mich., assignor to Hiram B. Miller, same place. Filed Sept. 28, 1881. (Model.)



Claim.—A chain-belt consisting of links composed of side bars having concave shoulders at one end and convex shoulders at the other end, the former shoulders adapted to fit into and bear against the latter, and all having a like radius, said side bars being connected by a cylindrical coupling-bar at one end and by a hook at the other end, forming a cylindrical bearing adapted to receive said coupling-bar, all substantially as set forth.

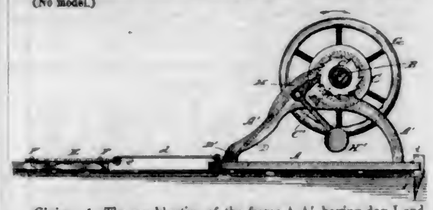
293,408. ORNAMENTATION OF GLASSWARE, &c. VICTOR BLÜTHGEN, Freienwalde-on-the-Oder, Prussia, Germany. Filed Oct. 6, 1883. (No model.) Patented in England Sept. 26, 1883, No. 4,589; in Italy Sept. 26, 1883, XXXII, 36, XVII, 15,946; in France Sept. 26, 1883, and in Belgium Sept. 26, 1883.

Claim.—The process of producing colored ornamentations upon glass, ceramic products, or other objects, which consists in applying a gelatinous substance that will produce a rigid or stiff transparent or translucent coating upon an object to which the design has previously been applied, as set forth, and that, in combination with said design, will bring out the character of the colored ornamentation or picture, as described, for the purpose specified.

293,409. DEFECATING SACCHARINE LIQUIDS. GEO. B. BOOMER, Tarrytown, N. Y. Filed July 12, 1883. (No model.)

Claim.—1. In the process of defecating saccharine liquid by passing it successively through heated vessels, the step herein described, consisting in drawing the liquid from the vessels at a point intermediate of the top and bottom of the liquid, for the purpose of leaving it free of scum and sediment.

2. The combination, substantially as hereinbefore set forth, of the train of vessels, each provided with a heating medium, an overflow-spout connected to one vessel at a point intermediate of the top and bottom, and a delivery-pocket connected to the adjacent vessel for receiving the liquid from the spout.

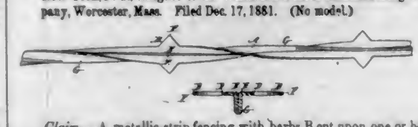


3. The combination, substantially as hereinbefore described, of the train of vessels, each provided with a heating medium, an overflow-spout adjustably connected to one vessel, and a delivery-pocket connected to the adjacent vessel for receiving the liquid from the spout.

4. The combination, substantially as hereinbefore set forth, of the vessel A, provided with a heating-coil, the vessel B, a means for conveying liquid from one such vessel to the other, and the longitudinal partitions arranged in the first vessel between the pipes composing its coil, such partitions terminating alternately near the opposite ends of the vessel, to form a circuitous channel.

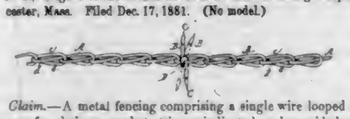
5. The combination, substantially as hereinbefore set forth, of the train of vessels closed at the top and provided with heating mediums, the end wall, K, of the first vessel, and the partition-walls N O, such end and partition walls terminating below the top of the vessels to leave openings for the passage of steam from one vessel to another.

6. The combination, substantially as hereinbefore set forth, of the train of vessels closed at the top and provided with heating mediums, the end wall, K, of the first vessel, and the partition-walls N O, such end and partition walls terminating below the top of the vessels, and gradually increasing in height, for the purpose specified.



293,410. CARPET-STRETCHER. GEORGE WASHINGTON BOWERS and THOMAS JEFFERSON THOMPSON, Beaver Falls, Pa. Filed Nov. 23, 1883. (No model.)

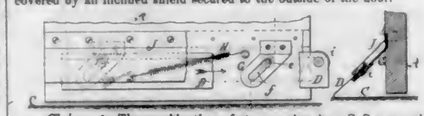
Claim.—1. The combination of the frame A A', having dog I and guide-bar D', flanged roller C, having ratchet-wheel C' and shaft B, means for rotating the roller in its bearings, pawl or dog H H', strap D, bifurcated strap *d*, and stretcher-bar E, of a zigzag shape, and provided with the teeth or hooks F and loops *e*, substantially as set forth.



2. In a carpet-stretcher, the stretcher-bar E, of a zigzag shape, and provided with teeth or hooks F, and loops *e*, for its attachment to the stretching machine or mechanism, substantially as set forth.

293,411. BARBED-METAL-STRIP FENCING. WILLIAM E. BROCK, New York, N. Y., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed Dec. 17, 1881. (No model.)

Claim.—A metallic-strip fencing with barbs B cut upon one or both edges thereof and integral therewith, the strip being folded at its center, as shown at G, with the extended flanges G and D D, substantially as and for the purposes set forth.



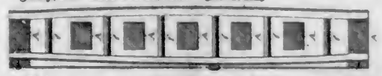
293,412. BARBED-WIRE FENCING. WILLIAM E. BROCK, New York, N. Y., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed Dec. 17, 1881. (No model.)

Claim.—A metal fencing comprising a single wire looped after the manner of a chain or crochet strip, as indicated, and provided with suitable barbs, substantially as described.

293,413. WEATHER-STRIP. GUSTAV BURKHARDT, Homer, Ill., assignor of one-half to Charles E. Wolfkill, same place. Filed Dec. 5, 1883. (No model.)

Brief.—A weather-strip consisting of inclined brackets with inclined slots, a spring-operated strip provided with pins that work in the slots of the bracket, and an inti-friction roller secured to one end, all covered by an inclined shield secured to the outside of the door.

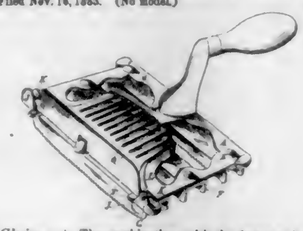
Claim.—1. The combination of the two brackets G G, secured to the lower edge of a door, and provided with inclined slots, the strip D, moving vertically upon one side of the brackets, and provided with laterally-projecting pins on one of its vertical sides, which are arranged, respectively, in the slots of the bracket, and a spring, H, acting on the strip, substantially as described.



2. The combination of the inclined guides G, the strip D at one side thereof, the spring acting on the strip to throw one end beyond the vertical edge of the door, and the friction-roller journaled to one end of the strip, for riding against the door-frame when the door is closed, substantially as described.

3. The combination of the brackets G G, attached to the door in inclined planes, and provided with inclined slots, the strip D, arranged upon one side of the brackets, and provided with lateral pins on one side, arranged, respectively, in the inclined slots, and a spring, H, acting on the strip, substantially as described.

4. The combination of the brackets G G, attached to the door and provided with inclined slots, the strip D, arranged at one side of the brackets and having lateral pins on one side, arranged, respectively, in the inclined slots, and a spring, H, secured at one end to the door and at the other end to the strip, substantially as described.

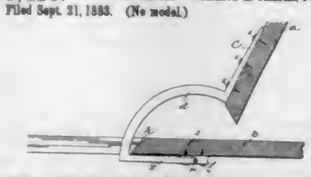


5. A weather-strip consisting of the brackets G, attached to a door and provided with inclined slots, the strip D, arranged upon one side of the brackets, and having lateral pins arranged, respectively, in the slots, an anti-friction roller journaled at one end of the strip, to ride against the door-frame when the door is closed, a spring, H, acting on the strip, and the inclined shield J, substantially as described.

293,414. SOUNDING-BOARD FOR PIANOS. GEORGE CADDICK, Allegheny, Pa. Filed Feb. 20, 1882. (No model.)

Claim.—In a piano, the double sound-board composed of the two sound-boards, one in front of the back framing, the other in rear of it, said boards being sprung into an arched or crowning form by means of sound-posts introduced between them, substantially as specified.

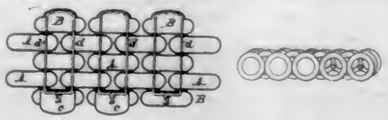
293,415. CURRY-COMB. FREDERICK A. CANFIELD, Thomaston, Conn. Filed Nov. 14, 1883. (No model.)



Claim.—1. The combination, with the frame or back of a curry-comb, of a combined comb and scraper, constructed as shown and described, and journaled thereupon, a bearing for the comb of the combined comb and scraper when shut down upon the said frame or back of the curry-comb, and a guard for the teeth of the comb when so depressed, substantially as set forth.

2. The combination, with the frame or back of a curry-comb, of a combined comb and scraper journaled thereupon in bearings formed integral with it, and provided with lips which are bent to secure the journals of the said comb and scraper in place, substantially as set forth.

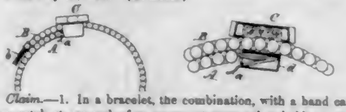
3. The combination, with the frame or back of a curry-comb, of a combined comb and scraper journaled thereupon, and lugs to prevent the said combined comb and scraper from tipping back, substantially as set forth.



4. The combination, with the frame or back of a curry-comb, of a combined comb and scraper journaled thereupon, a flat spring secured to the said frame and bearing upon the corner of the comb and scraper, and lugs to prevent the said comb and scraper from tipping back, substantially as set forth.

293,416. SCUTTLE-HINGE. WALLACE H. CARTER, Farmingdale, Me. Filed Sept. 21, 1883. (No model.)

Claim.—The hinge herein described, consisting of a part, *c*, for connection with the door, the part *e*, pivoted to a bracket or equivalent device secured to the floor, and the segment *d*, connecting the parts *c* and *e* the whole being arranged and operating substantially as described.

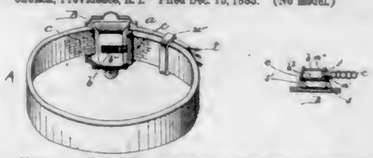


293,417. ORNAMENTAL CHAIN. HENRY A. CHURCH, Providence, R. I. Filed Nov. 13, 1882. (No model.)

Claim.—1. In a roller-chain, the combination, with wires or staples for securing the links together, of the links, each of which is provided with a pair of apertures of such form as to nearly fit the wires or staples, and thus prevent the links from turning on the staples.

2. The combination, with the links provided with the apertures arranged to nearly fit the staples, of the closed units B, the edge-cups provided with the caps C, and the staples *d*, said staples being secured at one end within the closed units and at the opposite end beneath the caps of the edge-cups, and the latter being arranged within said edge-cups, substantially as described.

293,418. CHAIN-BRACELET. HENRY A. CHURCH, Providence, R. I. Filed July 13, 1883. (No model.)



Claim.—1. In a bracelet, the combination, with a band carrying a spring-catch at one end, of an ornament arranged to hold one end of the band by frictional contact and to hold the other end of said band by virtue of the resilient action of the said catch, substantially as described.

2. The combination, with the slide C, provided with the friction-stop *c* and catch-socket *d*, of the band or chain provided with the catch *a*, the whole constructed to secure the bracelet and adjust the same, as described.

3. As a new article of manufacture, a band-bracelet provided with an ornament containing a friction-stop for adjusting the size of the bracelet, and a socket arranged to receive a spring-catch secured to the end of the band, as described.

293,419. CLASP FOR ROLLER-CHAIN BRACELETS. HENRY A. CHURCH, Providence, R. I. Filed Dec. 15, 1883. (No model.)

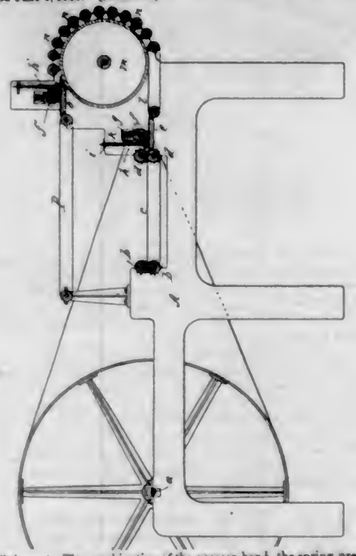
Claim.—1. In a roller-chain bracelet, the clasp or fastening herein described, consisting of a double-chambered slide provided at the back with an opening or slot adapted to receive suitable attaching means secured to the free end of the chain, as and for the purpose set forth.

2. In a roller-chain bracelet, the slide B, herein described, provided with the two chambers *a b*², the former adapted to receive and frictionally retain the chain, the latter chamber adapted by means of the opening *b* to receive and retain the free end of the chain when in use, substantially as shown and set forth.

3. In a roller-chain bracelet, the slide B, provided with chambers *a b*², and slotted opening *b*, in combination with the T-shaped clasp or fastening *a*² *a'*, secured to the free end of the chain, substantially as shown and described.

4. In a roller-chain bracelet, the slide B, herein described, provided with chambers *a b*², and slotted T-shaped opening *b' b*, in combination with the T-shaped fastening or clasp secured to the free end of the chain, substantially as shown and set forth.

293,420. WATCH-REGULATOR. ADLER C. CLAUSEN, Minneapolis, Minn., assignor of one-half to J. C. Slafter, same place. Filed Nov. 13, 1882. (No model.)



Claim.—In a regulator, the spring-arm F, held under the segment friction tight, substantially as herein shown, and for the purpose described.

293,421. HARNESS-LOOP. ADAM COFFMAN, Warsaw, Ohio. Filed Mar. 31, 1883. (No model.)

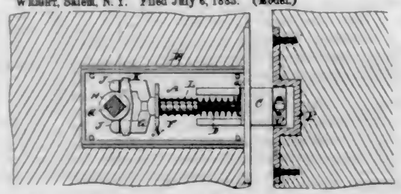
Claim.—A harness-loop, substantially as described, provided with the supporting strap-keepers C C on opposite sides, at the upper end of the loop, the inner edges of the keepers being close together, leaving a narrow opening in which the supporting-strap is clamped between the said keepers, as and for the purpose set forth.

293,422. MACHINE FOR EXTRACTING AND CLEANING THE FIBERS OF PLANTS. PHILIP COHN, New Laredo, Tamaulipas, Mexico. Filed June 6, 1883. (No model.)

Claim.—1. The combination of the presser-bar *h*, the spring-pressed roll *f*, having spiral blunt-edged blades *f'*, and the table *e*, whereby the plants may be held sufficiently and scraped, as described.

2. The combination of the endless traveling apron *l*, the drum *m*, and the rollers *n*, whereby the plant may be carried from one table to the other and reversed in position, as described.

293,423. SAMPLING-TUBE. PAUL CONTANT, Reims, France. Filed June 13, 1883. (No model.) Patented in France Nov. 13, 1882, No. 152,017.

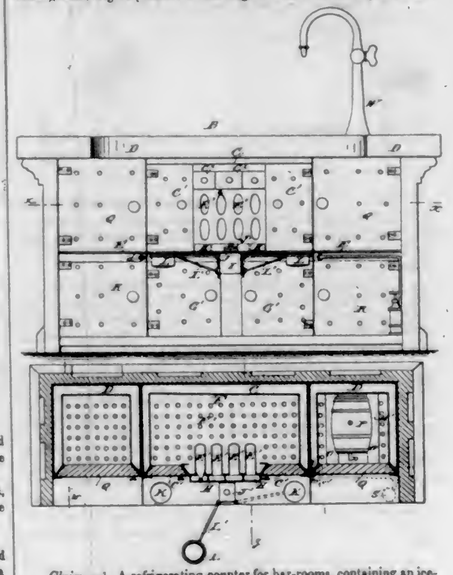


Claim.— 1. A sampling-tube adapted to be telescoped and provided with a testing-cup, substantially as described, for the purposes specified.

2. A sampling-tube composed of tube-sections arranged to telescope into one another, the end sections being provided with suction-orifices for drawing in the liquid to be sampled, substantially as described, for the purposes specified.

3. A sampling-tube composed of tube-sections arranged to telescope one into the other and provided with a holding device pivoted to the outer tube and adapted to be set at right angles thereto to form a projection or projections to hold the instrument when inserted in the bung-hole of a cask, as described.

293,424. EXTENSIBLE LATCH. BRONNIE COPELAND and FRANK WRIGHT, Salem, N. Y. Filed July 6, 1883. (Model.)



Claim.—1. An extensible latch-bolt consisting of a block swiveled on a screw, and connected by the latter to a piece provided with a screw-threaded aperture, substantially as herein shown and described.

2. A latch-bolt consisting of a block, C, provided with a counter-sink, O, a screw, D, provided with a head, E, and means for preventing the screw from sliding in the block, and of a tubular piece, F, provided with a fork, G, substantially as herein shown and described.

3. The combination, with the hub H, having arms K, of the fork G, formed with projections J and plate N, and having an internally-threaded sleeve, F, the screw D, having head E and pin *o*, the block C, having countersink O, and the spring L, substantially as shown and described.

293,425. REFRIGERATING-COUNTER FOR BAR-ROOMS. CHAS. ELBURY CROCKETT, Waupun, Wis. Filed Nov. 24, 1883. (No model.)

Brief.—Air compressed by a pump within hollow walls of ice-tanks within the counter serves as a non-conducting filling; also, through connecting-hose, to give pressure within kegs to force beer, &c., up to faucet.

Claim.—1. A refrigerating-counter for bar-rooms, containing an ice-box made in two or more independent removable sections, substantially as herein shown and described.

2. A refrigerating-counter for bar-rooms, containing an ice-box made in two or more independent removable sections, having hollow walls, substantially as herein shown and described.

3. The combination, with a refrigerating-counter for bar-rooms, of an ice-box provided with a series of pigeon-holes, with drawers above the pigeon-holes, and boxes for sugar, spices, &c., below the pigeon-holes, substantially as herein shown and described.

4. The combination, with a refrigerating-counter for bar-rooms, of an ice-box having a work-board projecting from its front at about the middle of its height, pigeon-holes for bottles, arranged above the work-board, and doors for the ice-box, arranged above and below the work-board, substantially as herein shown and described.

5. The combination, with a refrigerating-counter for bar-rooms, of an ice-box provided with a work-board projecting from its front at about the middle of its height, which work-board is provided with an aperture at one or both ends, and of rinsing tanks or cups held removably below the said apertures, substantially as herein shown and described.

6. The combination, with a refrigerating-counter for bar-rooms, of an ice-box provided with a work-board projecting from its front at about the middle of its height, which work-board is provided with an aperture at one or both ends, of rinsing tanks or cups held below the said apertures, and of swinging arms, in which the rinsing-cups are held, substantially as herein shown and described.

7. The combination, with a refrigerating-counter for bar-rooms, of an ice-box provided with a work-board projecting from the middle of its front, a box, I, arranged in the work-board and projecting from the same, and the box J, contained in the box I, and provided with an apertured bottom, substantially as herein shown and described.

8. The combination, with a refrigerating-counter for bar-rooms, of an ice-box provided with a work-board projecting from the middle of its front, a box, I, arranged in the work-board and projecting below the bottom of the same, which box I is in communication with the ice-box, and the box J, held in the box I, and provided with a perforated bottom, J³, and with a cover, J', substantially as herein shown and described.

9. The combination, with a refrigerating-counter for bar-rooms, of an ice-box formed of two or more independent removable sections, each section being provided with a work-board on the front at the middle of its height, substantially as herein shown and described.

10. The combination, with a refrigerating-counter for bar-rooms, of an ice-box having hollow walls, an air-forcing apparatus connected with the air-chamber formed by the hollow walls, and tubes connected with the chamber formed in the hollow walls and with a faucet on the bar, which tubes will be adapted to be connected with the bung or plug and with the spigot or faucet of the barrel or keg contained in the ice-box, substantially as herein shown and described.

293,426. MEANS FOR MEASURING VELOCITIES BY ELECTRICITY. FREDERICK W. CUSHING, New York, N. Y. Filed July 30, 1883. (No model.)

Claim.—1. The herein-described method of operating a time-recording device, which consists in first opening a shunt-circuit spanning the devices which actuate said recording-device, and, secondly, in breaking the main circuit in which said recording device and the devices which actuate it are included.

2. The combination, substantially as hereinbefore set forth, of a battery, a rheotome, a recording device included in the main circuit of said battery, and actuated by the pulsatory currents established by the action of said rheotome, and a shunt-circuit spanning said battery and rheotome, which normally prevents the action of said recording device.

3. The combination, substantially as hereinbefore set forth, of the battery, means for rendering its current pulsatory, the main circuit, means for shunting off the greater portion of the pulsatory current from said main circuit, and means for recording the pulsations traversing said main circuit whenever said shunt is broken.

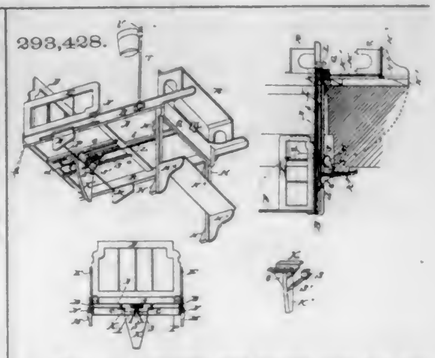
4. The combination, substantially as hereinbefore set forth, of a main circuit, including a rheotome, a battery, and a recording device, and a shunt-circuit normally shunting said battery and said rheotome.

5. The combination, substantially as hereinbefore set forth, of a rheotome, a battery, and a chemical recording device included in a main circuit, and a shunt-circuit for preventing the operation of said recording device.

6. The combination, substantially as hereinbefore set forth, of the shunt-circuit, the main circuit, including the battery, rheotome, and recorder, and means whereby said shunt and main circuits are successively opened by the passage of a moving body.

293,427. BRIDGE. CHAUNCEY G. DIBBLE, Farmington, Iowa, assignor of one-half to Frederick E. Bangs, New Haven, Conn. Filed Nov. 26, 1883. (No model.)

Brief.—Consists of arched beams having transverse ties carrying the platform, vertical struts between said ties and beams, chords extending from the foot of the arch at one end to the foot at the opposite end, and diagonal suspension-rods extending from the arch near the struts to the chord intermediate between the ties, and connected thereto at a point above the plane of the bottom of the ties.

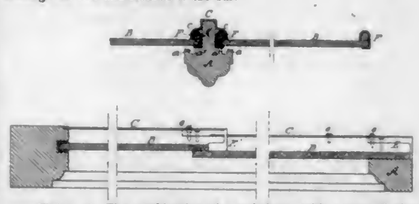


Claim.—The combination of the arched beams A, the transverse ties C, carrying the platform, vertical struts *a* between said ties and beam, chords D, extending from the foot of the arch at one end to the foot at the opposite end, and the diagonal suspension-rods *b*, extending from the arch near the struts to the chord intermediate between the ties, and there connected with the chord at a point above the plane of the bottom of the ties, whereby an upward bend is produced in the chords between the ties, substantially as described.

293,428. WINDOW-CLEANING CHAIR. ANNA DORMITZER, New York, N. Y. Filed Dec. 4, 1883. (No model.)

Brief.—Consists of a platform secured to a window-sill by a clamp which projects from blocks in ways upon the under side of the platform, and which is supported by a stay-frame. A thumb-screw extending from the front rearwardly engages a traveling nut which is secured to the clamp. A transverse connecting-bar couples inclined blocks and central clamp.

293,428.



Claim.—1. An unyielding clamp projecting rigidly from blocks traversing in ways upon the under side of the platform of a window-cleaning chair, in combination with its stay-frame, a thumb-screw extending under the platform from its front rearwardly, and a traveling nut upon said screw coupled to the clamp, substantially in the manner and for the purpose herein set forth.

2. The combination, with a central clamp adapted to traverse upon the under side of the platform of a window-chair in a direction from front to rear, and to engage the outer face of the sill or wall, and which is provided with a thumb-screw adapted to produce an adjustment of said clamp, of lateral inclined-faced blocks traversing longitudinally upon the sides of the platform, to rest upon the window-sill, and a transverse connecting-bar coupling said blocks with each other and the central clamp, so that the three shall move in unison, substantially in the manner and for the purpose herein set forth.

293,429. SKYLIGHT. ALEXANDER DRUMMOND, Edinburgh, Scotland. Filed May 31, 1883. (No model.) Patented in England July 14, 1882, No. 3,340.

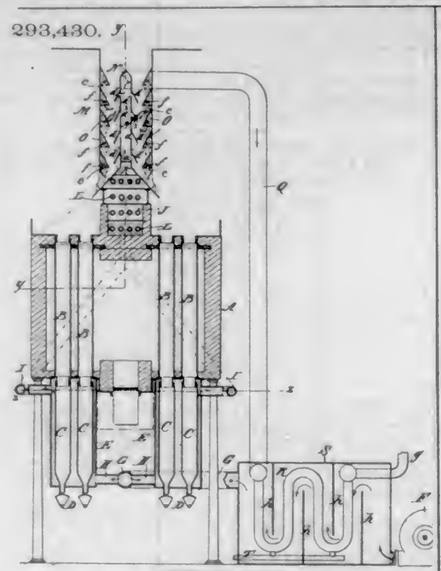
Brief.—Consisting of raised strengthening-ribs applied to the edges of the glass, provided with a water-proof filling combined with a cap embracing said ribs and secured to the bar.

Claim.—1. The combination of a sash-frame with a pane of glass having secured thereto strengthening-ribs F, the glass thus strengthened being applied in the frame, substantially as set forth.

2. The combination of a sash-frame having ridge-strips C, with panes of glass having secured thereto strengthening-ribs F, raised on the surface side, and adapted to be overlapped by said strips, substantially as described.

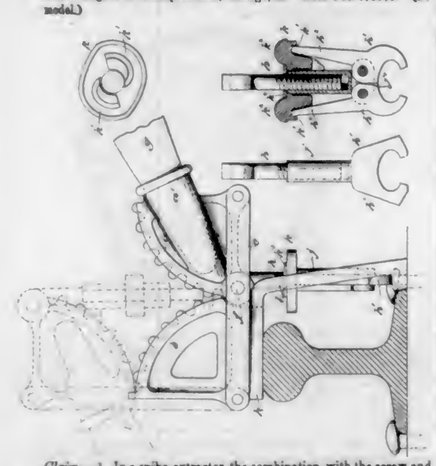
3. The combination of a sash-frame and ridge-strips C, with panes of glass having along the edges ribs F, formed of flanged strips filled with putty, into which the edge of the glass is set, substantially as specified.

293,430. APPARATUS FOR REVIVIFYING BONE-BLACK. EDWARD P. EASTWICK, New York, N. Y. Filed Nov. 1, 1883. (No model.)



Claim.—1. The combination, with the bone-black coolers C, of a casing surrounding the coolers for confining a current of air in contact with the coolers, substantially as and for the purposes set forth.

2. The pipe R, placed in box S, and connected with the drier M by pipe Q, in combination with the blower F, boxes E, and pipes G H, all arranged to operate substantially as and for the purposes set forth.



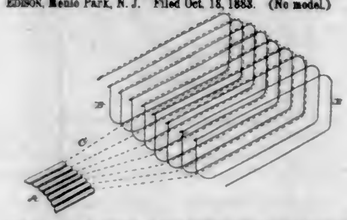
3. The casing E, surrounding the coolers C, and connected through suitable pipes with the drier M, in combination with an air-forcing device connected with the casing E, substantially as and for the purposes described.

4. The box or condenser S, connected with the drier M by suitable pipes, in combination with the blower F, connected with said box, and the pipe R, placed in the box, and connected with the drier M by pipe Q, substantially as and for the purposes set forth.

293,430.

293,431. SPIKE-EXTRACTOR. JOHN EBERT, Rockaway Beach, N. Y., assignor to Phillip A. Hall, Chicago, Ill. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a spike-extractor, the combination, with the screw and the pivoted claws having upwardly-projecting stems or arms, and an internally-screw-threaded sleeve, of the cam-ring fitted upon said sleeve, and the claw stems or arms, and the nut holding the cam-ring on the sleeve, substantially as and for the purpose set forth.



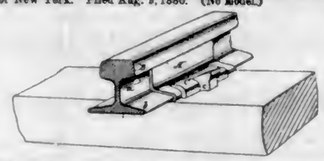
2. In a spike-extractor, the combination, with the screw and the pivoted claws having upwardly-projecting stems or arms, and the internally-screw-threaded sleeve, of the cam-ring having opposite eccentric grooves on its under side, which engage the upper ends of the claw stems or arms, substantially as and for the purpose set forth.

3. In a spike-extractor, the combination, with the screw and the pivoted claws having upwardly-projecting arms or stems, and the internally-screw-threaded sleeve, of the cam-ring having opposite eccentric grooves, and the nut which holds the cam-ring upon the sleeve, substantially as and for the purpose set forth.

4. The combination, with the connecting-bolt *h*, sleeve *j*, and pivoted claws A' A', formed with stems A^2 A^2, of the cam-ring *k*, placed upon the sleeve and upper ends of the stems and adapted to be turned, substantially as and for the purposes set forth.

5. In a spike-extractor, the bolt connected to the claws, the latter having a cam-ring, the clamping action thereof securing the claws upon the spike or other object, in combination with the intergearing sectors linked together, and one being pivoted to the upper end of the said bolt, and having a socket and handle, substantially as and for the purpose set forth.

293,432. ELECTRICAL GENERATOR OR MOTOR. THOMAS A. EDISON, Menlo Park, N. J. Filed Oct. 18, 1883. (No model.)



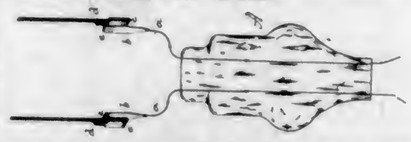
Claim.—1. The method of overcoming wholly or partially the spark at the commutators of dynamo or magneto electric machines or electro-dynamic motors, consisting in developing a counter electro-motive force opposed to the electro-motive force of the armature-coils as they are short-circuited, substantially as set forth.

2. In an electrical generator or motor, the combination, with the armature and commutator, of means for throwing a counter electro-motive force into the armature-coils as they are short-circuited, substantially as set forth.

3. In an electrical generator or motor, the combination, with the armature and commutator, of conductors connecting the armature-coils and commutator-bars and passing through the field of force, substantially as set forth.

4. In an electrical generator or motor, the combination, with the armature-coils and the commutator-bars, of extra loops wound upon the armature, and connecting the armature-coils and commutator-bars, substantially as set forth.

293,433. INSULATION OF RAILROAD-TRACKS USED FOR ELECTRIC CIRCUITS. THOMAS A. EDISON, Menlo Park, N. J., assignor, by mesne assignments, to the Electric Railway Company of the United States, of New York. Filed Aug. 9, 1880. (No model.)

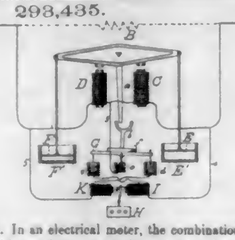


Claim.—1. A railway-rail provided with an insulating-covering except upon its head, substantially as set forth.

2. An insulating-cushion for railroad-rails, composed of a flexible water-proof fibrous material, substantially as set forth.

3. A line of rails electrically connected to form a circuit or part of a circuit, and having the foot and web of the rails covered with an elastic insulating composition adhering to the surface thereof, substantially as set forth.

293,434. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 7, 1882. (No model.)



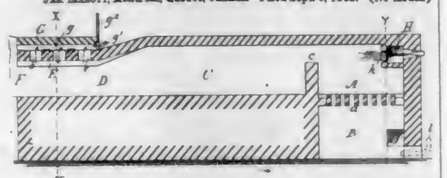
Claim.—1. In an incandescing electric lamp, the device for holding an end of the carbon during the process of electroplating, consisting of a flat piece of copper bent twice lengthwise upon itself, substantially as set forth.

2. The leading-in wires of an incandescing electric lamp, having their inner extremities formed into or attached to flat metal strips, each bent twice lengthwise upon itself, substantially as and for the purpose set forth.

293,435. ELECTRICAL METER. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 14, 1882. (No model.)

293,435.

Claim.—1. In an electrical meter, the combination of the pivoted beam, oscillated by an electro-magnetic mechanism for moving the beam in both directions by electro-magnetic action, of a recording apparatus, and reciprocating dash-pot plungers attached to such beam, substantially as set forth.

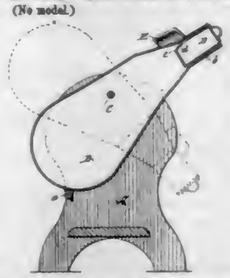


2. In an electrical meter, the combination, with a pivoted beam, of electro-magnets for tipping such beam in opposite directions, a circuit-controller moved by the beam, and a recording apparatus, substantially as set forth.

3. In an electrical meter, the combination, with a pivoted beam, of electro-magnets for tipping such beam in opposite directions, means for retarding the movement, a circuit-controller moved by the beam, and a recording apparatus, substantially as set forth.

4. In an electrical meter, the combination, with a pivoted beam, the main electro-magnets, and the dash-pots, of the circuit-controller operated by the beam, the recording apparatus, and the electro-magnets for working such recording apparatus, substantially as set forth.

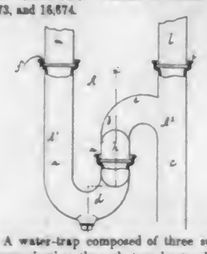
5. In an electrical meter, the circuit-controller composed of a pivoted bar, mercury-cups in which the circuit is made and broken, a mercury-cup for constantly maintaining electrical connection with the moving bar, and a tube partly filled with liquid, for throwing the bar to the limits of its movements, substantially as set forth.



293,436. APPARATUS FOR CONSUMING SMOKE IN FURNACES. JAS. ELLIOTT, Montreal, Quebec, Canada. Filed Sept. 6, 1883. (No model.)

Claim.—1. For introduction of air to the fire-chamber above the grate, vertical flues J J, formed in the side walls, and opening at their lower ends into the ash-pit, and joined at their upper ends to a flue, H, formed at the crown of said fire-chamber, at right angles to the flue of draft, and having openings *h h*, and a blower or fan for forcing said air through said flues and over the fire, substantially as and for the purpose described.

2. In a furnace, the combination, with flues J J and H, of the steam-pipe K, having nozzles *k k*, and a fan or blower, L, substantially as and for the purpose specified.



293,437. SHOT-CASE. QUINCY ADAMS ELLIS, Gatesville, TEX. Filed Sept. 8, 1883. (No model.)

Claim.—1. A case tapering toward its spout, a charger fitting said spout to slide therein, and a rod passing through said case to support it, the case being hung upon the rod to balance the spout upward, substantially as described.

2. The combination, with a case tapering toward its spout and means for hanging the same to balance the spout upward, of a drawer fitting said spout to slide therein, said drawer having a bottom, two sides and two ends, and an opening in its top, said case having an offset in the upper side of its spout, extending over the rear end of the drawer when inserted as described, whereby communication is made between the interior of the case and the interior of the drawer.

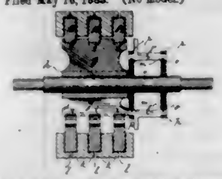
293,438. WATER-TRAP. WILLIAM J. ENGLISH, Cohoes, N. Y. Filed May 9, 1883. (No model.) Patented in Canada Nov. 11, 1882, Nos. 15,777, 16,573, and 16,574.

Claim.—1. A water-trap composed of three substantially parallel limbs, *a b c*, communicating through two bents, *d e*, an enlargement formed in the connecting-limb *b*, and a vent formed by extending the walls of the discharge-limb above the connection with bent *e*, whereby the vent is located above the discharge-limb and not in the bent *e*, substantially as described.

2. A water-trap composed of two sections, A' A^2, the section A' forming the inlet-limb *a* and part of the connecting-limb *b*, and being provided at its ends with bells *f n*, while the section A^2 forms the discharge-limbs *c* and part of the connecting-limb *b*, and is provided with a bell, *i*, substantially as shown and described.

293,439. HORSESHOE. THEODORE C. EVANS, Ludington, Mich. Filed Dec. 26, 1883. (No model.)

Claim.—As an improvement in jointed horseshoes, the combination, with the jointed heel-pieces, of movable heel-calks straight on one side but beveled on the other side and adapted to be turned in their fastenings, so as to have the beveled or inclined side face either the outside of the shoe or the inside, substantially as and for the purpose shown and set forth.

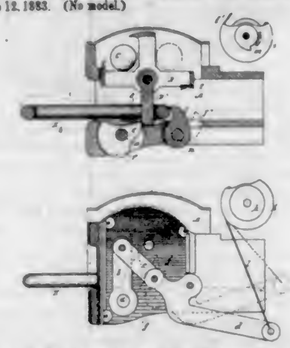


293,440. BIAS TAPE AND PROCESS OF MAKING THE SAME. CHARLES H. FARMER, Boston, MASS. Filed Dec. 4, 1882. (No model.)

Claim.—1. As a new article of manufacture, bias tape put up in sticks or rolls and formed of uniform width in continuous lengths of fabric, with a succession of pliable oblique and parallel joints having perfectly-matched cut edges, without projecting threads, substantially as set forth.

2. The improved process of making continuous bias tape, consisting in cutting the fabric at an angle of about forty-five degrees to its warp and filling, cementing together the selvages of the successive pieces to form a continuous band, winding said band upon a core of pasteboard or equivalent material susceptible of being cut with the fabric into strips, and cutting the band and its core lengthwise of said band into strips of the required width, substantially as set forth.

293,441. DYNAMO-ELECTRIC MACHINE. FREDERICK K. FITCH, New York, N. Y. Filed May 16, 1883. (No model.)



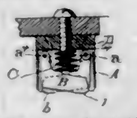
Claim.—1. In a dynamo-electric machine, the combination of an armature-ring composed of three or more segments connected together at their ends by overlapping joints and transverse rivets or screws, with a spider notched to receive said ring-segments, the latter being also notched to receive the spider-arms, substantially as described.

2. The combination, with an armature composed of two or more narrow rings, each wound with separate coils of insulated conductor, of a field-magnet internally grooved to receive said rings, and having the overhanging flanges *k* and slits *l*, substantially as described.

3. The armature-ring composed of two or more radially and peripherally grooved circular segments, A, having their ends adapted to tongue-and-groove joining, and the transverse securing screws or rivets, each segment having the internal notches, *f*, at its ends, adapting it for seating on a spider, substantially as described.

4. The commutator composed of the longitudinal strips *l'*, having the internal notches, *m*, in combination with the non-conducting heads *n*, having beads *o*, and the inclosing-hoops *p*, substantially as described.

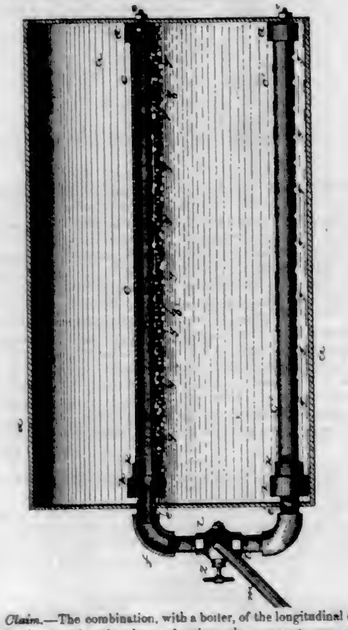
293,442. CAR-COUPLING. CORNELIUS FLYNN, Brooklyn, N. Y. Filed June 12, 1883. (No model.)



Claim.—1. The levers *b*, *c*, and *d*, inclosed within the box or compartment *f* and operated as described, in combination with the catch F and swinging bolt B', as and for the purpose set forth

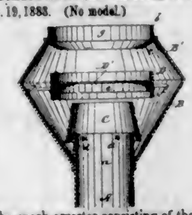
2. The levers *p*, *q*, and *r*, inclosed within the box or compartment L, and constructed as described, in combination with the hook or stop I and link E, as and for the purpose set forth.

3. The hook or stop I, constructed as described, in combination with the levers *p*, *q*, and *r*, the inclined plate or bar *o*, and the link E, as set forth.



4. In combination with the levers *b*, *c*, and *d* and catch F, the shaft *g*, provided with the fast pulley A, and loose pulley *i*, and hand-wheels *k k*, the whole being constructed as described, to operate in the manner set forth.

293,443. STAMP-CANCELER. ANNA M. FORTIER and SHADRACH M. A. FORTIER, San Francisco, Cal. Filed Oct. 1, 1881. Renewed Aug. 17, 1883. (No model.)

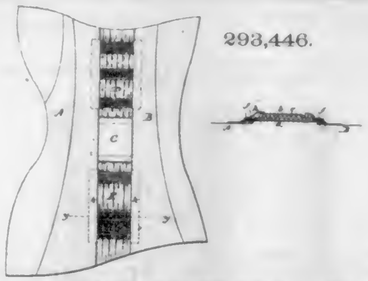


Claim.—In a canceling-stamp, the combination of the casing A' lid D, bent dogs B B, pivoted in said casing and provided with teeth *b b*, and the coiled spring C, resting on the horizontal arms of the dogs between the same and the lid of the case, substantially as shown and described.

293,444. STEAM-BOILER CLEANER. JAMES HARVEY FOSTER, Era, Tex. Filed June 27, 1883. (No model.)

Claim.—The combination, with a boiler, of the longitudinal cleaner-pipe having a series of under perforations, the aggregate area of which is about equal to the area of the pipe-opening, the cup and bolt connecting the closed end of the pipe with the boiler end, and the throttle-valve and waste-pipe, substantially as specified.

293,445. SPARK-ARRESTER. ABRAHAM O. FRICK, Waynesborough, Pa. Filed Nov. 19, 1883. (No model.)

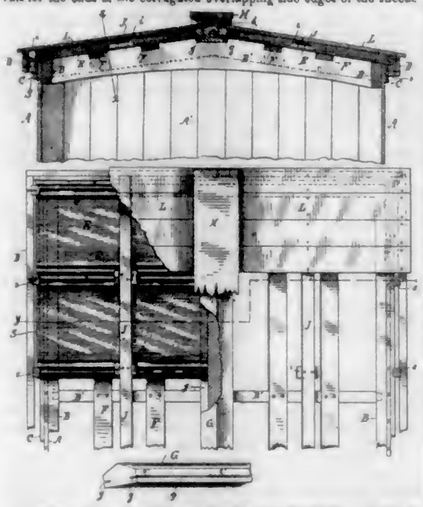


Claim.—1. The spark-arrester consisting of the combination of the deflector D D', composed of a ring of sheet metal with a circular sheet-metal flanged head inserted near its middle, the subjacent sleeve C, the double conical inclosure B B', and the smoke-pipe A, extending up and into the said sleeve, substantially as for the purpose described.

2. The spark-arrester consisting of the combination of the deflector D D', composed of a ring of sheet metal with a circular sheet-metal flanged head inserted near its middle, the double conical case B B', having flanges *b* and *c*, the smoke-pipe A, protruding into the same, and one or more sleeves, C, having its lower end arranged to overlap the smoke-pipe A and leave an annular space between, substantially as shown and described.

293,446. CORSET. THOMAS S. GILBERT, New Haven, Conn., assignor to Mayer, Stroese & Co., same place. Filed Oct. 8, 1883. (Model.)

Claim.—1. An elastic gore or section composed of two thicknesses of fabric, *a b*, the one narrower than the other, the two stitched together so as to leave both edges of the broader thickness exposed beyond the narrower thickness, the said stitching being in parallel lines transversely across the two thicknesses, and so as to form parallel pockets between said thicknesses, and helical or spiral metal springs *e* inclosed by such pockets, the ends of the springs extending beyond the edge of the narrower thickness, and the several springs secured at their ends to stripe, *f*, of flexible material, independent of the covering material, substantially as described.



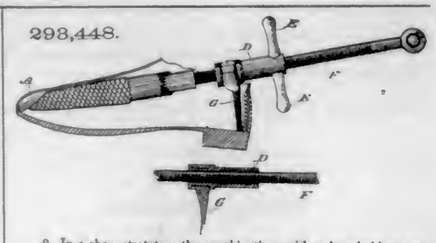
293,446.

2. In a corset, an elastic gore or section composed of two thicknesses, *a b*, of fabric, stitched together by transverse parallel lines of stitches to form transverse pockets between said thicknesses, one of said thicknesses broader than the other, and so as to leave the edges of the broader thickness exposed beyond the edges of the narrower thickness, and helical springs *c*, introduced into said pockets between said thicknesses of fabric, said springs extending beyond the edge of the narrower thickness, the ends of the springs secured to strips, *f*, of flexible material, independent of the two thicknesses which inclose the springs, the edges of the broader thickness stitched, respectively, to one thickness of the adjacent sections A B of the corset, the flexible strips which connect the springs stitched to the same thickness of the sections A B, the other thickness of the sections A B of the corset stitched to the first thickness of the elastic section outside the ends of the springs, the edges of said other thickness extending over and so as to form a flap to cover the ends of the springs, substantially as described.

293,447. CAR-ROOFING. ALBERT W. GILMORE, Chicago, Ill. Filed Nov. 1, 1883. (No model.)

Brief.—The upper edges of metal sheets are held in a horizontal groove on each side of the ridge-piece and the lower edges rest in spacing-blocks. The grooves in the ridge-piece have cross-grooves at intervals for the ends of the corrugated overlapping side edges of the sheets.

Claim.—1. The ridge-plate G, provided with two horizontal grooves, *g*—one in each side—substantially as and for the purpose described.

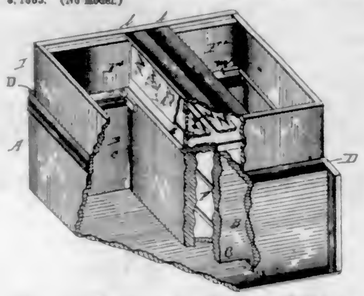


2. The sheet-metal covering described, held in position above by the pinching action of the grooves in the ridge-plate, and below by the stop-blocks *s*, substantially as described.

3. The ridge-plate G, having side grooves, *g*, provided with cross-grooves *d'* at proper intervals, corresponding to the ridges and grooves made by the corrugations of the metal sheets E, substantially as described.

293,448. DEVICE FOR STRETCHING BOOTS AND SHOES. HORACE GLEVES, Bridgeport, Conn. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination, with a detachable toe-cap attached at the end of a threaded rod in a device for stretching shoes, of a heel-plate swivelly attached to a follower-nut running on said rod, and means for operating said nut, substantially as set forth.



293,448.

2. In a shoe-stretcher, the combination, with a detachable cap or toe piece, of a follower-nut traveling upon the threaded rod which operates the stretching devices, and having swivelly attached thereto a heel-piece, and means for operating said rod and follower-nut independent of each other, substantially as and for the purpose set forth.

3. In combination with a device for stretching boots and shoes, as described, the cap or toe piece A and heel-piece G, connected with the follower-nut D, adapted to travel on the threaded rod F, substantially as shown and described.

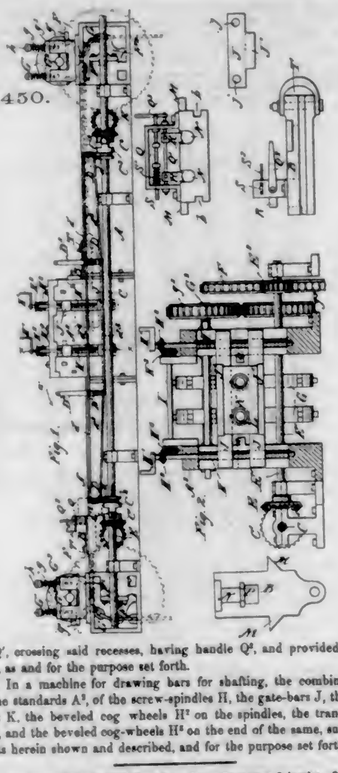
293,449. BEE-HIVE. THOS. GORSUCH, Huntingdon, Pa. Filed Mar. 8, 1883. (No model.)

Claim.—1. The combination, with the grooved plates or troughs for supporting the ends of the frames, of the adjustable walls or partitions having shoulders projecting over said troughs, and provided with downward extensions projecting into and closing the passages through said troughs, substantially as and for the purpose set forth.

2. The combination, with the troughs E E, constructed and arranged as described, of one or more adjustable walls, G, having shoulders *g*, and the leather pieces A A, attached to said shoulders and slitted to take over and into said troughs, essentially as and for the purpose set forth.

3. The bee-hive having the brood-frame chamber, with the brood-frames arranged in the central part thereof, the upper honey-frame casing having a comb-space wider than the lower chamber and immediately over the same, said upper casing having its bottom open for the passage of the lower comb-frames, and the adjustable partitions G, arranged to divide the comb-frames in the lower chamber from unoccupied spaces at the ends of said chamber, and cloths *l l*, located between the brood and honey frames, the parts being organized substantially as described, and for the purpose set forth.

4. In a bee-hive, the lower casing provided with chaff-chambers B B, partitions C C, and boards D D, with blocks *m* secured thereon, so as to provide supports for the frames F and partitions G, and an upper section, I, with sides *i i*, frames F', and flexible and removable separating means *l l*, the parts being organized substantially as shown, so as to provide spaces F^3 and K, into which the frmes may be extended.

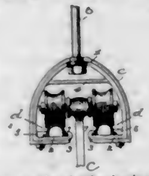


293,450. MACHINE FOR DRAWING BARS. JOHN S. GRIFFIN, Cleveland, assignor to himself and Mathew Baleyn, Newburg, Ohio. Filed Apr. 18, 1883. (No model.)

Claim.—1. The combination of the track A', the sliding carriages B B, having lugs M M, the shaft C, carrying loose beveled cog-wheels C', and its integral notched clutch-wheel C^2, the keyed sliding annularly-grooved clutch-wheel C^3, the centrally-pivoted lever D, having bifurcated prong *d*, the levers D', having upwardly-projecting handles D^2, and connecting with the ends of lever D by rods d' d^2, the transverse shaft F', having cog-wheel F, the sprocket-wheels F^2 F^3, and the chain G, attached to said carriages, as shown and described.

2. The combination of the two right and left cranked screw-spindles H H, the shafts I I, gearing with said spindles, and the gate-bars J J, having lugs J' and apertures *j'*, as and for the purpose specified.

3. A carriage, B, having a recess, N, terminating at its inner end in an enlargement, P, and forming shoulders, in combination with the



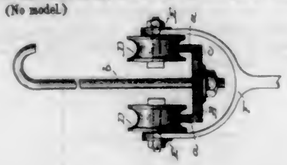
293,450.

shaft Q', crossing said recesses, having handle Q^2, and provided with cam R, as and for the purpose set forth.

4. In a machine for drawing bars for shafting, the combination, with the standards A^3, of the screw-spindles H, the gate-bars J, the die-holders K, the beveled cog wheels H^2 on the spindles, the transverse shaft I, and the beveled cog-wheels H^2 on the end of the same, substantially as herein shown and described, and for the purpose set forth.

293,451. HAY-CARRIER. FRED PAUL GROSSCUP, Columbus, Ohio, assignor to the Columbus Hay Tool Company, same place. Filed Nov. 30, 1883. (No model.)

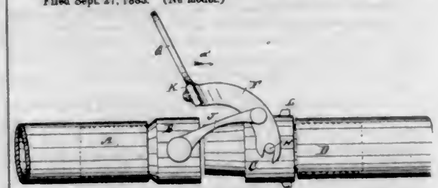
Claim.—1. The suspended bracket having inwardly-projecting arms with a space between the inner ends for the passage of the carrier-supports, in combination with the rails secured upon said ends, substantially as described.



2. The suspended bracket *c*, having arms 2 2, lips 3 3, and clamps 5 5, in combination with the rails *a*, substantially as described.

3. The suspended bracket *c*, having the arms 2 2, carrying the rails, and a cross-brace, 4, substantially as described.

4. A suspended bracket having divided arms 7 7, adapted to receive the ends of the rail-section, substantially as described.

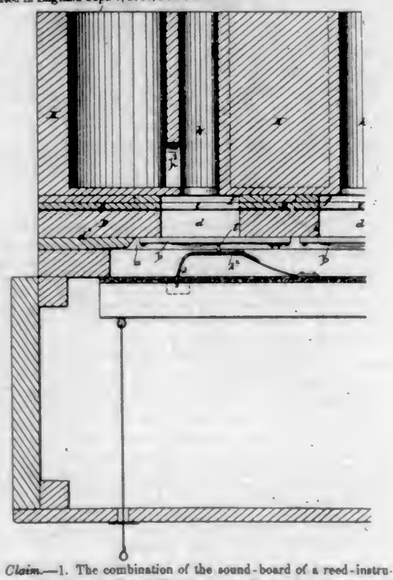


5. A suspended bracket adapted to receive and support the rails of the track and notched rails held to said bracket, substantially as described.

293,452. HAY-CARRIER. FRED PAUL GROSSCUP, Columbus, Ohio, assignor to the Columbus Hay Tool Company, same place. Filed Nov. 30, 1883. (No model.)

Claim.—A way or track for an elevator, of channel-iron, in combination with re-enforcing plates and suspension-rods passing through said channel-iron and plate, substantially as described.

293,453. HOSE-COUPLING. SAMUEL HAWER, Salt Lake City, Utah. Filed Sept. 27, 1883. (No model.)



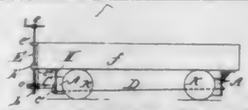
Claim.—1. A hose-coupling constructed with a fork united with one hose-section by links, with its bifurcated end adapted to receive pins or studs, on the other hose-section, which fork is provided with a spring-catch for locking the fork in place when the hose-sections are coupled.

2. In a hose-coupling, the combination, with the socket B, of the fork F, having notched ends, the links J, and the neck C, having studs H, substantially as herein shown and described.

3. In a hose-coupling, the combination, with the socket B, of the links J, the fork F, the neck C, having studs L, and the notched spring catch or lever K, pivoted on the fork F, substantially as herein shown and described.

293,454. REED-ORGAN. JAMES BAILLIE HAMILTON, Hammersmith, County of Middlesex, England. Filed Oct. 2, 1883. (No model.) Patented in England Sept. 7, 1883, No. 4,312.

Claim.—1. The combination of the sound-board of a reed-instrument and a series of pallets with a corresponding series of removable plugs or breech-pieces, each carrying two or more reeds common to one pallet and adapted to recesses in the sound-board, substantially as set forth.



2. The combination of the sound-board of a reed-instrument, having a series of spaced bars, *a*, with reeds and pallets near together, and with a superstructure rigidly secured to the sound-board through said bars, substantially as described.

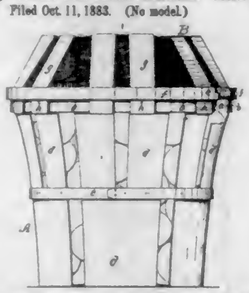
3. The combination of the sound-board, reeds, and pallets of a musical instrument, with a cavity-board having a communicating nostril, *h*, and mouth h^3 for each reed, substantially as specified.

4. The combination of the reeds of a musical instrument with pallets carrying exciting-springs *k*, adapted to come into contact with the reeds, substantially as set forth.

293,455. CAR-BRAKE. JOSIAH HARDING, Antofagasta, Chili. Filed Dec. 19, 1883. (No model.)

293,455.

Claim.—1. The combination of the pivoted hangers H at one end of the car, connected near their lower ends by the transverse shafts B with the elbow-lever C, pivoted on said shaft and connected by its long arm to the screw-staff E, and by its short arm to the connecting-rod D, secured to the hangers at the opposite end of the car, substantially as set forth.

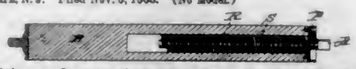


2. The combination of the pivoted hangers at one end of the car, connected near their lower ends by a shaft, B, on which is pivoted the elbow-lever C, with the rod D, provided at one end with a series of holes for adjustably connecting it with the short arm of the elbow-lever, and connected at its other end to clamps A, vertically adjustable on the hangers at the other end of the car, substantially as set forth.

3. The adjustable clamps A on bar *a'*, consisting of the plates *i*, carrying screws *k*, the plates *j*, and the teeth *l* on said plates *i j*, substantially as set forth.

4. In a car-brake for flexible wheel-bases, consisting of lever C and screw-staff E, connected to said brakes, as described, the staff E, suspended from the support *d'* by an oval collar, *e'*, as set forth.

5. The bar *a'*, for connecting the pull-rods D to the hind brakes, connected to the brakes by vertically-adjustable clamps, substantially as described.

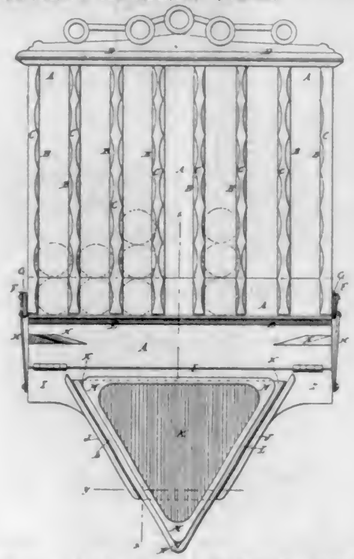


293,456. COVER FOR FRUIT-PACKAGES. JULIUS HARRIS, Ridgway, N. Y. Filed Oct. 11, 1883. (No model.)

Claim.—1. In combination with a basket for holding fruit, a cover, B, for the same, consisting of splints *g*, substantially as shown, having a portion of each splint near the respective ends thereof bent obliquely downward, and the extreme ends of each of said splints bent vertically downward and secured to one or more hoops or stays, *e f*, the vertical ends *h* of said splints projecting below the lower edges of said hoops or stays and fitting against the outer surface of the external hoop, *b*, of the mouth of the basket to strengthen the latter, substantially as set forth.

2. In combination with a basket for holding fruit and a cover for the fruit, consisting of netting or similar fabric, an outer cover or protector for the fruit and netting, consisting of splints *g*, substantially as shown, having a portion of each splint near its ends bent obliquely downward, and the extreme ends of each of said splints bent vertically downward and secured between concentric opposing hoops or stays *e* and *f*, the vertical ends *h* of said splints projecting below the lower edges of said hoops or stays and pressing tightly against the outer surface of the external hoop of the mouth of the basket, to strengthen the latter and hold the netting, substantially as shown and set forth.

293,457. SPRING SHADE-ROLLER. STEWART HARTSHORN, Millburn, N. J. Filed Nov. 8, 1883. (No model.)



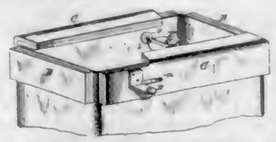
Claim.—1. In spring shade-rollers, the combination of the shaft or spindle and spring around the same with the roller and the cavity therein, substantially as described, so that any support for the inner end of the spindle or any connection of the inner end of the spring with the roller is dispensed with and rendered unnecessary.

2. In spring shade-rollers, the spindle R, the end plate, P, and spring S, connected together substantially as described, and combined with the roller so that the spring will rest upon the walls of the cavity thereof, as and for the purposes set forth.

3. In spring shade-rollers, the combination, with the roller, of the spindle R, attached thereto only at its outer end, the end plate, P, and spring S, secured at its inner end to the spindle and at its outer end to the plate, and the flattened bracket end A, connected together substantially as described, as and for the purposes set forth.

4. In spring shade-rollers, constructing the flattened or bracket end of the spindle with a shoulder and screw-tap, substantially as described, for attaching said spindle, the head or end plate of the roller, and the spring-carrying shaft together, as and for the purposes set forth.

293,458. BALL-RACK FOR POOL-PLAYING. JACOB S. HAUSMAN, New York, N. Y. Filed Dec. 31, 1883. (No model.)

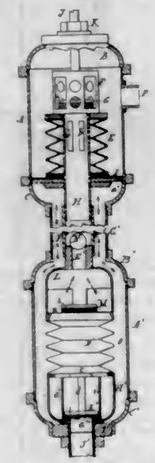


Claim.—1. A ball-rack constructed substantially as herein shown and described, and consisting of the back plate having a plate hinged to its lower edge and provided with vertical rack-bars having a plate hinged to their lower ends, the two hinged plates being connected by pivoted bars, and levers so arranged that the upward movement of the lower plate will swing the upper plate downward, as set forth.

2. In a ball-rack, the combination, with the back plate, A, and the rack-bars B, of the hinged plates E I, the pivoted connecting bars and levers F H G, the triangular plate K, and the triangle M, substantially as herein shown and described, whereby the balls will be made to pass from the rack to the triangle automatically, as set forth.

3. In a ball-rack, the combination, with the hinged plate I, having dovetailed flanges J, of the triangular plate K, having dovetailed flanges L, and the triangle M, having dovetailed sides, substantially as herein shown and described, whereby the said triangular plate and triangle will be kept in place when the hinged plate hangs in a vertical position, as set forth.

293,459. MAIL-BAG. WILLIAM HAWN, Knoxville, Tenn. Filed Dec 20, 1883. (No model.)



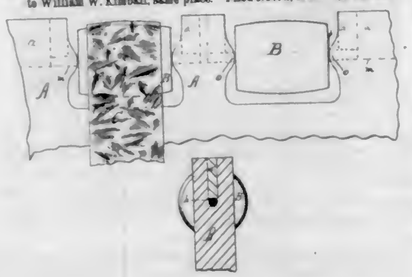
Claim.—A mail-bag provided on one of its sides with a slot and a perforated plate, and upon the opposite side of the bag a suitable perforated staple adapted to turn in its bearing after passing through the slot, to bring it over the perforated plate, for securing the two together by a suitable padlock, substantially as and for the purpose set forth.

293,460. BOTTLE. FREDERICK E. HEISS and FREDERICK STITZEL, Louisville, Ky., assignors to Thomas H. Sherley, same place. Filed Nov. 30, 1883. (No model.)

Claim.—In combination with a bottle having an inner projection forming a valve-seat, G, the perforated plug or stopper B, and valve C, secured by a stopper, D, substantially as shown and described.

293,461. PUMP. NATHAN HEMENWAY, Napa City, Cal. Filed Oct. 8, 1881. (No model.)

Claim.—1. In pumps for raising water, a cylinder, A', having secured in the lower end thereof a valve-chamber in open relation to the outside of the cylinder by an induction-pipe provided with a valve arranged within said chamber, and said chamber being in open connection with a flexible water-receiver, having in the upper end thereof a valve, whereby the water from the receiver is discharged into the said cylinder A', substantially as and for the purpose set forth.

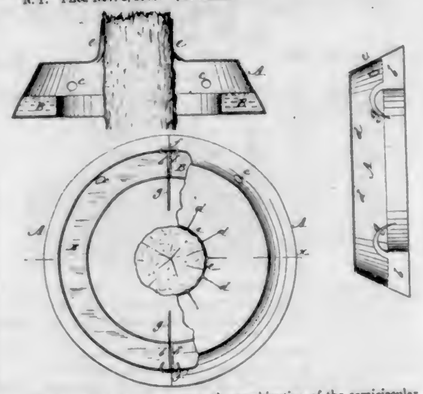


2. In an apparatus for raising water, in combination with the cylinder A' and its inclosed chamber and valve, water-receiver and valves M and N, a cylinder, A, arranged above the cylinder A', and provided at its lower end with a diaphragm, having secured thereto a flexible water-receiver with a central perforated tube or pipe therein, and having the upper end provided with a valve and the lower end connected to the receiver D' by a suitable pipe-connection, and the two cylinders connected by a corresponding pipe-connection, substantially as described, and for the purpose specified.

3. In pumps for raising water, the cylinder A, provided with a diaphragm, and water-receiver E, connected to said diaphragm, and having therein a perforated tube or pipe with the upper end furnished with a valve, and said cylinder provided with an outlet, substantially as herein described, and for the purpose specified.

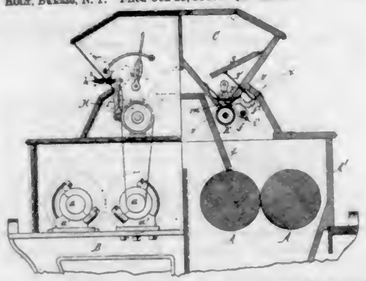
4. The valve M, consisting of a disk, *i*, connected to its seat i^2 by flexible rings i' n', said rings being secured to each other at two opposite points of a diameter, and respectively connected to the valve-disk *i* and valve-seat i^2 at the ends of two parallel diameters at right angles to the diameter joining the points of attachment of the rings i' n', substantially as shown and described.

5. In a pump, the combination, with the collapsible receivers D' E, constructed of light material, of a tubular connection between them, made of wood or other buoyant material, substantially as shown and described, whereby the lifting parts of the pump are rendered buoyant, as set forth.



293,462. ORGAN-TREADLE. JACOB HESSLER, Chicago, Ill., assignor to William W. Kimball, same place. Filed Nov. 2, 1881. (No model.)

Claim.—1. In a cabinet-organ, the roller-bar having openings allowing the rollers to be sunk below its edge, and a longitudinal saw-kerf, furnishing a seat for the roller-pivots, in combination with the rollers having their pivots seated and secured in said kerf, and the bands passing over said rollers, substantially as specified.



2. In a cabinet-organ, the roller-bar having cross-openings for the rollers, and a longitudinal saw-kerf for the pivots, the sides of the roller-openings approaching the rollers at the pivotal points, substantially as and for the purpose set forth, in combination with the rollers.

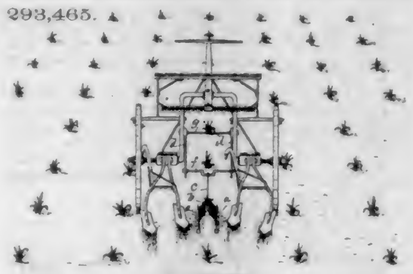
293,463. TREE-PROTECTOR. FRANKLIN R. HOUGHOOK, Brooklyn, N. Y. Filed Nov. 8, 1883. (No model.)

Claim.—In a tree-protector, the combination of the semicircular sections having corresponding troughs, B, with their ends *b b*, provided with hooks *g*, curved upward and downward and terminating intact with the tree, essentially as shown and described, and for the purpose set forth.

293,464. FEED MECHANISM FOR ROLLER-MILLS. NOAH W. HOLT, Buffalo, N. Y. Filed Oct. 23, 1883. (No model.)

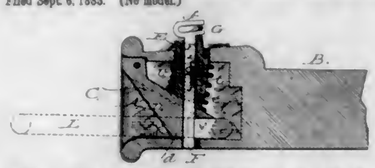
Claim.—1. The combination, with a feed-hopper, of a pivoted feed-gate capable of being adjusted on its pivot to regulate the flow of material, and mechanism whereby a reciprocating movement is imparted to said pivoted feed-gate to loosen the material, substantially as set forth.

2. The combination, with a feed-hopper, of a pivoted feed-gate having projecting pins, and mechanism whereby a longitudinal reciprocating movement is imparted to said feed-gate, substantially as set forth.



3. The combination, with a feed-hopper, of a pivoted feed-gate, mechanism whereby the feed-gate is automatically adjusted to regulate the flow of material from the feed-hopper, and mechanism whereby a longitudinal reciprocating movement is imparted to said feed-gate, substantially as set forth.

4. The combination, with a feed-hopper, of a feed-gate, a rod to which the feed-gate is secured, and which serves as a pivot for the feed-gate, and mechanism whereby a longitudinal reciprocating movement is imparted to said feed-gate, substantially as set forth.

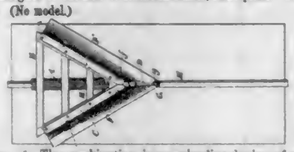


293,465. ATTACHING PLANT-SHIELDS TO CULTIVATORS. CHAS. H. HOPKINS, De Soto, assignor of one-half to H. S. Butler, Des Moines, Iowa. Filed July 23, 1883. (No model.)

Claim.—The combination of a rigid plant-shield and a pendent frame with the carriage of a straddle-row cultivator, to operate in the manner set forth, for the purposes specified.

293,465.

293,466. CAR-COUPLING. LORENZO D. HOOPER, Coffeyville, Kans. Filed Sept. 6, 1883. (No model.)



Claim.—1. The combination, with the hollow draw-head having openings in top and bottom plates, inclined pivoted tumbler-plate C, having frog D, with projecting heel *d* and hollow lug E, straight pin F, having a limited play in said lug and provided with the slitted head *f*, and the arched bar G, engaging said slitted head and having its legs pivoted to the opposite sides of the draw-head, substantially as described.

2. The combination, with the draw-head, pivoted tumbler-plate having hollow lug E, and sliding pin F, having slitted head *f*, of the arched bar G, engaging said head and having its legs pivoted to the opposite sides of the draw-head, and provided with the extensions *g*, substantially as and for the purpose set forth.

3. The combination, with the draw-head and inclined tumbler-plate having lug E, provided with notched rib *e*, of the latch *q*, arranged to engage said rib, substantially as described, and for the purpose set forth.

293,467. UNLOADING PLATFORM-CARS. JAS. HOULEHAN, Toledo Ohio, assignor of one-half to Rathbun Fuller, same place. Filed Dec. 14, 1883. (No model.)

Claim.—1. The combination, in an unloading device, of one or more wings horizontally or laterally movable, substantially as set forth.

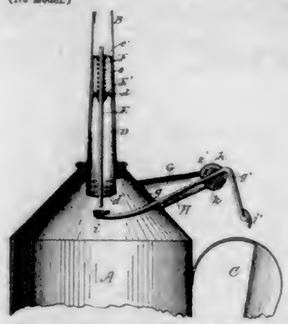
2. The combination, in an unloading device, of one or more wings horizontally or laterally moving upon a pivot or pivots, substantially as described.

3. The combination, in an unloading device, of one or more horizontally or laterally moving wings pivoted at its or their forward ends, substantially as described.

4. The combination, in an unloading device, of one or more horizontally or laterally and vertically moving wings, substantially as described.

5. The combination, in an unloading device, of wings, one of which is adapted to be swung on a line with the other wing, substantially as set forth.

6. The combination, in an unloading device, of one or more horizontally or laterally moving wings and one or more braces, substantially as described.



7. The combination, in an unloading device, of wings F F and devices or connections for securing one of said wings on a line with the other wing, substantially as described.

8. The combination, in an unloading device, of one or more horizontally or laterally and vertically moving wings and detachable connections permitting such movements of the wing or wings, substantially as set forth.

9. The combination, in an unloading device, of wings, one of which is adapted to swing on a line with the other wing, and a filling block or brace designed to be inserted between and brace the adjoining ends of the said wings, substantially as set forth.

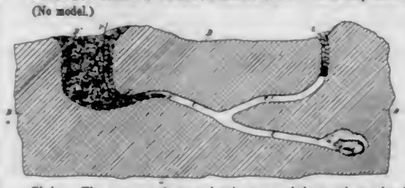
10. The combination, in a device for unloading, of a nose provided with a hinge, and wings pivoted thereto, substantially as set forth.

293,468. OIL-CAN. JOHN W. JACKSON, Sharpsville, Pa. Filed Nov. 28, 1883. (No model.)

Claim.—1. In combination with a self-closing oil-can, a valve-operating mechanism attached to the body of the oil-can, consisting of a rod, H, having a disk, *k*, with groove *k'* and supporting-pieces G, the parts having the slots *g g'*, substantially as shown and described, and for the purpose set forth.

2. In an oil-can, the means for closing the spout, consisting of the conical portion D, perforated at its lower end, and having a valve-seat, E', and bail *e*, and valve-carrying rod E, provided with a spiral spring, F, in combination with the hollow side pieces, G, supporting a lever, H, with grooved disk *k'*, the parts having slots *g g'*, the parts being organized substantially as described, and for the purpose set forth.

293,469. CLOTHING FOR PULLEYS. GILMAN JAQUITH, Maysville, Ky., assignor to January & Wood, same place. Filed July 20, 1883. (No model.)

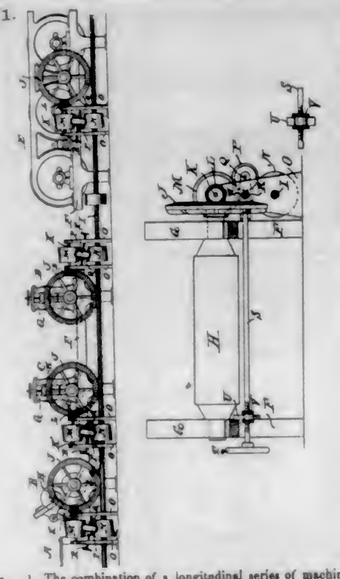


Claim.—1. A clothing for whirls and pulleys, composed of an adhesive composition applied to the band-driving surface of the pulley, and a spirally-wound thread or twine covering around the same, arranged to enter a female thread in the driving-surface of the pulley, substantially as specified.

2. A clothing for whirls and pulleys, consisting of a coating, *c*, composed of pitch and glue, and a covering, *d*, of thread or twine wound spirally around the same, and within a female thread cut in or formed around the driving-surface of the pulley, essentially as described.

3. A clothing for whirls and pulleys, consisting of an adhesive coating, *c*, applied to the band-driving surface of the pulley, having a female thread, *s*, in it, a covering, *d*, of thread or twine wound spirally around the same and within said female thread or groove, and an outer adhesive coating, *e*, substantially as specified.

4. A whirl or pulley having a spirally-grooved driving-surface and a clothing composed of an adhesive composition and spirally-wound thread or twine, essentially as shown and described.



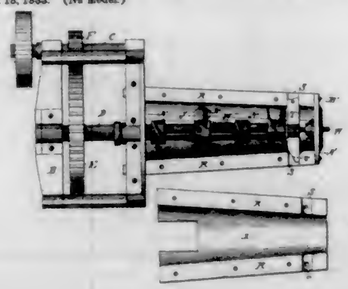
293,470. PROCESS OF EXTERMINATING GROUND-BURROWING ANIMALS. DANIEL L. JOHNSON, Kalamazoo, Mich. Filed July 24, 1883. (No model.)

Claim.—The process of exterminating ground-burrowing animals, which consists in firmly plugging up the mouth of the branch holes to the burrow, excavating the earth at the main entrance for a suitable distance on a line with the burrow, inserting a torpedo with fuse into the burrow beyond the terminus of the excavation, carrying the fuse to the surface of the earth, refilling the excavation, and firmly packing down the replaced earth, and in igniting the fuse, all substantially as set forth.

293,471. DRIVE FOR PAPER-MAKING MACHINES. GUSTAV KAPPENBERG, Hamilton, Ohio. Filed Nov. 15, 1883. (No model.)

293,471.

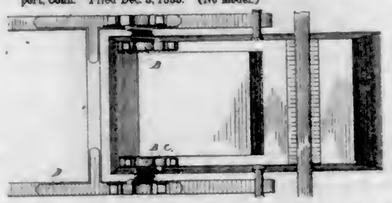
Claim.—1. The combination of a longitudinal series of machine parts to be independently driven, a line-shaft disposed parallel to such series of machine parts, a drum upon said line-shaft at each of said parts, a short shaft parallel to the line-shaft at each of said machine parts, connected thereto by gearing and provided with a drum, a friction-idler at each of the pairs of drums, and means for adjusting the idlers to and from the drums in starting and stopping of the machine parts, substantially as and for the purpose as set forth.



2. The combination of a longitudinal series of machine parts to be independently driven, a line-shaft disposed parallel to such series of machine parts, and provided with conical drums, a short shaft disposed parallel to said line-shaft at each of said machine parts, connected thereto by gearing and provided with a conical drum, a friction-idler arranged to be held into forcible contact with each of the pairs of conical drums, and a means for adjusting said idlers along the faces of said conical drums in regulating the speed of the machine parts, substantially as and for the purpose specified.

293,472. BUTTON. PHILIP KALESH, Chicago, Ill. Filed July 19, 1883. (No model.)

Claim.—In a button, the stem *a*, provided with neck *b* and pointed head *c'*, in combination with the hinged plates *c d*, whereof the plate *c* is provided with slot *g*, and plate *d* with socket *e* and catch *h*, substantially as specified.



293,473. TILE-MACHINE. PHILIP HENRY KELLS, Adrian, Mich. Filed Oct. 13, 1883. (No model.)

Claim.—1. In a tile-machine, the combination of the tempering-box sections I J, formed with recesses in their adjoining surfaces near the discharge end, and the cross-bar T, having one of its ends beveled, whereby the latter may be inserted into the recesses without taking the sections apart, as described.

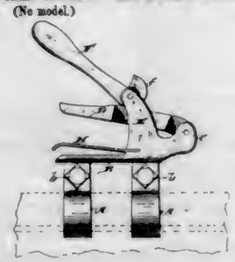
2. The tempering-box composed of halves or sections having laterally-extending suitably-connected flanges, provided with recesses in their inner adjoining sides, near the discharge end of the machine, a cross-bar seated in the said recesses and having a beveled end, and an outwardly-extending screw-threaded rod, a set-screw bearing against and retaining the said cross-bar, a core seated upon the screw-threaded rod, and a tile-ring secured detachably upon the end of the tempering-box, all arranged and operating substantially as set forth.

293,474. TWO-WHEELED VEHICLE. GEORGE W. KERR, Bridgeport, Conn. Filed Dec. 3, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, the spiral springs, as described, coiled about the pins connecting the body to the shafts, in combination with said body and the shafts, substantially as and for the purpose hereinbefore set forth.

2. In a two-wheeled vehicle, the shafts pivotally attached to the body, in combination with spiral springs coiled about the pivotal points, as described, and whose ends are attached, the one to the body and the other to the shafts, substantially as set forth.

3. The shafts, as described, in combination with the spiral springs, which act to take up the vertical and horizontal motion of the shafts, and the housings provided with cushions, against which the ends of the shafts may abut, all as described, and for the purposes set forth in this application.



293,475. LEGGIN. JULIA A. KING, Chicago, Ill. Filed Nov. 26, 1883. (No model.)

Claim.—1. As an improved article of manufacture, an elastic knitted leggin extended to cover the upper surface of the foot, and provided with a partial sole, B, and heel-opening at B', substantially as described.

2. The combination, with the elastic knitted leggin extended to cover the upper surface of the foot, of a partial sole, B, and a facing or binding, *a'*, about the heel-opening B', substantially as and for the purpose set forth.

293,476. REIN-HOLDER. LEBBEUS A. KOPLIN, Akron, Ohio. Filed Aug. 9, 1883. (No model.)

Claim.—1. A rein-holder consisting of a pair of clamping-jaws, whereof one is movable and actuated by a cam-lever which locks said jaw down, substantially as described.

2. The combination, with the lower jaw of a rein-holder, of a spring-

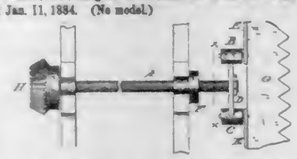


plate overlying the same, whereby reins of varying thickness may be clamped between the jaws, substantially as described.

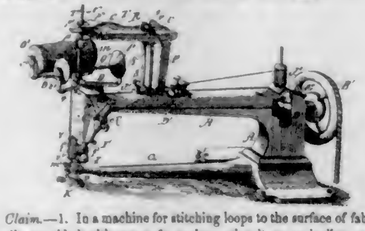
3. The combination, with the lower jaw, B, having the spring-plate H, of the pivoted jaw D and the cam-lever F, substantially as described.

4. The combination, with the jaw B and pivoted jaw D, of the spring G and cam-lever F, substantially as described.



5. The rein-holder described, consisting of the clamps A A', the jaw B, having spring-plate H, the pivoted jaw D, spring G, and cam-lever F, pivoted to arms E, substantially as described.

293,477. DEVICE FOR CONVERTING MOTION. WM. R. LAMPTON, Terre Haute, Ind., assignor of one-half to Willis O. Winn, same place. Filed Jan. 11, 1884. (No model.)

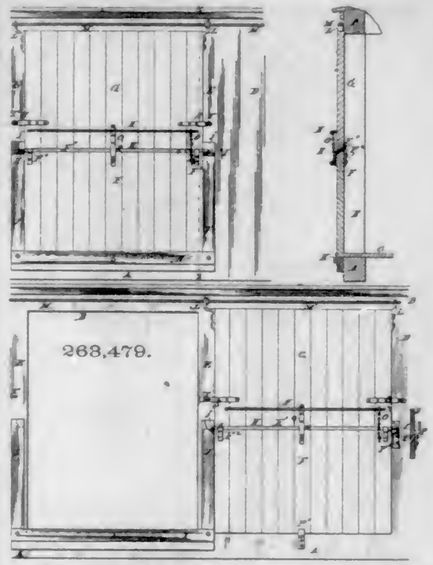
Claim.—In a machine driven by either cog or belt gearing, a mechanical movement or device for converting motion, consisting of the combination, with the loosely-journaled shaft-bearing, cam-shaped, as described, of the bracketed friction-rollers on and in combination with the reciprocating bar, whereby a continuous, steady, and even rectilinear motion is imparted thereto, substantially as described.

293,478. MACHINE FOR SEWING LOOPS TO THE SURFACE OF FABRICS. SALLY M. LEVY and ADOLF J. SIEMSRADSKY, Milwaukee, Wis., assignors to said Levy. Filed July 10, 1883. (No model.)

Claim.—1. In a machine for stitching loops to the surface of fabrics, a needle provided with means for reciprocating it on an incline, co-operating stitch-forming mechanism, and an arm provided with means for presenting the fabric to the needle in successive bends, in combination with mechanism for laying the material of which the loops are formed up against the fabric in the line of travel of the needle, substantially as set forth.

2. The looping-spindle and sleeve surrounding it and carrying the feeding-thimble, in combination with the needle adapted to reciprocate on an incline, the yarn-guide and its shaft, a pinion carried by the latter, and the driving-shaft geared to said pinion and to the driving mechanism of the machine, substantially as set forth.

3. The combination of two presser-feet, an elastic connection for drawing them toward each other, and a lever having a cam-head for separating them, in combination with the work-arm for supporting the fabric, substantially as set forth.



4. The combination of shaft B and its cams T^2 and S^2, levers T and S, bar R, looping-spindle, pinion p', and inclined needle, with the driving mechanism of the machine and intermediate connections, substantially as set forth.

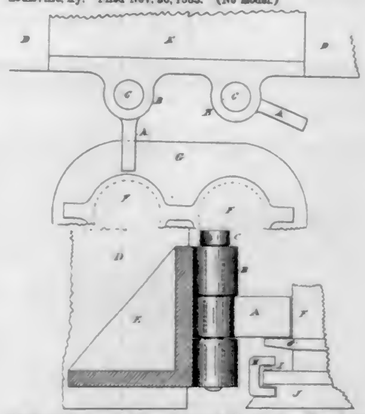
5. In a machine for sewing loops to fabrics, the combination, with the work-arm and its feed-disk, of a foot for supporting the work up under and against the feed-disk, and a cutting-blade fixed in said foot, substantially as set forth.

6. The combination of the inclined needle-bar and needle, a vertical looping-spindle, a work-arm carrying a feed-disk, and adapted to present the fold of the fabric to the action of the needle, and an upper and a lower presser-foot and operating mechanism, substantially as described, whereby a chain-stitch may be made in only one surface of the fabric, substantially as set forth.

263,479. RAILWAY-FREIGHT-CAR DOOR. NILS P. LILJEHOLM, St. Louis, Mo., assignor of one-third to Henry Goetz, same place. Filed Nov. 7, 1883. (No model.)

Brief.—A two-part door, the upper part being suspended upon hangers from a rod secured to the side of the car and bearing on and adapted to slide on the lower part, said lower part being connected to the upper by a bar and chain, and supported, when closed, by trunnions resting in slots in said pieces, and when open one trunnion rests in one of the slots and the other in a hook upon the side of the car.

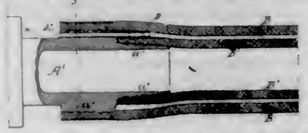
Claim.—1. A freight-car door consisting of two parts, an upper and lower, the upper part secured to the car, and the lower part connected to the upper part by a bar and chain.



2. The combination of a car-body having a door-opening, side pieces having slots at top and a strip at bottom to form a groove, a door in two parts, an upper and lower, the lower part having trunnions to occupy the slots, and the upper part supported over the lower part, and the lower part supported in the groove and between the side pieces by the trunnions.

3. The combination, with the lower part having trunnions, and a side piece having a slot at its upper end, of the hook to support the lower part away from the door-opening.

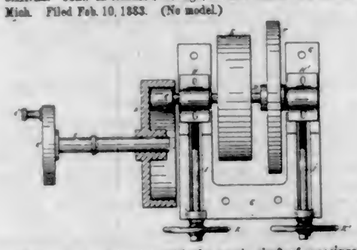
4. A freight-car door composed of a lower member, F, secured in place by the cleat K, side strips or pieces, J, with open slots *j* and trunnions I, and the upper member, G, secured to the side of the car and bearing on the top of the lower member, F, for the purpose set forth.



5. The combination, in a freight-car door, of a lower member, F, supported in position by trunnions I, side pieces, J, and cleat K, and an upper member bearing on the lower member, and supported on hangers L and rod M, substantially as set forth.

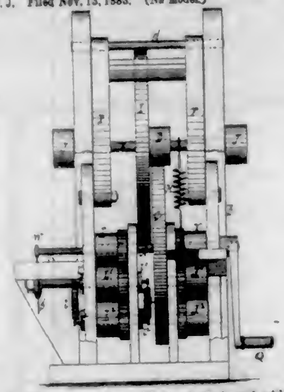
293,480. PIPE-MOLDING PIT. DENNIS M. LONG and JOHN KELLER, Louisville, Ky. Filed Nov. 30, 1883. (No model.)

Claim.—The combination of the wall D, the plate E, and the bars A, substantially as described.



293,481. FLEXIBLE TUBE FOR AIR-BRAKES, &c. FRANK A. MAGOWAN, Trenton, N. J. Filed Nov. 22, 1883. (No model.)

Claim.—1. The combination of an inner and outer flexible tube for air-brakes or other purposes, with an attachment having a tubular stem or tail-piece, to which both tubes are secured, substantially as set forth.



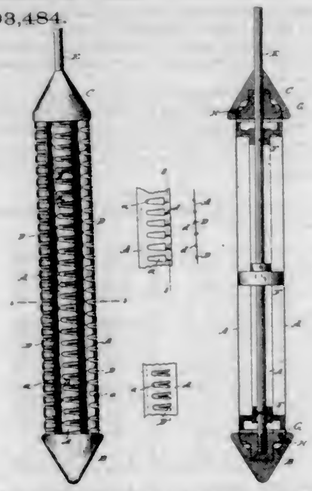
2. The combination of an inner and outer tube for air-brakes or other purposes, and a stem or tail-piece, constructed for attachment to both tubes, with a signaling device actuated by air or other fluid under pressure, which may gain access to the annular space between the two tubes, substantially as specified.

293,482. MECHANISM FOR DRIVING DYNAMO-ELECTRIC MACHINES. JOHN R. MARELL, Chicago, Ill., and JAMES H. WAYNE, Detroit, Mich. Filed Feb. 10, 1883. (No model.)

Claim.—The combination, with the crank-shaft of a reciprocating steam-engine, of a counter-shaft driven from the crank-shaft, and having thereon a fly-wheel, substantially as and for the purposes set forth.

293,483. MECHANICAL MOVEMENT. JEAN BAPTISTE MARTEL, Newark, N. J. Filed Nov. 13, 1883. (No model.)

Claim.—1. The combination, with the shaft A, and with the fly-wheel C, mounted on said shaft, of the friction-pulley D, the swinging arms F, the secondary fly-wheel I, and the spring or springs H, substantially as shown and described.



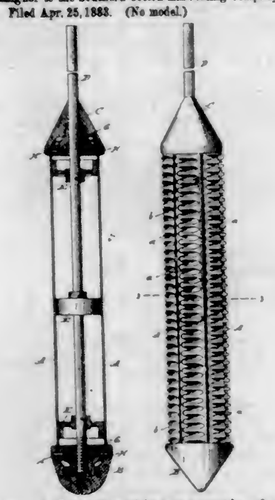
2. The combination, with the shaft A, the fly-wheel C, the friction-pulley D, the swinging arms F, and the secondary fly-wheel I, of the drums K K' K^4, substantially as shown and described.

3. The combination, with the shaft A, the fly-wheel C, the friction-pulley D, the swinging arms F, and the secondary fly-wheel I, of the drums L L' L^2, the cranks l' l^2, and the spring *l*, substantially as shown and described.

293,484. COTTON-PICKER STEM. CHARLES T. MASON, Jr., SUMTER, S. C., assignor to the Southern Cotton Harvesting Company, of South Carolina. Filed Apr. 25, 1883. (No model.)

Claim.—1. In a cotton-picker stem, the convex sheet-metal plate A, provided with slots *a*, recesses *d*, and teeth D, secured in said recesses, the said teeth lying in the slots *a*, substantially as described.

293,484.



2. In a cotton-picker stem, a series of convex sheet-metal plates, A, provided with slots and teeth, as described, the said plates being secured together at their adjacent edges by solder or otherwise, substantially as described.

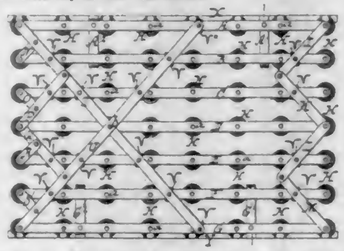
3. In a cotton-picker stem, the combination of the plate or plates A, having the slots *a*, recesses *d*, and teeth D, with the supporting-pieces F and G, cap-pieces B and C, and rod E, substantially as described.

4. In a cotton-picker stem, a periphery or outer envelope of sheet metal, substantially in the form of a series of parallel longitudinal convex beads, a series of slots being formed in each bead, and teeth arranged in said slots, substantially as described.

293,485. COTTON-PICKER STEM. CHARLES T. MASON, Jr., SUMTER, S. C., assignor to the Southern Cotton Harvesting Company, of South Carolina. Filed Apr. 25, 1883. (No model.)

Claim.—1. In a cotton-picker stem, a series of metal plates, A, provided with teeth *a* and recesses *b*, surrounding and secured to a support or supports attached to a central rod and so arranged that the teeth *a* of one plate shall lie in the recesses *b* of the next adjacent plate, substantially as described.

2. In a cotton-picker stem, a series of metal plates, A, provided with teeth *a* and upward projections or partitions *c'*, surrounding and secured to a support or supports attached to a central rod, and so arranged that the teeth *a* of one plate shall lie between the partitions *c'* of the next adjacent plate, substantially as described.



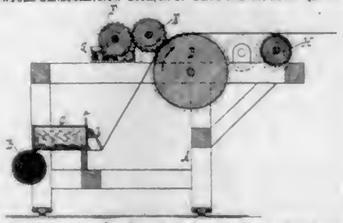
3. In a suspended cotton-picker stem, an end piece or cap for the

lower end thereof, substantially of wedge form, and having a blunt or rounded lower edge or extremity, substantially as described.

4. In a cotton-picker stem, the combination of the rod D, cap-pieces C and B, end pieces G, flanged supporting-disks E, and plates A, substantially as described.

5. A cotton-picker stem having on its periphery a series of recesses or indentations, the said recesses being arranged side by side and longitudinally or parallel to the axis of the stem, and teeth arranged in said recesses, the engaging ends of said teeth being on a level with or slightly below the outer surface of the partitions between the said recesses, substantially as described.

293,486. FOLDING-BED BOTTOM. GEORGE H. MAYNARD, Brooklyn, N. Y. Filed July 18, 1883. (No model.)

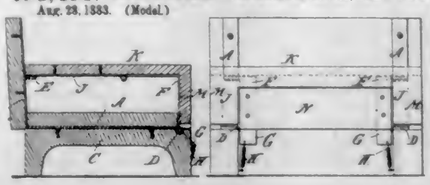


Claim.—1. The combination, with the bottom slats and with the springs mounted thereon, of the center braces T U, crossing each other and pivoted to the outer slats on opposite sides, and connected to the intermediate slats by the swivel-slides V, the end braces P and Q, connected at one end to the center slat and at the other end to the center braces T U, and the end braces I K L M, for holding the opposite ends of the slats in position, substantially as described.

2. The combination, with the bottom slats and with the springs mounted thereon, of the brackets A' A^2 G' G^2, the top slats X Y, the center braces T U, and the end braces I K L M, the braces being connected with the slats, and the several parts constructed and arranged substantially as described.

3. The combination, with the bottom slats and with the springs mounted thereon, of the center braces T U, pivoted to the outer slats on opposite sides and connected to the intermediate slats by the swivel-slides V, the end braces P and Q, connected at one end to the center slat and at the other end to the center braces T U, and the end braces I K L M, for holding the slats in position at the opposite end, substantially as described.

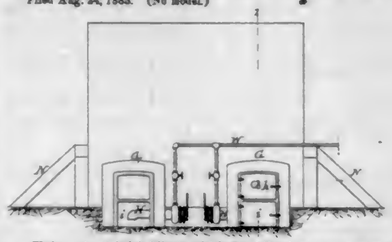
293,487. MANUFACTURE OF OIL-CLOTH. JOHN MCGAVIN and E. CRAWFORD SANDFORD, New York, N. Y. Filed Jan. 10, 1884. (No model.)



Claim.—1. In the manufacture of oil-cloth, the method herein described, consisting in coating and printing the cloth in one continuous operation.

2. The combination, substantially as hereinbefore described, of the color-box and doctor with the printing-cylinder and color-roller.

3. The combination, substantially as hereinbefore set forth, of the color-box and the doctor with the printing-cylinder, the pattern-cylinder, the color-roller, and the drag-roller.

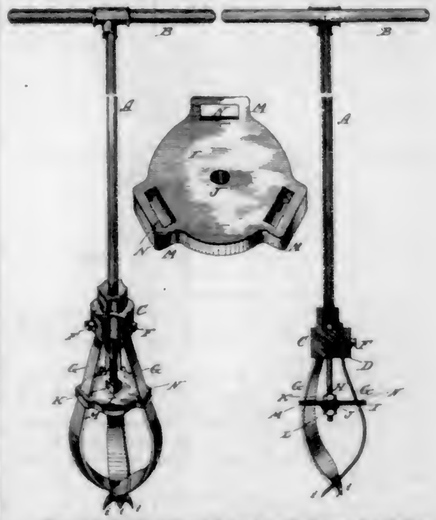


293,488. SOFA-BEDSTEAD. JOS. MCGRATH, Newton, Kans. Filed Aug. 28, 1883. (Model.)

Claim.—1. The combination, with a metallic band, A, a sofa-seat frame, C, and a back having the projections E, of the metallic angular bar F, hinged to an eye, D, of said band, the bar J, hinged to bar F, and the removable seat K, the latter being provided with downwardly projecting legs M, and a front board, N, secured between said legs to the inner shank of bar F, as shown and described.

2. The combination, with a seat-frame, C, having a back, B, of the bands A, the brackets E, the angularly-bent bars F, the removable seat K, and the bands J, secured to the under side of the same, the angular bars F being hinged to the bands A and J, substantially as herein shown and described.

293,489. BRICK-KILN. WILLIAM H. MELCHER, Philadelphia, Pa. Filed Aug. 24, 1883. (No model.)



Claim.—1. A brick-kiln in which the following elements are combined, namely: first, a chamber for containing the bricks to be burned; second, a combustion-chamber underlying the said brick-burning chamber; third, a continuous uninterrupted arched floor perforated throughout between the two chambers for supporting the stacked bricks to be burned; and, fourth, fire-places communicating with the said combustion-chamber, all substantially as set forth.

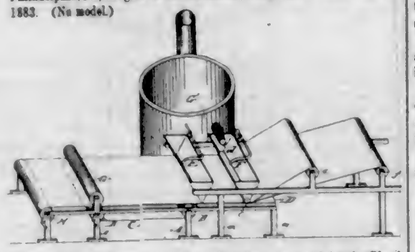
2. The combination of the chambers D and E of the kiln, perforated floor, and fire-places with blast-pipes, through which air under pressure is introduced into the ash-pits of the fire-places, substantially as specified.

293,490. POST-AUGER. JOHN E. MILES, Marlin, Tex. Filed Nov 6, 1883. (No model.)

Brief.—A cross-handled auger-shaft ends in a block having sockets and set-screws to receive and secure curved blades, and a central downwardly-projecting screw-threaded rod, on which an expander-disk having slotted extensions, through which the blades pass, is adjustably held by a nut above and below it.

Claim.—1. The combination, in a post-auger, of the socketed block, the screw-threaded rod extending from the center of the lower end of the block, the expander-disk fitting upon said threaded rod, and having the slotted wings or extensions, the two nuts for adjusting the position of the expander-disk upon the threaded rod, and the curved auger-blades, as and for the purpose shown and set forth.

2. The herein-described post-auger, consisting of the shaft, the cross-handle, the socketed block, the curved auger-blades, the set-screws securing the blades in their sockets, the screw-threaded rod extending from the center of the lower end of the block, the expander-disk having slotted wings or extensions, and the two nuts for adjusting said disk upon the threaded rod, as and for the purpose shown and set forth.

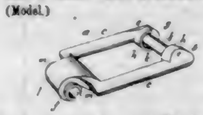


3. In a post-auger, the combination of the curved concave-convex auger-blades and the adjustable slotted expander-disk, whereby the lower pointed ends of the blades may be arranged to cross one another, as and for the purpose shown and set forth.

293,491. ROOFING FABRIC. HENRY M. MINER, Philadelphia, Pa., assignor to Charles Barclay, same place. Filed June 22, 1883. (No model.)

Claim.—The roofing fabric composed of a central burlap or similar fabric saturated with tar, and faced underneath with tarred paper and on top with sand or pebbles, and compressed, substantially as described.

293,492. MANUFACTURE OF ROOFING FABRICS. HENRY M. MINER, Philadelphia, Pa., assignor to Charles Barclay, same place. Filed June 27, 1883. (No model.)



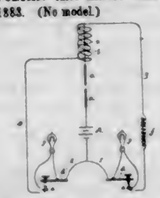
Claim.—1. The combination, with a frame, A, and kettle G', of rollers B B, apron C, hoppers E F, drawing roller or mandrel H, and compression-roller G, substantially as shown and described.

2. The combination, with hoppers E F and apron C, of table D, located beneath said hoppers and aligned with said apron, substantially as shown and described.

3. In combination with hopper F and table or support D, beneath the same, the guard *e*, substantially as and for the purpose set forth.

4. The process herein described for manufacturing roofing material by a continuous operation, consisting in passing sheets of burlap and paper or equivalent material beneath two hoppers, which supply, respectively, tar or adhesive substance and sand or gravel to the surface of the burlap, said sheets, with the tar and sand or gravel, being then subjected to compression, substantially as and for the purpose set forth.

293,493. DRIVE-CHAIN. ELIAS M. MORGAN, Belleville, Ill. Filed Dec. 4, 1883. (Model.)

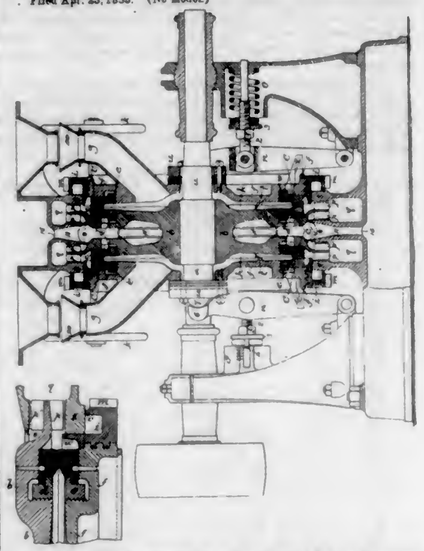


Claim.—The rectangular drive-chain link having at one end the cross-bar bearing *b*, and at the ends thereof lateral inwardly-facing shoulders *g*, formed with segmental inwardly-projecting flanges *h*, separated from the cross-bar bearing by circular interspaces *k*, and at the opposite end a hook, *l*, formed with lateral segmental outwardly-projecting flanges *m*, of less radius than the flanges at the opposite end of the link, and adapted to work in the interspaces between the said flanges and the cross-bar bearing, substantially as specified.

293,494. CUTTER-HEAD. J. HENRY MORRISON and EDWIN ALLEN, Norwich, Conn. Filed June 1, 1883. (No model.)

Claim.—In combination with the blank B, the side cutters, A A', (broken to receive the rim-cutters and washers,) two or more rim-cutters, E, each provided with the slot *c*, the washers *k*, and the barrel-cutters C, all of said cutters being secured to the blank B, as described, and for the purpose specified.

293,495. VOLTAIC-ARC LAMP. OTTO A. MOSER, New York, N. Y. Filed Apr. 20, 1883. (No model.)



Claim.—1. A voltaic-arc lamp having two paths for the current, one through the regulating mechanism and the carbons, the other through the carbons alone, substantially as set forth.

2. The combination, with a voltaic-arc lamp, of a circuit or circuits including the regulating mechanism and the carbons, a circuit including the carbons alone, and means for opening and closing either or both of said circuits, substantially as set forth.

3. The combination, with an arc-lamp, of electro-magnetic devices acting oppositely upon the movable carbon-carrier, and means for closing circuit to either of such devices, substantially as set forth.

4. The combination, with an arc-lamp, of the oppositely-acting electro-magnetic devices, a circuit energizing each of such devices, and also the carbons, a circuit including the carbons alone, and a circuit-controller for each of said circuits, substantially as set forth.

293,496. MACHINE FOR BREAKING OR REDUCING GRAIN. AUGUST CHRISTIAN NAGEL, REINHOLD HERMANN KAEMP, and ADOLPH LENNENBOOG, Hamburg, Germany, assignors to Nagel & Kaemp, same place. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination of a stationary disk and a rotating disk, each provided with a reducing-surface composed of inclined projections that form a diverging or funnel-like space between them, and adapt them to deliver but a single blow to the grains, substantially as shown and described.

2. The combination, with a stationary disk and a rotating disk, each having inclined reducing-surfaces that form a diverging or funnel-like space between them, of throwing-ledges *h*, secured to the rotating disk, the said ledges operating to throw the grains endwise between the reducing-surfaces, and the latter to split them lengthwise, substantially as shown and described.

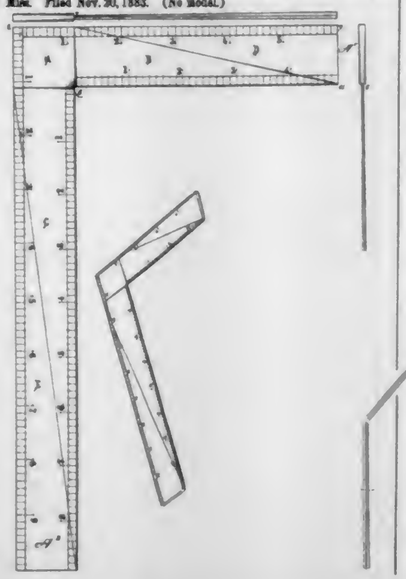
3. The combination, with a stationary reducing-surface, of a rotating disk provided with a co-operating reducing-surface and ledges *h*, the

outer ends of which terminate a considerable distance from the said reducing-surfaces, and thus provide a free space for the flight of the material, substantially as shown and described.

4. The combination, with a stationary disk, *f*, provided with a reducing-surface and a ledge, *i*, of a rotating disk, *b*, also provided with a reducing-surface, and having throwing-ledges, *h*, substantially as shown and described.

5. The combination, with a stationary and a rotating disk, each provided with reducing-surfaces, a feeding device communicating centrally with said disks, and a continuous delivery-channel receiving the reduced material from the periphery of said disks, of fans *p*, attached to the rotating disk and running in the inner part of said delivery-channel, whereby a current of air is drawn through the feeding-channel, and, mingled with the material, passes through the reducing-surfaces and into the delivery-channel, thus acting as a carrier for the material and operating to cool the same and the disks, substantially as shown and described.

6. The combination, with a stationary and a rotating disk, each provided with reducing-surfaces, a feeding device communicating centrally with said disks, a delivering-channel receiving the reduced material from the peripheries of said disks, and openings 11, of fans *p'*, attached to the rotating disk and running in the inner part of said delivering-channel, whereby a current of air is drawn through the openings 11 from behind said disks and mingles with the material that passes through the reducing-surfaces and into the delivering-channel, thus acting as a carrier for the material and operating to cool the same and the disks, substantially as shown and described.



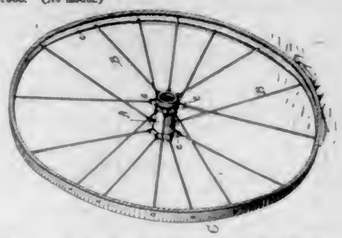
7. The combination, with the feed-channel *g* and conducting-channel *q*, of a rotating disk, *b*, provided with a reducing-surface and with fan-blades *p*, arranged to draw air through the feed-channel *g*, and with fan-blades *p'*, drawing air from behind the said disk, both series of blades delivering the air, together with the grist, into said channel *q*, surrounding the disk, substantially as and for the purpose described.

8. The means for attaching the rings C and *c*, that are provided with the reducing-surfaces, to the disks *b* and *f*, the same consisting, in the combination, with said rings and disks, of the rings *d* and *e*, overlapping said rings C *c*, and screwed onto offsets of the disks, substantially as shown and described.

9. The combination, with a stationary disk, *f*, provided with a reducing-surface, of an adjusting-ring, *i*, working on screw-threads on the body of the said disk and abutting against the frame of the machine, with means for rotating the said ring and means for maintaining it pressed into position with any required degree of force, substantially as shown and described.

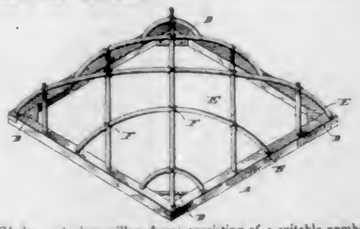
10. The combination, with a stationary disk, *f*, provided with a reducing-surface, of an adjusting-ring, *i*, working on screw-threads on the body of the said disk and abutting against the frame of the machine, with means for rotating the said ring to adjust the reducing-surfaces, substantially as shown and described.

293,497. **RULE AND TRY-SQUARE.** WILEY N. NASH, Starkville, Miss. Filed Nov. 20, 1883. (No model.)



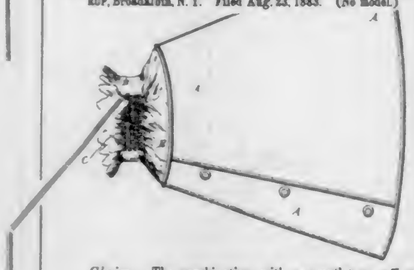
Claim.—1. A try-square having the surfaces of its arms divided into two right-angled triangles, the inner triangular portions being beveled from the diagonal line of division to the right angle 6, substantially as described.

2. A try-square having its outer ruling-edges of uniform thickness and its inner ruling-edges of increasing thickness toward their outer ends, substantially as described.



3. As a new article of manufacture, a try-square having a square corner-piece, A, of uniform thickness, and arms A' A^2, beveled on both sides thereof, substantially as described.

293,498. **WHEEL.** JOSEPH B. NEFF, Burlington, Iowa. Filed June 4, 1883. (No model.)



Claim.—As a new and improved article of manufacture, a wheel composed entirely of metal, consisting, first, of a hub made of one piece having annular thickened portions, and re-enforced by nipples *b*, projecting beyond the diameter of this hub, and having inclined screw-threaded holes through them, the staggered spokes screwed into said nipples, the jam-nuts *c* for the inner ends of the spokes, the rim C, centrally thickened to leave thin edges, and perforated, and the outer tenoned ends of the spokes passed entirely through the rim, shouldered, and riveted to this rim, all constructed in the manner shown and described.

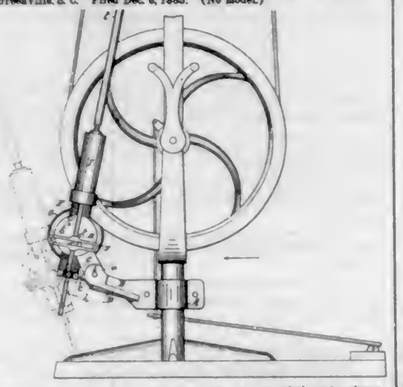
293,499. **DRESS-PILLOW.** GEORGE NOBLE, Pittsburg, Pa. Filed June 14, 1883. (No model.)

Claim.—A sham-pillow frame consisting of a suitable number of intersecting sections of reed or other light elastic material, bound together at their points of intersection, and having their ends securely fastened in a rigid wooden frame in openings or sockets which are made at right angles to the plane of said frame, the same being covered and cushioned, substantially as and for the purpose set forth.

293,500. **DRIVING CUFF AND WRISTLET.** BYRON EDWIN NORTHRUP, Broadalbin, N. Y. Filed Aug. 23, 1883. (No model.)

Claim.—The combination, with a gauntlet or cuff, of a flexible wristlet, B, attached thereto, and an elastic webbing, C, secured to the wristlet, as shown and described.

293,501. **DENTAL PLUGGER.** JESSE W. NORWOOD, Greenville, S. C. Filed July 18, 1883. (No model.)



Claim.—1. The tool-holder C, having squared end *b'*, annular shoulder c^3, and threaded socket *d*, having a reduced portion provided with a separate screw-thread, substantially as shown and described.

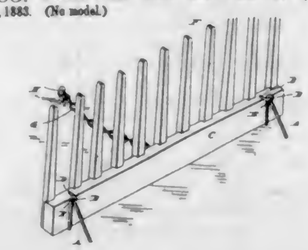
2. The dental mallet consisting of the cylindrical hard-metal sheath *f'*, the soft-metal core *f*, arranged in one end thereof, and the rubber cushion f^3, arranged in the opposite end of the sheath, substantially as shown and described.

3. The mallet-stop consisting of the tube G, the curved bearing-plate g^2, and a connecting-screw, g', substantially as shown and described.

4. The combination of the tool-holder having the squared anvil and collar, the nose-piece having the sleeve provided with stationary plug having a squared orifice, and the movable plug screwing into the lower end of the sleeve, and the spiral spring arranged between said collar and movable plug, substantially as shown and described.

293,502. **DENTAL-ENGINE ATTACHMENT.** JESSE W. NORWOOD, Greenville, S. C. Filed Dec. 6, 1883. (No model.)

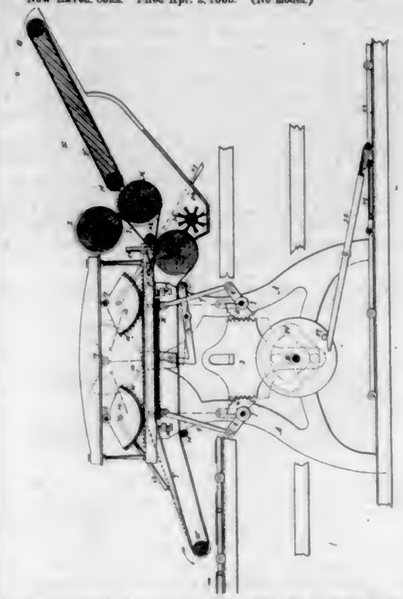
Claim.—1. An attachment to a dental engine consisting of a clamp, a journal-support, an air-pump, and a rotary shaft with friction-wheel and gearing connecting it with the pump, the said pumping mechanism being adjustable to or from the driving-wheel of the engine, as and for the purpose described.



2. The combination of the clamps A A', having offset B and spring D, and the articulated journal-support having lug *c*, and bearing the pumping mechanism, substantially as shown and described.

3. The combination, with the frame F, having cylinder at one end and a guide for the piston-rod at the other, of a shaft at right angles to the cylinder, bearing a disk with wrist-pin, and a piston-rod with piston, having a slotted frame in its length to receive the wrist-pin, as shown and described.

4. The combination, with the pump-cylinder and its piston and rod, having a slotted frame in the latter, of a disk having a series of holes at different distances from the center, and a wrist-pin adapted to fit in said holes, as shown and described.



5. The frame F, with sleeve arranged in and combined with a journal-support, and a set-screw for fixing the position of said frame, substantially as described.

293,503. **WATER-GATE.** FLOYD OGDEN, Fisherville, Ky. Filed Apr. 6, 1883. (No model.)

Claim.—A flood-gate consisting of the sill C, the uprights F, the angular standards A, and the journals B, having bearings therein, substantially as and for the purpose specified.

293,504. **MACHINE FOR ROLLING PIE-CRUST.** HENRY H. OLDS, New Haven, Conn. Filed Apr. 2, 1883. (No model.)

Claim.—1. In a pie-crust-rolling machine, the combination of the main frame, a table, and two segmental rollers supported therein, substantially as described, said rollers being constructed and mounted substantially as described, whereby they may be brought together to form a continuous cylindrical surface on their under side, and means, substantially such as described, for rolling the said rollers in opposite directions, substantially as set forth.

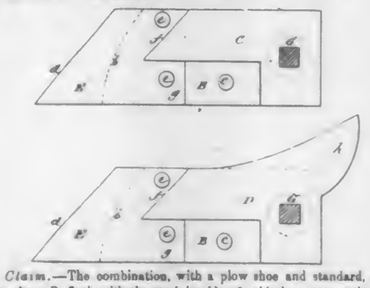
2. The two segmental-shaped rollers, each being provided with a toothed segment and a bearing on their respective axes, a horizontal rack, a horizontal bar parallel with the rack, the rollers, rack, and bar, combined substantially as described, whereby the toothed segments shall engage the rack and the said bearings work against the said horizontal bar, with mechanism, substantially such as described, to impart a movement to the rollers toward and from each other, and a table, as and for the purpose set forth.

3. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, two segment-shaped rollers, and mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with said table, substantially as described.

4. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, two segment-shaped rollers, mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with the plane of said table, and mechanism, substantially such as described, to impart to said table an up-and-down movement toward and from said rollers, substantially as described.

5. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, two segment-shaped rollers, mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with the plane of said table, and the pair of feed-rolls I K, and the cutter O, substantially as described.

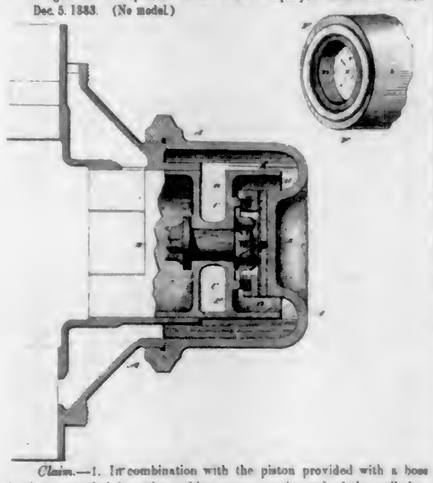
6. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, the segment-shaped rollers, mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with the plane of said table, the pair of feed-rolls I K, the cutter O, the hopper, and endless apron F therein, substantially as described.



7. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table,

two segment-shaped rollers, and mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with said table, with the intermittently-moving carriage, arranged to present the plates to receive the crust, substantially as described.

8. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, two segment-shaped rollers, mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with said table, mechanism, substantially such as described, to impart to said table an up-and-down movement toward and from said rollers, and the adjusting-roll 11, over which the lower run of said apron T passes, said roll connected to the table, substantially as and for the purpose described.

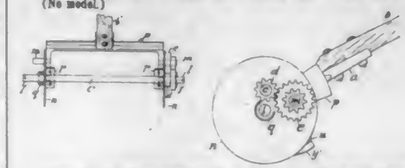


9. The combination of a table, an endless apron, supports, substantially such as described, whereby the said apron may pass over said table, two segment-shaped rollers, mechanism, substantially such as described, to impart an oscillatory or rolling movement to said rollers in a plane parallel with the plane of said table, a carriage, and mechanism, substantially such as described, to impart intermittent movement to said carriage, to present the plates to receive the crust, and a dog, 36, to arrest and hold said carriage, substantially as described.

293,505. COMBINATION-PLOW. JEFF D. PAGE, Arcadia, La. Filed Sept. 14, 1883. (No model.)

Claim.—The combination, with a plow shoe and standard, of a brace-plate, B, flush with the straight side of said shoe, arranged some distance below its upper edge, and receiving an angled plow-plate, substantially as shown and described.

293,506. PISTON WATER-METER. WILLIAM R. PARK, Taunton, assignor to the Equitable Water Meter Company, Boston, Mass. Filed Dec. 5, 1883. (No model.)



Claim.—1. In combination with the piston provided with a boss having a rounded face, the cushion at or near the end of the cylinder, also formed with a rounded face opposing that of the boss, and adapted to be struck by the latter as the piston nears the end of its stroke, substantially as shown and described.

2. In combination with the piston provided on its face with an annular boss, the annular cushion with rounded face held in a groove in the flange attached to the inner face of cylinder-head, substantially as and for the purpose set forth.

3. The annular flange on the inner face of the cylinder-head, provided with the annular dovetailed groove, the annular cushion held in the groove, and having its portion projecting above the face of the flange made rounded in cross-section, and the piston provided with an annular boss adapted to strike the cushion as the piston nears the end of its stroke, all combined substantially as and for the purpose described.

4. The annular flange on the inner face of the cylinder-head, provided with openings through its sides and on its face with an annular dovetailed groove, the annular rubber cushion fitting in said groove, and having its portion above the flange-face made rounded in cross-section, and the annular boss upon the cylinder, adapted to come in contact with the cushion as the piston approaches the end of its stroke, all combined and arranged substantially as and for the purpose set forth.

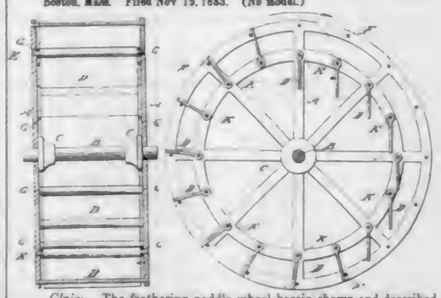
293,507. LAWN-MOWER. CHARLES H. PAYSON, Springfield, assignor of one-half to Peter T. Coffield, New Carlisle, Ohio. Filed June 6, 1883. (No model.)

Claim.—1. In a lawn-mower, the combination of the brace *p*, ground-wheels *g*, reel *a*, and actuating-gearing with the two stationary disks *n n*, around which the ground-wheels revolve, each disk provided with a bearing, *r*, for the reel-shaft, and studs *l m*, that serve as journals for the ground-wheels and the gears *e*, and also as a means of securing the brace to the disks, substantially as described.

2. In a lawn-mower, the combination of the disks *n n*, studs *l m*, gear-wheels *f e d*, reel-shaft *c*, bearings *r r*, and distance-pieces *q*, substantially as described.

3. In a lawn-mower, the combination of the ground-wheel *g*, provided with sleeve *i*, spring-pawl A, and ratchet spur-wheel *f*, substantially as described.

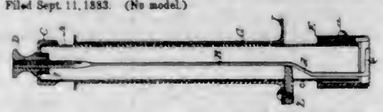
4. In a lawn-mower, the combination of a revolving reel, *a*, and adjustable rectangular cutting-knife *y y'*, the gearing *f d e*, partial circumferential distance-pieces *q*, and ground wheels *g*, substantially as described.



293,508. COLLAR. KOSSUTH PERPENTE, New York, N. Y. Filed Mar. 22, 1883. (No model.)

Claim.—1. A collar composed of an upper part, A, and of a separate lower part, B, which is overlapped by said part A, the two parts being connected where they overlap by the series of stitches *a b*, and constructed to form the tie-retaining sections *d* and recesses *s* at the places where they do not overlap, substantially as described.

2. A collar constructed of an upper part, A, and a lower part, B, said parts being stitched together where they overlap at *a b*, but disconnected entirely from each other between the rows of stitches, substantially as specified.



293,509. FEATHERING PADDLE-WHEEL. CHRISTIAN L. PETERSEN, Boston, Mass. Filed Nov 19, 1883. (No model.)

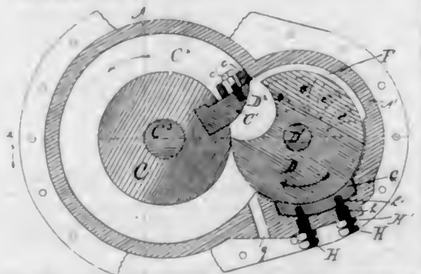
Claim.—The feathering paddle-wheel herein shown and described, consisting of frames A, secured on shaft B, and blades D, hinged at their

inner edges and adapted to be held to their work by the rods F, placed radially beyond the pivots of the blades and near their outer edges, substantially as shown and described.

293,510. CANCELING-STAMP. PETER PFEIFER, Durhamville, N. Y. Filed Sept. 11, 1883. (No model.)

Claim.—1. In a stamp-canceler, the tubular handle having apertures in its base, combined with a swinging bar suspended in said handle, and having serrated feet or prongs working in the apertures, substantially as described.

2. The tubular handle having an apertured base, combined with a swinging bar suspended from the upper part of the handle, and having serrated feet or prongs working through the apertures in the base, substantially as described.



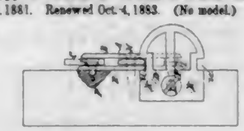
3. The tubular handle having an apertured base, combined with a swinging bar suspended from the upper part of the handle, and having serrated feet or prongs working through the apertures in the base, and the sliding sleeve operating to swing said bar, substantially as described.

4. The swinging bar suspended from the upper end of the tubular handle, having serrated feet or prongs at its lower end, and an intermediate bend or incline, in combination with said handle, and its sliding sleeve having a lug operating on said incline, substantially as described.

5. The swinging bar adjustable at the upper end of the tubular handle, and having serrated feet or prongs at its lower end, in combination with said handle having apertures in its base through which said prongs work, substantially as described.

6. In a device for canceling stamps, an apertured base having on its face serrations inclined in one direction, combined with movable feet or prongs serrated on their lower faces in an opposite direction, whereby the article is held in position while the movable feet or prongs cancel or deface the same, as set forth.

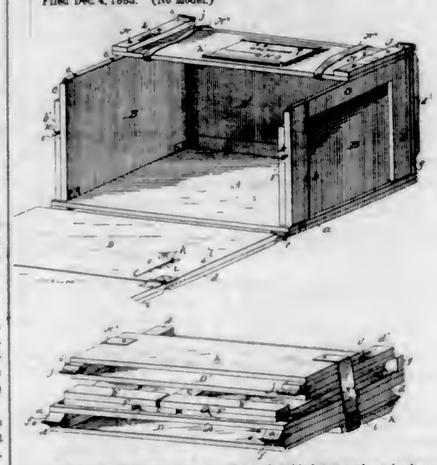
293,511. ROTARY ENGINE. JAMES H. PHELPS, Sharon, Wis. Filed July 19, 1883. (No model.)



Claim.—1. The combination, with the piston and its abutment, of the valve formed with the recess D^2 and rotating in unison with said piston, and the inlet-ports *e e'*, opened and closed by said valve, substantially as specified.

2. The combination, with the piston and its abutment, of the valve having the recess to receive the abutment and rotating in unison with said cylinder, the inlet-ports opened and closed by said valve, and the passage F, substantially as specified.

3. The rotary engine consisting of the piston and its abutment, and rotating in unison with the piston, the valve having the recess to receive the abutment, the inlet-ports opened and closed by the valve, and the outlet-port located near the end of the stroke, substantially as and for the purpose specified.



4. The combination, in a rotary engine, of the piston and its abutment, the valve and its recess, and inlet-ports opened and closed by said valve, with one or more sides corresponding to the recess in the valve, substantially as and for the purpose specified.

293,512. DOOR-LATCH. CHARLES W. PIERCE, Oak Hill, N. Y. Filed June 23, 1881. Renewed Oct. 4, 1883. (No model.)

Claim.—In a door-latch, the guard B, having the studs F extending through the plate E and into the door, in combination with the latch A, having a slot located under or behind said guard, and with an attaching-screw, H, located between said studs and passing through said slot in the latch, substantially as described.

293,513. SHIPPING-CASE. ANDREW M. PLATT, New Haven, Conn. Filed Dec. 4, 1883. (No model.)

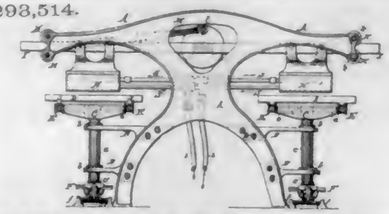
Claim.—1. In a shipping-case, the ends folded flat against the bottom, and the sides each carrying a section of the cover, one of the sides extending over the folded ends, while the other folds flat against the under side of the bottom, as and for the purpose set forth.

2. In a shipping-case, the ends hinged to the upper face of the bottom, and the sides each carrying a section of the cover, one of the sides being hinged to the bottom in such a manner as to fold against the under side of the same, and the other side being hinged to a cleat extending up from the bottom, so as to fold over the ends, the two sections of the cover folding over the sides, and the parts being secured in this position by means of suitable straps, as and for the purpose set forth.

3. In a shipping-case, the ends hinged to the upper face of the bottom and folding flat against the same, one of the ends being provided with a cross-bar overlapping the other end, and the bottom having cross-pieces secured to its under side, in combination with the sides provided with vertical strips, one of the sides being hinged to a cleat projecting up from the bottom, and the other side having hinges connecting its vertical strips to the cross-pieces of the bottom, and the cover or lid formed in two sections or parts, one section being hinged to each side, so as to fold flat against the inner and outer faces of the same, as and for the purpose set forth.

4. In a shipping-case, the sides and ends hinged to the bottom in any suitable manner, beveled catches or rods projecting from the ends and extending through openings or sockets in the sides, and a spring-pressed lever engaging with the catch and arranged to hold the parts in place, as and for the purpose set forth.

5. In a shipping-case, the sides and ends hinged to the bottom in any suitable manner, beveled catches or rods projecting from the ends and extending through openings or sockets in the sides, and a spring-pressed lever engaging with the catch and provided with an operating-rod, as and for the purpose set forth.



6. In a shipping-case, the sides and ends hinged to the bottom in any suitable manner, beveled catches or rods projecting from the ends and extending through openings or sockets in the sides, a spring-pressed lever engaging with the catch, a rod or projection attached to the lever and working in a slot in the sides of the case, and a rod attached to the head of said projection and working in guides on the interior of the said sides, as and for the purpose set forth.

7. In a shipping-case, the ends folding flat against the bottom, and the sides carrying a section of the cover, one of the sides extending over the said ends, and the other side folding flat against the under side of the bottom, beveled catches projecting from the ends, and spring-pressed levers engaging with said catches, as and for the purposes set forth.

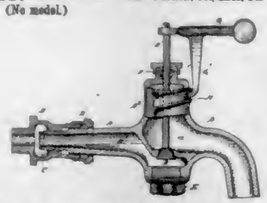
293,514. IRONING-MACHINE. HENRY PODGER, Bromley, County of Kent, and WILLIAM HOOK DAVEY, Highgate, County of Middlesex, England. Filed Mar. 9, 1883. (No model.) Patented in England Aug. 14, 1882, No. 3,867.

Claim.—1. In an ironing-machine, the combination, with an iron

293,514.

and means for reciprocating the same horizontally, of a bed mounted substantially as described, whereby it may be rotated and moved vertically, and a table, said table and bed being constructed substantially as set forth, whereby the table may be moved transversely on the bed, as and for the purpose specified.

2. In an ironing-machine, the combination, with the frame, the irons, and means for reciprocating them horizontally, of the bed C, having guide-rods *c*, journaled in brackets of the frame, and provided with the grooved rollers E, the table D, provided with the ribs or rails *d*, and means for raising and lowering said bed, substantially as herein shown and described.



3. In an ironing-table, the combination, with the frame A, having the brackets B B, of the bed C, provided with the guide-rod *c*, mounted vertically in the said brackets, and provided with the collars *b c'*, the treadle F, the lever G, connected to the treadle at one end, and the other end embracing the guide-rod *c*, and the table D, the said table and bed being constructed as set forth, whereby the former may be moved laterally upon the bed, substantially as shown and described.

4. In an ironing-machine, the combination, with the frame A A', provided with the guide-rollers K K', the guide-rod I, and means for operating said guide-rod, of the double-faced iron H', having the hollow journal *h'*, and journaled in hangers on the bar I, the burner N, and means for locking the iron in position, substantially as herein shown and described.

5. In an ironing-machine, the combination, with journaled and double-faced iron H', provided with the hollow journal *h'*, of the burner N, secured within the iron, and provided with side perforations, substantially as herein shown and described.

6. In an ironing-machine, the combination, with the journaled and double-faced iron H', and the burner N within said iron, of the disk R, secured to the journal *h* of the iron, and provided with the recesses *r*, and the locking-lever *t*, substantially as herein shown and described.

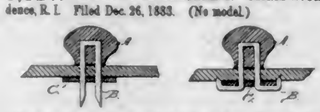
293,515. STOP-COCK. JOHN PORSCH, Jr., Erie, Pa. Filed Apr. 12, 1883. (No model.)

Claim.—1. In a stop-cock or faucet, the combination of a shell having an inclined surface upon its outside with a vertically-moving valve having a lever which, when moved over the inclined surface, opens or closes the valve, substantially as described.

2. In a stop-cock or faucet, the combination of a valve having a stem, and a lever or handle having an arm, with a head provided with an inclined screw-thread for the arm of the lever, substantially as described.

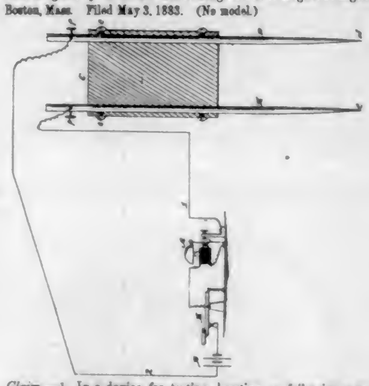
3. In a stop-cock or faucet, the combination of the shell or body A A' A^2, having inclined groove H and chambers *a a'*, and provided with stuffing-box F, with the valve D, having stem D', and handle G, having the arm G', substantially as described.

293,516. TACK-HAMMER AND TACK-HOLDER. ADDISON A. POTTER, South Otselic, N. Y. Filed Sept. 10, 1883. (Model.)



Claim.—1. As an article of manufacture, a hammer having its handle formed with one or more T-shaped grooves adapted to receive and hold the head portions of a number of tacks, substantially as and for the purpose set forth.

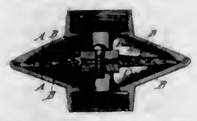
2. The handle A, provided with the T-shaped groove *a*, having at each end an enlargement, *a'*, in combination with the elastic bands D and E, substantially as and for the purpose shown.



3. The hammer B, provided within its face *b* with the diagonal undercut recess *b'*, in combination with the spring F, having an inward-curving outer end, *f*, substantially as and for the purpose set forth.

293,517. BUTTON AND FASTENING. GEORGE W. PRENTICE, Providence, R. I. Filed Dec. 26, 1883. (No model.)

Claim.—As an improved article of manufacture, the herein-described combined button and fastening-prongs, consisting of the solid leather head A, compressed upon the staple-shaped fastener B, and adapted for operation in connection with the washer C, substantially as and for the purpose specified.

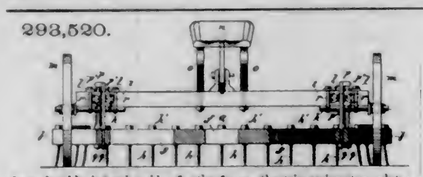


293,518. MEANS FOR ELECTRICALLY LOCATING AND FOLLOWING VEINS OF METAL IN THE EARTH. JEROME PRINCE, Milford, assignor, by direct and mesne assignments, to August P. Lighthill, Boston, Mass. Filed May 3, 1883. (No model.)

Claim.—1. In a device for testing, locating, or following metallic veins, the combination of metallic circuit-terminals adapted to be forced into the earth at different points, and an insulating bridge-block rigidly holding the terminals apart and in fixed relation to each other, with an electric circuit, a battery, and an alarm in the circuit, substantially as described.

2. In a device for testing, locating, or following metallic veins, the combination of metallic posts adapted to be forced into the earth at different points, and an insulating bridge-block, through which the posts pass, and are thereby held separated and in fixed relation to each other, with an electric circuit connected with the posts, a key, a battery, and an alarm in the circuit, substantially as described.

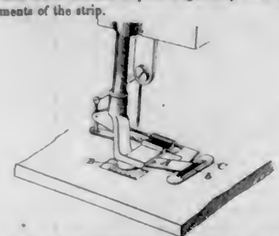
293,519. FILTER-CASE. EDWIN S. REED, Jersey City, N. J. Filed Sept. 26, 1883. (No model.)



Claim.—In a filter or filter-case, the combination, with two shells, A A, having collars penetrating to the center of said filter-case, and provided with water-ways E E, of filtering material C and screw D, whereby the filtering material is securely held in place between the two shells, substantially as described.

293,520. WHEEL-HARROW. FRANK I. RUNDLE, Lowell, Ohio. Filed Oct. 26, 1883. (No model.)

Claim.—In a sulky-harrow, the combination, with the frame *a*, constructed as described, of the axle *i*, axle-guides *p p*, having the parallel vertical arms *p'*, provided with bolt ends *q* and shoulders p^2, whereby they are connected to the side rails of the harrow-frame, as shown, to



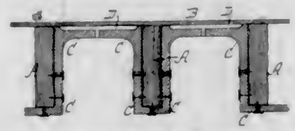
293,520.

form durably-braced guides for the frame, the triangular stop-plates *r*, arranged at each side of the guide-arms *p'*, and secured to the axle by means of the bolts *s*, whereby lateral motion of the frame is prevented, substantially as specified.

293,521. RUFFLING ATTACHMENT FOR SEWING-MACHINES. JOSEPH S. SACKETT, New Haven, Conn., assignor, by direct and mesne assignments, to himself and Jane Halliwell, same place. Filed Apr. 2, 1883. (No model.)

Brief.—The guide attached to the end of the ruffler-blade extends equally to the right and left of the line of the path of the needle, and so that the strip operated upon may be brought by hand close up in one end of the slot for a certain number of stitches, and then thrown over into the opposite end of the slot, for producing scallop-work by the transverse movements of the strip.

Claim.—In a ruffling attachment for sewing-machines, the combination therewith of the guide C at the fixed end of the crimping-blade, and attached to or made substantially a part of it, and constructed with a transverse slot longer than the width of the crimping-blade, the said slot closed at both ends and extending to the right and left of the crimping-blade, substantially as described.

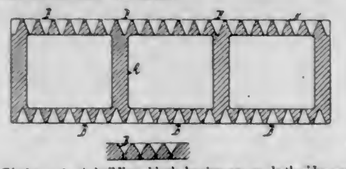


293,522. CARRIAGE-CURTAIN FASTENING. JOHN SAGE, Lockport, N. Y. Filed Nov. 1, 1883. (No model.)

Claim.—As a new article of manufacture, a fastening device for carriage-curtains, consisting of a body portion, a cap revolving thereon, and a pin-extension or rivet, substantially as set forth.

293,523. FIRE-PROOF BUILDING. JOHN J. SCHILLINGER, New York, N. Y. Filed Oct. 10, 1883. (No model.)

Brief.—A sheathing for the floor-beams and the floors of buildings consists of sections molded to the general shape of the exposed portions of the beams and floors, and with a depression in the top of the floor-sections.

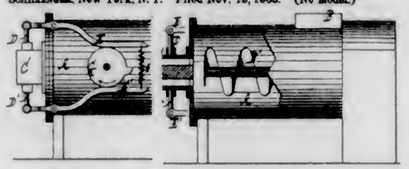


Claim.—1. A fire-proof sheathing for the beams and floors of buildings, molded in sections, and each section in a single piece to extend across the lower edge and vertically along each side of the floor-beam, and laterally or horizontally along the floor, substantially as described.

2. A fire-proof sheathing for the floor-beams and the floors of buildings, molded in sections to the general shape of the lower exposed portions of such beams and floors, and with a depression in the top of the floor-sections, to relieve the same from downward pressure, substantially as described.

3. The combination, with the floor-beams and floor of a building, of a fire-proof sheathing molded in sections, each section being in a single piece and extending across the lower edge and vertically along the sides of the floor-beam, and laterally or horizontally along the floor, substantially as described.

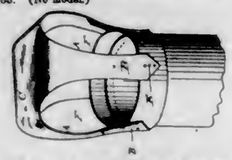
293,524. BUILDING-BLOCK. JOHN J. SCHILLINGER, New York, N. Y. Filed Nov. 15, 1883. (No model.)



Claim.—1. A building-block having one or both sides provided with nail-holes, substantially as shown and described.

2. A building-block having one or both sides provided with nail-holes tapering in an inward direction, substantially as shown and described.

3. A hollow building-block having one or both sides provided with nail-holes tapering in an inward direction and passing entirely through the walls of the block, substantially as shown and described.



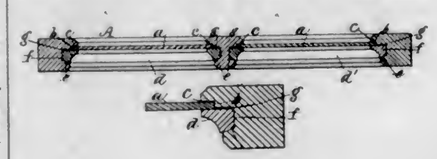
293,525. MACHINE FOR MAKING BUILDING-BLOCKS. JOHN J. SCHILLINGER, New York, N. Y. Filed Nov. 15, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with the hopper, its feed device, and the block-forming die, of the reciprocating punches arranged in the die for perforating the blocks, and a means for imparting motion to the punches.

2. The combination, substantially as hereinbefore described, with the hopper, its feed device, and the block-forming die, of the reciprocating punches arranged in opposite sides of the die, the levers supporting the punches, and the trip-wheel common to both levers.

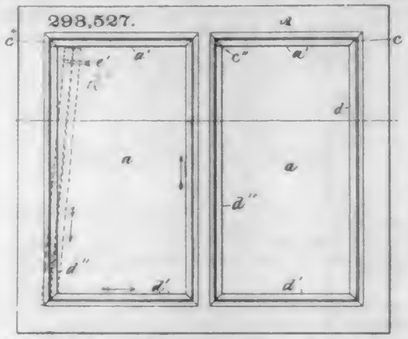
293,526. CHIMNEY-CAP. MICHAEL SCHOLL, San Francisco, Cal. Filed May 31, 1883. (No model.)

Claim.—1. The metallic blank C, having four arms or points, B B, the sides of which are formed by the curvatures A A, substantially as described.



2. A chimney-cap composed of the metallic blank C, having four perforated arms or points, B, with curved sides, said arms being bent down, as shown, and connected to the chimney pot or stack, whereby four truncated oval openings, F F, of equal dimensions are formed, substantially as described.

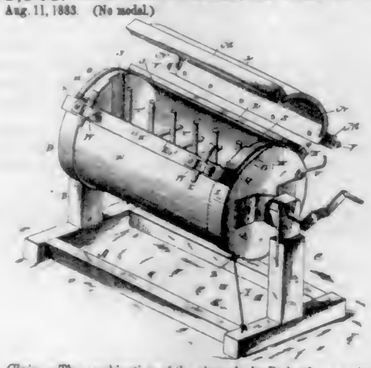
293,527. WINDOW-SASH. HENRY W. SCHRODER, Springfield, Ohio. Filed June 13, 1883. (No model.)



Brief.—The device consists of detachable beveled strips having a single fastening to secure the glass in the window-frame.

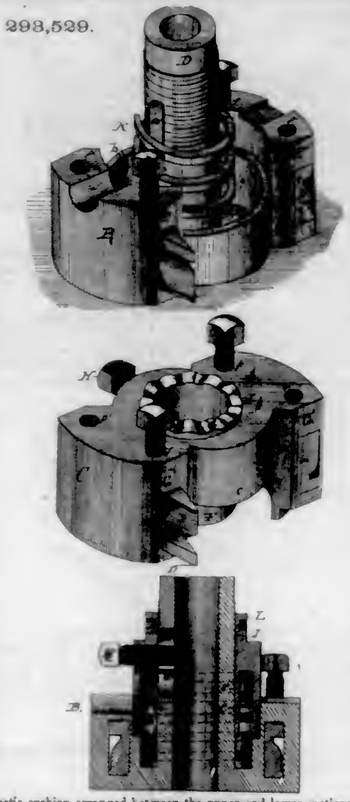
Claim.—1. A sash for windows, having a groove beveled upon its upper interior side, to adapt it for the insertion of a strip of like reversed shape, substantially as and for the purpose set forth.

2. The sash-frame A, having the fixed mold *a'* thereon, the groove *f* on the other three sides of the opening for the glass, and having the detachable strips *d*, *d'*, and *d''*, adapted to be inserted into the groove *f* in the order named to secure the glass, the last strip, *d'''*, being fastened



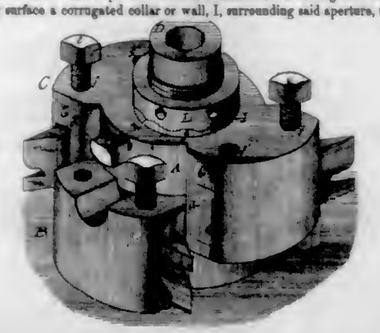
293,527.

at its top end to the sash-frame by means of a screw or its equivalent, substantially as set forth.



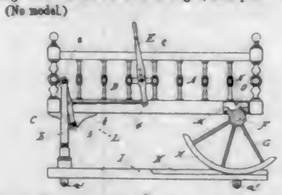
3. The combination, with a sash-frame having a rabbet and a groove over the same, and having a fixed mold at the upper end of the glass-opening, as described, of the rubber strip *c*, and the insertible and detachable strips *d*, *d'*, and *d''*, adapted to be locked into their position within the groove and fastened over the glass on the inside of said sash, substantially as set forth.

293,528. CHURN. OCTAVUS F. SCRIBNER, Bells Fountain, Wis. Filed Aug. 11, 1883. (No model.)



Claim.—The combination of the churn-body D, having opening J, the cleats K, secured along the sides of said opening and having grooves Q, packing-strips R, placed in the said grooves, panking P, placed in grooves O in the heads H of the churn, hooks U, pivoted to the heads H, and loops W, secured upon one of the cleats K, with the cover having cleats M, downturned ends N, and studs V, and the wedge-shaped keys X, substantially as set forth.

293,529. CUTTER-HEAD. GEO. J. SHIMER, Freemansburg, assignor to Samuel J. Shimer, Milton, Pa. Filed July 13, 1883. (No model.)



Claim.—1. In a cutter-head, the combination, with the lower section having the elongated screw-threaded hub, of the upper section provided with a central aperture to fit over said hub, and having on its upper surface a corrugated collar or wall, I, surrounding said aperture, the elastic cushion arranged between the upper and lower sections, and the nut L, screwed upon the central hub, and having its under surface adapted to form a locking engagement with the said collar I, substantially as described.

2. A cutter-head composed of two parts capable of vertical adjustment, the under section whereof is formed with a central screw-threaded hub and circular side walls, and the upper section whereof is formed with a depending sleeve and circular side walls, and having formed on its upper surface and around its central opening a circular wall with V-shaped projections or their equivalents, in combination with a locking-nut formed with V-shaped projections or their equivalents on its under surface, substantially as described.

3. The combination, with the lower section provided with a central hub, in which is formed a vertical slot, *a*, of the upper section fitting over said hub, and provided with the set-screw H, arranged to pass through the slot in the hub, the elastic cushion between the two sections, and suitable means for securing the upper section to the hub, substantially as described.

293,530. COMBINED CRIB AND CRADLE. SAMUEL G. SIDE, Port. Ind., assignor of one-half to WM. H. AUGUR, same place. Filed Aug. 6 1883. (No model.)

Claim.—1. The combination of a crib, stationary supports therefor, and links connecting the crib at one end with such supports, and rockers, substantially as described, pivoted to the crib at its opposite end, as and for the purposes specified.

2. The combination of a base, stationary supports attached thereto, a crib, rockers, substantially as described, pivoted to the crib at one end and mounted on said base, and links connecting the opposite end of the crib to the stationary supports, as and for the purposes set forth.

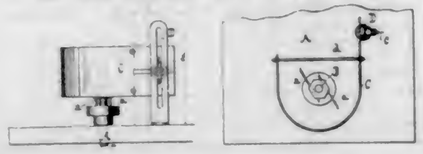
293,531. BUTTON. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Nov. 21, 1883. (No model.)

Claim.—The garment-button A herein described, consisting of the front *a* and staple *b*, the former being provided with the neck or shank *a'*, the face thereof having openings a^2 therein, said neck also adapted to receive the convex-headed staple *b*, the latter being rigidly secured therein by suitable means during the process of manufacture, and forming a bead, a^3, around the lower edge of the shank and the bearing-surfaces *f* outside the prongs *b'*, substantially as shown and set forth.

293,532. MANUFACTURE OF COMPOUND ELECTRICAL WIRE. LUTHER L. SMITH, Ansonia, Conn., assignor to the Postal Telegraph Company, New York, N. Y. Filed Oct. 8, 1883. (No model.)

Claim.—The herein-described compound wire, consisting of the steel or iron core *a*, coated with an electro-deposit of copper, *b*, and then covered with a strip of copper folded around the electro-coated wire, and so as to bring the two edges of the covering substantially together, and substantially as specified.

293,533. UNDERGROUND WIRE-CONDUIT. THOMAS L. SMITH, New York, N. Y., assignor of one-half to Daniel A. Mathews, same place. Filed Dec. 14, 1883. (No model.)



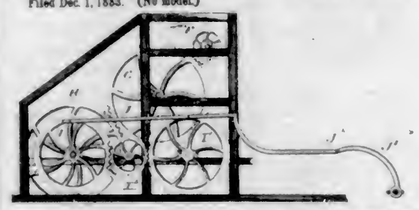
Claim.—1. In an underground telegraph conduit or pipe, the bridge B, having the upright parts *b*, in which are made the notches *n*, for supporting the wires, and having the sides of said uprights covered with glass plates, substantially as and for the purpose described.

2. The combination, substantially as hereinbefore set forth, of a pipe or conduit for underground electric conductors, consisting of the long and short sections A and A', placed alternately, and the bridge or support B, for the conductors, placed approximately in the middle of each of the longer sections, and consisting of the base B' and the upright parts *b*, in which are the notches *n*, for supporting the wires, and having said uprights covered with glass plates.

3. The combination, substantially as hereinbefore set forth, of a pipe or conduit for underground electric conductors, consisting of the sections A and A', of two different lengths, so constructed that the cover or upper part of the short sections may be removed without disturbing the longer sections, and the bridge or support B, for the conductors, placed approximately in the middle of each of the longer sections, and consisting of the base B' and the upright parts *b*, in which are the notches *n*, for supporting the wires, and having said uprights covered with glass plates.

293,534. GUARD FOR MOLDING-MACHINES. JOHN O. SQUIRES and JOSEPH K. SHRIVER, Baltimore, Md. Filed Dec. 26, 1883. (No model.)

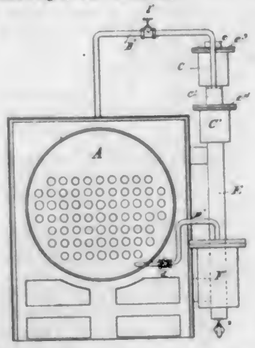
Claim.—In a molding-machine, the table A, the vertical slotted standard D, attached rigidly to the table, the slotted guard C, having a curved end, and parallel sides connected by a stiffening-brace, and the bolt *c*, all combined substantially as and for the purpose specified.



293,535. MANUFACTURE OF PORTIONS OF A HARNESS. JAMES STANLEY and THEODORE F. LEMASSENA, Newark, N. J., assignors, by mesne assignments, to Lillian Lemassena, same place. Filed July 20, 1883. (No model.)

Claim.—1. The process herein shown and described for manufacturing certain parts of harness from leather scraps, which consists, first in pasting the scraps together with cement in a suitable mold; second, in pressing the same in a finishing-mold; third, in freeing the pressed article from its moisture; and, fourth, in applying a water-proof coating to the surface and drying the same thereon, all substantially as and for the purpose set forth.

2. A horse-collar or other analogous articles of harness formed of scraps of leather, united by suitable cement and pressed to their finished form, and having a coating of water-proof material, substantially as herein set forth.

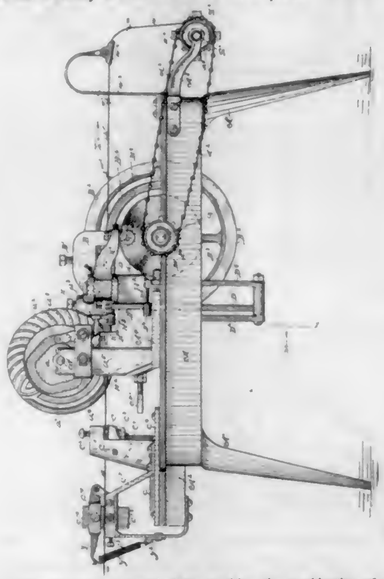


293,536. VELOCIPEDE. JOHN MORRIS STAPLES, Rose Mills, Va. Filed Dec. 1, 1883. (No model.)

Claim.—1. In combination with the axle A, having crank *a* and friction-roller *a'*, and with the wheels A', rigidly hung upon said axle, the pitman J^3, wheels I I', connected by the rod J and gear I^3, and the gears F G H, the crank K, and frame D, as and for the purpose set forth.

2. In combination with the forward axle pivoted at the king-bolt, the frame D and segment D', the shaft D^2, having cranks $d\,d^2$, the spring-bolt d', the bar M, and links d^3, as and for the purpose set forth.

293,537. FEED-WATER PURIFIER. WM. K. STEVENS, Mansfield, Ohio. Filed Aug. 3, 1883. (No model.)



Claim.—1. In combination with the boiler A, feed-pipe D D', and steam-pipes B B', the two precipitating-chambers C C' *c c'*, and connecting-pipe c^2, when arranged and operating substantially as and for the purpose described.

2. The combination of boiler A, the two precipitating-chambers C C' c c', the filter-chamber F, containing the shell F', provided with the perforated bottom *f*, perforated lead disk H, and intermediate filtering material, and the several connecting-pipes, substantially as described.

293,538. MACHINE FOR MAKING BARBED WIRE. LESLIE E. SUNDERLAND, Joliet, Ill. Filed Oct. 30, 1883. (No model.)

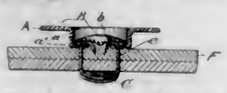
Brief.—One main wire is fed through tension and straightening plates by a reciprocating head whose dies form crimps in the wire at the points where the barbs are to be applied. The coiling-head which applies the barb-wire has reciprocatory and rotary motions and recedes as it wraps the barb, forming a long coil the length of the crimp. The movable barb-cutting die is carried by an arm which oscillates horizontally. The applied barb is compressed and straightened between movable and stationary dies and the barbed wire is spooled.

Claim.—1. In a wire-barbing machine, the combination of the shaft S, crank P', pitman P, reciprocating head K, having the adjustable stop Z^4 and set-screws Z^3 Z^5, reciprocating head *c*, having the bell-crank jaw *c'*, crimping-dies *o o'*, set-screws c^3 c^5, and supporting-roller c^2, straightening-plates c^{10} c^{12}, stem H^5, and coiling-shaft H^2, having the coiling-hook *v*, and adapted to reciprocate and rotate, as and for the purpose set forth.

2. In a wire-barbing machine, the combination of the shaft S, sprocket-wheel *h*, sprocket-chain h^3, sprocket-wheel *h'*, shaft a^4, cam-wheel *a*, having the cam-channels *a' a² a³*, lever a^7, having the roller-wrist n', saddle a^5, annular ring H^6, having the two ears or pins H^4, coiling-shaft H^2, having the coiling-hook *v*, and adapted to reciprocate and rotate its coiling end simultaneously, pinion *m*, and stem H^5, as and for the purpose set forth.

3. In a wire-barbing machine, the combination of shaft S, waved cam-wheel D^7, wrist-rollers D^4 D^4, arms D^3 and D'', hanger D^4, link D^2, lever D', set-screw dies n^4 n^2, set-screw n^3, dog *r'*, spring r^3, standard *r*, and guide-tube r^5, as and for the purpose set forth.

4. In the wire-barbing machine described, the combination of the shaft S, waved cam H^1, lever H', having the head H, standard H^2, cutting-off dies Z and Z', set-screws *v'* and Z^2, and bed-plate A^4, as and for the purpose set forth.

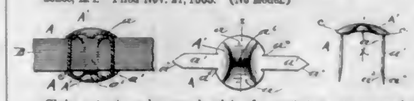


5. In a wire-barbing machine, the combination of the shaft S, cam-wheel B^7, arm B^4, having the roller-wrists to run in the cam-channel of said cam, head B, pivoted to standard B^2, bed-plate B^3, die R^3, and set-screw B', as and for the purpose set forth.

6. In a wire-barbing machine, the combination of the cam-wheel *a*, lever a^7, saddle-link a^6, annular ring H^6, and pinion *m*, adapted to rotate and reciprocate the coiling end of the coiling-shaft H^2 simultaneously, as and for the purpose set forth.

7. In a wire-barbing machine, the combination of the reciprocating head *c*, dies *o* and *o'*, and supporting-roller c^2, as and for the purpose set forth.

8. In the wire-barbing machine described, the combination of the straightening-plates c^{10} c^{12}, strand-wire feed consisting of the reciprocating head *c* and bell-crank jaw *c'*, and dies *o* and *o'*, operated by the mechanism described, coiling-shaft H^2, having the coiling-hook *v*, and adapted to reciprocate and rotate its coiling end simultaneously by the mechanism described, cutting-off dies Z Z', and their operating mechanism, barb-wire feed described and illustrated, particularly in Fig. 5, press B, having the die-press R^2, and operated as described, guide-shoe W', and spring-standard W^2, all adapted to operate as and for the purpose set forth.

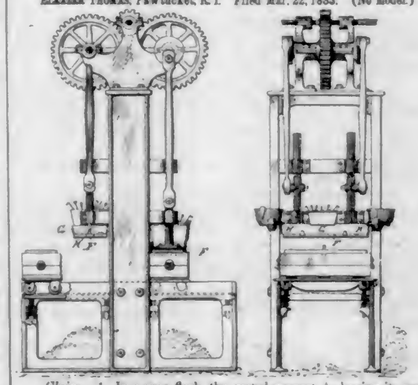


293,539. BUTTON. JAMES F. TRAYER, Providence, R. I. Filed Nov. 21, 1883. (No model.)

Claim.—1. The garment-button herein described, consisting of the front A, having a depending shank or neck, *a*, the flat face *a'* of the latter being provided with openings a^2 and central opening, a^3, and further consisting of the clinching-disk B, rigidly secured within the shank *a*, substantially as shown, and for the purpose set forth.

2. The button herein described, composed of the metallic front A, having an apertured shank, *a*, and clinching-disk B, rigidly secured within said shank, as described, in combination with a staple adapted to be inserted through the fabric from the under side thereof and clinch against said disk B, substantially as shown and set forth.

293,540. COMBINED STAPLE AND DIE. JAMES F. TRAYER, Providence, R. I. Filed Nov. 21, 1883. (No model.)



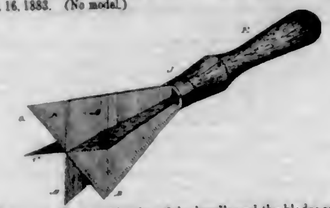
Claim.—1. As an improved article of manufacture, the pronged and enlarged headed staple herein described, provided with clinching or deflecting dies wrought or formed in said head and integral therewith, substantially as and for the purpose set forth.

2. The staple A, herein described, consisting of the enlarged head A' and prongs *a'*, said head having concave deflecting surfaces or dies formed on its under side at right angles to the prongs, substantially as shown and set forth.

3. The method of fastening, consisting in inserting the prongs of the die-headed staple, herein described, through the fabric or material at right angles to a similar staple inserted through the material from the opposite side thereof, the ends of the prongs being then clinched beneath the heads and against the dies of the staples, all substantially as shown and set forth.

293,541. MACHINE FOR MAKING MOLDS FOR CASTINGS. ELEAZER THOMAS, Pawtucket, R. I. Filed Mar. 22, 1883. (No model.)

Claim.—1. In a snap-flask, the grated support A, having its marginal band and cross-bars broadest at the lower edges, in combination with the corner-strips B, for the purposes herein set forth.

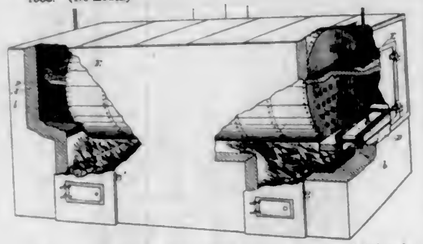


2. A snap-flask provided with a corner-hinge and with two spring tongues, C C, with catches or shoulders *c* to bind the parts together or to release them, one of said fastenings being cut away centrally to permit the other to enter, substantially as and for the purpose set forth.

3. In a snap-flask, the spring-tongues C C, in combination with the metallic plates D D, formed, respectively, with the recess *d'* and the corresponding prolongation, *d*, serving to prevent independent lateral move-

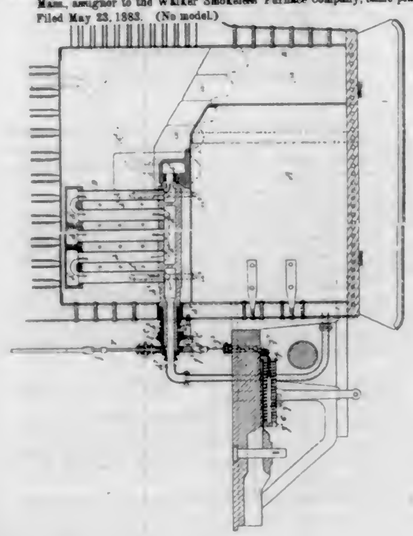
ment of the parts of the cope or nowel, substantially as and for the purposes herein set forth.

4. The adjustable follower-board F, provided with hooks H and guides I, substantially as and for the purposes herein set forth.



293,542. MINCING-KNIFE. ROBT. J. VICTOR, Hudsondale, Pa. Filed Apr. 16, 1883. (No model.)

Claim.—1. The combination of the handle and the blades arranged radially therein, the first blade of the series being provided with a single long slot, the last blade with a short slot, and each of the intermediate blades with both a long and a short slot, as set forth, by which the blades may all be connected together, substantially as described.



2. The combination, substantially as described, of the handle and the blades formed with correlative slots, whereby they may be connected together, as set forth, and with shanks and shoulders, by which they may be fixed on the handle.

293,543. DAMPER. ROBERT L. WALKER, Boston, Mass., assignor to the Walker Smokeless Furnace Company, same place. Filed May 23, 1883. (No model.)

Claim.—In a damper for covering openings above and below it, a pointed projection on one side, and a trough on the other side, adapted to enter a trough in the lower seat and to receive a pointed projection on the upper seat, substantially as and for the purposes set forth.

293,544. STEAM-BOILER FIRE-BOX. ROBERT L. WALKER, Boston, Mass., assignor to the Walker Smokeless Furnace Company, same place. Filed May 23, 1883. (No model.)

Claim.—1. The combination, in a steam-boiler fire-box, of a water-leg centrally located therein and dividing it into two compartments, a space between the water-leg and tube-sheet forming a communication between the two compartments, and corrugated fire-brick covering this space and partly covering the compartments, substantially as set forth.

2. A damper for covering the openings from the compartments of a fire-box, substantially as hereinbefore described, consisting of a series of pipes connecting return-bends or water-blocks to water-spaces in the damper-shaft, as and for the purposes set forth.

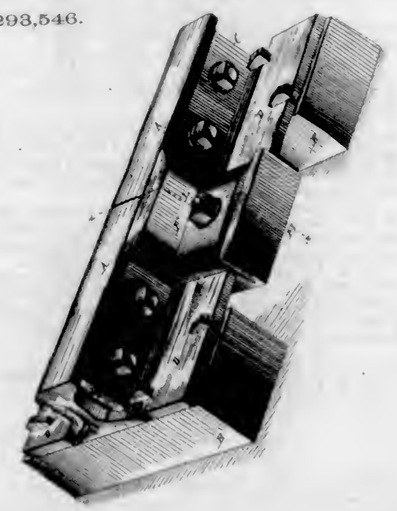
3. The combination, substantially as hereinbefore set forth, of a damper for covering the openings from the compartments of a fire-box, and having a water-channel, substantially as described, within it, with a pipe connecting the inner end of the damper-shaft with the space over the crown-sheet, and a pipe connecting the outer end of the damper-shaft with the rear water-leg, as and for the purpose set forth.

4. The combination, substantially as hereinbefore set forth, of a damper, a spring for maintaining a close fit between one end of the damper-shaft and its bearing, and a thrust-plate for supporting one end of the spring, with a series of anti-friction rollers, located substantially as described, and for the purposes set forth.

5. The combination of a damper for covering two openings and a lever for operating the damper, substantially as described, with a device for resisting the movement of the damper from a vertical position, substantially as and for the purposes set forth.

6. The combination, substantially as hereinbefore set forth, of a damper for covering the openings from compartments of a fire-box, with a steam or air controlled piston having its rod connected to the shaft of the damper, a cylinder in which the piston moves, and a valve operated by hand, by means of which steam or air may be admitted to and released from the cylinder, to move the piston in either direction, for the purpose set forth.

293,545. FOUNTAIN-PEN. LEWIS E. WATERMAN, Brooklyn, N. Y. Filed Sept. 19, 1883. (No model.)

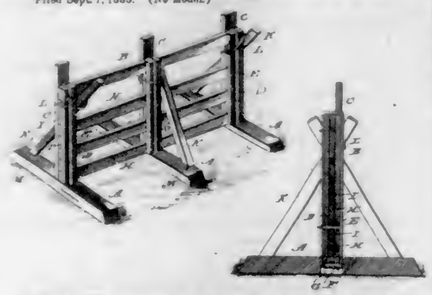


Claim.—1. An ink-duct for a fountain-pen, consisting of a bar having a longitudinal groove formed in its surface and one or more longitudinal fissures in the side or sides of said groove, substantially as set forth.

2. In a fountain-pen, the combination, substantially as hereinbefore set forth, of a barrel or ink-reservoir, a tube connected therewith, an ink-duct supported within said tube, and consisting of a bar having one or more longitudinal grooves formed in that portion of its surface which is in proximity to the pen, with one or more longitudinal fissures in the side or sides of said groove or grooves, and a pen secured between said tube and ink-duct.

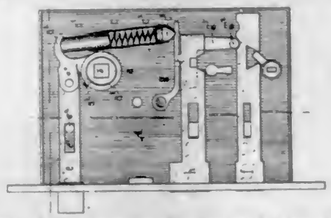
3. A fountain-pen having an ink-duct provided with one or more longitudinal fissures formed in its walls, for facilitating the passage of the ink through said duct.

293,546.



293,546. RAILWAY-RAIL CHAIR. GEORGE WEEKS, East Oakland, Cal. Filed Nov. 10, 1883. (No model.)

Brief.—A suspension rail-joint consisting of the usual fish-plates and bolts, longitudinal side plates, a chair with upwardly-extending arms, a locking-block on one side of the rail, and an angle locking-block on the other side, having its outer surface beveled, and its sides of such a height that its upper edge will be flush with the tread of the rail.



Claim.—The combination, with the rails A A, of the B B, and fish-plates C C, of the side plates, D D, having apertures I I, chair E, having upwardly-extending ends, and provided with apertures H H, locking-block G, having aperture K, and angle locking-block F, provided with apertures J J, and having its outer surface at either end beveled or rounded and its sides of such a height that when placed in operative position its upper edge will be flush with the top of the rails A A, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

293,547. FENCE. NELSON WERTH and WILLIAM SPIKER, Mendon, Ohio. Filed Sept. 7, 1883. (No model.)

Claim.—The combination, in a portable fence, of the bottom sills, A, recessed on the under side, posts consisting of the uprights C and D, vertical wire ties E, connecting said uprights, and twisted to form a knot, F, in the recessed sills, planks or rails B H, spacing-blocks I, braces K, and wire ties L, constructed and combined to form a portable fence-panel, substantially as and for the purpose shown and set forth.

293,548. DOOR-LOCK. BRUNO WESSELMANN, Hamburg, Germany. Filed Oct. 2, 1883. (No model.) Patented in Germany Dec. 9, 1882, No. 23,911.

Claim.—1. The combination of the knob-spindle *b*, nut *a a'*, having ears a^4 and extension-hook a^2, spring-bolt *e*, hinged to the ears a^4, spring-actuated slide-bolt *c'*, guide-socket c^3, tumbler *g*, having a seat for the guide-socket and a downwardly-extending arm, g' g^3, main bolt *h*, and latch *f*, substantially as set forth.

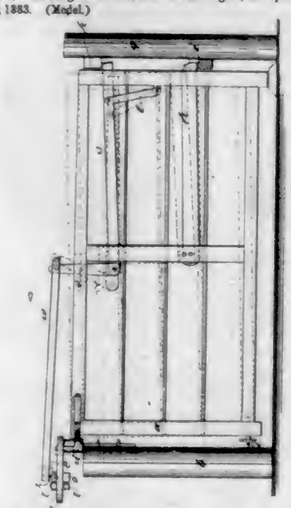
2. The combination of the knob-spindle *b*, nut *a a'*, having extension-hook a^2, spring-bolt *e*, hinged to ears of the nut *a a'*, tumbler *g*, main bolt *h*, and a spring-actuated bolt *c'* and guide-socket c^3, interposed between the hook a^2 and the tumbler *g*, substantially as set forth.

3. The combination of the knob-spindle *b*, interior nut, *a*, placed on said spindle, and having a guide-stop, a^3, exterior sleeve, *a'*, having a guide-slot, a^5, extension-hook a^2, and ears a^4, spring-bolt *e*, hinged to the ears a^4, and a spiral spring, *d*, interposed between a shoulder, *b'*, of the spindle and the interior nut, *a*, substantially as set forth.

293,549. UMBRELLA-RUNNER. JAMES BERNARD WILSON, Philadelphia, Pa. Filed June 7, 1883. (No model.)

Claim.—1. An umbrella-runner comprising a sleeve, C, and notch D, said sleeve having lips *c c*, which project from its upper edge and beyond the top of said notch, substantially as shown and described.

2. The method of producing blanks B B for forming umbrella-runner sleeves, said blanks having each projecting lips *b b* at one end, and curved edges *b' b'* at the other, the lips *b b* of one blank being cut from the plate on either side of the curved edges of the next blank, substantially as shown and described.



3. An umbrella-runner comprising a sleeve, C, and notch D, with lever-catch E, said lever being supported on flanges c^3 c^3, composed of the outwardly-turned edges of the sleeve, said lever terminating below the notch, and said flanges being reduced in height between the edd of the lever and notch, to form a recess for the reception of a binding or finish, substantially as shown and described.

4. In an umbrella-runner comprising a sleeve, C, and lever-catch E, said lever being pivoted on supports c^3 c^3, and terminating below the notch, arresting-stops for limiting the inward motion of said lever-catch, substantially as shown and described.

5. In an umbrella-runner comprising a sleeve, C, with flanges c^3 c^3 and a lever-catch, E, pivoted thereon, the lugs c^4 c^4, struck up from said flanges and forming stops to limit the inward motion of said lever, substantially as shown and described.

6. The combination of sleeve C and notch D, fastened together by means of lugs struck up from said sleeve and turned over on said notch, substantially as shown and described.

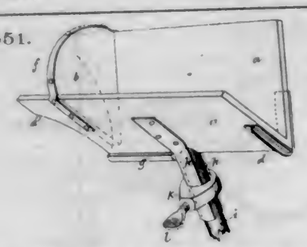
293,550. GATE-OPERATING APPARATUS. HENRY ZIEGLER, North Lima, Ohio, assignor to himself and Enos Ziegler, same place. Filed Aug. 13, 1883. (Model.)

Claim.—1. The upper hinge of the gate, consisting of the cranked pivots *d* and the slotted plate *e*, pivoted to the post at *g*, and having cords connected to and extending along the roadway for opening and closing the gate, substantially as described.

2. The combination of the slotted plate *e*, pivoted to post *b*, levers *l*, and cords *j*, with the gate *a*, having pivots *d*, eccentric to the hinge *c*, said pivots working in the slots of the plate *e*, substantially as described.

3. The combination of stops *o*, with the levers *l*, slotted plate *e*, and the gate *a*, said gate being provided with pivots *d*, and the plate being pivoted to the post, substantially as described.

4. The combination of the stop *p*, levers *s* and *u*, and bar *w*, with the gate *a* and the plate *e*, having slots *f*, said gate being connected to the plate by the eccentric pivots *d*, which enter said slots *f*, and the plate being pivoted to the post *b*, and having cords attached to it for opening and closing the gate, substantially as described.



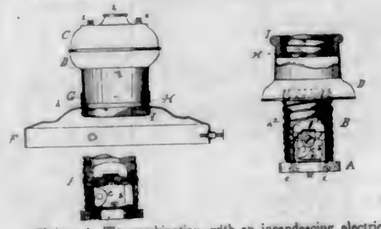
293,551. BUILDER'S HOD. STANLEY ASHWORTH, New York, N. Y. Filed Oct. 19, 1883. (No model.)

Claim.—1. As a new article of manufacture, a builder's hod having its trough or box made of paper, substantially as herein set forth.

2. A hod having its V-shaped trough formed of a sheet or mass of paper without seams or joint at the apex of the V, substantially as and for the purpose set forth.

3. A hod having its box formed entire of paper, or equivalent plastic material, pressed or molded in one integral structure without seams or joints at its angles, substantially as and for the purpose set forth.

293,551.



4. A hod having its trough formed of paper strengthened by metallic fittings affixed at the edges thereof, substantially as herein set forth.

5. The combination, with a hod-box, of the metallic strengthening-eroteh *d*, affixed thereto at the edge of its open end, substantially as and for the purpose set forth.

6. A hod having its fork formed of two strips, *h h*, affixed to the box, with a handle adapted to fit between the same, and an encircling clasp to securely clamp the strips to the handle, substantially as set forth.

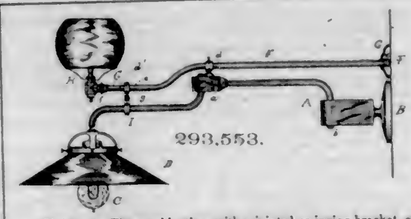
7. The combination, with a hod-box, of the metal strips *h h*, affixed thereto, the handle *a*, adapted to fit between the same, and the collar *k* and set-screw *l*, arranged to clasp said strips, substantially as and for the purpose set forth.

293,552. SOCKET FOR ELECTRIC LAMPS. SIGMUND BERGMANN, New York, N. Y., assignor to Bergmann & Co., same place. Filed Oct. 9, 1882. (Model.)

Claim.—1. The combination, with an incandescing electric-lamp socket, of a shade-holder removably secured directly upon said socket, whereby said shade-holder may be removed without displacing said socket, substantially as set forth.

2. The combination, with an incandescing electric-lamp socket, of a shade-holder having a central ring or band fitting over said socket, and means for removably holding said band over said socket, substantially as set forth.

3. The combination, with the inner and outer metal portions of an incandescing electric-lamp socket, of a shade-holder fitting upon said outer portion, and a removable screw-threaded flanged ring of insulating material placed between said inner and outer portions, whereby the shade-holder is held removably, substantially as set forth.



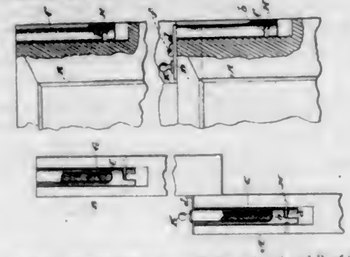
4. The combination, with the inner and outer metallic portions of an incandescing electric-lamp socket, of a removable screw-threaded insulating band or ring placed between them, substantially as set forth.

5. In an incandescing electric-lamp socket, the combination, with a screw-threaded metallic sleeve, B, forming one terminal, of an insulating-piece, *f*, supported by a metal plate, *a*, above the bottom of sleeve B, the metal plate *g* upon piece *f* forming the other terminal, the binding-screws *d d'* within said sleeve B, and openings permitting the introduction of the circuit-wires within said sleeve B, and their proper connection with the binding-screws, substantially as set forth.

6. In an incandescing electric-lamp socket, the combination, with an insulating-base perforated to permit the passage of the circuit-wires therethrough, and the socket terminals supported upon said base, of a metal cap, C, secured to said base and having a central opening, *h*, the metal sleeve H, and securing device I, substantially as set forth.

7. In an incandescing electric-lamp socket, the combination, with base A, of the metal screw-sleeve B, supported thereon and forming one terminal, the other terminal supported within said sleeve, openings A^7 in the sleeve B, the cap C, secured to the base A, and the sleeve D, adapted to be passed over the sleeve B, and secured in position after the circuit-connections are made, substantially as set forth.

293,553. COMBINED GAS AND ELECTRIC LAMP FIXTURE. SIGMUND BERGMANN, New York, N. Y., assignor to Bergmann & Co., same place. Filed Oct. 9, 1882. (No model.)



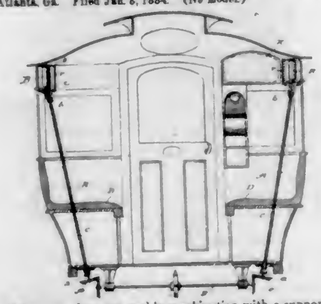
Claim.—1. The combination, with a jointed swinging bracket, of a gas-burner and an electric lamp supported by such jointed swinging bracket, and a flexible connection supported by said jointed swinging bracket for supplying one of such two devices with its lighting agent, the other being supplied through the bracket, substantially as set forth.

2. The combination, in a swinging bracket, of a jointed portion supporting both an incandescing electric lamp and a gas-burner, and so constructed and connected as to supply one of them with its lighting agent, and a flexible portion supported by the jointed portion, so constructed and connected as to supply the other, substantially as set forth.

3. The combination, with an electrical jointed swinging bracket carrying concealed circuit-wires, of a flexible tube supported by said bracket and carrying a gas-burner, substantially as set forth.

4. The combination, with the electrical jointed swinging bracket carrying an electric lamp, of the flexible gas-tube connected with the wall gas-pipe, the metal pipe G, secured to the end of the flexible tube and carrying the gas-burner, and the clamp I, supporting the pipe G from the electrical bracket, substantially as set forth.

293,554. SASH-CORD FASTENER. HENRY L. BLODGETT, Chicago, Ill., assignor to the Goforth Window Company, same place. Filed Jan. 23, 1883. (No model.)

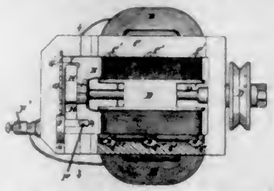


Claim.—1. The combination, with the sashes A and B, of the horizontal rotating plate D, having the laterally-projecting side arms, F, provided with the vertical projection *d* for engaging the pin on the sash, substantially as described.

2. The combination of the cord-tube C, having the bayonet-joint *a b*, with the coupling-pin H of the sash, all constructed and operating substantially as specified.

3. The cord-tube C, constructed with the interior annular shoulder, *g*, in combination with the cord G and the tapering screw *h*, passing into the cord and wedging the same within the tube under the said shoulder, substantially as described.

293,555. TRAVELING SIGN FOR CARS. THOMAS H. BOWLES, Atlanta, Ga. Filed Jan. 8, 1884. (No model.)



Claim.—1. In a car, and in combination with a supporting-case for such mechanism, an endless band provided with advertisements, rollers supporting the same, an inclined shaft connected by a universal joint

with one of said rollers, bearings *o b*, supporting the shaft, and means for operating the same, substantially as described.

2. The rollers B and *m*, the band mounted thereon, and means for moving the same continuously, said rollers being combined with a case formed of upper and lower strips, and a longitudinal dividing-board forming a support for said strips, and located between the parallel portions of the band, thereby preventing rubbing of such portions against each other, all as set forth.

3. The combination of the supporting and driving rollers B and *m*, carrying an endless band, the case composed of upper and lower strips, and the supporting and dividing board, together with the guide-rollers *p p*, supported in such case between the advertising-band and the frame of the car, whereby such band is deflected and freed from friction against the car-frame, all as set forth.

293,556. ELECTRIC MOTOR. WALTER BRADBURY, St. Louis, Mo., assignor to George S. Calhoun, same place. Filed May 25, 1883. (No model.)

Claim.—1. In an electric motor, the armature provided with ribs of double-V-shape form, and the magnets having corresponding grooves tapering toward the center from both directions, substantially as shown and described, for the purpose set forth.

2. In an electric motor, the adjustable disk provided with notches on its periphery, to be engaged by a pawl secured to the frame, and provided with brushes or plates, whose free ends bear upon the commutator, and one of which is insulated and has connected to it one of the conducting-wires, substantially as shown and described, for the purpose set forth.

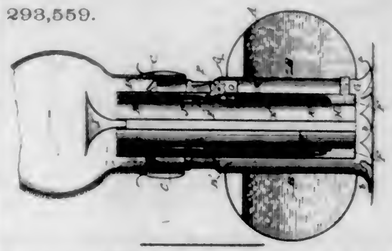
293,557. CULTIVATOR. BYRON G. BRADLEY, Chicago, Ill., assignor to Furst & Bradley Manufacturing Company, same place. Filed Apr. 30, 1883. (No model.)

Brief.—A fixed cross-bar beneath the evener affords a central pivot upon which the hangers turn as the evener vibrates.

Claim.—1. The hangers C, loosely connected with the draft-evener, and having a central pivotal connection with a fixed support, and constructed to receive adjustably the draft-connection, substantially as described.

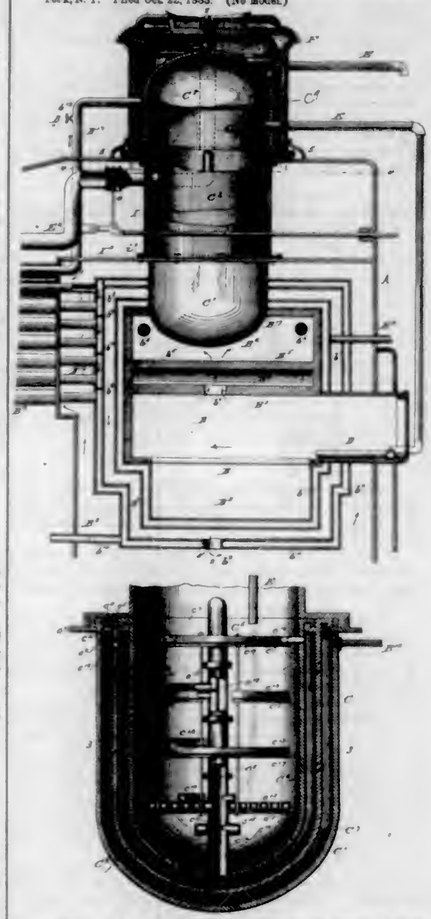
2. The combination of the draft-evener A, support B, the hangers C, pivoted to the support and connected with the draft-evener, the single-trees E, and hooks or rods D, connecting the single-trees to the hangers, substantially as described.

293,558. REED-BOARD. MELLEN BRAY, Newton, Mass. Filed Aug. 8, 1883. (No model.)



Claim.—1. In a musical instrument, a sheet-metal reed-board provided with a series of openings for the passage of air, and having a portion thereof upon each side of each of said openings bent upward to form guides to receive the reed-plates, substantially as described.

2. In combination with a series of reed-plates and tongues, a sheet-metal reed-board provided with a series of openings, *a*, a series of guides for receiving said reed-plates, formed by striking up or bending portions of said board, substantially as and for the purposes described.



293,559. LAMP. LEWIS OLSON BREKKE, Decorah, Iowa, assignor of one-half to L. E. Davidson, same place. Filed Aug. 23, 1883. (No model.)

Claim.—The combination, with the oil-reservoir, wick-tube, and central air-flue, of the cylindrical casing B, inserted centrally through the reservoir, having its open top shaped to form a seat for the chimney-holder and its projecting lower open end notched and bent outwardly to form the flaring feet or supports *b b*, as shown and set forth.

293,559.

293,560. HYDROCARBON-FURNACE. WILLIAM H. BROOKS, New York, N. Y. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a hydrocarbon-furnace, a fire-box entirely inclosed within a superheater, forming the walls of the fire-box, substantially as described.

2. In a boiler, the combination of a fire-box and a superheater entirely inclosing said fire-box, and divided into two parts by the smoke-flue connected with said fire-box, and having inlet B^{10}, connected to the outer part, and outlet-pipe B^{12}, connected to the inner part, substantially as described, and for the purpose set forth.

3. In a hydrocarbon-furnace, the combination of a water-chamber having flues, and a fire-box connected with said flues and entirely inclosed within a superheater connected with the water-chamber, substantially as described.

4. In a hydrocarbon-furnace, the combination of a fire-box, a superheater inclosing and forming the walls of the fire-box, a flue inclosing the superheater and connected with the fire-box, and pipes connecting said superheater and the steam-space of the boiler, substantially as described.

5. In a hydrocarbon-furnace, the combination of a fire-box, a superheater inclosing said fire-box, a flue inclosing the superheater and connected to said fire-box, fire-tubes connecting said flues with the exit, and pipes passing through said tubes and connecting the superheater and the steam-space of the boiler, substantially as described.

6. In a hydrocarbon-furnace, the combination of a fire-box, a superheater inclosing and forming the walls of the fire-box, and a retort projecting through the superheater into the fire-box, substantially as described.

7. In a hydrocarbon-furnace, the combination of a fire-box, a superheater inclosing and forming the walls of the fire-box, and a retort projecting through the superheater into the fire-box and connected with the superheater by a supply-pipe, substantially as described.

8. In a hydrocarbon-furnace, the combination of a fire-box, a superheater inclosing the fire-box, a flue inclosing the superheater, and a retort projecting through the superheater and flue into the fire-box, substantially as described.

9. In a hydrocarbon-furnace, the combination of a boiler having a steam-dome, and a retort projecting into said dome, substantially as described.

10. In a hydrocarbon-furnace, the combination of a boiler having a steam-dome, a fire-box below said dome, and a retort projecting into said dome and fire-box, substantially as described.

11. In a hydrocarbon-furnace, the combination of a boiler having a steam-dome, a fire-box below said dome, a superheater inclosing said fire-box, and a retort projecting into said dome and through the superheater into the fire-box, substantially as described.

12. In a hydrocarbon-furnace, the combination of a boiler having a steam-dome, a fire-box below said dome, a superheater inclosing said fire-box, a flue inclosing said superheater, and a retort projecting into said dome and through the flue and superheater to said fire-box, and connected with the superheater by a supply-pipe, substantially as described.

13. In a hydrocarbon-furnace, a retort having its cap inclosed within a second cap, substantially as described.

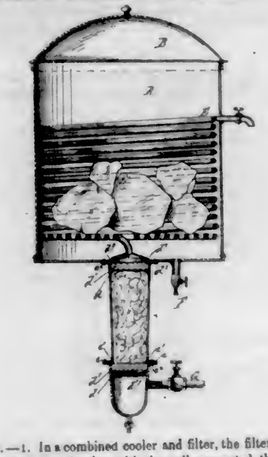
14. In a hydrocarbon-furnace, the combination of a boiler, a fire-box, and a retort, said retort projecting through the top of the boiler and into the fire-box, substantially as described.

15. In a hydrocarbon-furnace, the combination of a casing connecting the crown-sheet and top of the boiler, and a retort having a flange which rests upon the top of the boiler, substantially as described.

16. In a hydrocarbon-furnace, the combination of a boiler having a dome, a retort projecting into said dome, a steam-supply having a throttle-valve, and a valve-rod conforming to the shape of the retort and extending to the cab, substantially as described.

17. In a hydrocarbon-furnace, a vaporizer consisting of a tube divided in two vertical passages, plates having spiral passages connected with the vertical passages, and a perforated plate below said plates connected with one of the vertical passages, substantially as described.

18. In a hydrocarbon-furnace, a vaporizer consisting of a tube formed in sections having longitudinal partitions, plates having passages connected with said tube, a perforated plate for discharging steam, and means for holding the sections of the tube together, substantially as described.



19. In a hydrocarbon-furnace, a vaporizer consisting of a tube having longitudinal and horizontal partitions, coils around and each connected with said tube above and below the partitions, and a perforated plate for discharging steam, substantially as and for the purpose set forth.

293,561. TELEPHONE-TRANSMITTER. HENRY C. BUCK, Somerville, assignor to Francis M. Holmes, Boston, Mass. Filed June 27, 1881. (No model.)

Claim.—In a telephone-transmitter, the combination of an electrode, *b*, mounted on a stand, B, constructed substantially as described, a base, D, which supports the stand B, and the wire *f*, electrically connected with base D, stand B, and electrode *b*, with the diaphragm A, provided with an electrode, *a*, and wire *f*, substantially as and for the purposes set forth.

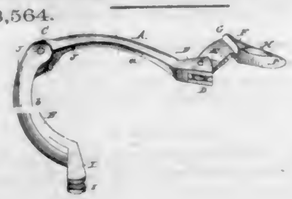
293,562. COMBINED WATER FILTER AND COOLER. FRANK E. CADY, Auburn, N. Y. Filed June 25, 1883. (No model.)

Claim.—1. In a combined cooler and filter, the filtering and sediment chambers, in combination with the coil connected therewith, and forming a continuous passage from said chambers to the outlet-pipe, substantially as described.

2. In a combined cooler and filter, a spiral coil for holding the filtered water, constituting a receptacle for the ice, and forming a continuous passage from the filter to the outlet-pipe, substantially as and for the purpose set forth.

3. In a combined filter and cooler, the combination, with a supply pipe or main, of a sediment-chamber arranged below the filter, a coil forming a receptacle for the ice, and a filter arranged between the sediment-chamber and coil for filtering the water in its passage from the supply to the outlet pipe, substantially as described.

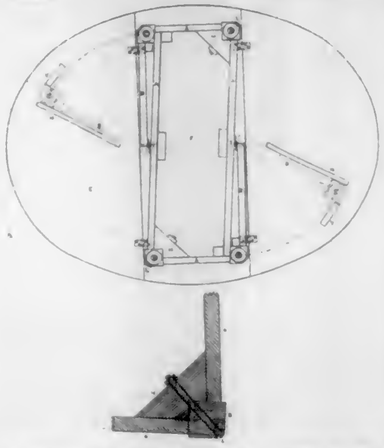
4. In a combined cooler and filter, the combination, with the supply pipe or main, and with the filter and coil, of a cooling-chamber interposed between the filter and coil, substantially as and for the purpose described.



5. In a combined filter and cooler, the combination, with the coil forming a receptacle for the ice, of the inclosing-case surrounding the coil, and a filter located outside of the inclosing-case, and between the supply-pipe and coil, substantially as described.

293,563. ELECTRIC BATTERY. CHARLES L. CLARKE and JOHN LEDUC, Manchester, County of Lancaster, England, assignors to the Domestic Electric Manufacturing Company, New York, N. Y. Filed Mar. 20, 1882. (No model.) Patented in England Mar. 1, 1882, No. 985; in France Mar. 11, 1882, No. 147,830; in Belgium Mar. 14, 1882, No. 57,354; in Germany Mar. 31, 1882, No. 21,985; in Canada Apr. 3, 1882, No. 14,563; in Italy Apr. 10, 1882, No. 14,079; in Austria June 24, 1882, No. 11,800, and in Spain Aug. 1, 1882, No. 2,859

Claim.—An electric-battery cell consisting of a case containing zinc and silver-foil and chloride of silver, with a solution of an alkaline sulphate as an excitant, substantially as described.



293,564.

293,564. BAG-FASTENER. CORNELIOUS COLLINS, Ottumwa, Iowa, assignor of two-thirds to John B. Ennis and William W. Ennis, both of Ottumwa, Iowa. Filed Nov. 12, 1883. (No model.)

Claim.—In a bag clasp or fastener, the curved parts A and B, having beveled edges *a b*, hinged at C, and provided with the projecting lips or ears D and I, in combination with the hinged latch E, provided with the shouldered thumb-piece F, recessed at H, substantially as set forth.

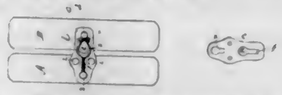
293,565. LEAF-TABLE. JACOB A. CONOVER, New York, N. Y., assignor to Albert F. Childs, Washington, D. C. Filed June 24, 1882. (No model.)

Claim.—1. In a table, a top composed of a central part and two leaves hinged thereto, in combination with a supporting-frame consisting of parallel side and end rails, and two legs attached thereto, the said frame being of less width than the central part of the top, and attached to the same diagonally, and two leaf-supporting arms hinged to the supporting-frame, and having each a leg attached thereto, substantially as and for the purpose set forth.

2. In a table, a top composed of a central part and two leaves hinged thereto, in combination with a supporting-frame consisting of a frame having parallel side and end rails, and two legs attached to the said frame at diagonally-opposite corners, the said frame being of less width than the central part of the top, and attached to the same diagonally, and two leaf-supporting arms having each a leg, as set forth, and hinged to the supporting-frame, as described, as and for the purpose specified.

3. In a table, a top composed of a central part and two leaves hinged thereto, in combination with a supporting-frame consisting of parallel side and end rails, and two legs attached thereto at diagonally-opposite corners, said frame being of less width than the central part of the top, and attached diagonally to the central part of the same, with the legs near the edges of the same, and two leaf-supporting arms having each a leg, as set forth, and hinged to the frame, as described, so that each arm may be folded against the side of the frame and along that portion of the frame farthest from the edge of the central part of the table, as and for the purpose set forth.

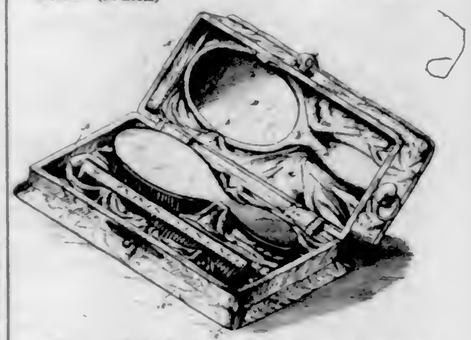
4. The combination of a table-top composed of a central part and a leaf hinged thereto with a supporting-frame consisting of parallel side and end rails, and two legs attached thereto at diagonally-opposite corners, said frame being of less width than the central part of the top, and attached diagonally to the central part of the same, with the legs near the edges of the same, and a leaf-supporting arm having a leg, as set forth, and hinged to the frame, as described, so that said arm may be folded against the side of the frame, and along that portion of the frame farthest from the edge of the central part of the table, the opposite side of the table having means for supporting it, as and for the purpose set forth.



5. The combination, with a table-leg and a frame for supporting a table-top, of a wooden block in the form of a scalene triangle secured to said frame, and having a notch the faces of which are at right angles to each other, to receive one corner of the leg D, a bolt, and a nut, as and for the purposes set forth.

293,566. PAPER MANUFACTURE FROM THE PLANT GALEGA. HENRIQUE DA COSTA CORRÊA LEITE, Lisbon, Portugal. Filed Jan. 23, 1884. (Specimens.)

Claim.—1. The process of making paper from the galega plant, which consists in placing the plant in a water bath, then rolling or kneading it, then boiling it in lime-water, then boiling it in a lotion of lime and soda, after which it is again washed, compressed, and placed in a bath of chloride of lime, and after being removed from this bath and dried is finally triturated and refined, substantially as set forth.



2. As a new article of manufacture, paper made from the galega plant, the pulp being obtained by washing and boiling the plant in suitable solutions, then rolling, triturating, and refining it, the paper requiring no admixture of rag pulp for felting it, substantially as set forth.

293,567. CORSET-BUSK FASTENING. DAVID ESSEX, Corona, N. J., assignor, by mesne assignments, to Theodore C. Bates, North Brookfield, Mass. Filed Mar. 15, 1880. (No model.)

Claim.—The combination, with a corset-busk, of an eye-plate provided with the opening *x*, to receive and hold the rear part of the laterally-movable spring-fastening *l*, substantially as shown and described.

293,568. TOILET-CASE. FRANZ FEIGE, New York, N. Y. Filed July 16, 1883. (No model.)

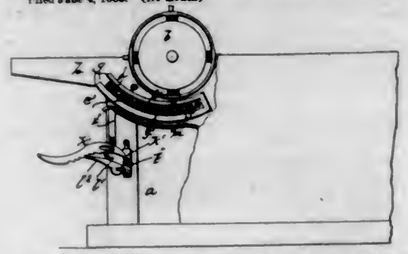
Claim.—1. In a toilet-case having a textile cover, I, uncut and folded at the corners *i*, as described, the combination of the tray A, having the inclined comb-seat *g k* and spring, with the cover A′, having mirror side springs, *b*, and the guides *b′*, all constructed substantially as described.

2. In a toilet-case, the combination of the tray A, the inclined partition or comb-seat *g k*, and the spring, substantially as described.

3. In a toilet-case, the tray A, having brush-handle springs *d*, and the comb-seat *g k*, in combination with the cover A′, having the mirror side springs, *b*, the handle guides or stays *b′*, and the flexible covering, substantially as described.

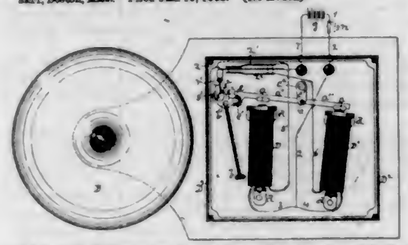
4. A toilet-case having a textile cover, I, uncut at the corners *i*, which are folded or crimped and lapped at the upper edge and finished, substantially as described.

293,569. SNOW-PLOW. ISAAC S. FILBERT, Washington, D. C. Filed July 27, 1883. (No model.)



Brief.—A scraper for clearing gutters has a landside to run next the curb, a receptacle for weights, and a diagonal mold-board with a rod projecting from it at right angles to the landside, to which a clevis connecting the draft-pole thereto is pivoted. The draft-pole has an adjustable connection to the point of the scraper.

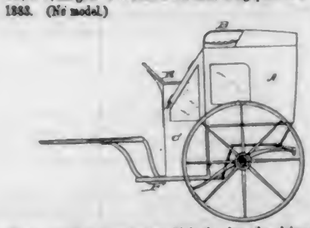
Claim.—1. A snow-plow adapted for cleaning street-gutters, consisting of a landside, A, parallel with the line of draft, a mold-board, B, oblique thereto, a receptacle for the weights F, and a stiff pole, I, connected by a pivoted clevis to the beam G, projecting laterally from the mold-board, substantially as shown and described.



2. In combination with the plow A B and tongue or pole I, connected by pivoted clevis to the mold-board in rear of the point of the plow, the guard chain or rod J, having one end secured to the point of the plow and the other to the pole or tongue in advance of clevis attachment, substantially as and for the purpose set forth.

293,570. THRASHING-MACHINE. MARION JACKSON FOSTER, Ashley, Ill., assignor, by mesne assignments, of one-half to Wm. H. Carter and Martha J. Carter, both of same place, and William T. Moore, Richview, Ill. Filed June 4, 1883. (No model.)

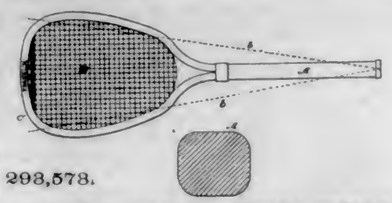
Claim.—The combination, with the concave constructed as described, of the cross-bar, the notched lever for operating the concave through the cross-bar, the cross-arm, the pivoted pawl, and spiral spring, substantially as specified.



293,571. ELECTRIC BELL-RINGING APPARATUS. OSCAR GASSETT, Boston, Mass. Filed Jan. 19, 1883. (No model.)

Claim.—1. The armature-lever *a′*, recessed as at *e*, in combination with the three-pronged rocker *e²* and circuit-changer *r*, substantially as set forth.

2. The electro-magnets D D′ and their respective circuits, the armature-lever *a′*, recessed at *e*, the three-pronged rocker *e²*, carrying a vibrating bell-hammer, *b*, the circuit-changer *r*, and contact-terminals *z z′ z²*, in combination with each other, with reference to reversing the current after and only after the corresponding armature motion has ceased, substantially as set forth.



293,572. TWO-WHEELED VEHICLE. HARRY GREENFIELD, Harrison, N. J., assignor to Hincks & Johnson, Bridgeport, Conn. Filed Oct. 23, 1883. (No model.)

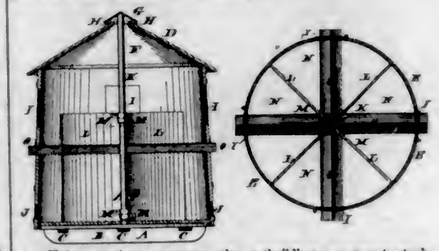
Claim.—A two-wheel vehicle having the driver's seat placed above the occupant's seat and over or forward of the axle, and provided on the front side with doors C and supplemental doors D all substantially as herein set forth.

293,573. TENNIS-RACQUET. ARTHUR T. GREENOUGH and WILLIAM H. BOARDMAN, Franklin, N. J., assignors to Andrew Peck and W. Irving Snyder, both of New York, N. Y. Filed Dec. 19, 1883. (No model.)

Claim.—1. A tennis-racquet having a stringed bowl, B, formed by a rim, C, shaped so that its sides will follow substantially lines which diverge equally from the center line of the handle and meet at the center of the end of the handle, as shown in Fig. 1, as and for the purposes shown and described.

293,573.

2. A tennis racquet or bat with rim C beveled or chamfered on the inner face surrounding the strings, substantially as shown and described.



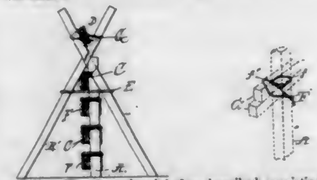
3. A tennis-racquet with rim C chamfered or beveled on the inner edge, so that the plane of the chamfer or bevel is substantially tangent to the surface of a ball which touches the surface of the stringed portion and the rim at the same time, as and for the purpose shown and described.

4. In a tennis racquet or bat, the chamfered or beveled rim C, formed and shaped to form a bowl to receive strings, as shown in Fig. 1, in combination with a handle, A, substantially as shown and described.

5. In a tennis-racquet, the rim C, with its inner edge cut away so as to form a concave bevel from the strings to the face of the rim, substantially as shown and described.

293,574. GRANARY. R. MONROE GRIER, St. Louis, Mo. Filed Sept. 22, 1883. (No model.)

Brief.—Consists of a sectional oval-shaped portable structure having a roof with a cap and ventilator, the whole provided with encircling-bands of metal or wood and mounted upon runners, and provided with partitions, doors, ventilators, and center pole.



Claim.—1. As a granary or other outbuilding, except water-tank, a circular or oval-shaped portable structure composed of a series of sections or panels, and the whole provided with encircling outside bands or hoops, and mounted upon the foundation-skid A, substantially as shown and described.

2. A granary or outbuilding, except water-tank, composed of a series of circular sectional panels provided with hoops or encircling-bands of metal or wood, in combination with partitions, doors, and ventilators, substantially as and for the purpose specified.

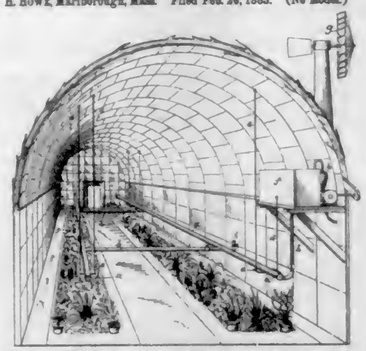
3. As a granary or outbuilding, except water-tank, a circular structure provided with encircling hoops or bands, in combination with the runners B and cross-ties C.

4. In a granary, domicile, ice, fuel, or animal house, or other shelter, a circular or oval-shaped portable structure provided with hoops or bands of metal or wood, in combination with skid A, roof F, cap G, ventilators H and O, doors I and J, center pole, K, and partitions L, all substantially as and for the purpose set forth.

293,575. FENCE. JOHN A. GROVE, Bluffton, Ind. Filed July 14, 1883. (No model.)

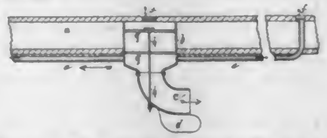
Claim.—The fence hereinbefore described, consisting of the single posts having their upper ends beveled and extended above the top rails of the panels, the rails C, having their ends lapped one upon the other and upon the posts A, the double-loop wire fastenings F, the stakes B, the stakes B′, rested upon the beveled upper end of the posts A, the riders D, bound to the stakes by the wires G, and the adjustable loops E, passed around the stakes and between two adjacent rails, as and for the purpose set forth.

293,576. SAW FOR COTTON-GINS, &c. DANL. B. HASELTON, Charleston, S. C. Filed Nov. 17, 1883. (No model.)



Claim.—1. A saw provided with a series of angular teeth having their heels higher than their toes, as and for the purpose set forth.

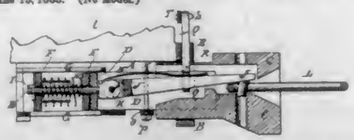
2. A saw having a series of angular teeth, C, the points or toes D thereof being lower than the heels E, and having plane breasts *a*, as set forth.



3. A saw having angular teeth C, provided with plane breasts *a*, recesses F, and heels E higher than the points or toes D, as set forth.

293,577. WATERING APPARATUS FOR HOT-HOUSES. WARREN H. HOWE, Marlborough, Mass. Filed Feb. 26, 1883. (No model.)

Claim.—The improved sprinkling apparatus for hot-houses, consisting of a system of distributing perforated pipes suitably suspended in the house, and an elevated supply tank or pump, and connecting-pipes, branches, and regulating-cocks, contrived for the supply and distribution of the water, for regulating the moisture and temperature of the air, substantially as described.

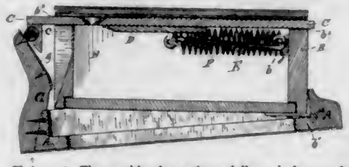


293,578. CAR-VENTILATOR. OWEN H. JONES, Hartford, Conn., assignor of one-half to Frank C. Smith, New York, N.Y. Filed Feb. 15, 1883. (No model.)

Claim.—1. The combination of air-box *b* with air-pipes *c c*, said pipes being provided with registers, and said box being provided with an exit-tube adapted to revolve on the air-box, and provided with a means to turn the opening in a direction opposite that in which the car is moving, substantially as shown.

2. As a car-ventilator, box *b*, pipes *c c*, tube *c*, having vane *d*, and a rod, A, all constructed and operating in combination substantially as shown.

293,579. CAR-COUPLING. THOMAS COKE JONES, Willows, Cal. Filed June 15, 1883. (No model.)



Claim.—1. A car-coupling constructed substantially as herein shown and described, and consisting of the draw-head A, the U-shaped draw-bar D, the spring-pressed coupling-hook J, the bow and yoke N O, and a mechanism for raising the coupling-hook, as set forth.

2. In a car-coupling, the combination, with the draw-head A, the U-shaped draw-bar D, the spring coupling-hook J, the bow N, and yoke O, of the lifting-bar Q, the lever T, the catch-bar X, and the bar Y, substantially as shown and described.

3. In a car-coupling, the combination, with the draw-head A and the U-shaped draw-bar D, of the coupling-hook J, provided with a recess at its rear end, spring M, bow N, yoke O, draw-rod E, cross-bars F, slides G, and spring H, substantially as shown and described.

4. In a car-coupling, the combination, with the draw-head A, the U-shaped draw-bar D, the coupling-hook J, the bow N, and yoke O, of the lifting-lever Q, the lever T, the catch-bar X, keeper W, slotted bar Y, and foot-lever *b*, substantially as shown and described.

293,580. CIGAR-CUTTER. ALVA H. KIRK, Minneapolis, Minn. Filed Apr. 9, 1883. (No model.)

Claim.—1. The combination, substantially as before set forth, of a tilting box, a reciprocating gage-plate mounted thereon, and a movable cutting-blade pivoted to said gage-plate.

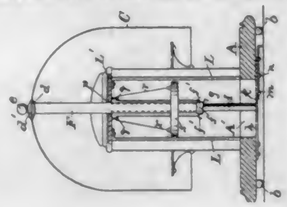
2. The combination, substantially as before set forth, of a tilting box, a reciprocating gage-plate mounted thereon, and a rotating curved cutting-blade eccentrically pivoted to said gage-plate.

3. The combination, substantially as before set forth, of the tilting box, the gage-plate mounted and adapted to slide thereon, the rotating curved cutting-blade eccentrically pivoted to the gage-plate, the connecting-rod, and the spring.

4. The combination, substantially as before set forth, of the stationary base, the fixed cam-grade thereof, the tilting box, the sliding gage-plate, the rotating curved cutting-blade pivoted to the gage-plate, the connecting-rod, and the spring.

5. A cigar-cutter, substantially such as before set forth, embodying a stationary base and a detachable tilting box.

293,581. FOOT-REST FOR VELOCIPEDES. WILSON KERNELY, Washington, Lehigh County, Pa. Filed Nov. 8, 1883. (No model.)

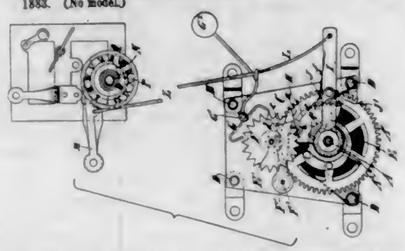


Claim.—1. The combination, with a foot-rest for bicycles and other like vehicles, of a foot-stand having an adjustable coupling for attaching the foot-stand to a crank-pin, substantially as and for the purposes described.

2. The combination, in a self-balancing foot-stand, of the hollow weight B and removable cap G, substantially as and for the purposes described.

3. The combination of the self-balancing foot-stand, the pivoted slotted plate C, hook F, and the loaded pendant B, substantially as and for the purposes described.

4. In a self-balancing foot-rest, the combination of a laterally-adjustable plate, a hollow loaded pendant, and means for tightening or loosening the latter on a crank-pin, all constructed and adapted to operate substantially in the manner and for the purposes described.

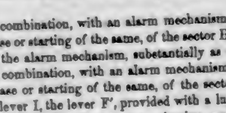


293,582. SHOW-CASE. DANIEL E. LADD and ELIJAH J. B. WHITAKER, Baltimore, Md.; said Ladd assignor to William T. Whittaker, same place. Filed Aug. 2, 1883. Renewed Dec. 20, 1883. (No model.)

Claim.—1. The combination, with a show-case cover having a vertical support rigidly attached to and depending from the center of the cover, adapted to move vertically, of a cap-piece, L, serving as a guide for the support, standards to sustain the cap-piece, and cords and weights to counterpoise the show-case cover, as set forth.

2. The combination, with the show-case cover C, having a vertical support on which the same is sustained, provided with a catch, *g*, of a cap-piece, L', through which the vertical support may move freely, standards to sustain the cap-piece, cords and weights to counterpoise the show-case cover, and a latch-bar to engage with the catch, as set forth.

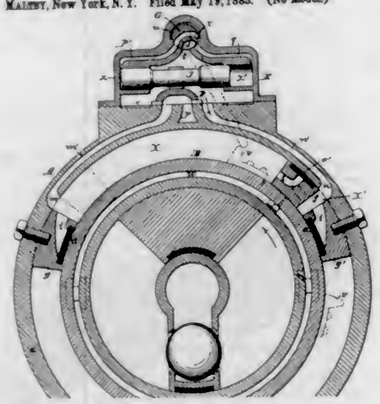
293,583. ALARM-CLOCK. CHARLES S. LEWIS, Waterbury, Conn., assignor to the Waterbury Clock Company, same place. Filed July 30, 1883. (No model.)



Claim.—1. The combination, with an alarm mechanism and a cam for controlling the release or starting of the same, of means so actuated by the cam that a second rotation of the cam will be necessary to cause the release or starting of the alarm mechanism.

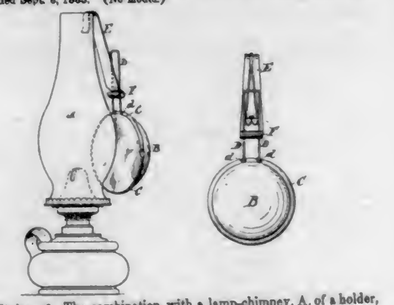
2. The combination, with an alarm mechanism and a cam for controlling the release or starting of the same, of means so actuated by the cam that a second rotation of the cam will be necessary to cause the release or starting of the alarm mechanism, and means whereby the alarm mechanism will be blocked after running short periods, substantially as specified.

3. The combination, with an alarm mechanism and a cam controlling the release or starting of the same, of the sector H, lever I, and means for blocking the alarm mechanism, substantially as specified.



4. The combination, with an alarm mechanism and a cam controlling the release or starting of the same, of the sector H, provided with a lug, *b*, the lever I, the lever F', provided with a lug, *c*, and the escapement or strike wheel F of the alarm mechanism, provided with a pin, *d*, substantially as specified.

293,584. BARB FOR FENCE-WIRE. TYLER C. LOMB, Joliet, Ill., assignor to Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Mar. 13, 1882. (No model.)



Claim.—As an improved article of manufacture, the barb made from a short piece of wire split at its ends, and the prongs or sharpened ends thus formed bent out, substantially as described.

293,585. OSCILLATING STEAM PUMPING-ENGINE. FRANK D. MALLEY, New York, N.Y. Filed May 19, 1883. (No model.)

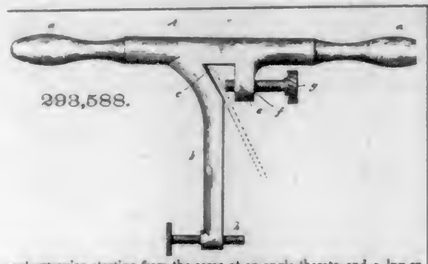
293,586. LENS ATTACHMENT FOR LAMPS. CHARLES F. MARTINE, Boston, Mass., assignor of one-half to William H. Kimball, same place. Filed Sept. 6, 1883. (No model.)

Claim.—1. The combination, with a lamp-chimney, A, of a holder, E, having a hook at its upper end, and curved and perforated at its lower end, F, and the sliding loop D, attached to the frame C of a lens, B, substantially as and for the purpose set forth.

2. The rim or frame C of a lens, B, constructed with grooves *d d*, in combination with the loop D, as and for the purpose set forth.

293,587. STORE-SERVICE APPARATUS. WILLIAM MILLER, Boston, Mass. Filed Dec. 19, 1883. (No model.)

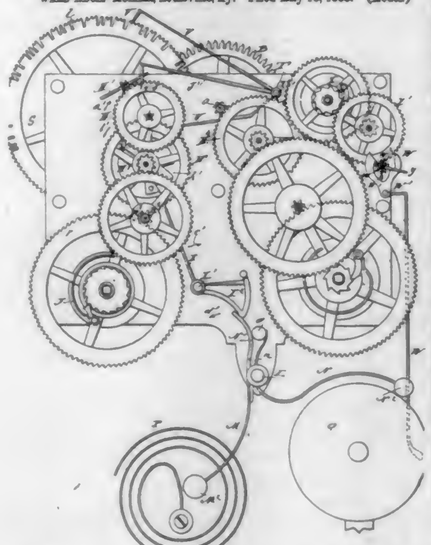
Claim.—1. In a store-service system, the combination, with a wire track, of vertically-movable end supports therefor, and mechanism, substantially such as hereinbefore described, connecting said end supports, whereby an attendant at either end of the track is enabled to raise either of said end supports and simultaneously lower the opposite support, and thereby give the track an inclination in either direction, as set forth.



2. The combination of the wire track, the endless chains or bands *f f*, mounted on pulleys *g g g g*, and secured to said supports, and the endless cord or chain *j*, mounted on pulleys rotating with the pulleys *g g*, as set forth.

3. The combination of the wire track, the vertically-movable end supports, having detents to engage and hold a car when the latter reaches the lower end of the track, springs, as *g*, at the ends of the track, adapted to be compressed by the car, mechanism, substantially as described, for simultaneously raising either of said end supports and lowering the other, and a fixed device at each end of the track, adapted to disengage the car from the detent which holds it when the support carrying said detent is raised, thereby allowing the spring to impel or start the car, as set forth.

293,588. SAW-SET. JAMES M. MORRHEAD, The Plains, Va., assignor of one-half to J. Blake Kendall, Washington, D.C. Filed Sept. 27, 1883. (No model.)



Claim.—A saw-set consisting of a tool having two handles, a lat-

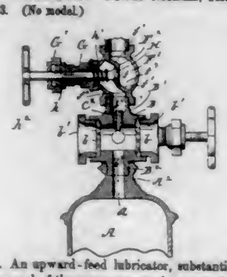
293,588.

eral extension starting from the same at an angle thereto, and a lug or ear opposite said angular portion, the extension and lug being provided with set-screws, whereby the teeth of the saw may be bent or set at a uniform angle, substantially as specified.

293,589. STRIKING MECHANISM FOR EIGHT-DAY CLOCKS. EDWARD ADOLF MÜLLER, Louisville, Ky. Filed May 13, 1883. (Model.)

Claim.—1. The combination, with the second-hand arbor *a*, of the loose sleeve C, the spring *c*, the sixty-toothed wheel *c'*, and the wheel H^4, carrying pinion J^4 on its pivot, said wheel being a part of the hand-operating mechanism, as shown and described.

2. The combination, with the sleeve C, of the disk F, having equidistant studs *f* and cam projection F', the lever G, having one end behind said disk and an upwardly-projecting arm, G', the wheel H, flier H', and spring J, the latter being a part of the striking mechanism and connected with said wheel, as and for the purpose set forth.



3. In a clock, the combination, with the hour-bell P, the quarter-hour bell Q, and the hammers M N, of the adjustable shaft I', provided with an arm, P, adapted to act on the upper ends of the hammers, and with an arm, I, adapted to be acted upon by the striking mechanism, substantially as herein shown and described, and for the purpose set forth.

4. In a clock, the combination, with the bells P Q, of the hammers M N, provided with the tongues M' N', the springs *m n*, and the adjustable shaft I', provided with the arm P, adapted to act on the tongues M' N', and with the arm I, adapted to be acted upon by the striking mechanism, substantially as herein shown and described, and for the purpose set forth.

5. In a clock, the combination, with the disk F, mounted on the sleeve C of the hour-hand, of the studs *f*, the cam-ridge F', the lever K, the spring K^3, the sliding shaft I', the arms I and P, the hammers M N, and the bells P Q, substantially as herein shown and described, and for the purpose set forth.

6. In a clock, the combination, with the alarm-hammer W, of the anchor W^3, the shaft *w*, the tooth *w'*, the pinion w^2, cog-wheels for revolving the pinion, the arm Y, and the alarm-releasing lever E, substantially as herein shown and described, and for the purpose set forth.

293,590. LUBRICATOR. ALONZO NOTEMAN, Toledo, Ohio. Filed June 30, 1883. (No model.)

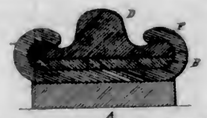
Claim.—1. An upward-feed lubricator, substantially as described and shown, composed of the cup or reservoir arranged at the lower end thereof, the sight-chamber mounted thereon, and the condenser arranged above the sight-cylinder, the said reservoir, sight-cylinder, and condenser being arranged in a line, one above the other, and provided with connecting passages or openings, also arranged or formed in line with each other, as and for the purposes specified.

2. The lubricator, substantially as described and shown, consisting of the cup or reservoir A, the sight-cylinder mounted thereon, and closed at its ends by transparent plates, and communicating with the cup A through the passage b^2 *a*, the horizontal pipe D, connecting the sight-cylinder and the steam-pipe, the feed-pipe C', opening into the cylinder B at a point opposite the connecting-pipe D, the dropper C^2, threaded as shown, and adjustable into the cylinder B in line with the passage b^2 *a*, and the condenser F, communicating with the dropper C^2, and provided with suitable valve, F', the said condenser, dropper, and passage b^2 *a* being arranged in line with each other and relatively to the oil-feed and connecting-pipes C' D, all as and for the purposes specified.

3. In a lubricator, substantially as hereinbefore shown and described, the sight-chamber B, having its opposite ends or openings closed by transparent plates *b*, and provided with upper and lower nipples, B' B^2, and lateral nipples B^3 B^4, in combination with reservoir A, screwed on lower nipple, B', the condenser-pipe F, screwed on upper nipple, B', and provided with suitable valve, F', the feed-pipe C' and connecting-pipe D, screwed, respectively, on the nipples B^3 B^4, and the dropper C^2, forming the connection between the condensing-pipe and the sight-chamber B, and extended into the latter and adjustable vertically, in the manner as and for the purposes specified.

293,591. SLIDING BED FOR MACHINERY. FREDERICK OUTRAM, Montreal, Quebec, Canada. Filed Dec. 4, 1882. Renewed Nov. 6, 1883. (No model.) Patented in Canada July 5, 1882, No. 15,043.

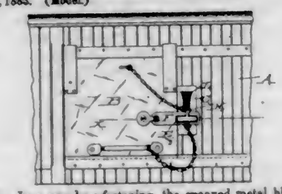
Claim.—1. In a file-cutting or like machine, a stationary bed and a carrier sliding therein having at their meeting surfaces longitudinal grooves.



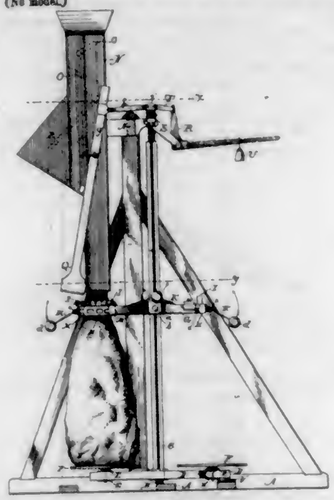
2. The combination, in a file-cutting or like machine, of a bed-plate having a number of longitudinal grooves, and a traveling carrier having a number of corresponding longitudinal feathers formed integral with it, and adapted to engage with the grooves in the said bed-plate, substantially as and for the purpose set forth.

293,592. RAILWAY-RAIL LOCK. JAS. PATTERSON, Brooklyn, N. Y., assignor of one-half to Henry C. Wright, same place. Filed Nov. 14, 1883. (No model.)

Brief.—A street-railway rail fastening having the longitudinal stringers cut away crosswise to form shoulders and seats for the base-plate and clamps.



293,592.



Claim.—In the construction of a street-railway fastening for rails, the sleeper A, cut away crosswise to form shoulders *a a* and *z z*, and surfaces *c c* and *d d*, in combination with the plate B, the clamps F F, and the rails D D, substantially as and for the purpose set forth.

293,593. SLIDING-DOOR LOCK. SAMUEL S. PETERSON, Wyandotte, Kans., assignor of one-half to William C. Duvall, Kansas City, Mo. Filed Nov. 13, 1883. (Model.)

Claim.—In a car-door fastening, the grooved metal block C, provided with the dovetailed groove D, and the metal block E, provided with a dovetailed tenon fitting into the dovetailed groove D, and perforated to receive a slotted key or seal, H, in combination with the hasp F, pivotally secured to the car-door, all substantially as shown, and for the purposes described.

293,594. GRAIN-SACKER. RICHARD HOPE PURNELL, Rosedale, Miss., assignor of one-half to THOMAS R. McGuire, same place. Filed July 12, 1883. (No model.)

Claim.—1. A horizontal disk or table provided with and supported on a vertical pivot, in combination with means independent of said table for holding a bag open thereon, said table being free to revolve on its pivot, to accommodate any twisting tendency of the bag, as described.

2. The combination, with two parallel jaws, of a series of spurs adapted to play vertically through the faces of said jaws, two rods supporting said spurs, levers pivoted to the jaws, supporting said rods at one end and weighted at the other end, whereby the spurs are held projecting from the jaws, or may be withdrawn, to hold or release a sack, as described.

3. A pair of parallel jaws adapted to hold a sack by the sides of its mouth, in combination with a pair of parallel end pieces hinged to said jaws at the four ends thereof, with rule-joint and jack-knife-blade hinges, as described, whereby a sack may first be held with its mouth open, and then the two sides be closed together while attached to the holder, as specified.

4. A vertical shaft stepped to rotate in a frame, a pair of cross-bars secured upon said shaft near its lower end, a disk or base-piece on each end of said bars, a frame provided with jaws for holding open sacks upon said base-pieces, and means, substantially as described, for adjusting said frame vertically, for the purpose specified.

5. A vertical shaft, a step for the same to rotate in, means for supporting an open sack on either of two sides of the shaft, and a cylindrical bearing at the upper end of the shaft flattened on two sides, in combination with an upper bearing having a circular hole to fit the cylindrical portion, and a narrow extension of the hole on one side, adapted to fit the flattened portion of the shaft, as described, whereby the shaft will be free to rotate when tipped one way and held from rotation when tipped the other way, as described.

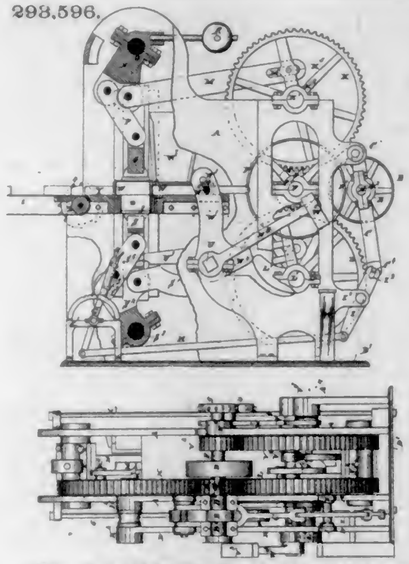
6. A vertical shaft, a step for it to rotate in, means for supporting a sack open on either of two sides of the shaft, and an upper bearing in which the shaft may vibrate laterally, in combination with a flue suspended over the sack-holder, a gate swinging across to close the lower end of the flue, and a rod connecting the gate with the top of the shaft, whereby the filling of the bag vibrates the shaft and closes the gate, as described.

7. The combination, with a vertical shaft adapted to vibrate upon its toe and to rotate in an upper bearing, of a head journaled on top of said shaft, and a rod pivoted to said head connecting it with a flue-gate, whereby the gate is operated to open and close by the vibrations of the shaft, yet the shaft is free to rotate without affecting the gate-connections.

8. A vertical shaft stepped to rotate in a frame and to vibrate laterally at its top, means for supporting a sack on said shaft, to be filled, a flue secured to the frame, with its delivery over the mouth of the sack-holder, a gate adapted to vibrate across the flue, and a connection between the gate and the top of the shaft, in combination with an elbow-lever pivoted in the main frame, connected by one arm with the top of the shaft, having a graduated scale on the other arm, and provided with a balance-poise, as described, whereby the filling of the sack causes the shaft to vibrate to close the gate, and the graduated arm and poise decide the amount required to fill the sack, as described.

293,595. KIOSK. ANTONIO CUTÁS Y RIBOT, Los Angeles, Cal. Filed Dec. 10, 1883. (No model.)

Brief.—Consists of a portable frame or structure having movable plates of glass upon the inner side, and elevating and transporting mechanism consisting of vertically-adjustable wheels connected with operating-levers.



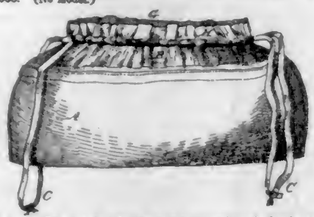
Claim.—1. A kiosk for advertising purposes, having an elevating and transporting mechanism, substantially as shown and described, and movable plates of glass, for the purpose set forth.

2. The portable kiosk having the elevating mechanism, consisting, substantially as shown and described, of the wheels D, racks C, pinions B, shafts A, ratchets F, pawls H I, and levers G, all in combination, substantially as and for the purpose shown and described.

3. In a kiosk, the vertically-moving wheels mounted upon vertical racks, and connected, substantially as shown, with operating-levers, for the purpose set forth.

293,596. BRICK-MACHINE. ROBERT N. ROSS, St. Louis, Mo., assignor, by direct and mesne assignments, to the Eureka Brick Machine Manufacturing Company, Louisville, Ky. Filed Feb. 5, 1883. (No model.)

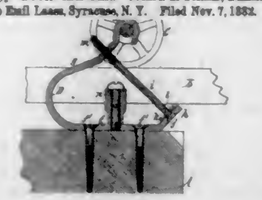
293,596.



Claim.—1. In a brick-machine, the stationary molds Z, in combination with plungers Q and S, connected to blocks N and S' by links P and S', and coupling links or arms M and S' and drive-wheels K and L, to which the arms are connected, and suitable means for turning the wheels, substantially as shown and described.

2. In a brick-machine, the charger W, operated in one direction by arms W', pivoted to the shaft U, and cams L' V' on the shafts L' V', and in the other direction by a counter-balance, V', substantially as shown and described, for the purpose set forth.

3. In a brick-machine, the combination of driving-pulley B and friction-roller F, secured to the swinging frame C, and the friction-roller brought and held in contact with the driving-roller F by pivoted arm I, rod H, lever G, and frame G', all substantially as shown and described, for the purpose set forth.

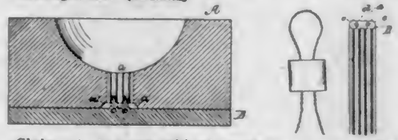


293,597. POCKET. WILLIAM F. RUSSELL, Peabody, Mass. Filed Sept. 14, 1883. (No model.)

Claim.—1. In a pocket for garments, a series of elastic straps, D, applied on one side of the interior of the mouth of the pocket, and on the opposite side a series of eyes, E, substantially as described.

2. A pocket for garments, provided with a series of elastic straps, D, applied on one side of the interior of the mouth, and on the opposite side with a series of eyes, E, and with puckering-strings C, for closing the pocket, substantially as described.

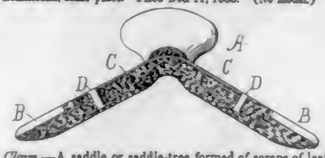
293,598. DOOR-HANGER. JOSEPH E. SCHMID, Buffalo, assignor of one-half to Emil Lasss, Syracuse, N. Y. Filed Nov. 7, 1882. (No model.)



Claim.—The combination, in a door-hanger, of wheels or rollers C C, a plate, *f*, secured to the door and provided with an ear, *h*, a movable arm, *g*, provided with a bearing for the wheels and connected with the plate *f*, and a bolt, *i*, connecting the fixed portion of the hanger-frame with the movable arm *g* thereof, whereby the roller-bearing is adjusted, substantially as set forth.

293,599. SHOE-LACE, &c. FRANK P. SHOREY, Auburn, N. Y., assignor of one-half to Samuel S. Wood, same place. Filed Dec. 10, 1883. (No model.)

Claim.—As an improvement in laces or lace-cords for shoes, corsets, and analogous purposes, the tag or stiffener composed of a piece of wire inserted through the lace or cord near its end, and then doubled upon itself and twisted in two spirals around the free end of the lace or cord and around itself, to form a pointed end, substantially as shown and set forth.



293,600. LEAD RIBBON FOR METALLIC SEALS. ELISHA C. SLOAN, Boston, Mass., assignor to Joseph H. Chadwick, Agent, same place. Filed Aug. 6, 1883. (No model.)

Claim.—1. As a new article of manufacture, a continuous lead seal-ribbon pressed hot through a die, substantially such as described, perforated throughout its length at *c c*, substantially as and for the purpose described.

2. In a machine for forming lead ribbon for metallic seals, perforated throughout its length with cavities for wires for attaching said seals, the combination, with the die A and bridge B, provided with the slot *a* and basin *a'*, of the conical spurs *c*, for forming the longitudinal perforations of the ribbon, substantially as described.

293,601. SADDLE OR SADDLE-TREE. JAMES STANLEY and THEODORE F. LEMASSENA, Newark, N. J., said LEMASSENA assignor to Lillian Lemassena, same place. Filed Dec. 11, 1883. (No model.)

Claim.—A saddle or saddle-tree formed of scraps of leather pasted together into the desired form, and combined with a spring inserted in the arch, substantially as and for the purpose set forth.

293,602. LOCOMOTIVE-GRATE. ISAAC W. SWALLOW, Kingston, Pa. Filed Oct. 29, 1883. (No model.)

Claim.—1. In a locomotive-grate, the water-bars extending longitudinally of the fire-box, in combination with the front and rear sections of connected tumbler-bars, operated by shaking-rods from the exterior of the fire-box, substantially as specified.

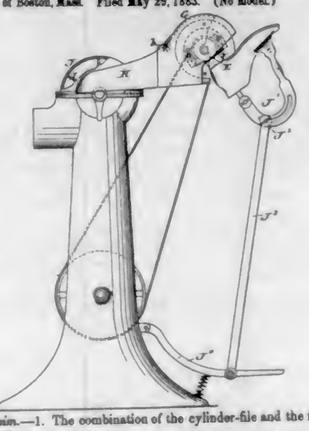
2. In a fire-grate for locomotives, the combination, with the water-bars extending longitudinally of the fire-box, of the tumbler rods or bars, connected to the slotted connecting-bars by an intermediate and two outer arms, and a connecting-rod passed through the several arms and the slotted connecting-bar, substantially as specified.

293,603. PRESS FOR WHEAT-BRAN, &c. MELCHISEDEK Y. THOMPSON, Arkadelphia, Ark., assignor of one-half to Austin M. Crow, same place. Filed Nov. 23, 1883. (No model.)

Claim.—1. The rotary baling-box consisting of the cast ends and their center bearings, the horizontal corner timbers and their side boards

293,603.

and doors at each end, and the middle opening for the packing-box, substantially as specified.



2. The combination, with a rotary baling-box having chambers at opposite ends, formed by beveled-edged boards and doors, of the headless packing-box having bevel-edges, and the straps and fastening-wedges of the baling-box, substantially as specified.

3. The combination, with a rotary baling-box having cast and peripherally-toothed circular ends, of the large fixed bearing-nuts, the followers having reversely-threaded screw-stems, and the driving cog-wheels engaging the teeth of the cast ends, substantially as specified.

4. The rotary press-box having the followers in opposite ends and their reversely-threaded screw-stems, the end castings and the wooden circles having radial handles, and the binding-straps encircling the timbers of said press-box, substantially as specified.

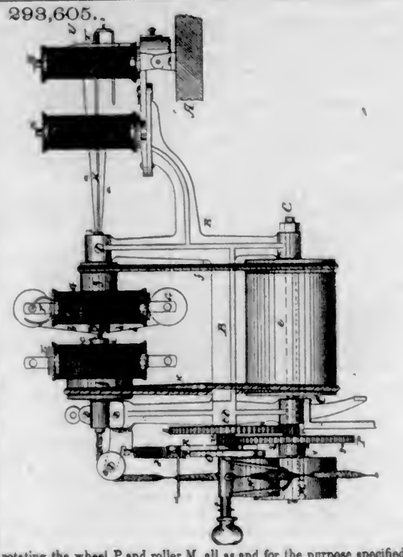
5. The combination, with a rotary press-box having end chambers and a middle opening, of a headless packing-box in the middle opening, oppositely-moving followers in the end chambers having reversely-threaded screw-stems, and loose heads of the packing-box moving in the end chambers, with the followers to the packing-box, substantially as specified.

293,604. MACHINE FOR FINISHING HEEL-BOTTOMS. MERRILL A. TYLER and DANIEL S. SMITH, Rockland, assignors, by direct and mesne assignments, of seven-twelfths to Thomas C. Dunn and Edward H. Dodge, both of Boston, Mass. Filed May 29, 1883. (No model.)

Claim.—1. The combination of the cylinder-file and the rests V V, as set forth.

2. The combination, with the cylinder-file, of the adjustable rests V V, substantially as described, and for the purpose stated.

3. The combination, with the cylinder-file, of the adjustable rests V V, the hood S, to which said rests are secured, the slotted plate N, and the flange K, the parts being held and adjusted by set-screws, and all being arranged substantially as described.

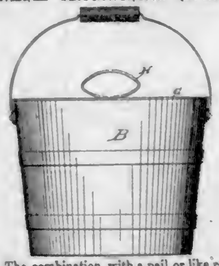


4. The combination, in an organized machine, of a rotary cylinder-file, the guard-plates arranged to gage the depth of cut of said file, and a shoe-holding jack pivoted to a standard, as described, so as to present the heel properly to said file, substantially as shown and described.

293,605. MACHINE FOR MAKING ORNAMENTAL LOOPED CORD. ALWIL URBAHN, Paterson, N. J. Filed Apr. 5, 1883. (No model.)

Claim.—1. The combination, with the guide-tube A, for the core-threads, of the inner rod or core-pin, H, carrying the perforated enlargement or disk *n*, which can be removed with said rod H, substantially as and for the purpose specified.

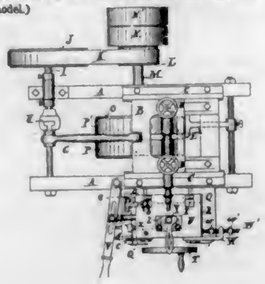
2. The combination of the posts E, tubes A *i*, core-pin H, and means for revolving spools containing enveloping and binding threads around the core-pin, with the lever R, having guide-loop *w*, wheel P, having projection *v*, rollers M and N, and means, substantially as described, for



293,605.

rotating the wheel P and roller M, all as and for the purpose specified.

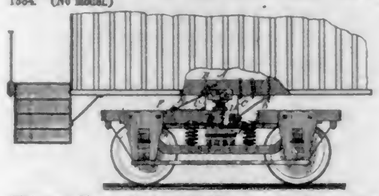
3. The wire or rod H, having tapering front end, combined with the adjusting-screw T and post U, and with mechanism, substantially as described, for supplying the core-threads and wrapping the same with enveloping-threads and binding-threads, as set forth.



293,606. EGG-CARRIER. LEVI J. WALLICH and WASHINGTON E RIGLER, Arcenville, Ill. Filed Nov. 17, 1883. (No model.)

Claim.—1. The combination, with a pail or like receptacle, of a series of separate trays, each consisting of a single disk having egg-holding apertures, a depending flange, and a central support secured to the disk, the supports and flanges being of such height that each disk supports a series of eggs independently of the other disks.

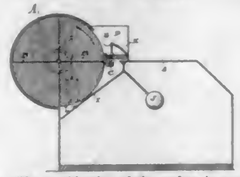
2. In combination with a vessel or receptacle, a cover composed of a double thickness of material, the inner thickness being split and formed into a flange, and having a paper handle secured to it, all substantially as described.



293,607. MORTISING-MACHINE. HENRY A. WILBUR, Cambridge, assignor of one-half to Frank W. Lowe, Boston, Mass. Filed May 22, 1883. (No model.)

Claim.—1. In a mortising-machine, the combination of the plate R, sliding in brackets Q Q, and operated by the screw S, through the nut *r* on plate R, and the sliding plate U, operated by the lever V and connecting-rod *u*, the screw W', adjustable stop W, and check-nuts *w w'*, all as shown, and for the purpose set forth.

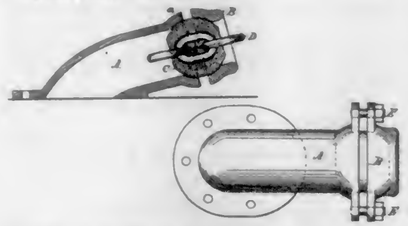
2. In a mortising-machine, the combination of the sliding plate R, the bar *c*, fixed to the plate R, the adjustable slide *e*, attached to the bracket Q, and the arm *d*, pivoted to the slide *e*, and provided with a recess fitting over the bar *c*, for the purpose of regulating the depth of cut at each end of the mortise for the reception of the pulley-flanges, as set forth.



293,608. RAILWAY-CAR. THOMAS L. WILSON, Port Hope, Ontario, assignor of one-half to Austin D. Cable, Montreal, Canada. Filed Jan. 2, 1884. (No model.)

Claim.—1. The combination, with the intermediate longitudinal timbers, A, of angle-brackets C, one arm of each being bolted to its respective intermediate timber, A, while the other arm extends downwardly behind the truck-transom D, and is provided with a flange, *d*, to project below the bottom of the said transom, and a diagonal brace, E.

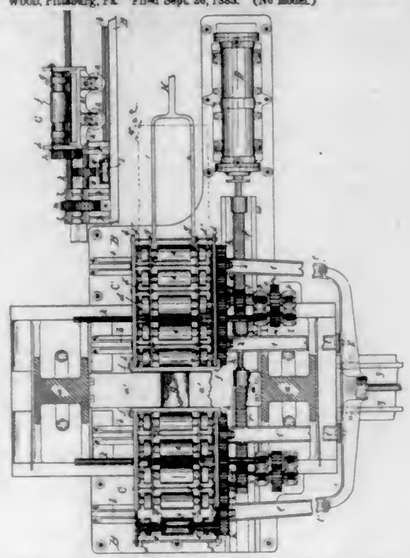
2. The combination, with the side timbers, F, of a truck, of angle-brackets C, bolted to the top side of the said timbers F, as specified, provided with a flange, *d*, to project over the body-bolster B of the car, and with a brace, E, substantially as and for the purpose specified.



293,609. VERMIN-TRAP. HENRY THEODORE WIENDT, Toronto, Ontario, Canada. Filed Sept. 14, 1883. (No model.)

Claim.—1. The combination of the casing A, provided with the winged platform B, revolving in the cylindrical part A' of said casing, which part is provided with openings G, the bait-box D, having a hinged cover, F, and an opening, H, communicating with said cylindrical part A', and the pivoted hook C, whose lower end receives and supports the wings of the platform, and whose upper end carries a bait-hook, E, all constructed and arranged substantially as shown and described.

2. A casing, A, having a winged platform, B, within it, and an opening leading into one of the wings of the said platform, in combination with a pivoted support having a supporting-hook at its lower end and the bait-hook at its upper end, and the hinged platform I, provided with weight J, all constructed and arranged substantially as described.

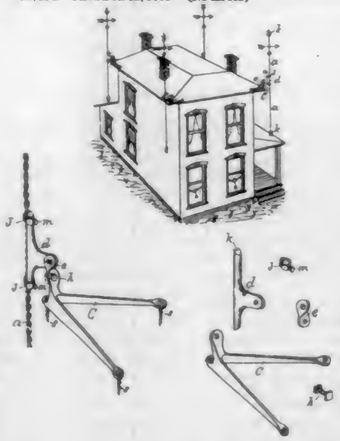


293,610. HAWSE-PIPE. HERMAN WEPFER, Brooklyn, N. Y., assignor of one-half to the American Ship Windlass Company, Providence, R. I. Filed June 9, 1883. (No model.)

Claim.—1. An improved hawse-pipe stopper, consisting of a two-part spherical stopper arranged to receive a cable or cable-chain and to fit the hawse-pipe, and provided with attachments for compressing it laterally, so as to cause it to expand and engage snugly with the sides of said pipe, substantially as described.

2. The combination, with a hawse-pipe, a ring, B, and connecting-bolts E for the same, of the spherical stopper C, made in two parts, each of which is formed with depressions to receive the chain or cable, as described.

293,611. FEED-TABLE FOR HAMMERING-MACHINES. W DEWEES WOOD, Pittsburg, Pa. Filed Sept. 26, 1883. (No model.)



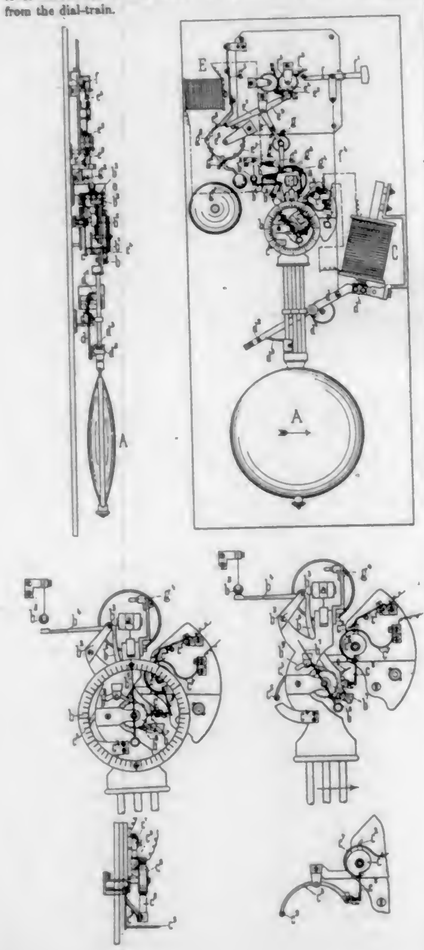
Claim.—1. In a machine for hammering sheet-iron, the combination of the anvil A, the reciprocating carriages C C', the rolls *e*, mounted in said carriages, means for reciprocating said carriages, and means for rotating the feed-rolls, substantially as shown and described.

2. In a machine for hammering sheet-iron, the combination of the anvil A, the reciprocating carriages C C', the feed-rolls *e e*, mounted in said carriages, the gear-wheels A, and idlers A', the reciprocating rack *r*, means for transmitting motion from rack to the gears and idlers, and means for reciprocating the carriages, substantially as shown and described.

3. The combination of the carriage C, the feed-rolls *e*, provided with grooves *e'*, the longitudinal and transverse bars *g f*, the gears and idlers A and A', and the means for rotating said gears and idlers, substantially as shown and described.

293,612. LIGHTNING-DIFFUSER. LEONIDAS G. WOOLLEY, Indianapolis, Ind. Filed Dec. 12, 1883. (No model.)

Claim.—1. A neutralizer or diffuser of atmospheric electricity, consisting of an electrical conductor placed in a vertical position, and provided with one or more points at its upper and lower ends, the lower end of said neutralizer or diffuser terminating above the ground, substantially as shown and described.



2. Two or more electrical conductors arranged in a vertical position, and having their upper and lower ends provided with points, said conductors being attached to different parts of a building, and having no metallic connection with each other or with the ground, substantially as set forth.

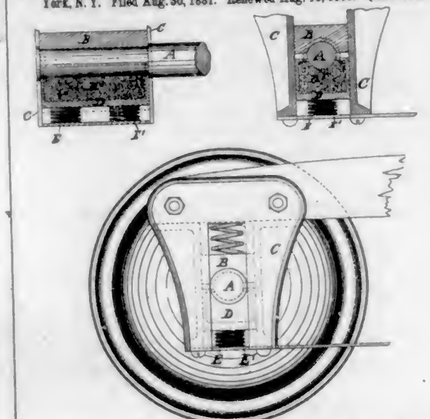
3. An electrical conductor arranged in a vertical position, and having its upper and lower ends provided with points, the upper end of said conductor terminating above the roof or top of a building, and the lower end terminating below said roof or top of a building and above the ground, substantially as and for the purpose set forth.

4. A vertical conductor having points at both its upper and lower ends, in combination with an adjustable support, constructed as shown and described, and for the purpose set forth.

293,613. ELECTRIC CLOCK. GUSTAV MAXIMILIAN HEROTHET, Hamburg, Germany. Filed Aug. 15, 1883. (No model.)

Brief.—Seconds indicated on a disk attached to the pendulum-rod by a hand advanced at each oscillation. Circuit closed at each rotation of second-hand, and impulse given to the pendulum by release of the armature-lever when circuit is broken. Connections with the armature-lever actuate the minute-wheel. An electric strike-work is controlled from the dial-train.

Claim.—1. In an electric clock, the combination, with a pendulum and an electric circuit, of the ratchet-wheel b^3, the angle-lever b^4 b^5, the pawl b^6, the suspended weight b^8, and the stop device consisting of the parts *c*, c^2, c^3, c^4, and *c'*, or their equivalents, all constructed and relatively arranged substantially as herein set forth.



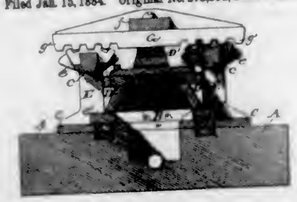
2. In an electric clock, the combination of the bobbin C with the pendulum A, the ratchet-wheel b^3, the lever *c*, the disk c^2, with arm c^3, and finger c^4, and spring c^5, the contact-spring *c'*, and the arresting-lever c^4, substantially as and for the purpose specified.

3. In an electric clock, the combination of the pendulum A, having bracket d^3, and the inclined lever *d*, having armature *d'*, and pin or roller d^2, with the magnet or bobbin C, and the stop d^4, substantially as herein set forth.

4. In an electric clock, the combination of the minute-wheel f^2 with the bobbin C, the lever *d*, the thread f^3, the lever *f*, the counter-weight *f'*, and the ratchet-pawl f^2, substantially as set forth.

5. In an electric clock, the combination of the bobbin E, the armature g^2, the lever g^3, the pawl g^4, the ratchet-wheel c^2, the disk c^4, the lever *c c' c³*, the minute-wheel f^2, the angle-lever *g g'*, and the projection g^5, with the contact-springs g^7 g^8, the pendulum A, and the pin g^4, substantially as and for the purpose specified.

293,614. JOURNAL-LUBRICATING BOX. GEORGE F. SENTER, New York, N. Y. Filed Aug. 30, 1881. Renewed Aug. 16, 1883. (No model.)



Claim.—1. A hollow lubricating-box adapted to contain a stiff plastic or semi-solid lubricant, provided with a longitudinal opening in the side next the journal, whereby the body or mass of said lubricant is allowed to contact with the journal, said box being constructed of soft anti-friction metal adapted to wear away with the lubricant, whereby the latter is kept in contact with the journal, substantially as described.

2. In a journal-box, the combination of a hollow lubricating-box adapted to contain a semi-solid lubricant, constructed of soft anti-friction metal, and provided with a longitudinal opening on the side next the journal, a spring for holding said lubricating-box in contact with the journal, and a rest for said spring, substantially as described.

3. The combination of the slotted pedestal C, the bearing-box B, the axle A, the rectangular hollow lubricating-box D, constructed of soft anti-friction metal, and provided with a longitudinal opening in its upper side, the semi-solid lubricant D', contained in said box, the spring E, and plate E', all substantially as described.

REISSUES.

10,449. BALANCE SLIDE-VALVE. WARREN T. REASER, Rockford, Ill. Filed Jan. 15, 1884. Original No. 273,891, dated Mar. 13, 1883.

Claim.—1. In a balanced slide-valve, the combination of supports having bearing-surfaces curved from a common center, cross-arms rigidly connecting the supports in pairs, and a bar connecting the cross-arms with each other and with the valve, substantially as described.

2. In a balanced slide-valve, the combination of supports having bearing-surfaces at top and bottom, curved from a common center, cross-arms rigidly connecting the supports in pairs, and having toothed segments *g g*, with a bar supporting the valve, and having teeth that engage with those of the segments *g g*, substantially as described.

3. The combination, with a slide-valve and its seat, of vibrating supports having segmental or rocking bearings at their upper and lower ends, toothed segments connected thereto, toothed segments *g g*, toothed bars *h h*, cross-bars *c c*, and rod or bar G, substantially as set forth.

PHOTO-LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

OPINION Touching the Right of Employés of the Patent Office to file an Application for a Patent.

1. SECTION 480 R. S. CONSTRUED.

Under Section 480 R. S. officers and employés of the Patent Office are prohibited from acquiring, directly or indirectly, any interest whatever in a patent, and are also prohibited from filing an *application* for a patent.

2. SAME—APPLICATION EVIDENCE OF A PARTY'S TITLE.

An application is the evidence of an applicant's title to the exclusive right or privilege sought, and since he can acquire no interest in the thing itself, to say that he might nevertheless take steps to establish his title thereto would be to pronounce an absurdity.

3. SAME—APPLICATION AND FEE TO BE RETURNED.

Applications filed in contravention of the statute as construed by this decision will be returned to the party filing the same, and the fee will also be returned.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, February 5, 1884.

I am called upon to decide whether an officer or employé of this bureau may file and prosecute an application for a patent. Section 480 of the Revised Statutes provides that—

> All officers and employés of the Patent Office shall be incapable, during the period for which they hold their appointments, to acquire or take, directly or indirectly, except by inheritance or bequest, any right or interest in any patent issued by the Office.

That the section just quoted renders all officers and employés of the bureau incapable of acquiring, directly or indirectly, any interest whatever in a patent is clear. I am equally clear that they are alike prohibited from filing or prosecuting an *application* for a patent. It would seem on its face absurd to hold that a party may file and prosecute a claim to obtain a right or privilege in which he is by express provision of statute made incapable of acquiring any interest whatever.

An application is the basis upon which the right to a patent rests. It is the evidence of applicant's title to the *exclusive right* or *privilege* sought. But since he can acquire no interest in the thing itself, to say that he might nevertheless take steps to establish his title thereto would be to pronounce an absurdity. The reason upon which the section rests is clear. The proceedings of the bureau in the matter of considering the claims of applicants are secret, and for obvious reasons. It would be palpably unjust to allow those who, by virtue of their employment, learn the nature, character, and scope of an applicant's invention, to enter the field as a competitor to obtain a patent for the same or a similar invention, and especially when such officer or employé may be charged with the duty of passing upon the patentability of the invention mentioned and described in his competitor's application. Public policy and common justice to the inventors of the country who are prosecuting claims for patents before this Office render it necessary that the section of the statute which renders the officers and employés of the Patent Office incapable during the period for which they hold their appointment of acquiring any interest in a patent be strictly enforced.

Applications filed in contravention of the statute as construed herein will be returned to the party filing the same. Of course the fee will be returned.

BENJ. BUTTERWORTH,
Commissioner.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

ESTEY *et al. v.* BURDETT.

Decided January 7, 1884.

1. BURDETT'S REED-ORGAN PATENT—CLAIM 1 CONSTRUED AND DEFINED.

Claim 1 of Letters Patent No. 67,241, granted February 23, 1869, to Riley Burdett, as inventor, for seventeen years from August 24, 1868, for an improvement in reed-organs—namely, "The arrangement, in a reed musical instrument, of the reed-board A, having the diapason set *a* and its octave set *b* and the additional set L extending from about at tenor F upward through the scale, substantially as and to the effect set forth"—defined and construed.

2. SAME—ANTICIPATION.

A reed-board with two sets of reeds and a third partial set was made and put into an organ by one Dayton prior to the invention of Burdett, and, such organ being put in evidence, it was held that the alleged infringing organs contained nothing which, so far as said claim 1 was concerned, was not found in such prior organ.

3. SAME—CLAIM 2 CONSTRUED—ANTICIPATION—NON-INVENTION.

As to claim 2—namely, "The reed-board A and foundation-board G, constructed with the contracted valve-openings D F F, and the reeds arranged in relation thereto, all in the manner described"—it was held that, in view of the state of the art, there was no invention in making the length and size of the valve-opening greater or less in a reed-board of a given width, or where the reed-board was made wider or narrower, or had more or less sets of reeds in it, either full or partial; and that the vibrating ends of the lowest and longest reeds in such prior organ were as near together as they were in the reed-boards of the alleged infringing organs. On these views a decree was entered in favor of the defendant.

APPEAL from the Circuit Court of the United States for the District of Vermont.

Mr. E. N. Dickerson and *Mr. Wm. M. Evarts* for the appellants.

Mr. Geo. Harding and *Mr. E. J. Phelps* for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought for the infringement of Letters Patent No. 87,241, granted February 23, 1869, to Riley Burdett, the plaintiff, for seventeen years from August 24, 1868, for an improvement in reed-organs. The specification of the patent is in these words:

Figure 1 is a perspective view of one of my reed celeste organs. Fig. 2 is a diagram plan, showing the relative arrangement of the reeds. Fig. 3 is a vertical transverse section of my reed-board, &c.

This invention consists, first, in the arrangement of the reed-board; second, in a method of tuning, by which a peculiar quality of tone is produced, and by which the power of the instrument is greatly increased without an increased resistance in the action, and without an increase of power being necessary to operate the bellows. The advantages gained by my peculiar arrangement are a greatly increased power and variety of tone. This is effected by the use of an additional set of reeds, commencing at tenor F, or thereabout, and running upward through the scale of the instrument, and tuning the same in the peculiar manner hereinafter described. No other reed musical instrument containing the same number of reeds, so far as I know, has ever possessed so great a variety or pleasing quality of tone, while simplicity of construction, compactness of form, and ease of operation are other excellences of this arrangement not found in others.

I will now describe particularly the construction of that part of my instrument which forms the subject of this patent. The case, bellows, pedals, &c., may be in general construction and arrangement like those in common use, and therefore no special description is required. The foundation of the reed-board is also constructed in the usual manner, but the reed-board proper, in itself, differs from the ordinary reed-board in the following particulars, viz: The main board A contains two sets of reeds running through

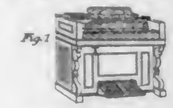


Fig. 1

Fig. 2

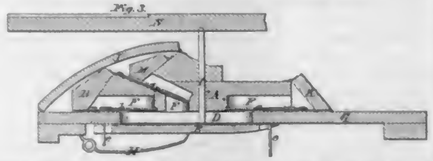

Fig. 3

the entire scale, the back set of which is marked *a*, and is tuned as a unison or diapason, while the front or octave set, marked *b*, is tuned an octave above the diapason. In the arrangement of these reeds, it will be seen that the lowest and longest reeds in the diapason and the octave sets are placed with their vibrating ends as near together as they can be, with room only for the tracker-pin, which communicates the motion of the key to the valve beneath the reeds; but as the reeds continually shorten as they advance upward in the scale, there is necessarily a vacant space left between the diapason set *a* and the octave set *b*, which constantly enlarges itself, and has heretofore been regarded as useless. Within this space, commencing on tenor F and running upward through the scale, I have introduced a third set of reeds, L, which forms the distinguishing feature of this instrument. These are placed in the reed-board over the octave set *b*, and run obliquely to the foundation-board G, as shown in Fig. 3, the vibrating ends resting on the same base as the other sets of reeds *a* and *b*. These reeds are of the same size as the corresponding ones in the diapason *a*, and are tuned either a trifle above or below the diapason, but only sufficiently so to produce a slightly waving and undulating quality or effect, without producing any discord. A few trials will enable any tuner of reed instruments to tune these reeds so as to realize the best effect. This method of tuning will, when this set of reeds, which I have named the "Harmonic Celeste," is drawn and used in connection with the diapason, produce a most wonderfully pleasing and captivating effect, while the power and beauty of both sets of reeds are greatly augmented and enriched in a manner which cannot be realized without being heard. Fig. 2 shows a top view of the reed-board proper, wherein the location of the reeds is shown with reference to the divergence of the reeds of the diapason set *a* and the octave set *b*, and also the space afforded for the introduction of the third set L. Fig. 3 exhibits a transverse section of my reed and foundation board, showing the arrangement of my reeds and the valve-connections. In this figure, A is the reed-board, G is the foundation-board, D is the valve-opening, E is the valve, and F F are the throats over which the reeds are located and placed. The valve E is retained in its proper place by the pins *e e* and spring H, and is operated by the tracker-pin I, which rests upon its upper surface, and passes upward through the reed-board to the under surface of the key N. The swell-boards J and K and stop-dampers B and M are raised whenever desired by the knee-stop C, Fig. 1, or by a hand draw-stop, or by some other convenient device.

Another important advantage arising from the introduction of the harmonic celeste is that a greater power and variety are attained than can be by the use of any of the octave coupling arrangements now in use. These, while they augment the power by drawing down octaves to the keys actually played, are objectionable, inasmuch as they offer more than double the resistance to the key, and are thus often exceedingly undesirable. In my instrument no such objection can ever arise, as the pressure upon the keys is always the same, whether one or all the sets of reeds are used. This is of prime importance to the performer, as the required exertion becomes involuntary, and not a matter of calculation, and thus the mind is not distracted from the proper feeling and expression of the music performed.

The claims of the patent are as follows:

1. The arrangement, in a reed musical instrument, of the reed-board A, having the diapason set *a* and its octave set *b* and the additional set L, extending from about at tenor F upward through the scale, substantially as and to the effect set forth.

2. The reed-board A and foundation-board G, constructed with the contracted valve-openings D F F, and the reeds arranged in relation thereto, all in the manner described.

3. The diapason *a* and its octave or principal *b*, arranged over the same valve-opening, as described, so that the octave unison may be produced, when desired, without the use of coupler, and without any additional pressure upon the keys.

4. In connection with the reed-board A, having the sets *a*, *b*, and L, as described, the independent dampers B and M, as set forth.

The circuit court made an interlocutory decree declaring the patent to be valid so far as claims 1 and 2 are concerned; that those two claims had been infringed; that the plaintiff was not the original and first inventor of what is set forth in claim 4, and did not before the commencement of this suit file a disclaimer of what is claimed in claim 4, and had not unreasonably neglected to file such disclaimer, and had presented evidence of his having filed such disclaimer; that no evidence had been offered to show any infringement of claim 3, and that the plaintiff was entitled to recover profits and damages because of such infringement. A reference to a master to ascertain the same was ordered, and a perpetual injunction was awarded as to claims 1 and 2. On the report of the master a final decree was made for the plaintiff for $161,011.79, without costs to either party. The decisions of the circuit court in the case are reported in 15 Blatchf. C. C. R., 349, 16 Id., 105, and 19 Id., 1. The defendants have appealed.

An examination of the text of the specification shows that the inventor purposed to cover by his patent two things: (1) a new arrangement of the reed-board; (2) a new method of tuning. In the application for the patent claim 1 read as it does now, while claims 2, 3, and 4 had specific reference to the method of tuning described. The Patent Office rejected all the claims. The plaintiff then amended two of the claims relative to tuning, still retaining the tuning feature in them, and added the claims which are now claims 2, 3, and 4. The Office then rejected all seven of the claims. On appeal to the Examiners-in-Chief the decision rejecting the three tuning claims was affirmed, and that rejecting the other four claims was reversed, and the patent was issued accordingly. There is nothing in claims 1 and 2 as granted which has any reference to any new method of tuning, unless it is to be intended, in accordance with the description, that the partial set is to be capable of being tuned a trifle above or below the diapason set. Except, perhaps, to that extent, all there is in the descriptive part of the specification in relation to a new method of tuning may be dismissed from consideration, as it was introduced to lay a foundation for the original claims 2, 3, and 4 in reference to such new method of tuning. Claims 1 and 2, as they stand, relate only to the arrangement of the reed-board and the sets of reeds, in conjunction with the foundation-board and the valve-openings and the valves.

The specification shows that the inventor takes a reed-board having two sets of reeds running through the entire scale, a diapason set, and an octave or principal set, and makes no change in the foundation-board, or in the case, bellows, pedal, &c. The reed-board with the two sets was old. In its structure, as shown in figure 2 of the drawings, and as described in the specification, the lowest and longest reeds in the two sets are placed so near together as to leave between them room only for the tracker-pin, which communicates motion from the key to the valve; but as the reeds shorten continually as the scale proceeds upward, there is a vacant space between the ends of the reeds in the two sets, which space continually grows wider. Within that space the inventor introduces a third set of reeds, commencing at or about tenor F and running upward through the scale. He places this third set over the octave set, and the reeds run downwardly in a direction oblique to the foundation-board, and their vibrating ends, which are their lower ends, rest on the same base as that of the other two sets of reeds. They are of the same size as the corresponding reeds in the diapason set. The point of advantage in bringing down the vibrating ends of the reeds in the third set, so that they shall rest on the same base with the vibrating ends of the reeds in the other two sets, is shown by the evidence to be the same point of advantage which is set forth in the specification of the prior patent granted to the plaintiff on the 9th of January, 1866. In that the invention is stated to be to so make the reed-board that the three or four sets of reeds in it shall be acted upon instantly and simultaneously by the rush of air upon the opening of the valve; and it is set forth that that result is effected by placing two sets of reeds on the same horizontal plane and placing the other sets on an inclined plane, each with its base on the same level as the first and second sets, thus making the head of each reed equidistant from the valve and making each produce instantaneous concerted sound.

There was introduced in evidence a reed organ, known as "Exhibit No. 21," containing a reed-board with two sets of reeds and a third partial set, alleged to have been made by one Dayton in 1866, prior to the plaintiff's invention. There was much testimony on the question as to whether the reed-board and reeds in this organ were made prior to the plaintiff's invention in the shape in which they appeared when put in evidence. The circuit court decided that question in the affirmative, but nevertheless it held that the arrangement of reed-board and reeds found in No. 21 did not embrace the entire arrangement specified and claimed in claim 1 of the patent, because, although it had a reed-board no wider than was necessary for two full sets of reeds, and had an additional partial set of reeds put in on an incline, and although the reeds in that set may have been tuned flat in relation to the diapason set, yet such reeds did not rest on the same base as that of the other two sets of reeds.

We concur with the circuit court in its conclusion as to the genuineness and the date of No. 21, but are of opinion that there is nothing found in the alleged infringing organs which, so far as claim 1 of the plaintiff's patent is concerned, is not found in No. 21. The vibrating reeds in the partial set in the alleged infringing organs do not rest on the same base as that of the other two sets of reeds, and occupy a position in that respect no different in reference to any requirement of the plaintiff's patent from that occupied by the vibrating ends of the partial set in No. 21. In all other respects in which the alleged infringing reed-board and reeds embrace what is covered by claim 1 of the plaintiff's patent what they contain is found in No. 21.

The material point in claim 2 is the contraction of the valve-openings. The idea is that the valve openings and passages for the two complete sets of reeds and the intermediate partial set are contracted or condensed within the same space which was usually occupied by the valve openings and passages for only two complete sets of reeds in an instrument of the usual prior construction; and that therefore no more force is required to be applied to the keys to open the valves than where only two full sets of reeds are used. The circuit court was of opinion that the valve-openings in No. 21 were not the contracted valve-openings of the plaintiff's patent, because they were as large as the valve-openings in a reed-board having three full sets of reeds; and that the lowest and longest reeds in No. 21 did not, as in the plaintiff's arrangement, have their vibrating ends as near together as they could be, with room between them only for the tracker-pin. Our conclusion is that the absolute length and size of the valve-opening was a matter of judgment, in view of the state of the art shown, and that there was no invention in making its length and size greater or less in a reed-board of a given width, or where the reed-board was made wider or narrower, or had more or less sets of reeds in it, either full or partial. The dimensions of the valve-opening and of the valve are regulated by the judgment of the manufacturer as to the quantity of air necessary, and the resistance to be overcome in working the valve and the inconvenience of the leakage of air. We are also satisfied that the vibrating ends of the lowest and longest reeds in No. 21 were as near together as they are in the reed-boards of alleged infringing organs.

It results from these considerations that the decree of the circuit court must be reversed, and the case be remanded to that court, with direction to dismiss the bill.

U. S. Circuit Court—Southern District of New York.

DRYFOOS *v.* WIESE.

Decided January 24, 1884

1. PROCESS—PROCESS OF OPERATING A MECHANISM NOT PATENTABLE.

A party having invented effective means for giving circular direction to a feed mechanism is entitled to a patent for said means, but not for merely giving such direction apart from the mechanism, nor to the process of operation of his mechanism for giving such direction.

2. REISSUE—BROADENING OF THE INVENTION BEYOND THAT ORIGINALLY PRESENTED NOT PERMISSIBLE.

A claim in a reissue which covers an invention clearly beyond that shown in the original is invalid, whether the time elapsing between the reissue and original patent is great or not.

3. SAME—LAPSE OF A FEW MONTHS NOT TOO GREAT.
A reissue granted within a few months of the date of the original patent, and before others appear to have done anything in that region of invention, is looked upon favorably.

4. SAME—INVALIDITY OF ONE DOES NOT AVOID ANOTHER CLAIM.
A claim valid in a first reissue is valid in a second reissue, notwithstanding the latter contains an invalid claim.

5. INFRINGEMENT.
The accomplishment of the same result, but by different means, does not constitute infringement.

Mr. Edmond Wetmore for the plaintiff.
Mr. Gilbert M. Plympton for the defendant.

WHEELER, *J.*:

This suit is brought upon Reissue Letters Patent No. 9,097, granted February 24, 1880, to August Beck, assignor to the orator, for an improvement in quilting-machines. The original was No. 190,184, dated May 1, 1877. It was reissued in No. 8,063, dated January 29, 1878, and surrendered for the reissue in suit. The improvement was and is stated in the original and reissues to be for improvements on the quilting-machine shown in Letters Patent No. 159,884, dated February 16, 1875, granted to the same inventor. That machine was for quilting by gangs of needles in zigzag parallel lines, and was fed by cylindrical rolls having an intermittent rotary motion, which would move the cloth while the needles were out of it, and could be arranged to feed in straight lines direct or oblique. The original of the patent in suit showed different mechanism for actuating the feed-rolls, so that the length of stitch could be varied at pleasure, and conical rolls having an intermittent motion to feed the conical bodies of skirts and skirt-borders in a circular direction when the needles were out of the cloth, as well as cylindrical rolls for straight goods, and other improvements upon the other parts of the machine, and had claims for the feed mechanism and improvements upon the other parts of the machine, but none of the conical feed-rolls. The first reissue further described the conical feed-rolls as made of such taper as to conform to the shape of the skirt or border to be quilted, and claimed the combination of the series of needles with the conical feed-rolls acting intermittently, in place of one of the other claims. The reissue in suit still further describes the conical feed-rolls as the embodiment of a feed device which extends substantially throughout the width of the conical strip of goods, and as it departs from the shorter curved edge and approaches the lower curved edge is adapted to have a proportionately-increased range of feed-movement, so that it will feed the conical strip of goods in the requisite curved path evenly and without any injurious strain or drag, and further claims the combination, with the gang of sewing mechanism and the cloth-plate which supports the goods under them, of a feed device operating intermittingly in the intervals between the formation of the stitches, which extends and operates substantially across the conical strip of goods, and which as it departs from the shorter curved edge and approaches the longer curved edge of the goods is adapted to have a proportionately-increased range of feed-movement.

The defendant is engaged in using a quilting-machine for quilting conical goods, having a gang of needles and short cylindrical feed-rollers at each edge of the goods, which they feed in a circular direction by moving at different rates of speed constantly, the needles having a forward movement corresponding to that of the cloth while in it, and also one with a four-motion feed, which is capable of feeding in a circular direction by lengthening the feed at the longest edge of the goods, but is not shown to have been so used or intended to be so used. The validity of the reissue and infringement of it, if valid, are denied.

Beck well appears to have meritoriously invented effective means for giving circular direction to the feed of quilting-machines having gangs of needles for quilting several parallel seams. He set forth these means in the specification and drawings of his original patent, and seems to have been well entitled to then have a patent for them and for the combination of the mechanism with the gang of needles. But he does not appear to have been entitled to a patent for merely giving such direction to such feed-motion apart from the mechanism nor to the process of operation of his mechanism for giving such direction. (*McKay* v. *Jackman*, 20 Blatchf., 466; 12 Fed. Rep., 615.) Neither could he claim the combination of mechanism not then known or its processes with the needles. He invented his own mechanism and the combination of that with the co-operating parts of the machine, and nothing more, and seems to have been entitled to a patent for those and no more. The first reissue was within a few months of the original, and before others appear to have done anything in that region of invention, and seems to have been well enough. (*Meyer* v. *Goodyear*, 11 Fed. Rep., 891; *Hartshorn* v. *Eagle Shade Roller Co.*, 18 Fed. Rep., 90.) The second reissue was more than two years after the original, but, whether too long after or not, was in effect for the combination of the gang of needles and cloth-plate with any feeding mechanism which would reach across the cloth and feed the long side faster than the other. This was clearly beyond the invention shown in the original, and, except as to the mechanism shown in the original, beyond the invention in every way. This claim of the reissue is therefore wholly invalid. (*Wing* v. *Anthony*, 106 U. S., 142; *James* v. *Campbell*, 104 U. S., 356.) The new claim of the first reissue brought forward into the second, being valid in the first, is not avoided by the invalid claim of the second. (*Schillinger* v. *Greenway Co.*, 24 O. G., 495; *Gage* v. *Herring*, 107 U. S., 640.) The orator appears, therefore, to be entitled to a monopoly of the conical rollers in that combination. It is argued that the defendant's machines invade that monopoly. Those machines have not conical rollers, nor are they claimed to have any of his other mechanism. It is said that there is no invention in dividing the conical rollers into parts, and that the parts are the equivalent of the whole. This is not what the defendant does. The orator's machine gives the circular direction by mechanism that accomplishes that result in one way; the defendant's by different mechanism that accomplishes it in a different way. That claim, therefore, is not infringed.

Let there be a decree dismissing the bill of complaint, with costs.

14,767.—CARPET.—*John Merry*, Brooklyn, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed January 16, 1884. Term of patent 3½ years.

14,768.—WALL-POCKET.—*William H. Miles, Jr.*, Brooklyn, N. Y. Application filed December 20, 1883. Term of patent 3½ years.

14,769.—CARPET.—*Howard North*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed November 9, 1883. Term of patent 3½ years.

14,770.—CARPET.—*Edward Poole*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed November 9, 1883. Term of patent 3½ years.

14,771 to 14,773, inclusive.—CARPET.—*Edward Poole*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed January 4, 1884. Term of patents 3½ years.

14,774.—RUBBER SHOE.—*Everett B. Preston*, Chicago, Ill. Application filed September 18, 1883. Term of patent 7 years.

14,775.—CARPET.—*Fred F. Ricker*, Philadelphia, Pa., assignor to *Bromley Brothers, (Limited,)* same place. Application filed January 2, 1884. Term of patent 3½ years.

14,776.—CARPET.—*Emil G. Sauer*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed January 4, 1883. Term of patent 3½ years.

14,777 and 14,778.—CARPET.—*Stephen Smith*, Philadelphia, Pa., assignor to *Horner Brothers*, same place. Applications filed January 22, 1884. Term of patents 3½ years.

14,779 to 14,781, inclusive.—CARPET.—*Charles W. Swapp*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed November 14, 1883. Term of patents 3½ years.

14,782.—CARPET.—*Charles W. Swapp*, New York, N. Y. Application filed November 23, 1883. Term of patent 3½ years.

14,783 to 14,793, inclusive.—CARPET.—*Charles W. Swapp*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed November 23, 1883. Term of patents 3½ years.

14,794 to 14,801, inclusive.—CARPET.—*Charles W. Swapp*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Applications filed January 4, 1884. Term of patents 3½ years.

14,802.—MISS'S JACKET.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19, 1883. Term of patent 3½ years.

14,803.—MISS'S COSTUME.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19, 1883. Term of patent 3½ years.

14,804.—MISS'S POLONAISE.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed November 19, 1883. Term of patent 3½ years.

14,805.—GIRL'S COSTUME.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed December 26, 1883. Term of patent 3½ years.

14,806.—CARPET.—*Lucy W. Valentine*, Boston, assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed November 9, 1883. Term of patent 3½ years.

14,807.—INKSTAND-FRAME.—*Webster R. Walkley*, Brooklyn, N. Y., assignor of one-half to *The Peck, Stow & Wilcox Company*, Southington, Conn. Application filed December 24, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

10,941.—PLUG, TWIST, FINE-CUT, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Robert James Christian*, Richmond, Va. Application filed January 16, 1884.
"The word 'PIONEER.'"

10,942.—PLUG, TWIST, FINE-CUT, AND SMOKING TOBACCO, CIGARS, AND CIGARETTES.—*Robert James Christian*, Richmond, Va. Application filed January 16, 1884.
"The arbitrary word 'SENATOR.'"

10,943.—REFINED HYDROCARBON OIL.—*Clark & Warren*, Corry, Pa. Application filed December 28, 1883.
"The letters 'C' and 'W' and the symbol '&.'"

10,944.—MINERAL WATER.—*Clark Cornwell*, Ypsilanti, Mich. Application filed December 31, 1883.
"A landscape, in the foreground of which is a derrick, tank, vats, barrels, and men engaged in filling and handling such barrels. In the background there are represented trees and shrubbery, derrick, tank, and barrels."

10,945.—WHISKY.—*Forster, Müller & Co.*, Baltimore, Md. Application filed January 14, 1884.
"The word 'ELEVATOR.'"

10,946.—NATURAL MINERAL WATERS.—*Fred. Hollender & Co.*, New York, N. Y. Application filed January 12, 1884.
"The word 'NEPTUNE.'"

10,947.—ANIMAL-TRAP.—*Elijah P. Peacock*, Chicago, Ill. Application filed December 5, 1883.
"The words 'LITTLE THROTTLER.'"

10,948.—TOILET-PINS.—*Thomas Porter*, New York, N. Y. Application filed January 14, 1884.
"The pictured representation of a cupid seated on the back of a dolphin, with a pin grasped in his right hand."

10,949.—MEDICINE TO PURIFY THE BLOOD.—*Lewis Jacobs & Co.*, Talladega, Ala. Application filed November 1, 1883.
"The words 'LEWIS JACOBS & Co.,' with a picture or representation of said Lewis Jacobs."

10,950.—BISCUITS OR CRACKERS.—*E. J. Larrabee & Co.*, New York, N. Y. Application filed January 26, 1884.
"The words 'SNOW FLAKE,' the snow-flakes, and a bird."

10,951.—ORANGES AND LEMONS.—*Antonio Minaldi*, New York, N. Y. Application filed January 23, 1884.
"The figure of an obelisk and the words 'THE OBELISK,' both or either."

10,952.—ORANGES AND LEMONS.—*Antonio Minaldi*, New York, N. Y. Application filed January 23, 1884.
"The figure of a drummer-boy or the word-symbol 'DRUMMER-BOY.'"

10,953.—ORANGES AND LEMONS.—*Antonio Minaldi*, New York, N. Y. Application filed January 23, 1884.
"The figure of a bicycle or the word 'BICYCLE.'"

10,954.—CRACKERS.—*John B. Ruger & Sons*, Lafayette, Ind. Application filed January 23, 1884.
"A representation of the sun."

10,955.—SMOKING-TOBACCO, CHEWING-TOBACCO, AND SNUFF.—*H. Wilkens & Co.*, Baltimore, Md. Application filed October 20, 1884.
"The word 'MARTHA.'"

10,956.—BISCUITS, CRACKERS, OR CAKES.—*Walter G. Wilson*, Philadelphia, Pa. Application filed January 26, 1884.
"The word-symbol 'WILSON'S.'"

10,957.—TINNED SPOONS AND FORKS.—*G. I. Mix & Co.*, Yalesville, Conn. Application filed January 18, 1884.
"The word 'MALACCA.'"

LABELS.

3,899.—Title: "DICKEY'S INDIAN BLOOD AND LIVER PILLS."—*John R. Dickey*, Goodson, Va. Application filed January 30, 1884.

3,900.—Title: "DR. WILDER'S VEGETABLE LIVER REMEDY."—*Joseph T. Fleming*, Princeton, Ind. Application filed January 30, 1884.

3,901.—Title: "GREBE'S SAGE HAIR TONIC."—*Conrad Grebe*, Chestnut Hill, Philadelphia, Pa. Application filed January 24, 1884.

3,902.—Title: "FOR GOODNESS SAKE DON'T SAY I TOLD YOU." (FOR TIP-LININGS FOR HATS.)—*Francis G. Hanson*, Brooklyn, N. Y. Application filed January 22, 1884.

3,903.—Title: "PINT ENGLISH" (FOR PICKLES.)—*F. & J. Heinz*, Pittsburg, Pa. Application filed January 23, 1884.

3,904.—Title: "ART CLUB" (FOR CIGARS.)—*S. F. Hess & Co.*, Rochester, N. Y. Application filed January 22, 1884.

3,905.—Title: "DR. VON BREEMBERG'S ZYMOTIC MALARIA ANTIDOTE."—*Edwin W. Higbee*, Northampton, Mass. Application filed January 26, 1884.

3,906.—Title: "DR. VON BREEMBERG'S HOMEOPATHIC BILIOUS POWDERS."—*Edwin W. Higbee*, Northampton, Mass. Application filed January 26, 1884.

3,907.—Title: "DELICIOUS SIPS" (FOR ROASTED COFFEE.)—*Herman Hulman*, Terre Haute, Ind. Application filed January 28, 1884.

3,908.—Title: IRVINE'S INDIGOTIQUE."—*Samuel I. Irvine*, Newville, Pa. Application filed January 26, 1884.

3,909.—Title: "KINSEY'S FINE GRAHAM BREAKFAST CAKE FLOUR."—*Z. B. Kinsey*, Rochester, Pa. Application filed January 25, 1884.

3,910.—Title: "GRAND ROYAL SEC." (FOR CHAMPAGNE.)—*Luyties Brothers*, New York, N. Y. Application filed January 26, 1884.

3,911.—Title: "MOUNT CLEMENS SPRUDEL WATER."—*Henry F. Meier*, Mount Clemens, Mich. Application filed January 23, 1884.

3,912.—Title: "VEGA" (FOR CIGARS.)—*Nilson Bros.*, St. Paul, Minn. Application filed January 22, 1884.

3,913.—Title: "BANNER TIP" (FOR SHOES.)—*Benjamin F. Oblinger*, Philadelphia, Pa. Application filed January 24, 1884.

3,914.—Title: "DR. REND'S ACTINIC SPECTACLES AND EYEGLASSES."—*W. Robert Rend*, Oshkosh, Wis. Application filed January 22, 1884.

3,915.—Title: "WILLIAMS' LINIMENT."—*J. Allen Rice*, Milford, Mass. Application filed January 29, 1884.

3,916.—Title: "THE NICKEL SWEET CHOCOLATE PACKAGE."—*Runkel Brothers*, New York, N. Y. Application filed January 24, 1884.

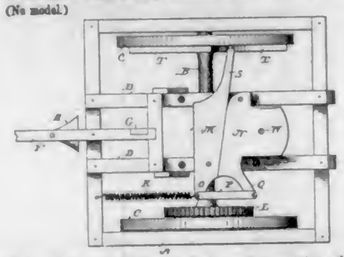
3,917.—Title: "DAZZLEINE GOLD AND SILVER POLISH, PRODUCES A DAZZLING BRILLIANCY WHICH IT RETAINS."—*Hugh M. Spalding*, New York, N. Y. Application filed January 26, 1884.

3,918.—Title: "A NO. ONE SMOKE" (FOR CIGARS.)—*George T. Warren*, Flint, Mich. Application filed January 26, 1884.

3,919.—Title: "THE FLINT" (FOR CIGARS.)—*George T. Warren*, Flint, Mich. Application filed January 26, 1884.

3,920.—Title: "WOMACK'S SPECIFIC."—*W. D. Wear*, Tarrant County, and *A. M. Womack*, Bosque County, Tex. Application filed January 23, 1884.

3,921.—Title: "SILVER PILLS."—*Wells & Church*, San Francisco, Cal. Application filed January 24, 1884.



3,922.—Title: "TURKISH BATH" (FOR A LINIMENT.)—*David W. Wentworth* and *Jared P. Wentworth*, Great Falls, N. H. Application filed December 14, 1883.

3,923.—Title: "NEW PROCESS YEAST."—*E. Delavan Woodruff*, Auburn, N. Y. Application filed January 23, 1884.

PATENTS

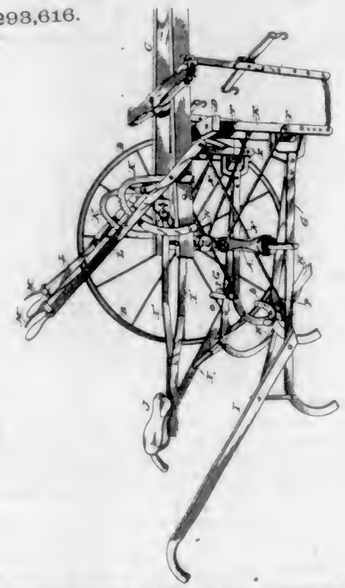
GRANTED FEB. 19, 1884.

293,615. COMBINED CORN-PLANTER AND FERTILIZER-DISTRIBUTER. WILLIAM NOAH ARNOLD, Omen, Tex. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination of the frame, the revolving axle having transporting-wheels, blocks or bars upon the inner side of one of the latter, longitudinal frame-bars, a hopper mounted upon the same, a pair of levers or plates pivoted upon the longitudinal frame-bars, under opposite sides of the hopper, and forming the bottom of the latter, arms extending from the said levers and connected by a pivoted rod, a spring connecting the arm of the front lever with the front part of the frame, and an arm extending from the opposite side of the front lever and adapted to engage the blocks or bars upon the inner side of the adjoining transporting-wheel, substantially as set forth.

2. In a combined corn-planter and fertiliser-distributer, the combination of a hopper, a pair of levers, forming the bottom of the same, mechanism for moving or opening the said levers in opposite directions, so as to permit the escape of a portion of the contents of the hopper, a seed-hopper arranged in rear of the main hopper above the rear lever, a seed-cup formed in the latter, a bottom plate having an inclined opening or chute, and mechanism for automatically closing the levers or bottom plates of the main hopper, substantially as set forth.

3. In a combined seed-planter and fertilizer-distributer, the combination of the seed-hopper, the seed-slide consisting of a lever, which forms part of the bottom of the fertilizer-hopper, mechanism for moving the said lever or seed-slide in a rearward direction to receive seed from the hopper, a spring arranged to move the said lever or seed-slide in a forward direction by a quick and sudden action upon the cessation of the actuating mechanism, and a bottom plate having a forwardly-inclined opening or chute, through which the seed will be thrown by the forward action of the seed-slide, as and for the purpose set forth.



293,616. WHEEL-CULTIVATOR. CHARLES A. BAKER, Moline, Ill. Filed Aug. 4, 1883. (No model.)

Brief.—The rod from the lever may slide through the foot-block, permitting the beam to rise, or by the insertion of a pin be locked at a fixed position.

Claim.—1. In a riding and walking cultivator, the combination of the following elements: a wheeled frame, shovel-carrying beams free to swing in a lateral direction, jointed at the forward ends to said frame and provided with operating-handles at the rear, a driver's seat mounted upon the frame, hand-levers mounted upon the frame, devices for locking said levers in different positions, rods connecting the hand-levers to the respective beams, and means, substantially as described, whereby said rods may be given a rigid or a sliding connection at one end, as occasion may require.

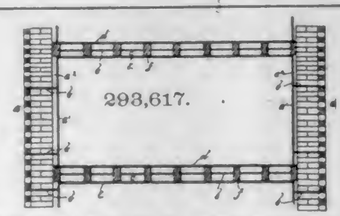
2. In a wheeled cultivator, laterally and vertically swinging shovel-beams, jointed at their forward ends to the frame, combined with hand-levers mounted upon the frame and provided with devices whereby the levers may be locked in different positions, rods connecting the lower ends of the hand-levers with the respective beams, said rods being arranged to slide through their connection at one end, as described, and the removable keys or pins inserted through the sliding end of the rod for

293,616.

the purpose of preventing the sliding movement, whereby the levers may be caused to act simply for lifting the beams, for suspending the same at a given elevation, or for the additional purpose of locking the beam down positively in an operative position.

3. The wheeled frame having the laterally and vertically swinging shovel-beams jointed thereto at their forward ends, the hand-levers having their lower ends substantially over the forward ends of the beams, the locking devices for said levers, the rods N, having their upper ends jointed to the levers substantially over the forward ends of the beams, and their rear ends extended through eye-plates on the beams, and provided with nuts or heads at the lower end, and a key or locking device combined with said rod above the eye-plates.

4. In combination with the shovel-beams and suspending or lifting rods, the combined eye and foot plates, as described.

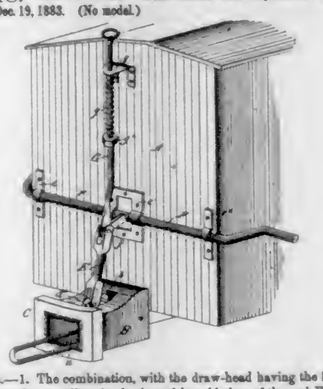


5. In combination with the shovel-beam and the lifting-rod, the plate attached to the beam and provided with a series of openings, as described, whereby a lateral adjustment of the lifting-rod with respect to the beam is permitted.

293,617. PROTECTING BUILDINGS FROM VERMIN, FIRE, &c. FREDERICK W. BARTLETT, Buffalo, N. Y. Filed Apr. 6, 1883. (No model.)

Brief.—The spaces between the lath and plaster and the walls and between the ceilings and floors are sectioned by intervening partitions sealed with cement.

Claim.—1. A building having the spaces between the lath and plaster and the walls and between the ceilings and floors sectioned by means of intervening partitions of suitable material placed in position during the construction of the building, and carefully sealed with mortar, cement, &c., so as to form permanent barriers to the circulation of vermin, fire, and air, substantially as shown and described.



293,617.

2. In a building, the combination, with the wall *a* and lath and plaster *a'*, of the dividing partition or partitions *b*, as and for the purpose stated.

3. In a building, the combination, with the floor *d* and ceiling *e*, of the dividing-partitions *b*, as and for the purpose stated.

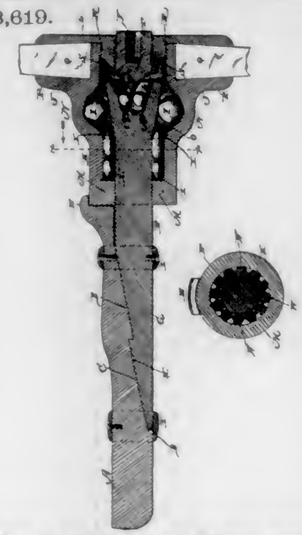
293,618. CAR-COUPLING. JAMES LARKEN BIAS, Guyandotte, W. Va. Filed Dec. 19, 1883. (No model.)

Claim.—1. The combination, with the draw-head having the longitudinal slot and a coupling-hook pivoted in said slot, of the rod E, pivoted to the upper end of said hook, and pivoted to the lower end of a rod, G, said rod being secured in a bracket, *g*, and provided with a coil-spring, *g'*, whereby the coupling-hook is held in position and the accidental displacement of the link prevented, substantially as set forth.

2. The combination, with a draw-head having the longitudinal slot *a* and a coupling-hook pivoted therein, of a rod, E, pivoted to the upper end of said hook, a lever, F, secured in brackets to the front of the car, and provided with the central arm, *f*, a rod, G, secured in a bracket to front of the car, its lower end, together with arm *f'* of the lever F, being pivoted to the upper end of the rod E, substantially as set forth.

3. The combination, with a draw-head having the longitudinal slot *a* and a coupling-hook pivoted therein, of a rod, E, pivoted to the upper end of said hook, a lever, F, secured in brackets to the front of the car, and provided with the central arm, *f*, a rod, G, secured in a bracket to the front of the car, its lower end, together with the arm *f'* of the lever F, being pivoted to the upper end of the rod E, and a coil-spring mounted on said rod G, its upper end bearing against the bracket *g*, and its lower end against the burr or washer *g²*, substantially as set forth.

293,619. WHEEL. RICHARD THOS. BISHOP, St. Louis, Mo., assignor of one-half to Theodore Hunt, same place. Filed Nov. 27, 1883. (No model.)

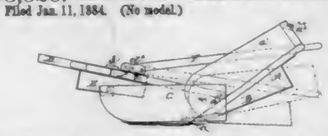


Claim.—1. The combination, with a shaft or axle beveled on its under side at its outer end, and having a recess provided at its inner or lower edge with an outwardly-extending lug, of a detachable spindle having a projecting portion adapted to fit in the said recess, and suitable connecting clips or bands, substantially as set forth.

2. The combination of an axle having beveled outer end, B, and overhanging flange E, with a detachable spindle having a tapering or conically-enlarged outer end, and inwardly-extending beveled arm G, and a wheel mounted upon the said spindle, substantially as set forth.

3. The combination, with a spindle having a tapering or conically-enlarged outer end, of a wheel consisting of a mainly cylindrical sheath or casing having a bulging portion forming an interior angular groove, an inward-projecting flange at its inner end, and an exterior angular flange near its outer end, and a cap having an inwardly-projecting threaded flange fitting in the outer end of the sheath, and interposed friction-rollers, substantially as set forth.

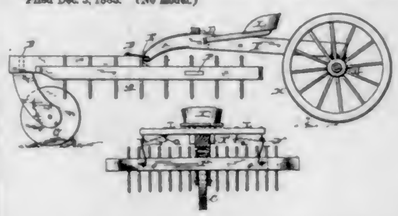
4. The combination of a spindle having a tapering or conically-enlarged outer end provided with a recess, Z, with a wheel comprising a sheath, K, having flanges M P, and interior annular groove O, cap L,



293,619.

having flange S, provided with exterior and interior screw-threads, and plug T, having conical inner end, U, and recess V, and the friction-rollers W, and balls Y and A', all arranged and operating substantially as set forth.

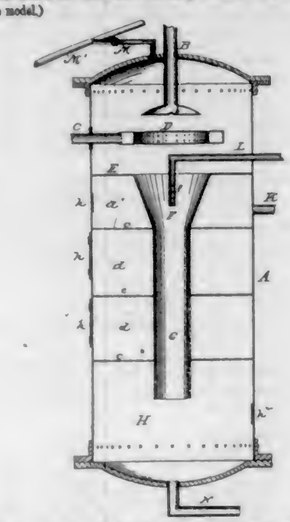
5. The combination, with a detachable spindle having tapering or conically-enlarged outer end provided with recess Z, of a wheel fitted or arranged upon said spindle, and equipped with a plug having a conically-pointed inner end entering the recess Z, and friction-balls placed in the said recess and bearing against the said plug, substantially as set forth.



293,620. SNOW-SCRAPER. GEORGE A. BIRCH, East Greenbush, N. Y. Filed Jan. 11, 1884. (No model.)

Claim.—1. In a snow-scraper, the combination, with a face-board, A, and tongue D, hinged to said face-board, and provided with a lever, F, adapted to engage with the face-board A, substantially as described, of the runners C, pivotally connected to the face-board A, all being constructed and arranged to operate substantially as herein specified.

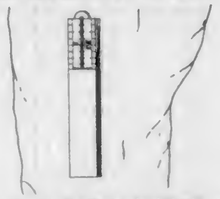
2. In a snow-scraper, the combination, with a face-board, A, provided with the runners B, or their described equivalents, of the tongue D, hinged to said face-board, and a lever, F, fulcrumed to said tongue and adapted to secure the face-board A in its angular position, and to effect the dumping movement of said face-board, substantially as herein specified.



293,621. SULKY-HARROW. JAMES E. BEARD, Cold Water, Ohio. Filed Dec. 3, 1883. (No model.)

Claim.—The combination of a harrow provided at its front end with means for the attachment of a removable caster-wheel, the beam hinged to the harrow at its front end, and supported at its rear end upon the axle-tree, which is supported upon wheels, and provided with a seat and a

hole for the attachment of said caster-wheel, the cross-bar, and the hooks for supporting the rear end of the harrow while being transported, substantially as shown.



293,622. FEED-WATER HEATER AND PURIFIER. JOHN H. BERKSHIRE, Muscatine, Iowa, assignor to the Kennedy & Berkshire Feed Water Heater and Filter Manufacturing Company. Filed Sept. 27, 1883. (No model.)

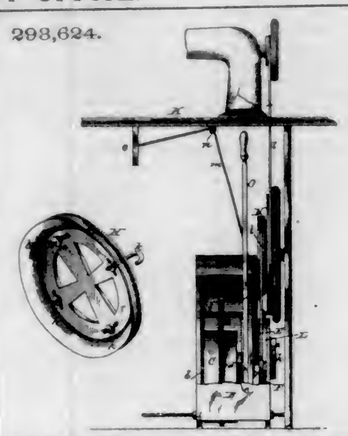
Claim.—1. In a feed-water heater having the scum-chamber F, consisting of the mouth of the central tube, G, the scum-blow-off pipe consisting of the horizontal portion L, arranged above the water-line, and of the vertical portion *f*, extended downward in the center of the scum-chamber, and perforated from the water-line downward to its closed end, substantially as and for the purposes set forth.

2. In a feed-water pressure-heater, the escape-pipe M, connecting the water and steam receiving chamber of the heater with a steam-circulating pipe, M', in combination with the live-steam-induction pipe C, substantially as and for the purposes described.

293,623. HOLDER FOR MECHANICS' RULES. JAMES S. BORDEN, Terre Haute, Ind. Filed Nov. 23, 1881. (No model.)

Claim.—1. A rule-holder for mechanics' rules, consisting of the case A, spring-pin B, and safety-eye C, constructed and arranged for operation substantially as described and shown.

2. In combination with overalls or other articles of clothing, a rule-holder composed of the elements A, B, and C, as described, and applied substantially as and for the purpose set forth.



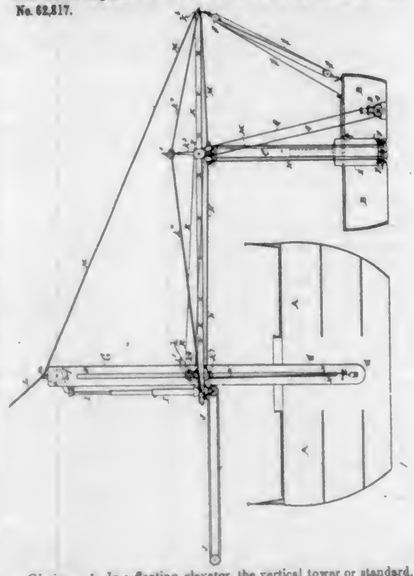
293,624. MECHANICAL MOTOR. FRIEND NEWTON BRETT, Sparta, Wis. Filed Dec. 10, 1883. (No model.)

Claim.—1. In a motor, the combination, with suitable winding mechanism, of a removable and reversible drum, inclosing the usual coiled spring, the shaft of said drum having secured to its ends right-hand and left-hand ratchet-wheels, substantially as and for the purpose set forth.

2. In a motor, the combination, with a removable and reversible drum containing the usual coiled spring, and having upon its shaft right and left hand ratchet-wheels, of an arm loosely mounted on the shaft, and carrying a spring-dog, and an adjustable link pivoted to the arm and to an adjustable lever, substantially as and for the purpose set forth.

3. A mechanical motor consisting of a reversible drum inclosing a

293,624.



coiled spring, and having right and left hand ratchet-wheels upon its shaft, a reversible pawl to engage therewith, an upright arm loosely mounted on the shaft, and carrying a spring-dog, a pivoted lever, and a link connecting said lever with the arm, both the lever and link being adjustable, to adapt them to the drum when reversed, substantially as and for the purpose specified.

4. In a motor, the combination, with the band-pulley thereof, of a grooved pulley provided with adjustable clamps for detachably connecting it to the fly-wheel of a sewing-machine, substantially as and for the purpose specified.

5. A brake mechanism for sewing-machine motors, consisting of a spring-brake arranged over the driving-belt pulley of said motor, and a cord attached thereto, which extends up over a pulley secured to the under side of the sewing-machine table, and its end secured to a pivoted lever, also secured to the under side of the table, and adapted to be operated by the knee of the person sewing, substantially as and for the purpose specified.

293,625. FLOATING ELEVATOR. WILLIAM SOUTHERN BREES, Liverpool, County of Lancaster, England. Filed May 18, 1883. (No model.) Patented in England Oct. 7, 1882, No. 4,732, and in Belgium Oct. 8, 1883, No. 62,817.

Claim.—1. In a floating elevator, the vertical tower or standard, the frame arranged to swing both vertically and horizontally upon the said standard, and the endless elevator attached to and adjustable ver-

tically with respect to the overhanging end of the frame, all combined substantially as described.

2. In a floating elevator, the combination of the pillar or standard, a supporting-frame connected to said standard in such manner as to swing both vertically and horizontally, and an elevator, substantially as described, connected to the outer end of said frame, and adjustable vertically thereon by means substantially as described.

3. In a floating elevator, the combination of the tower or standard, the frame movable vertically and horizontally about the same, and the elevator connected to the end of said frame by means substantially as described, adapted to permit the elevator to be raised and lowered, and also varied in inclination with respect to the supporting-frame.

4. In a floating elevator, the combination, with a fixed supporting-frame, K, of an upright elevator having an endless chain of buckets, substantially as described, said elevator being movable in a vertical direction with respect to the frame, and driving-pulleys h', for said elevator, mounted on the supporting-frame, whereby the vertical adjustment of the elevator is permitted without affecting the action of the driving mechanism.

5. A floating elevator formed of a floating base, a column, a frame-work cradle or jib jointed to same, so that it can stand at any required angle, and an elevator-frame hung from the said jib, but capable of being stowed away, lying flat upon said jib, without disconnecting the driving mechanism, substantially as described.

6. In a floating elevator, the combination of a column, C, a frame, K, pivoted to same, so as to be swung to almost any angle, with the axis of said column horizontal or vertical, and an elevator, G, pivoted to said frame, so as to hang to any desired angle with the vertical, substantially as described.

7. The combination of the frame K, the shaft A, the elevator G, capable of partial rotation on the shaft A, and also capable of being raised or lowered while the shaft remains stationary, and elevator driving-pulleys mounted on said shaft, substantially as described.

8. The combination of an elevator, G, formed of a slotted frame-work, belt or chain of buckets, and the requisite pulleys and driving-shaft A, working in slot of frame, with carriage g' and system of pulleys thereon carrying the belt of buckets, and driving same without any other contact than a sliding or rolling one with the frame-work.

9. The slotted elevator G, suspended by chain or rope N, but free otherwise to descend, and driven by shaft A, passing through the longitudinal slot in the elevator-frame.

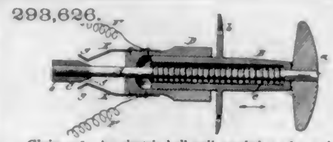
10. The combination of slotted elevator-frame G, the chain of buckets, the driving-shaft A, passing through the slot, and the carriage g', carrying the driving and tension pulleys, and carried itself by the shaft A.

11. In an elevator-frame, the driving mechanism consisting of a driving-axle driven by wheels h', and carrying driving-wheels g^3, and a carriage, g', which in turn, on spindles in suitable bearings, carries tension-pulleys g^4 and runners g^5.

12. In combination with an elevator, the driving-pulleys g^3, carrying pulleys g' and g^4, tension-pulleys g^4, and deflecting-pulleys g^2, substantially as and for the purposes specified.

13. In an elevator, the combination of the upright endless chain of buckets g^6, mounted in a vertically-adjustable frame, the supporting-pulleys g', guide-pulleys g^4, pulleys g^3, arranged to deflect the chain inward below the pulleys g', and the spout i^3, entering between the pulleys g' and g^3, as described and shown, whereby the delivery of the grain from the buckets into the spout is insured.

14. In combination with an upright elevator having an endless chain of buckets, as described, a spout or hopper, I, affixed to the front of said elevator, and a series of pivoted doors, i, mounted in the front of said spout or hopper, and each adapted for adjustment as a spout or deflector, whereby the delivery of the grain may be effected at any required point in the length of the spout or hopper.



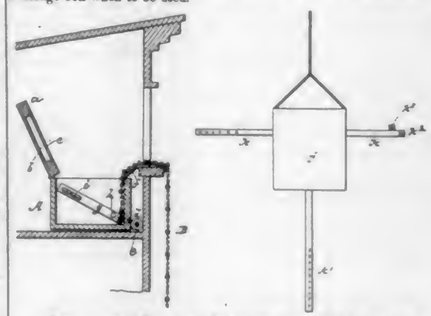
15. In combination with the frame K, the elevator containing an endless chain of buckets supported upon said frame, and adjustable thereon, both as to height and inclination, and a telescopic hopper or chute having one end affixed to the upper end of the elevator, and the opposite end affixed to the supporting-frame, whereby the delivery of the grain at a fixed point is secured, notwithstanding variations in the position of the elevator.

16. The combination of the pivoted elevator-frame G, the guiding-ropes M and N, attached to opposite ends of same, and leading to winches, and the guide-pulleys l^2 and l^2, placed near opposite ends of the horizontal or oblique-lying frame K, carrying said elevator-frame, all for the purposes specified.

17. The pivoted head-stock c, free to rotate horizontally on the column C, and carrying pulleys c'' and c^3, and the trunnions c', for pivoted bracket l^2 and its frame or jib K, substantially as specified.

18. The frame-work cradle or jib K, formed with a straining-post, l^2, and tie-rods l^4, and a bracket, l^3, immediately below the straining-post, fitted with bearings, so that the said jib can freely oscillate on the journals or trunnions of said bearings, for the purposes described.

293,626. ELECTRIC BELL-PULL. AUGUSTUS S. BUNKER, Lawrence, Mass. Filed Nov. 26, 1883. (No model.)



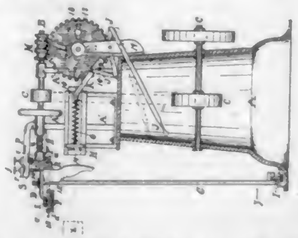
Claim.—1. An electric bell-pull consisting of a casing cast with a circumferential flange, a spring and spindle constructed substantially as described, and an insulator adapted to fit over the end of the casing, substantially as and for the purpose set forth.

2. In an electric bell-pull, the combination, with a suitable casing and an insulator fitting over the end of the same, of a spindle having at one end detachably connected a beveled button, and at its opposite end a button formed with a conical or beveled inner face, substantially as and for the purpose set forth.

3. An electric bell-pull consisting of a casing cast with a circumferential flange or escutcheon, and having connected to its inner end an insulator provided with curved or bent spring-arms and conducting-wires, and a spindle extending through the casing and insulator, and having a spiral spring coiled around it, and provided at one end with a button formed with a conical or beveled face, and at the opposite end with a knob beveled outward upon its inner side from its center of axis, substantially as and for the purpose described.

293,627. FIRE-ESCAPE. SPENCER D. BUTLER, Marshfield, Oreg. Filed June 6, 1883. (No model.)

Brief.—A pad or front piece made of a stout bag and provided with suitable attaching-straps and buckles is secured to one end of an escape-rope which is passed around a cleat and pin on a bar secured in a storage-box when to be used.



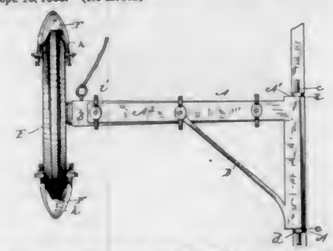
Claim.—1. In a fire-escape, the combination, with the receptacle A, constructed and arranged as described, of the inclined plate or bar g, secured to the inside of the receptacle, and provided with a pin, h, at its lower end, and the cleat i at its upper end, said cleat and pin or stud adapted to operate in connection with the rope of an escape, whereby said escape is lowered, as described.

2. In a fire-escape, the combination of the receptacle, plate g, pin h, cleat i, and escape J, having straps $k\ k\ k'$, as shown and described.

3. In a fire-escape, the escape consisting of the rope, the bag j at the end thereof having secured thereto straps $k\ k\ k'$, adapted to fasten the escape to the wearer, as shown and described.

293,628. HEEL TRIMMING AND BREASTING MACHINE. ULDERIC D. BYRON, Chicago, Ill., assignor of one-half to Albert E. Dike, same place. Filed Aug. 8, 1883. (No model.)

Claim.—1. In machines for trimming and breasting boot and shoe heels where the breasting-knife and the cutter-head operate at different times on the heel, the intermediate gear-shaft, B, of the cutter-head, and the intermediate gear-worm, M, wheel L, provided with pin 13, levers J J' K, with the main drive-gear C C C, as specified.



2. The jack F F' D, hung in bearings 1, 2, and 3 by mechanism to have vertical rocking and horizontal reciprocating motions, as described and shown.

3. The wheel L, provided with pin 13, disconnected from and operating intermittently on the lever J J' K 16, in combination with worm-gear M and breasting-knife H, as a means for breasting a heel at the proper time, while there is a continuous movement of the driving-gear.

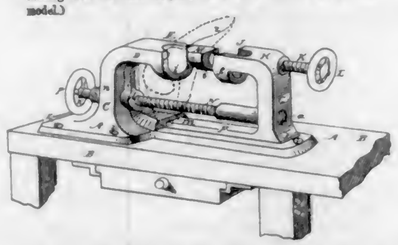
4. The guard 20, combined with the plate r, slotted at $m\ m$, slotted arm P, and set-screws $l\ l$, for adjusting the guard to different lengths of cutter-heads.

5. The pattern-guide 23, hung to a grooved support, A, in combination with spring v, to allow heels of varying depths at all parts to be brought to the knives.

293,629. ROW-GUIDE. ROBERT W. CHAPPELL, Waverly, Va. Filed Sept. 10, 1883. (No model.)

Claim.—The land-marker herein described, comprising the combination of the triangular-shaped frame A, diagonal brace D, axle-bar B, marking-wheel E, with the adjustable markers F, and the axial bearings, substantially as described.

293,630. TIRE FOR VEHICLE-WHEELS. CHAS. JACKSON CLARKE Mount Crawford, Va. Filed Aug. 15, 1883. (No model.)



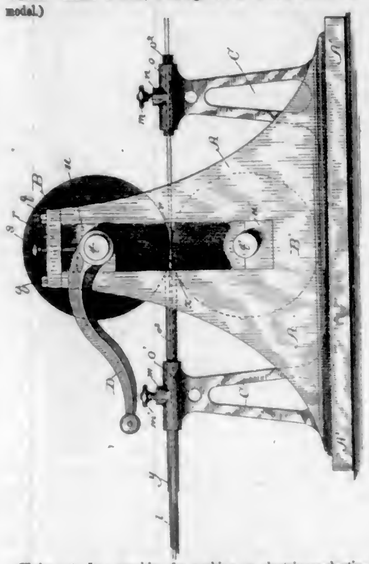
Claim.—1. A felly-protector consisting of a flanged bisected ring, C, and detachable piece D, in combination with the central piece, E, secured in place by a screw, f, substantially as shown and set forth.

2. A felly-protector consisting of a flanged bisected ring, C, and detachable piece D, provided with recesses for the lugs e, in combination with a central piece, E, secured in place by a screw, f, substantially as specified.

3. A felly-protector consisting of a flanged bisected ring, C, and detachable piece D, provided with recesses for reception of the lugs e on said ring, in combination with the central beveled piece, E, screw f, and the bolts d, all constructed substantially as specified.

293,631. MOLD FOR MOLDING THE UPPERS OF BOOTS AND SHOES. GEORGE H. CLARK, Boston, Mass., assignor to the Clark Glove-Fitting Boot and Shoe Company, Portland, Me. Filed May 5, 1883. (No model.)

Claim.—1. The improved mold herein described, the same consisting of the bed A, having the standard C and arm D, provided with the die E, the slide F, having the standard G and arm H, provided with the recess J, the shaft N, provided with the wheel P, and the shaft K, provided with the wheel L and die M, combined and arranged to operate substantially as set forth.



2. In a mold for molding or stretching the uppers of boots and shoes, the clamp or clamping device, between the jaws of which the upper around its shank portion is grasped and firmly held or kept in its normal condition, in combination with the movable die or former adapted to mold or stretch the unclamped portion of the upper at the shank, substantially as specified.

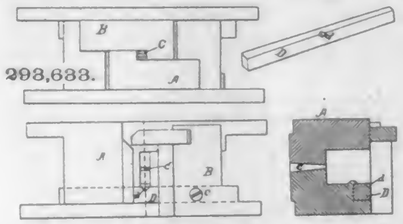
3. In a mold for molding or stretching the uppers of boots or shoes, the clamp or clamping device, between the jaws of which the upper around its shank portion is grasped and firmly held or kept in its normal condition, in combination with the movable die or former and suitable operative mechanism, said die or former being adapted to override or partially override and mold or stretch the unclamped portion of the upper at its shank, substantially as set forth.

4. In a mold for molding the uppers of boots and shoes, the recess J, in combination with the arm H, arm D, die E, and die M, substantially as shown and described.

5. The process of molding or stretching the upper of a boot or shoe at its shank, substantially as herein described, the same consisting, essentially, in uniting the vamps and quarters, then clamping the portion around the shank to hold or keep it in its normal condition, and while so clamped molding or stretching the shank portion, substantially as set forth.

293,632. MACHINE FOR LAYING ELECTRIC CONDUCTING-WIRES. HENRY B. COBB, Wilmington, Del. Filed Nov. 24, 1883. (No model.)

Claim.—1. In a machine for pushing an electric conducting-wire through a tube formed to receive it, the combination, with the frame A A', adjustable rollers B B', and mechanism for adjusting the said rollers relatively to each other, of the upright C, die c^3, supported by the said upright, and mechanism for detachably securing the said die to the said upright, substantially as described.



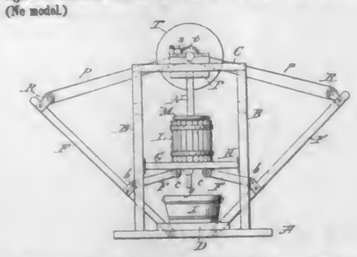
2. In a machine for pushing an electric conducting-wire through a tube formed to receive it, the combination, with the frame A A', adjustable rollers B B', and mechanism for adjusting the said rollers relatively to each other, of the upright C', the tube c^3, supported by the said upright, and mechanism for detachably securing the tube c^3 in position to the said upright, substantially as described.

3. In a machine for pushing an electric conducting-wire through a tube, the combination, with the frame A A', adjustable rollers B B', mechanism for adjusting the said rollers relatively to each other, and upright C', having tube c^3 adjustably secured thereon, of the upright C, die c^3, and mechanism for detachably securing the said die to the said upright, substantially as described.

293,633. TYPE-CASTING MOLD. JAS. M. CONNER, New York, N. Y. Filed Dec. 26, 1882. (No model.)

Brief.—A notched rod is adapted to slide in front of the matrix in the mold. For "descending" letters, the notched portion is brought opposite the matrix, forming a continuation of the hollow portion of the mold. For ordinary letters, the unnotched portion is made to register with the matrix.

293,633.



Claim.—A mold for forming type which may be descending or not, provided with the adjustable strip D, having at one edge the notch *d*, whereby the mold is adapted for both kinds of type, as set forth.

293,634. SAILOR'S JACKKNIFE. THOMAS J. COWIN, United States Navy. Filed July 23, 1883. (No model.)

Claim.—In combination with a sailor's jackknife having the usual lanyard-hole through the handle at the butt-end thereof, a swivel, *b*, provided with a yoke, B, having bent ends *f f*, adapted to enter said lanyard-hole *a* in the jackknife-handle from opposite sides, the whole designed to provide a means for proper and substantial securement of the knife to the lanyard, substantially as described.

293,635. FRUIT-PRESS. BURWELL J. CURRY, Huntsville, Ala., assignor of one-sixth to John H. Rannoker, same place. Filed Nov. 30, 1883. (No model.)

Claim.—1. In a fruit-press, the concaved follower or plate G, substantially as described.

2. In a fruit-press, the concaved follower or plate G, having spout *g*, substantially as described.

3. In a fruit-press, the concaved follower G, having radial grooves *r e*, opening *f*, and spout *g*, substantially as described.

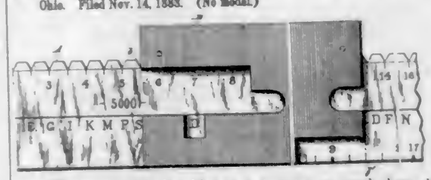
4. In a fruit-press, the combination, with the uprights B B and follower G, of the guides H H, attached to the follower, and provided with rollers *d d*, adapted to bear on the faces of the uprights, substantially as described.

5. In a fruit-press, the combination, with the concaved follower G, having spout *g* and rabbet *h*, of the slotted plate K, substantially as described.

6. In a fruit-press, the combination of the concaved follower G, slotted plate K, tub L, and piston M, substantially as described.

7. In a fruit-press, the combination of the uprights B B, concaved follower G, having spout *g* and guides H H, the slotted plate K, tub L, piston M, suspended rigidly by rod N, the levers E F, drum Q, pulleys R R, and rope *p*, substantially as described.

8. In a fruit-press, the combination of the sills A A, uprights B B, cross-pieces C C, base D, cross-beam P, rod N, piston M, drum Q, rope *p*, levers E E, having pulleys R R, levers F F, concaved follower G, having spout *g*, the slotted plate K, and tube I L, substantially as described.



293,636. ARTISTIC TILE. GYULA DE FESTETICS, Perth Amboy, N. J. Filed Jan. 16, 1884. (No model.)

Claim.—1. As a new article of manufacture, an artistic tile consisting of a clay body with superimposed crystals or vitreous masses thereon, secured through the medium of a fluxing material, as described.

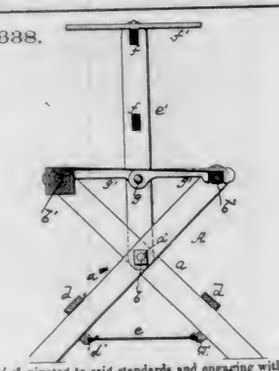
2. The herein-described method of producing artistic tiles, consisting in the application upon the surface of the clay body of a fluxing material and crystals or vitreous masses and uniting the whole by means of heat, substantially as described.

293,637. DUPLEX-CHECK SCALE-BEAM. JOHN A. DENUTH, Toledo, Ohio. Filed Nov. 14, 1883. (No model.)

Claim.—1. A series of letters or characters on a scale-beam, in combination with a poise so arranged that always at the same distance from the part of the poise that indicates the weight on the scale-beam one or more of the aforesaid letters or characters will be exposed to view, while the adjacent letters or characters on one or both sides will be concealed by the poise, substantially as set forth.

2. In a scale-beam provided with a scale and poise arranged in the usual manner, the combination, with a series of letters or characters and an open space in the poise, as aforesaid, of a second scale and a pointer or other means on the poise for indicating numbers on the second scale, and so arranged that the numbers indicated on the second scale should be different from the numbers indicated at the same time on the first scale, but should always be of the same relative value to the said numbers indicated on the first scale, substantially as set forth.

3. The combination of two scale-beams, each arranged with a scale and poise in the usual manner, and each provided with a series of letters and an opening in the poise for reading the same, and with a second scale and pointer, substantially as set forth.



4. One or more secondary scales whose figures bear a given ratio to the figures on the primary scale, where the weights are indicated, and a series of letters or characters, the said scale being provided with suitable mechanism whereby figures are indicated on the secondary scale and letters or characters of the said series are exposed to view, and always at the same distance from the point where the weights are indicated on the primary scale, substantially as set forth.

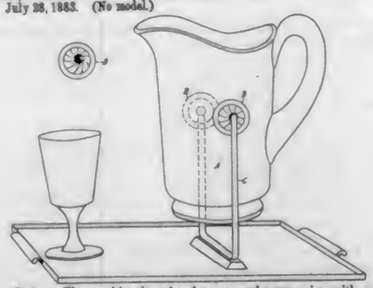
293,638. QUILTING-FRAME. LUCIAS E. DICKSON, Brazil, Ind. Filed Aug. 4, 1883. (No model.)

Claim.—1. The combination, with a suitable frame-work, of quilting-rolls having bearings in said frame-work, and lock-catches pivoted to said frame-work, with their outer ends constructed, substantially as described, to engage with said rolls and prevent them from turning, as herein set forth.

2. The combination of the legs *a a*, pivoted to each other, quilting-rolls *b' b²*, having bearings in said legs, upright standards *d' d'*, and lock-

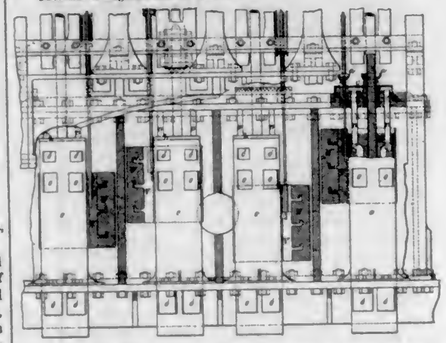
293,638.

catches *g' g²*, pivoted to said standards and engaging with the said rolls, substantially as and for the purpose herein specified.



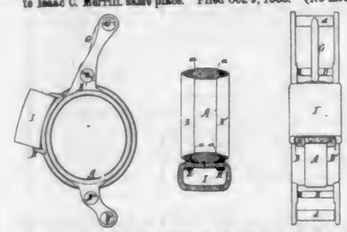
3. A combined quilting-frame and clothes-rack, comprising pivoted legs, quilting-rolls, having bearings in said legs, standards at both ends of the frame, pivoted to said legs, cross-bars connecting the standards and legs, respectively, on opposite ends of the frame, pivoted locking-hooks, which engage with the quilting-rolls, means for keeping the legs from spreading too far apart, and arms pivoted to the cross-bars connecting the standards, substantially as and for the purpose set forth.

293,639. MODE OF DECORATING GLASSWARE. JOHN SEFTON DRINAN, London, Ontario, Canada. Filed June 1, 1883. (No model.)



Claim.—The mode of decorating the hollow stems and cover-knobs of articles made of glass in representation of an aquarium, substantially as and in the manner hereinbefore described.

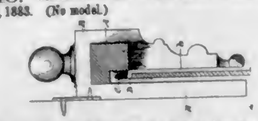
293,640. JUG. JOHN SEFTON DRINAN, London, Ontario, Canada. Filed July 28, 1883. (No model.)



Claim.—The combination of a glass or earthenware jug with a rigid handle of the same material, a separate tray, also of the same material, and a U-shaped metal swing grasping the jug between its two upper ends, and held in an upright position by having the part central between the two ends inserted in a cavity in the tray, substantially as and in the manner hereinbefore described.

293,641. HYDRAULIC MACHINERY. WILLIAM DONALDSON, Ambleside, County of Westmoreland, England. Filed June 11, 1883. (No model.) Patented in England Jan. 18, 1883, No. 294.

Claim.—The combination of parts, consisting of one or more cylinders, *c*, surrounded by a liquid-holding casing, *d*, the balanced cylindrical valve V and its adjusting-weight, with the loose safety-valve-cylinder cover or lid *b*, cap K, and lubricators *s* and *a*, together with the weighted valve H, all substantially as described and illustrated, for the purposes set forth.



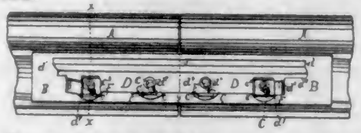
293,642. TUG. GEORGE CRAWFORD EASTMAN, Lewiston, Me., assignor to Isaac C. Merrill, same place. Filed Oct. 9, 1883. (No model.)

Claim.—1. The shaft-supporter having its metallic parts B B' provided with grooves to receive the edge of the packing and connected by screws arranged in them, the said parts, in combination with the packing A, arranged between the rings of such parts, with its inner and outer peripheries essentially even or flush with the next contiguous surfaces of such rings, all substantially as set forth.

2. The shaft-supporter composed of the two grooved metallic parts B B', the leather packing A, and their connection-screws C, D, E, and F, a buckling-tongue, G, adapted to two of the screws, and a buckling-loop, I, of leather or other suitable material, arranged in eyes extended from the said two parts and connected to the packing between them, as specified.

293,643. CURTAIN-POLE. CYRUS ENERLY, Columbus, Ohio. Filed Dec. 17, 1883. (No model.)

Claim.—1. A pole or cornice for curtains, having a guideway on its rear face for the reception of adjustable curtain hangers or supports, the latter being free to slide on or in said guideway, but unable to rise therefrom, substantially as herein set forth.



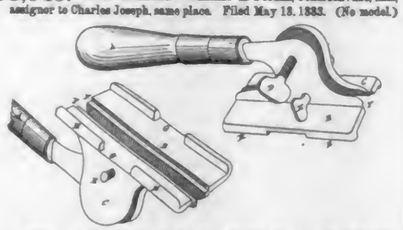
2. A pole or cornice for curtains, having an attachable and detachable guideway on its rear face for the reception of adjustable curtain hangers or supports, the latter being free to slide on said guideway, but unable to rise therefrom, substantially as herein set forth.

3. A pole or cornice for curtains, having on its rear face a metallic guideway or strip consisting of a body portion or attaching-plate and a hook-shaped outer or guide portion, in combination with hook-shaped

certain hangers or supports fitted on said guideway or strip, substantially as herein set forth.

4. The combination of brackets having vertical slots intersecting with their curtain-pole openings, with the curtain pole or cornice, and the curtain or curtains sliding thereon and adapted to be carried through the slots in the brackets, substantially as herein set forth.

293,644. DEVICE FOR SECURING THE SPLICE-JOINTS OF RAIL-ROAD-RAILS. DAVID L. EMRY, Carthage, Mo. Filed Nov. 26, 1883. (No model.)



Claim.—1. A device for securing the splice-joints of railroad-rails, composed of a spring-washer, F, upon a bolt, C, said bolt having screw-nuts c' c^2, with different-sized threads, and a plate, D, having the parts d d' d^3 and ends d^4 turned back upon itself, all substantially as shown and described.

2. In a device for securing the screw-nuts on bolts extending through the splice-joints of railroad-rails, a plate, D, with parts d d' d^3 and a part, d^4, turned outward and backward upon itself, substantially as shown and described, for the purposes set forth.

3. The combination of a plate, D, having the parts d d' d^3 and a piece, d^4, with screw-nuts c' c^2, having different-sized threads, upon a bolt, C, holding the fish-plates of railway-rails, substantially as and for the purpose set forth.

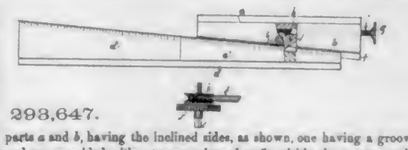
4. The combination of a plate, D, having the parts d d' d^3 and piece d^4, with concave and convex spring-washer F upon the bolts and under the nuts, holding the splice-joints of railway-rails, substantially as and for the purpose set forth.

293,645. FILE-HOLDER. WILLIAM H. FOSTER, Jeffersonville, Ind., assignor to Charles Joseph, same place. Filed May 18, 1883. (No model.)

Claim.—In clamp-handles for files, having tine A, with stationary jaw B, flange H, and rabbet F, as above described, combined with the movable jaw C, having flange H, rabbet F, and set-screw E, which is used for the purpose of closing the jaws upon the file, and also to answer as a fulcrum when the jaws are forced up more firmly by the screw D, substantially as described, and for the purpose set forth.

293,646. MEANS FOR SUSTAINING DOWEL-PINS OR HINGE-PINS. AMOS F. GERALD, Fairfield, Me., assignor to the Gerald Sewing Machine Cabinet Company, New York, N. Y. Filed July 11, 1883. (No model.)

Brief.—To prevent the splitting out of dowel or hinge pins in wood, strap metal bent into heart or other shape is driven into the wood so as to surround the pin-pole.



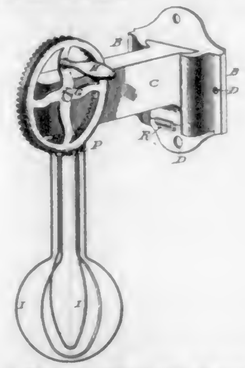
Claim.—1. The combination, with a dowel or hinge pin and a piece of wood into which it is inserted or to be inserted, of a strip of metal inserted into the piece of wood so as to extend around the pin and into a portion of wood at some distance from the pin, substantially as specified.

2. The combination, with a dowel or hinge pin and a piece of wood into which it is inserted or to be inserted, of a strip of metal bent into the shape of a heart and inserted into the piece of wood so that the obtuse point will extend close to the pin, substantially as specified.

293,647. MACHINIST'S TOOL. FRED I. GETTY and FREDERICK DICKINSON, Geneva, Ohio. Filed June 7, 1883. (No model.)

Claim.—1. A machinist's tool consisting of the combination of the parts a and b, having the inclined sides, as shown, one having a groove, and one provided with a tongue adapted to fit within the groove, and a means to hold and adjust the parts, substantially as and for the purposes shown.

2. In a machinist's tool, the inclined piece a, provided with a rack, in combination with a piece, b, having a spur-wheel adapted to mesh with the rack, and a means to turn the spur-wheel, substantially as shown.



3. A tool consisting of wedge-shaped pieces having a means to hold them in position, in combination with pieces c and d, whereby both outside and inside measurement may be made, substantially as shown.

4. A tool consisting of two pieces, wedge-shaped in the direction of their length, as shown, having a means to hold them in position, and provided with a graduated scale whereby variance is indicated, substantially as shown.

5. In a machinist's tool, the combination of a piece, a, having a rack, with piece b, having stem h, worm-gear i, spur j, and pivot l, substantially as shown.

6. A machinist's tool consisting of the two parts a and b, having inclined sides, and having two or more series of graduations marked thereon, and a means to adjust and hold the parts in position, substantially as shown.

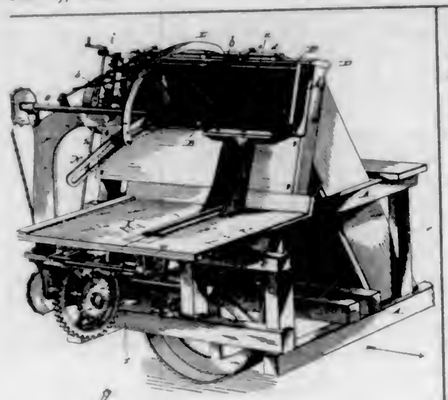
293,648. EGG-BEATER. HANNAH ZEPHYRENE GIBSON, Oberlin, Ohio. Filed Nov. 5, 1883. (No model.)

Claim.—1. The large cylindrical wires, all revolving in the same direction, substantially as described.

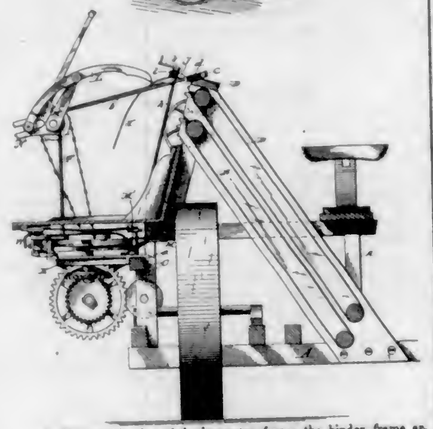
2. The revolving wires, all permanently attached to a single pinion, substantially as described, and for the purpose set forth.

3. The combination of the arm, bracket, and driving-wheel with the pinion and wires, substantially as described, and for the purpose set forth.

4. The revolving wires separated at the bottom, as described, and for the purpose set forth.



293,649. GRAIN-BINDER. JOHN H. GORDON, Rochester, N. Y. Filed Feb. 5, 1878.

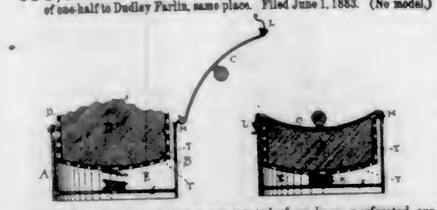


Claim.—1. In combination with a harvester having an elevating-apron, a binder-frame having a base portion, E, and an elevated binder-arm support, F, the base portion being connected to the harvester below the delivery end of the conveyer-apron, and the elevated portion being connected to the harvester at a point above the delivery end of the elevator-apron, substantially as described.

2. In combination with a harvester provided with a grain-elevator, a binding-machine having an overhanging arm, F, sustained at its upper end by stays or braces connecting with the harvester-frame at a point above the delivery end of the elevator.

3. In a grain-binding machine, an overhanging arm or standard to sustain the binder-arm, in combination with a brace extending from the overhanging end or portion of the arm to a rigid support out of the path of the grain, substantially as shown and described.

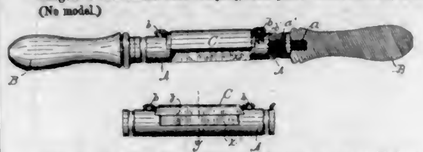
4. The binder-frame E F, having its base provided with arms engaging upon the harvester-frame, and its standard or bracket provided with the braces, having rollers mounted on a track or rail on the harvester-frame.



5. The combination of the harvester-frame, the binder-frame arranged to slide thereon, the rack-bar attached to the binder-frame, and the vertical shaft mounted in fixed bearings in the harvester-frame, and provided at its lower end with a pinion to engage the rack, and at its upper end with a hand-crank in position to be operated by the attendant, whereby the crank is maintained in constant and convenient relation to the driver's seat.

6. In combination with the harvester-frame and the binder-frame arranged to slide thereon, the pinion G, having its shaft mounted in fixed bearings in the harvester-frame, and the rack-bar engaging said pinion and connected by a vertical pivot to the binder-frame, as described, whereby the rack is permitted to adjust itself to the varying relations of the frames, and thus avoid a clamping or binding action.

7. In a grain-binding machine, the combination of a binding table or platform and an intermittingly-acting kicker or deliverer located below the same, and arranged to extend beyond its outer edge, as described and shown, whereby it is caused to separate such bundles as may cling together after leaving the table and hang upon the side of the machine.



293,650. PEN-CLEANER. THOS. C. GORMAN, Albany, N. Y., assignor of one-half to Dudley Farlin, same place. Filed June 1, 1883. (No model.)

Claim.—1. A pen-cleaner constructed of an inner perforated cup or vessel to contain a sponge provided with a spring, an outer cup or stand provided with a stud to retain the spring, and a convex cover to press the sponge when closed, substantially as described.

2. In a pen-cleaner, the perforated cup B, provided with the sponge D and the spiral spring K, in combination with the outer stand, A, provided with the convex cover C, and the stud O, all substantially as described, and for the purpose set forth.

293,651. SPOKESHAVE. ALBERT D. GOODELL, Miller's Falls, Mass., assignor to the Millers Falls Company, same place. Filed Nov. 30, 1883. (No model.)

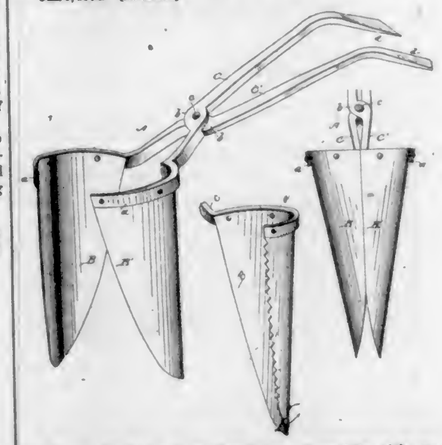
Claim.—1. A spokeshave consisting of the body A, removable handles B B, and circular cutter or knife C, and the set-screws b b, adapted to secure in place the cutter or knife C by pressure of the screw-heads upon the edges of the same, substantially as and for the purposes set forth.

2. In a spokeshave, the body A, circular knife C, arranged and secured thereto, so that the chips or shavings pass under said knife to the place of discharge, in combination with detachable handles B, substantially as and for the purposes set forth.

3. In a spokeshave, the circular knife or cutter C, formed with a straight cutting-edge, and adapted to be detachably secured to the body of the shave by suitable means, as and for the purposes set forth.

4. In a spokeshave, the body A, straight circular knife C, and set-screws b b, adapted to hold the said knife to the body, combined as and for the purposes set forth.

5. The combination of the body A with straight circular knife suitably secured thereto, and the detachable handles B B, substantially as set forth and described.



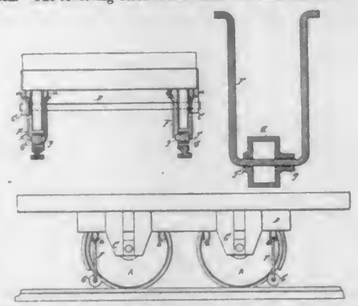
6. In a spokeshave, the body A, with bevel x', in combination with the circular knife or cutter C, substantially as and for the purposes described.

7. In a spokeshave, the body A, provided with the rear discharge-passage, x, in combination with a circular knife or cutter having a straight cutting-edge and suitably secured to said body, substantially as and for the purposes described.

8. A spokeshave provided with a straight circular body adapted to receive a straight circular knife or cutter, and to discharge the chips or shavings under the said knife or cutter and to the rear of the working-face, all substantially as and for the purposes set forth.

9. In a spokeshave, the combination of the body A, provided with the discharge-opening x, formed by removing a portion of the body, and having a face-bevel, x', and circular knife formed with a straight cutting-edge and adapted to be detachably secured to the said body, substantially as and for the purposes set forth.

293,652. TRANSPLANTER. ELIAS A. GROSS, Camden, N. J. Filed Jan. 9, 1884. (No model.)

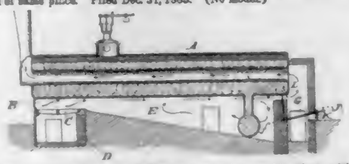


Claim.—The herein-described transplanter A, consisting of the sections B B', having the serrated edges, as shown, handles C, secured at their upper ends, said handles overlapping one another, and provided with enlarged portions near their ends to receive a rivet or bolt for piv-

oting the sections together, said handles extending at nearly a right angle to the sections B B′, substantially as set forth.

293,653. LIFE-GUARD AND TRACK-CLEARER. CHAS. W. FIELD and RICHD. B. LOCKE, Brooklyn, N. Y. Filed Apr. 7, 1883. (No model.)

Brief.—The hanger is made of a bar or rod of metal passing through the block and forming the axle thereof. It also extends up both sides of the block and is hooked to the car-body in such a manner as to swing thereon. The revolving block is cast hollow to admit the axle.



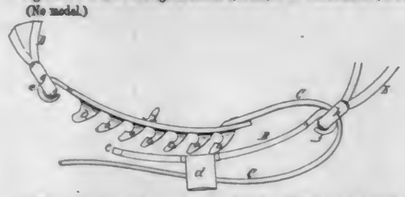
Claim.—1. In a life-guard and track-clearer, the herein-described hanger for the revolving block, the same being made of a bar or rod of metal passing through the block in order to form the axle thereof, extending up on both sides of the block and arranged to be applied upon the car-body and to swing thereon, substantially in the manner and for the purposes set forth.

2. In a life-guard and track-clearer, the hanger for the revolving block, made of a bar or rod of iron passing through the block, the hooks or rings for connecting said hanger with the car-body, and the revolving block, all combined and arranged to permit the hanger to swing freely in its supports, substantially as shown and described.

3. In a life-guard and track-clearer, the revolving block arranged to swing in front of the car-wheel, the same being cast hollow and admitting the axle, substantially as and for the purposes set forth.

4. The herein-described hollow revolving block or guard, provided with the projecting hub on one side to clear the flange of the car-wheel and another hub or projection on the opposite side to prevent wearing against the hanger, substantially as shown and described.

293,654. STEAM-BOILER FURNACE. PERRY JOHNSON, Cincinnati, Ohio, assignor of one-half to Augustus G. Bolinger and Lewis G. Hopkins, both of same place. Filed Dec. 31, 1883. (No model.)



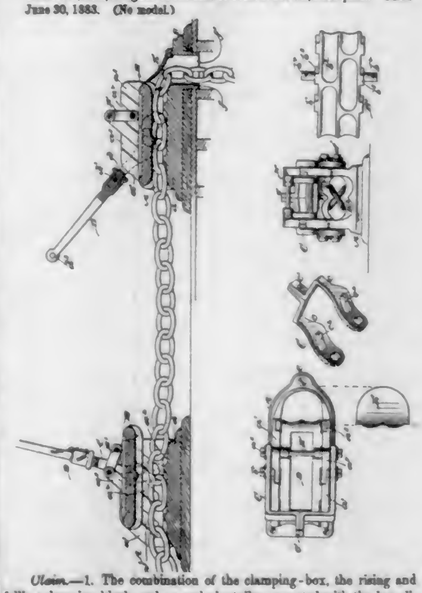
Claim.—1. In a steam-boiler furnace, the combination, with a boiler, of a grate whose rear end is level with its supporting-pier, a gradually-shelving combustion-chamber, which extends underneath the boiler its entire length in rear of said pier, a pier at the rear end to close the said combustion-chamber at bottom, formed with a vertical opening, and having its top concaved out to conform to the shape of the lower part of the boiler to form a narrow throat, and a gate or shutter to slide in said opening to regulate the width of or to close the throat, as set forth.

2. In a steam-boiler furnace, the combination, with boilers, of a grate whose rear end is level with its supporting-pier, a gradually-shelving combustion-chamber, which extends underneath the boilers their entire length in rear of said pier, a pier at the rear end to close the said combustion-chamber at bottom, formed with a vertical opening, and having its top concaved out to conform to the shape of the lower part of the boiler to form a narrow throat, and a gate or shutter to slide in said opening to regulate the width of or to close the throat, as set forth.

3. In a steam-boiler furnace, the combination of a grate-support about level with the grate, a combustion-chamber having a floor shelving downwardly from the grate-support, a pier at the rear of the combustion-chamber, having a vertical opening and top conforming in shape to the lower portion of the boiler to form a narrow throat, a gate or shutter of similar shape at top as the top of the pier to slide vertically in the opening, a lever whose short arm lifts and lowers the gate or shutter, and means to hold the long arm of the lever to its adjustment to regulate the width of or close the throat, as set forth.

293,655. HAME-FASTENER. WILLIAM H. JOHNSON, De Lancy, assignor of one-half to George E. Marvine, Delhi, N. Y. Filed Jan. 30, 1883. (No model.)

Claim.—In a hame-fastener, the combination of the part A, provided with hooks *a a*, and adapted to be attached to the eye *g* of one hame, D, the part B having a long slot, *b*, therein, and provided with a catch, *c*, and adapted to be attached to the eye *h* of the other hame, E, and the flexible strap C, secured to the free end of the hook part A, and adapted to be passed through the hame-eye *h*, around the part B, all substantially as and for the purpose herein specified.



293,656. SADDLE FOR BICYCLES. JAMES ALFRED LAMPLOUGH, Birmingham, County of Warwick, England. Filed Dec. 28, 1883. (No model.) Patented in England Feb. 24, 1883, No. 1,008.

Claim.—1. The combination, with the frame or support, and the seat composed of leather or similar flexible material, of the adjusting devices comprising a slotted plate, a pin working in the slot, and a screw for adjusting the position of said pin in said slot, substantially as described.

2. The combination of the seat, made of leather or similar flexible material, the concavo-convex support or frame having three arms or branches, and the fastening devices for securing the seat to the ends of said arms or branches, substantially as described.

293,657. LOCKING-PAWL FOR ANCHOR-CHAINS. THOS. P. LUCAS, Galveston, Tex., assignor of one-half to John S. Brown, same place. Filed June 30, 1883. (No model.)

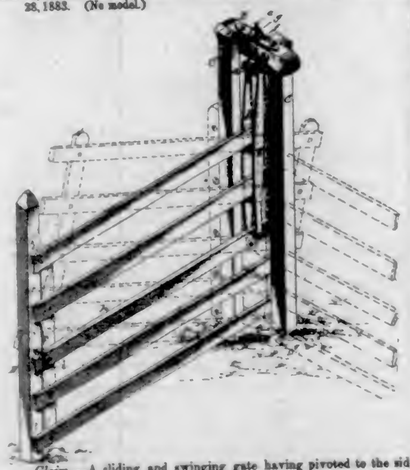
Claim.—1. The combination of the clamping-box, the rising and falling clamping-block, and a pawl pivotally connected with the box directly over the block, and having its free end adapted to fall by gravity and rest upon the upper surface of the block to lock the latter in engagement with the cable, substantially as described.

2. The combination of the clamping-box and the rising and falling clamping-block with the pintle supported by the sides of the box above the block, and the yoke-shaped pawl suspended at one end from the pintle, and having its other end adapted to fall by gravity and rest upon the upper surface of the block to lock the latter in engagement with the cable, substantially as described.

3. The combination of the clamping-box having its sides provided with upwardly-projecting lugs, the clamping-block, and a locking-pawl pivotally connected with the said lugs directly over the clamping-block, and adapted to fall by gravity and rest upon the upper surface of the block to lock the latter in engagement with the cable, substantially as described.

4. The clamping-block A, having its side walls, *a′*, brought together at one end and constructed on its under side with the depending flanges *f f′*, in combination with the clamping-block, substantially as described.

5. The combination, with the clamping-block having its sides provided with the inclined slots, and the clamping-block having the lugs *b′*, provided with studs *b²*, of the forked lever C, having the shank *c′*, and the detachable handle D, having a socket adapted to said shank, substantially as described.

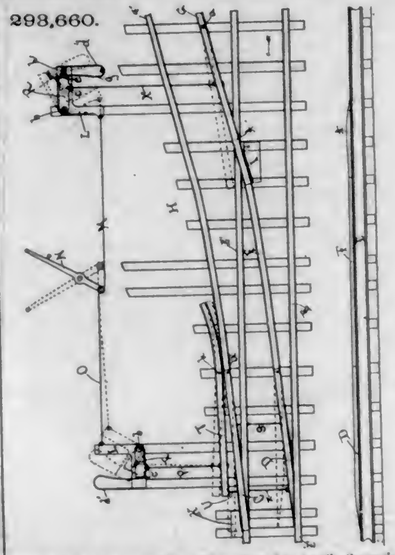


293,658. BUTTON-FASTENER. CHARLES BERNHARD MAENDL, Kansas City, Mo. Filed June 18, 1883. (No model.)

Claim.—1. A button-fastener consisting of a disk having a suitable slot therein and a radial extension from the periphery of said disk, constituting the bolt, which is adapted to be bent over in the plane of said disk and in line with its slot and enter the eye of a button, and an auxiliary extension from the periphery of said disk, which is adapted to be bent over and upon the end of the opposite extension of the disk, as shown and described.

2. In combination with a button having a suitable eye, a fastener consisting of a disk, and a slot in said disk to receive the eye of the button, and a radial extension from the periphery of said disk, constituting the bolt, which is adapted to be bent over in the plane of said disk and in line with its slot, and an auxiliary extension from the periphery of said disk, which is adapted to be bent over and upon the opposite extension of the disk, as shown and described.

293,659. GATE. ROBERT E. MASON, Vernon County, Mo. Filed June 28, 1883. (No model.)



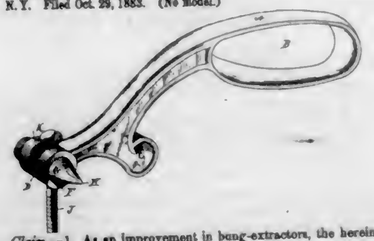
Claim.—A sliding and swinging gate having pivoted to the sides of its central rail suitable hanger-straps, the upper ends thereof being pivoted to a swivel-connection, consisting of a horizontal sleeve having a screw-threaded bolt extending up through the cross-brace of the gate-posts, and held thereto by an adjusting screw-nut, by which means the gate is rendered vertically adjustable, substantially as and for the purpose set forth.

293,660. RAILWAY SWITCH AND CROSSING. DANIEL MCCARTHY, Norwich, Conn., assignor to Patrick J. O'Connor, same place. Filed June 20, 1883. (No model.)

Brief.—At a junction of main track and siding a movable inclined

293,660.

crossing-rail cut away underneath to adapt it to overlie the main rail, and the points formed to fit closely against or overlap the rails of the main track, are operated from the same hand-lever, being connected therewith by separate mechanism, consisting in each case of a bell-crank lever and links. To render the rails mentioned movable automatically independently of the hand-operating mechanism, the connection between the rails and the bell-crank embraces a bar pivoted to the bell-crank and held by a spring, so as to yield to the movement of the rails when pushed by the car-wheels, and the hand-lever is locked. A stop-block, as described, is provided for the crossing-rail.



Claim.—1. The combination of the siding-rails G G′, main rails E E′, movable part A, and points C D, the parts C A overlapping the rail E′, the lever-rail T, connected to the points C D, and a moving mechanism with automatic releasing-connections for moving parts C D A, all substantially as described.

2. The combination, with the fixed rails of main track and sidings, and the movable parts, as described, of the arms R, bell-crank levers L, spring-catches, and the moving operating-lever connected with the bell-crank levers, all substantially as described.

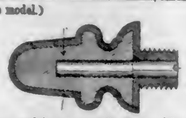
3. The combination of the bell-crank lever L, the arm R, the spring-catch carried upon the lever L, and adapted to hold the arm R and the points of the switch, all substantially as described.

4. The combination of the siding-rails G G′, main rails E E′, movable part A, block I, having upturned iron flange, and inclined face parallel with the rail of the siding, and face *i*, parallel with the rail of the main track, with the space for the flange of the wheel between, all substantially as described.

293,661. BUNG-EXTRACTOR. ADELBERT H. MCKEAN, Trumansburg, N. Y. Filed Oct. 29, 1883. (No model.)

Claim.—1. As an improvement in bung-extractors, the herein-described device, comprising a handle or lever constructed with a fulcrum-stud and with a transversely-perforated head, a plug seated in the said head where it may partially revolve, and a screw extending through said plug and through slots in the said head, with means for holding the screw in place, as set forth.

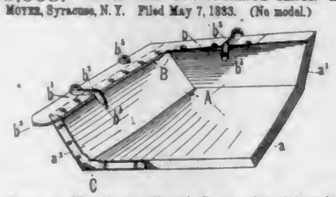
2. As an improvement in bung-extractors, a device comprising a



lever or handle having a fulcrum-stud, a head, a plug seated in said head and having a conical point extending beyond the same, and a screw passing vertically through said plug, with means for holding the screw in place, substantially as set forth.

3. In a bung-extractor, the herein-described lever or handle provided with a fulcrum-stud having on its under side a rib or flange, substantially as and for the purpose set forth.

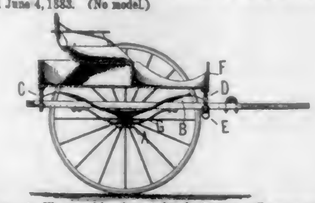
4. A bung-extractor comprising a lever or handle having a transversely-perforated head having slots in its upper and lower sides, a plug seated in said head and having at one end a projecting conical point and at the other end a longitudinal recess, a screw passing through the said plug and through the slots in the head, and having a recess in one side, a pin entering the recess in the plug and engaging the recess in the side of the screw, and a pin or wedge driven transversely through the plug and retaining the pin in the latter, as set forth.



5. The herein-described improved bung-extractor, the same comprising the lever or handle having an opening or hand-hold, a rounded fulcrum-lug having a rib or flange on its under side and a transversely-perforated head, a plug seated in said head and having an extending conical point, and a screw passing vertically through said plug and through slots in the upper and lower sides of the head, with means for holding the screw in place, whereby the plug is permitted to partially revolve, as set forth.

293,662. HINGE-TIP. HARVEY MILLER, Cincinnati, Ohio. Filed Oct. 20, 1883. (No model.)

Claim.—As an article of manufacture, a hinge-tip consisting of an outer metal shell cast over and inclosing a pressure-resisting form, and having the screw cast hollow and integral therewith, substantially as described.

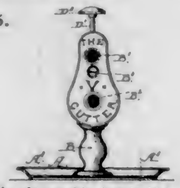


293,663. CORNER-IRON FOR CARRIAGE-SEATS. HARVEY A. MOYER, Syracuse, N. Y. Filed May 7, 1883. (No model.)

Claim.—1. The flat metallic strip B, of L-shaped form, having the series of screw-openings, and the ribs b^2, with short extensions, as and for the purpose described.

2. In combination with the main corner-iron, the auxiliary corner-iron having the overhanging portion *c*, as described.

293,664. PLEASURE-CART. HARVEY A. MOYER, Syracuse, N. Y. Filed June 4, 1883. (No model.)



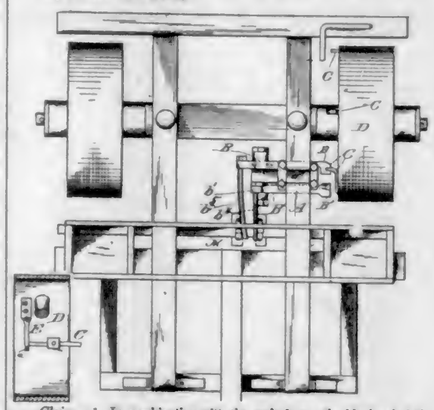
Claim.—1. The combination of the shaft system G, supported from the lower side of the axle, and the spring system B B C D, supported from the upper side of the axle, with the shackles E E, as described.

2. In combination with the side springs, B B, and end spring, D, the shackles E E, having the iron *a*, bolts a' a^2, and iron a^3, as described.

293,665. CIGAR-CUTTER. WM. H. MYERS, Reading, Pa., assignor of one-half to Jacob Hall, same place. Filed Apr. 28, 1883. (No model.)

Claim.—1. A cigar-tip cutter composed of the following elements: a half-case having chutes and side openings for the cuttings, front openings for the introduction of the cigar-tips, and a spring-rest and guide-recess for the piston-rod, in combination with a back or cap having corresponding spring-seat and guide-recess and a filling-piece, a double-yoke piston-rod provided with angular knives having ears, said knives being secured within the yoke by means of clamps and screws, the spring arranged to throw the piston-rod back to its highest position, and a base-tray, all said parts being removably connected with each other, as set forth.

293,665.



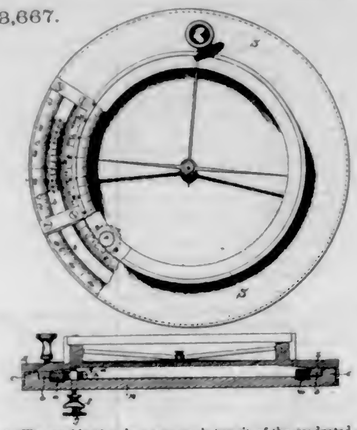
2. In a cigar-tip cutter, the half-case provided with perforations B' B^2, countersink B^3, thickened portions B^4, chute-openings B^5, chutes B^6, guide and spring rest B^7, screw-hole B^8, and piston-rod guide-slot B^9, in combination with back or cap C, piston-rod D, knives F F, having ears F' F', screws G^2, clamp G, spring E, and base or tray A, substantially as and for the purpose set forth.

3. In a cigar-cutter, as described, the cap C, provided with a reenforce, C^2, a threaded boss, C', half spring-seat, piston-rod guide C^3, and filling-piece C^4, in combination with half-case B, piston-rod D, knives F F, having ears F' F', clamp G, spring E, and tray A, all the parts being connected substantially as and for the purpose specified.

4. The double-yoke piston-rod D, provided with stem D', knob D^2, tail D^3, threaded screw-holes D^4, said yoke being recessed to receive the knives or cutters F F, and clamp G, having projecting lugs G', screw-holes G^2, and securing-screws, in combination with spring E, half-case B, and cap C, having seats and guides B' and C^3, slot B^9, filling-piece C^4, and tray A, substantially as shown, and for the purpose described.

5. In a cigar cutter or nicker, angular V-shaped knives F, having ears F' integral therewith, piston-rod D, having recesses, and a stem, D', and knob D^2, provided with clamp G, lugs G', and screws for securing the knives in said recesses, in combination with half-case B, and cap C, having openings B' B^2, seat and guide B' and C^3, slot B^9, and spring E, whereby the depression of said knob will bring the knives in contact with the cigar-tips, cut, shear, or nick the same, and the piston-rod will be returned to position by the spring, substantially as shown, and for the purpose set forth.

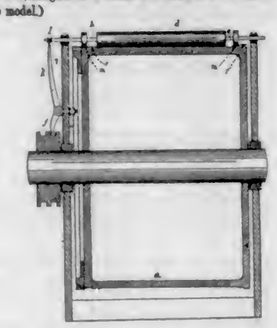
293,666. SEED-PLANTER. JOHN F. W. NEETHEL, Arago, Nebr. Filed July 19, 1883. (No model.)



Claim.—1. In combination with the main frame, the blocks a' a^2 a^3 and the clips *a*, the lever B, pivoted below upon one side of the block a^2, and having upward extension *b*, trip b', and arm b^4, the lever B', having arm b^4, and pivoted above upon the opposite side of the block a^2, and the pivoted lugs or levers C, adapted to impinge alternately upon said levers, as set forth.

2. The pivoted lugs or levers C, each alternate one being bent to project inward, and the hooked springs E, combined with the trip-levers B and B', arranged as shown, and with the feed-bar M, all adapted to serve as and for the purposes set forth.

293,667. SURVEYOR'S AND ENGINEER'S TRANSIT. THOMAS LEA NIXON, New Tacoma, Wash. Filed Aug. 27, 1883. (No model.)



Claim.—1. The combination, with a surveyor's transit, of a graduated course-ring, *a*, having gear-teeth in the edge thereof, the pinion meshing with said teeth, the clamp-plate of said pinion, the spindle carrying said pinion and clamp-plate, and a tightening or clamp nut fitted to threads upon said spindle, substantially as described.

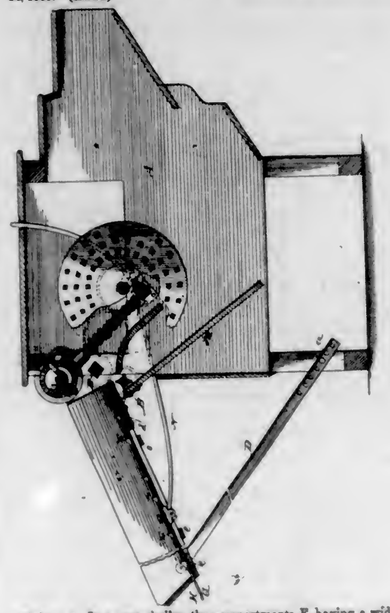
293,667.

2. The combination, in a surveyor's transit, of the graduated circle *c*, the graduated ring *a*, and the vernier *b*, between said circle and ring, having double graduations extending to both edges thereof, substantially as described.

293,668. COLOR-PRINTING PRESS. JOHN W. OSBORNE, Washington, D. C., assignor to William H. Forbes, Boston, Mass. Filed June 6, 1883. (No model.)

Claim.—1. The combination, with the form-carrying bed of a printing-press, of inking-rolls and mechanism, substantially as described, whereby the rolls may be shifted endwise, and at the same time caused to approach or recede from the forms, all co-operating substantially as stated.

2. The cylinder provided with high and low bearers, the inking-rolls and their trucks, and means, substantially as described, for shifting the trucks lengthwise of the cylinder from the high to the low bearers, all the parts being in combination, substantially as described.



3. The cylinder provided with a high and a low bearer at each end, the low bearer having the specified relation to the form, the inking-rollers having trucks arranged, as specified, to ride on said bearers, the lever for shifting the trucks, and an operating-cam, all in combination, as set forth.

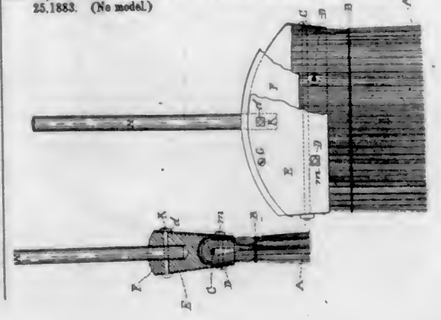
4. The cylinder having two high bearers extending around it, and having low bearers alternating with high bearers arranged beside said first-mentioned high bearers, said low bearers extending the length of the respective forms, in combination with inking-rolls having trucks on the shafts thereof, said trucks being capable of shifting lengthwise to ride on high or low bearers when operated by suitable mechanism, substantially as described.

5. The combination, with the stock or spindle of an inking-roll, of a truck splined to said stock, high and low bearers on the cylinder of the press, and mechanism, substantially as described, for shifting the truck lengthwise of the roller-spindle, so that it may ride on either the high or low bearer, substantially as described.

6. The combination, with the cylinder of a press having high and low bearers at each end, of inking-rolls having driving-trucks upon their spindles, a lever pivoted to the frame and engaging with the trucks, and a cam adapted, substantially as described, to shift said lever and trucks, all in the manner and for the purpose substantially as stated.

293,669. CORN-SHELLER. HARVEY PACKER, Rock Falls, assignor to Thomas A. Galt and George S. Tracy, both of Sterling, Ill. Filed Aug. 24, 1883. (Model.)

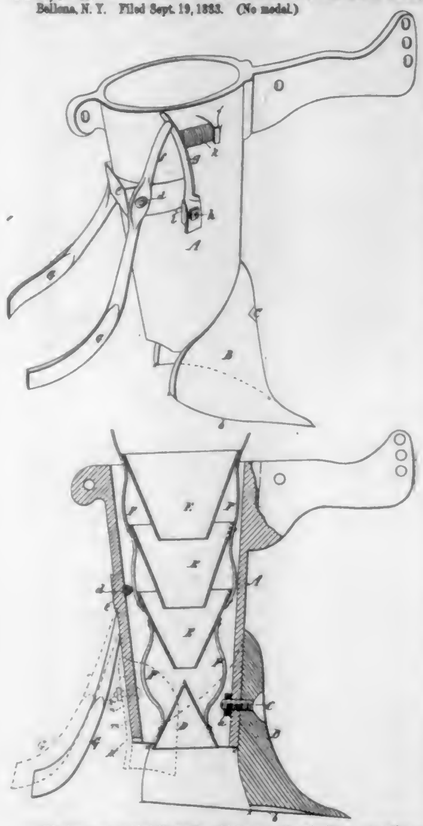
Claim.—1. In a corn-sheller, the compartments F, having a width but slightly greater than the transverse diameter of the ears of corn, the bars G, arranged in compartments F, and provided with spurs L, in combination with means for imparting to said bars reciprocating movement in the line of such sheller, substantially as shown, and for the purpose described.



2. The combination of the hopper C, compartments F, partitions E, and the reciprocating bars G, the whole placed and operating in the line of such sheller, substantially as shown, and for the purpose specified.

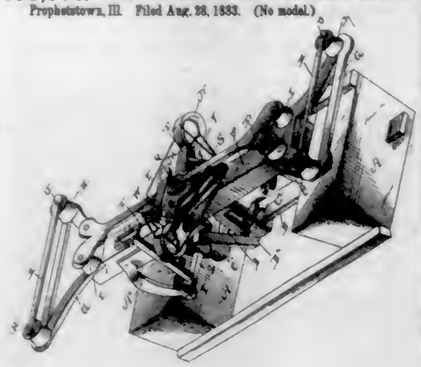
3. In a corn-sheller, the feed-hopper C, having its outer end adjustable vertically, and provided with the partitions E and compartments F, the bars G, arranged to reciprocate in the line of such sheller, and the transverse shafts B, in combination, substantially as shown, and for the purpose mentioned.

4. In a corn-sheller, the combination of the hopper C, provided with partitions E and compartments F, the board M, the bars G, and means for imparting to such bars reciprocating motion in the line of such sheller, substantially as shown, and for the purpose described.



5. The hopper C, provided with a closed bottom, consisting of the bars G and board *d*, in combination with the board M and a corn-sheller, relatively arranged as hereinbefore described, whereby an uninterrupted and entirely closed surface is provided for the passage of the loose corn from such hopper to such sheller, substantially as shown, and for the purpose specified.

293,670. BROOM. WILLIAM H. PAINE, Barnstable, Mass. Filed Aug. 25, 1883. (No model.)

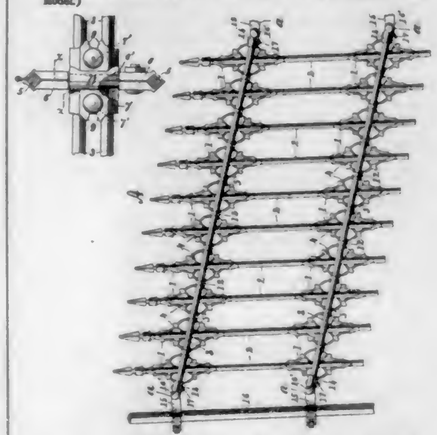


Claim.—The improved broom herein described, the same consisting of the filling A, rod C, bolts D, case E, block F, screws G, handle H, bolt K, and nuts *d w x*, all constructed, combined, and arranged to operate substantially as set forth.

293,671. SEED-DRILL. JAMES H. PURDY and CHARLES T. WELSH, Bellona, N. Y. Filed Sept. 19, 1883. (No model.)

Claim.—A seed-drill tooth which comprises in its construction a series of hollow inverted truncated cones, E, a conical scatterer, D, suspended beneath the lowermost cone of the series, an adjustable guard, M, for preventing too great scattering of the grain during shallow plowing, and vibrating coverers G, substantially as described.

293,672. CHECK-ROW CORN-PLANTER. EARL HOUSTIN REYNOLDS, Prophetstown, Ill. Filed Aug. 28, 1883. (No model.)



Claim.—1. In a check-row corn-planter, the combination, with the seed-boxes, connected seed-slide, and brackets, of the cross-bar F, the end frames, G G, provided with horizontal pulleys H and I, the parallel guards K and L, connected to the axles of the pulleys, and the guide-disk M, substantially as and for the purpose set forth.

2. In a check-row planter, the guide-disk M, consisting of the horizontal cruciform plates O P, with the oppositely-arranged loops N N, the braces U and V, and the upper and lower spindles, Q R, as described.

3. In a check-row planter, the combination, with the guide-disk M, constructed substantially as described, of the crank W, attached to the upper end of the spindle Q thereof, pitman X, crank Y, rock-shaft Z, with crank B^2, and seed-slide C, with bracket C^2, substantially as and for the purpose set forth.

4. As an attachment to a planter, the cross-bar F, with the end frames, G G, provided with pulleys H and I, and guard-plates K K, the cruciform guide-disk M, connected to the cross-bar F, and a transverse guard-plate, L, the crank W, pitman X, crank Y, rock-shaft Z, with crank B, and slotted bracket C^2, substantially as described.

293,673. IRON FENCE. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. In an iron fence having double-rail sections, as described, pickets between said rail-sections, and notched clip-bands between the pickets, for securing the rails and pickets together, the combination, with said pickets, rails, and bands, of the ornament-frames having their concentric bars extending in the central line between the rails, and engaging with the notches in said clip-bands, which operate as guides to keep the ornaments in line between the rails, and to retain the pickets upon their pivotal centers during the operation of adjustment, substantially as set forth.

2. In an iron fence having double rails square in their cross-section, and the intermediate picket-rod pivotally centered upon the inner angles of said rails, and adapted for adjustment thereto, as described, the combination therewith of an ornament having its frame-bars between the rail-sections concentric to said pivotal center, and a clip-band notched in either side at the center, with which said frame-bars engage, and which operates as a guide for the same in adjusting the fence-panel, as set forth.

3. In a double-rail iron fence, with its rails square in their cross-section, and having pickets of the same form between the rail-sections, and pivotally engaged therewith, the ornament-frames having the central converging loop-bars extending to the angle and inner sides of the rear rail-section, and adapted to facilitate the adjustment of the picket, by having the points of the loop-bars beveled downward and inward to fit the inclined sides of the rail on either side of the angle of the same, substantially as set forth.

4. In a double-rail iron-fence panel having the picket and its ornament pivoted between the rail-sections, the combination, with the rails and ornament-bars, of a clip-band provided with sprockets, between which said ornament-bars are allowed to move in adjusting the fence-panel, substantially as set forth.

5. A flexible connection for the attachment of the rails of an iron fence to the line or terminal post thereof, having that part attached to the rails pivoted to the section attached to the post, to allow it to conform to the adjustment of said rails when inclined either upward or downward, substantially as set forth.

6. In a double-rail-fence panel for an iron fence, the flexible clamp-connections *a*, for attaching the rail ends of the panel to the terminal post, consisting of the hinged section 15, having the ears 15′, extending therefrom, and the section 14, (attached to the ends of the rails of the panel,) pivoted between said ears by a bolt, 16′, extending through the hole *b*, and having its upper and lower halves clamped to the rail ends 3 by a vertical bolt, 17, extending through them between the rails, substantially as set forth.

7. A clip-band for clamping the rail-sections together in a double-rail iron fence, having sprockets projecting therefrom at the middle of its sides, to form a cleft or notch between them, to adapt it for the engagement therewith of the circular frame-bars of the ornament of a picket pivoted between said rail-sections in the central longitudinal line thereof, as set forth.

8. A cross-tie connection for a line-post for adjustable iron fences, having the section which incloses the rail ends horizontally divisible and pivoted upon the transverse section which connects the two uprights of the post, said transverse section being cylindrical in the middle part, to provide for the adjustment of the fence to grade, substantially as set forth.

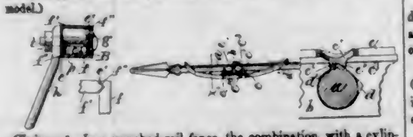
9. The combination, with the line-post, having uprights 5 and section 6 attached to and connecting said uprights, of the two-part section 7, pivoted upon said section 6 and adapted to operate in connection therewith in the adjustment of the fence to grade, substantially as set forth.

10. In an adjustable iron fence having a two-part section connecting the rail ends to the post, the combination, with said two-part section, of the transverse cross-piece having a cylindrical middle part adapted to pivot said section, and vertical bolts extending through the latter on either side of said cross-piece, for securing the section and rail ends together.

11. A cross-tie plate for the line-post of an iron fence, having a fixed part extending transversely across the fence-line, and connecting the uprights of the post, and having a movable part extending across said fixed part, inclosing the connecting rail ends, and centrally pivoted upon the fixed part, to allow of the adjustment to grade of the connecting fence-panels, as set forth.

12. The combination, in a double-rail fence, of the cross-tie plate attached to the line-post, and provided at either end with notches to adapt it to engage with the frame of the ornament, and to allow of the adjustment of the latter therein, as set forth.

13. In a double-rail iron fence having pickets and their ornament-frames pivotally centered between the rail-sections, the separable splicing-band, horizontally divided, and having the triangular divisions upon the inside of the two sections, and the slots in its ends, to adapt it for coupling the rails, and allowing of the adjustment of the engaging picket, substantially as set forth.



14. In a line-post for a double-rail iron fence, the two bent uprights 5, having the arched or bent top, and extending perpendicularly from thence to the ground-line, from which they diverge in a curved line outward, and then extend downward, terminating in flat disk-shaped feet 22, and having their uprights connected at the rail-line by cross-tie plates, and below the ground-line by the cross-braces and their adjustable clamping attachments, as and for the purpose set forth.

15. In a line-post for a double-rail fence, the cross-braces having their alternate ends secured to the two uprights of the same by the clamp-plates, and adapted for adjustment upon said uprights, substantially as and for the purpose hereinbefore set forth.

16. In an iron fence having double-rail sections, and adapted for adjustment, as described, the line-post C, having the cross-tie connections D for coupling the ends of the rails together, and allowing their adjustment therewith, and the continuous-rail bar forming the two perpendicular uprights and the base of the same in a single piece, and having the cross-braces 18, and the clamp-plates 19, by which their ends are secured to the uprights of the post, below the ground-line, and by which said braces are made adjustable, all arranged substantially as set forth.

17. A two-part clamp-plate for securing a brace to a line-post, provided with a cavity for the insertion of the end of the brace, and a flange at the lower edge of said cavity, in combination with a brace having a notch in one side of the end, engaging with said flange, and adapted to be adjusted by the movement of the clamp-plate upon the rod of the upright, substantially as specified.

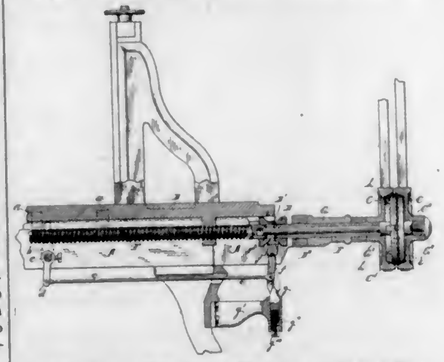
293,674. IRON FENCE. TIMOTHY ROGERS, Springfield, Ohio, assignor to the Rogers Fence Company, same place. Filed Mar. 24, 1883. (No model.)

Claim.—1. In a punched-rail fence, the combination, with a cylindrical picket-rod formed with an angle on one side and a notch in said angle, and adapted to be engaged with the rail, as described, of an ornament having sprockets extending from its frame-bars upon either side of said picket-rod, which, when said frame-bars are bent or set back against the rod, will straddle said angle and secure the rod from turning axially, substantially as set forth.

2. In a punched-rail fence, an ornament for a picket-rod formed with an angle thereon, having sprockets extending across the line of the rod, and adapted to engage therewith by being set back with a punch beyond the front line of the rail, substantially as set forth.

3. An adjustable sleeve-connection for the rails of an iron fence, consisting of two short angular pieces of iron with engaging angles and grooves on their flanges, to retain them in position, and lugs cast on the inside of one of the sections, adapted to engage with notches in the end of the inserted rail, whereby the connection is made and the adjustment secured, and having a fastening-bolt securing the end of the brace of the line-post, the two sections of the sleeve, and the rails together, substantially as set forth.

4. The combination, with the T-channel rails *b*, having notches *g′*, of the box-sleeve connection B, formed of the two angular sections *f* and *f′*, having lugs *g*, and each provided with the angles *e′* and the grooves *f″*, to adapt them for engaging each other, the brace A of the line-post, and the bolt *i*, by which the whole is secured together, substantially as specified.



5. A foot-piece for a line-post in two longitudinal vertically-divided sections, having a central oblong hole to adapt it for adjustment upon the base, and having a socket in either end for the insertion of the picket-rod, said sockets being made with a longitudinally oblong hole, to adapt them for the adjustment of the picket in the direction of the fence-line, and with a drainage-hole of less diameter at the lower end of the socket, substantially as set forth.

6. In a line-post, the combination, with the base D, having the oblong slot *p* therein transversely to the fence-line, of the foot-piece C, having the slot *p′*, and the oblong socket-holes *k*, for allowing the adjustment of the picket therein, as set forth.

7. The combination, with the base D, having the oblong vertical slot *p*, and the arm *j*, having the vertical hole *i*, with inclined sides, of the brace A and the set-screw *i′*, with their auxiliary connecting devices, as set forth.

8. In a punched fence having a picket adapted to engage with the rail, after being inserted, by a partial rotation on its axis, the combination, with said picket and rail, of an ornament having its frame-bars bent over the front of the rail, the ends of said ornament inclosing said picket above and below said rail, and having sprockets extending from its frame-bars upon either side of the angle of the picket, whereby the latter is prevented from turning, as set forth.

293,675. METAL-PLANER. FREDRICK P. ROSBACK, Chicago, Ill., assignor to Charles Colahan, Cleveland, Ohio. Filed Sept. 20, 1883. (No model.)

Claim.—1. In a metal-planing machine, the combination of a reciprocating table, B, the screw F, with its actuating-shaft G, disk C′, and pulleys C C, substantially as shown and described.

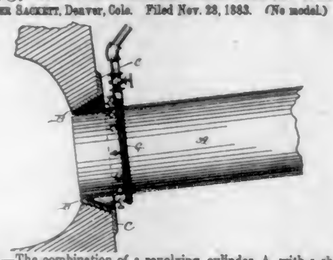
2. The combination of the carriage B, screw F, its actuating-shaft G, disk C′, and pulleys C C, provided with space *i i*, said space serving as an air cushion to the sliding disk C′, pulleys C C, and carriage B in its operation, substantially as shown and described.

3. The combination of the screw F, provided with slots F′ G′, shaft G, with its pins or keys D′ C″, disk C′, and pulleys C C, with the sliding carriage and the tripping devices, substantially as shown and described.

4. The planer-carriage B, provided with lugs *a a*, screw F, shaft G, clutch C′, pulleys C C, pins or keys D′ C″, clutch-sleeve D, rock-shaft *c*, and crank-levers *b d*, rod *e*, and clutch-lever *f*, to impart reciprocating movements to said carriage, substantially as shown and described.

5. The sliding carriage B, provided with the lugs *a a*, the rock-shaft *c*, its crank-levers *b d*, rod *e*, clutch-lever *f*, stop-pin *g*, clutch-sleeve D, and rollers E E and shaft G, for imparting reciprocating movements to

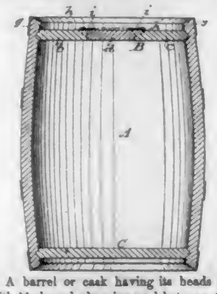
disk C', in combination with the pulleys C C and the screw F, whereby the planer-bed is caused to move back and forth.



6. The pulleys C C and their belts traveling in opposite directions, the friction-disk C', its sliding pins A A, reciprocating shaft G, and its pin G'', for imparting rotary movement to shaft F, substantially as shown and described.

7. The shifting-lever *f*, its fulcrum *f''*, bevel-wheels E E, sleeve D, vertical sliding stop-pin *g*, provided with its spring *g''*, and set-screw *g'''* and supporting-arm *g'*, substantially as and for the purpose set forth.

8. In the mechanism imparting a reciprocating movement to a planer, the screw F, the friction-disk C', and the pins A A, fitted loosely therein and projecting beyond the sides thereof, in combination with the pulleys C C, whereby a space is secured for compression of air, which serves as a cushion, preventing sudden shock or jar in the shifting of said friction-disk, substantially as shown and described.

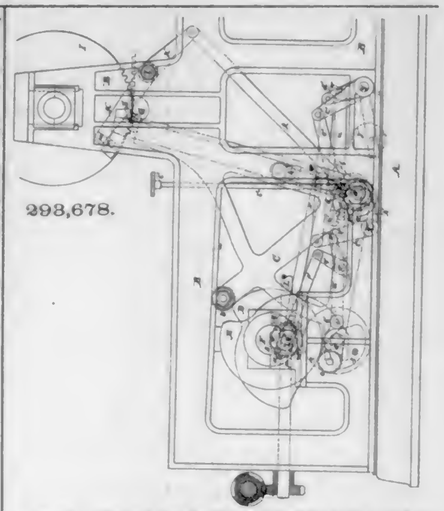


9. The reciprocating friction-clutch C', provided with its two bevel-edges, for alternately engaging pulleys C C, and its sliding pins A A, shaft G, and screw F, substantially as shown, and for the purpose described.

293,676. REVOLVING CYLINDER FOR FURNACES. SHERMAN GARDNER SACKETT, Denver, Colo. Filed Nov. 23, 1883. (No model.)

Claim.—The combination of a revolving cylinder, A, with a short flanged ring or collar which is secured thereto, and the water-pipe G, the parts being arranged to operate substantially as shown.

293,677. BARREL OR CASK FOR LIQUID AND SIMILAR ARTICLES. FREDERICK SCHEIPER, Union, N. J. Filed June 25, 1883. (No model.)



Claim.—1. A barrel or cask having its heads provided with a wedge-piece, *d*, with U-shaped edges inserted between the parts *b* and *c*, having corresponding seats, said wedge-piece inserted through an opening, *e*, protected by a metal piece, *f*, and held in place by the hoop *g*, substantially as shown, and for the purpose set forth.

2. A barrel or cask having one or both heads provided with a wedge-piece, *d*, having its edges made U-shaped, and fitting into corresponding grooves in the parts *b* and *c*, in combination with packing material *h*, held in place by metal strips *i* on each side of the wedge-piece, and extending over the joints, substantially as specified.

3. In a barrel or cask, the combination of the parts *b* and *c* with the wedge-piece *d*, inserted through the opening *e*, protected by the metal piece *f*, and held in place by the hoop *g*, in the manner shown, and for the purpose set forth.

4. A barrel or cask consisting of the body A, heads B C, one or both provided with a wedge-piece, *d*, having U-shaped edges fitting into corresponding grooves in pieces *b c*, the opening *e*, protected by metal piece *f*, and the packing material *h*, secured by metal strips *i* on each side, and covering the joints of said wedge-piece *d* and parts *b* and *c*, all constructed and arranged substantially as shown and specified.

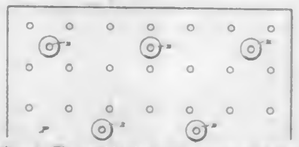
293,678. PRINTING-PRESS. WALTER SCOTT, Plainfield, N. J. Filed Apr. 10, 1883. (No model.)

Claim.—1. The combination, with the impression-cylinder having a toothed segment, of a three-armed lever provided with a toothed sliding bar, and mechanism for operating said lever, all substantially as described.

2. The combination, with the impression-cylinder having a toothed segment, of the three-armed lever C, provided with a toothed sliding bar, H, and cams D and E, for actuating said lever, substantially as described.

3. The combination, with the impression-cylinder, of a lever, as C, provided with a bar, as H, an eccentric-strap having a socket, as *g*, eccentric, as *d*, and its actuating mechanism, substantially as described.

4. The combination, with the impression-cylinder, of a lever, as C, provided with a bar, as H, eccentric, as *d*, and its operating mechanism, an eccentric, as *e*, a catch-lever, as K, and actuating-cams, as D and E, substantially as described.



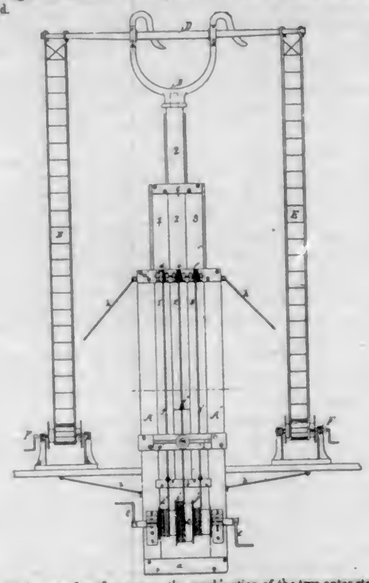
5. The combination, with the impression-cylinder, of a lever, as C, bar, as H, and its actuating mechanism, a lever, as K, and its actuating mechanism, and a mechanism, substantially as described, for operating the parts at every second revolution of the crank-shaft.

6. The combination, with the impression-cylinder, of a lever, as C, bar, as H, and its actuating mechanism, a lever, as K, and its actuating mechanism, and a mechanism, substantially as described, for operating the parts so that the form-bed can travel beneath the inking-rolls any number of times for each impression taken, substantially as described.

7. The combination, with the impression-cylinder, of a lever, as C, bar, as H, and its actuating mechanism, a lever, as K, and its actuating mechanism, a mechanism, substantially as described, for operating the parts so that the form-bed can be reciprocated any number of times for each impression taken, and a mechanism, substantially as described, for preventing the tripping of the parts except at proper times, substantially as described.

8. The combination, with the impression-cylinder, of a lever, as C, bar, as H, and lever, as K, and their actuating mechanisms, substantially as described, of a mechanism, substantially as described, for operating the parts so that the form-bed can be reciprocated any number of times for each impression taken, and a mechanism, substantially as described, for preventing the return of the parts except at proper times, substantially as described.

293,679. VOLTAIC PLASTER. WILLIAM F. STARK, New York, N. Y. Filed Sept. 20, 1883. (No model.)

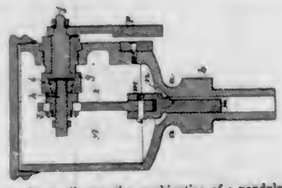


Claim.—1. The combination, with a porous or adhesive plaster, of the eyelets of zinc on the adhesive face thereof, and the perforated pieces of copper on the reverse side, for the purpose of creating a voltaic current and yet avoiding the contact of copper with the skin, substantially as described.

2. In a porous or adhesive plaster, the voltaic element composed of an eyelet-piece of zinc attached through the plaster to a corresponding perforated piece of copper on the reverse side of the plaster, for the purpose set forth, and substantially as described.

293,680. FIRE-ESCAPE. JOHAN STENWENDER, Allegheny, Pa. Filed Oct. 19, 1883. (No model.)

Brief.—An extensible structure having a detachable hook with a cross-piece attached thereto. An endless rope with baskets or cars secured to it moves over pulleys in the ends of the said cross-piece, and a tightening mechanism for holding said rope tant is placed upon the ground.



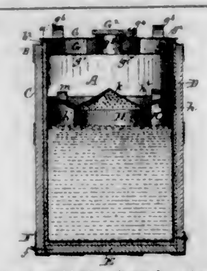
Claim.—1. In a fire-escape, the combination of the two outer standards, 1 3, the central standard, 2, the ropes *g g' g''*, which are secured to the lower ends of the standards and to the pulley *d' d' f'*, guiding-pulleys, and a detachable hook, B, having a cross-piece secured thereto, substantially as shown.

2. In a fire-escape, the combination of the three vertically-movable pieces 1 2 3 and a mechanism for raising and lowering them, the hook, the cross-piece, and suitable means applied to the cross-piece for raising and lowering persons and things, substantially as shown.

3. The combination of the hook, the cross-piece provided with pulleys, an endless rope or chain having baskets secured thereto, and a tightening mechanism on the ground for guiding and stretching the rope while in use, substantially as shown and described.

293,681. OIL-CUP. HERMAN W. STEMMERICH, Pittsburg, Pa. Filed Oct. 19, 1883. (No model.)

Claim.—1. In an oil-cup, the combination of a pendulum, a shaft which passes through the side of the cup below its top, nut *i*, block *d*, wrist-pin *h*, pitman *k*, and plunger *m*, the parts being combined and arranged to operate substantially as shown and described.



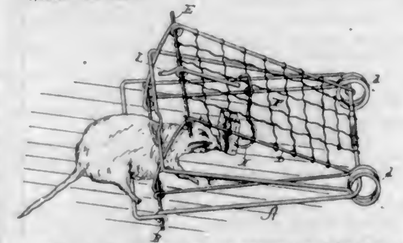
2. In an oil-cup, the combination of the pendulum P, shaft *f*, block *g*, and nut *i*, substantially as set forth.

3. The combination of the nut *i*, wrist-pin *h*, pitman *k*, and plunger *m*, arranged and operating substantially as described.

293,682. SHIPPING MILK-CAN. JOSEPH F. SWAB, Cedar Rapids, Iowa. Filed Dec. 6, 1883. (No model.)

Claim.—1. In combination with the polygonal wood casing of a milk-can, the upper hoop, B, of sheet metal, having a smooth uninterrupted horizontal surface, and sides composed of plane segments, having one of their ends overlapping the flanged end *b* of the adjoining segment, and soldered thereto, substantially as and for the purpose described.

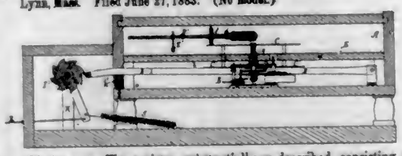
293,682.



2. The combination, with the polygonal wood casing and bottom of a milk-can, of the lower hoop, F, of sheet metal, having its upper portion formed with angles corresponding with the wood casing, and its lower portion slitted and bent under the bottom of the casing, and one end of each turned-under segment overlapping the end *f* of the adjoining segment, substantially as and for the purpose described.

3. In a transportation milk-can, a float composed of two concentric cylinders, the inner one of less depth than the outer one, an air-tight cover extending from the top edge of the outside cylinder inward and downward to the top edge of the inner cylinder, and a perforated cover secured over the central opening of the inner cylinder, substantially as and for the purpose set forth.

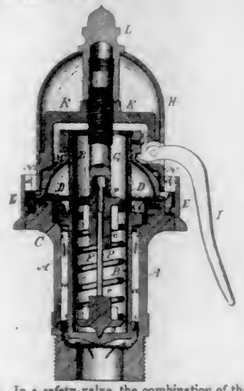
4. The combination of the concentric cylinders A A', of different length, the flat annular disk uniting them at the bottom, the flaring annular cover uniting the upper edges of said cylinders, and the perforated cone *d* over the inner cylinder, whereby a milk-can float is produced, to operate as set forth, for the purpose specified.



293,683. RAT-TRAP. JOHN L. SIMONDS, Detroit, Mich. Filed Sept. 1, 1883. (No model.)

Claim.—1. In an animal-trap, the combination of the base-wire, made of a single piece of wire, formed with the side lopped eyes, and provided with the transverse rod B, the spring striking-arm, likewise made of a single piece of wire connected to the transverse rod B of the base-wire, and the side inclined pieces, D, having the eyes *d'*, and provided with the transverse rod E, and a rod or wire for suspending the bait-hook, substantially as described.

2. The animal-trap herein described, consisting of the combination of the base-wire, made of a single piece of wire, formed with the side looped eyes, and provided with the transverse rod B, with the spring striking-arm connected to the said base-wire at its front end, the inclined roof, the suspended bait-hook, and trigger, substantially as described.



293,684. WATCHMAN'S TIME-DETECTOR. JAMES EDWIN TARBOX, Lynn, Mass. Filed June 27, 1883. (No model.)

Claim.—1. The register, substantially as described, consisting of the time-piece movement, the lever and its spring, the tablet or sheet, marked as explained, the disk, the arm, the screw and its wheel, and the marker, all being arranged essentially and to operate as set forth.

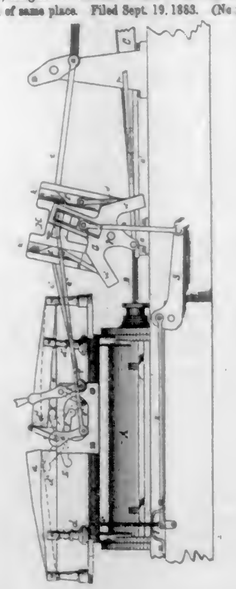
2. The combination, with the register, substantially as described, of the mechanism, essentially as explained, for depressing the lever of such register, such mechanism consisting of the shaft I, its toothed wheel L, series of toothed wheels O, O', O², and O³, and their series of operative pawls and levers, provided with springs and pulling-wires, all being as represented.

293,685. SAFETY-VALVE. REHARD J. THOMAS, Milwaukee, Wis. Filed Aug. 7, 1883. (No model.)

Claim.—1. In a safety-valve, the combination of the base A, valve C, plate D, and stem B, substantially as and for the purposes set forth.

2. The combination, in a safety-valve, of the base A, valve C, hollow threaded stem B, adjustable plate D, spiral spring F, disks *o* and *p*, cross-head K, and adjusting-screw G, substantially as and for the purposes set forth.

3. In a safety-valve, the cap H and lock-nut L, in combination with the spring F and adjusting-screw G, substantially as and for the purposes set forth.



4. In a safety-valve, the combination of the cap H, shell E, screw G, and lock-nut L, substantially as and for the purposes set forth.

5. The combination, in a safety-valve, of the base A, valve C, stem B, spring F, disks *o* and *p*, stem P, adjusting-screw G, and cross-head K, substantially as and for the purposes set forth.

6. In a safety-valve, the combination of the base A, shell E, inner shell, N, cross-head K, adjusting-screw G, spring F, valve C, hollow stem B, adjustable umbrella-shaped plate D, cap H, set-nut L, and lever I, substantially as and for the purposes set forth.

7. The combination, in a safety-valve, of the adjustable umbrella-shaped plate D, the base A, provided with the flange *m m*, and the valve C, substantially as and for the purposes set forth.

293,686. STEAM-ENGINE VALVE-GEAR. WILLIAM D. THOMAS, Pittsburg, Pa., assignor of one-half to Thomas M. Herriott and Cavett & McKnight, all of same place. Filed Sept. 19, 1883. (No model.)

Claim.—1. In a steam-engine valve-gear, the combination, with apparatus moving with the exhaust-valve cam-rod, of a slide therein connected with the supply-valves, and a frame pivoted below said exhaust-valve cam-rod and adapted by its vibration to free said slide, substantially as set forth.

2. In cut-off apparatus, the combination of a wabbler connected to the exhaust-valve cam-rod, and having a sliding block mounted therein, connected with the supply-valves, and a frame pivoted in front of said wabbler, and adapted by its vibration to free said sliding block, substantially as and for the purposes set forth.

3. In cut-off apparatus, the wabbler H, connected to the exhaust-valve cam-rod, and having the sliding block *m* and cut-off blocks *l l'* mounted therein, in combination with the pivoted frame G, having rods connected to said cut-off blocks, substantially as and for the purposes set forth.

4. In cut-off apparatus, the pivoted wabbler H, provided with the sliding block *m*, connected with the supply-valves, in combination with the sliding cut-off blocks *l l'*, operated by suitable apparatus to control the motion of said block *m*, substantially as and for the purposes set forth.

5. In cut-off apparatus, the pivoted wabbler H, provided with the sliding block *m*, connected with the supply-valve apparatus, in combination with cut-off blocks *l l'*, sliding within said wabbler, and having inclined upper faces, l^2, substantially as and for the purposes set forth.

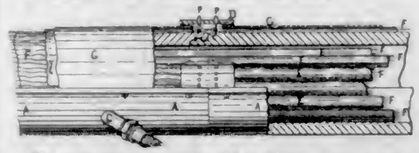
6. In cut-off apparatus, the pivoted frame G, having the arms $n' n^2$, said arms having slides *t*, mounted in suitable guides, in combination with means for varying the position of the slides in the arms, substantially as and for the purposes set forth.

7. In cut-off apparatus, the pivoted frame G, having the vertically-moving slide *r*, in combination with the rod *s*, and suitable means for varying the position of the slide in the frame, substantially as and for the purposes set forth.

8. In cut-off apparatus, the pivoted frame G, formed of the body *n*, having the slide *r* and arms $n' n^2$, having the slides *t*, in combination with links *u*, and suitable means for adjusting said slides in the frame, substantially as and for the purposes set forth.

9. In cut-off apparatus, the combination, with the wabbler H, having the cut-off blocks *l l'* therein, of the pivoted frame G, provided with the slides *t*, rods *v v'*, connecting said slides with the cut-off blocks, and means for varying the position of the slides, and so varying the throw of the cut-off blocks, substantially as and for the purposes set forth.

10. In cut-off apparatus, the combination, with the wabbler H, having the slide *m* and cut-off blocks *l l'* therein, of the pivoted frame G, having the slides *r t t*, links *u*, connecting said slides, and rods *v v'*, connecting cut-off blocks and the slides *t t*, substantially as and for the purposes set forth.

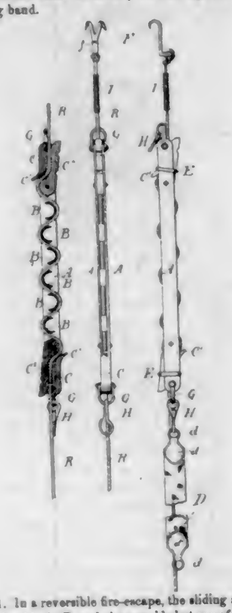


293,687. LINE-INDICATOR FOR TYPE-WRITING MACHINES. CHAS. G. TINSLEY, Grand Rapids, Mich. Filed May 29, 1883. (No model.)

Claim.—1. In a type-writing machine, the combination, with the line feeding mechanism and the feed-table, of an indicator or graduated plate adapted to support upon its upper surface the sheet of paper being printed, and means for removably securing said plate to said table, substantially as described.

2. In a type-writing machine, the combination, with the line feeding mechanism and the feed-table, of a graduated indicator-plate adapted to be secured to said table in such position as to support the end of the sheet of paper being printed, and an adjustable pointer projecting above the upper surface of the said plate, substantially as described.

293,688. UNDERGROUND ELECTRIC-WIRE CONDUIT. CHARLES H. TRASK, Lynn, Mass. Filed June 22, 1883. (No model.)



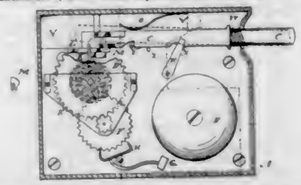
Claim.—1. An underground conduit provided with a series of insulated wire cables, and having one or more of said cables extended outward therefrom, and carried into a separate conduit, and having the insulated wires thereof separated and connected with a series of insulators, and extended beneath a casing and outward through a perforated cap-piece, substantially as described, as and for the purposes set forth.

2. The combination, with the conduit A B, of the outer casing, G, and perforated cap-piece D, as and for the purposes set forth.

3. The combination, with the conduit A B, of the insulated wire cables E, insulated wires F, insulators *t*, lead jacket *l*, casing G, perforated cap-piece D, and connecting-tubes C, constructed and arranged substantially as described, as and for the purposes set forth.

293,689. FIRE-ESCAPE. JOHN USBORNE, Arnprior, Ontario, Canada. Filed May 17, 1883. (No model.)

Brief.—A fire-escape in which the friction device is provided with fixed blocks or bearings, over and between which the rope is rove, and pivoted clamps at the ends, which may be held against the rope by an elastic encircling band.



Claim.—1. In a reversible fire-escape, the sliding arm or guide provided with friction-blocks B, and also provided at one of its two ends with a suspension device, H, and a friction-brake, C'', the latter with an actuating-spring, and also adapted to be operated by hand, as described, whereby the attendant is enabled to grasp and operate either brake, the other being automatically actuated at the same time by means of its springs.

2. In a fire-escape, the frame or body provided with the fixed friction-surfaces B and C', the two pivoted brakes C'', and springs applied to actuate said brakes, whereby the action of both brakes is secured automatically independently of the control of the operator.

3. In a fire-escape, the combination, with the frame having the stationary friction-surface C', of the pivoted brake C'', and the elastic encircling band E, the parts being provided as described with a series of notches to admit of the band being secured in different positions.

4. The combination of elastic bands E with the bar and the brake-blocks C C^2, all substantially as described, and for the purpose set forth.

293,690. ALARM-LOCK. ROBERT G. VARNAR, New York, N. Y., assignor of two-thirds to Garrett S. Mott, Philadelphia, Pa., and James G. Smith, Hackensack, N. J. Filed Sept. 18, 1882. (Model.)

Claim.—1. The combination, substantially as described, of an alarm mechanism and detent with a laterally and vertically movable sliding bolt having its fulcrum in the edge of the casing, and provided with a releasing shoulder or projection for releasing the alarm mechanism upon a longitudinal movement of said bolt in a straight line.

2. The combination, with a laterally and vertically movable bolt, of an alarm mechanism whose detent is arranged in the path of the bolt when moved laterally by any unauthorized means, a releasing projection or shoulder upon the side of the bolt for releasing the alarm mechanism upon a longitudinal backward movement in a straight line, and an operating key or knob for throwing back the bolt, constructed in the manner described, to lift the end of the bolt carrying the releasing-projection, so that the latter will avoid the detent of the alarm mechanism.

3. The combination, with the alarm-detent mounted on mainspring-arbor of an alarm mechanism, of the bolt C, having operating-shoulder N, and the lateral and vertical pressure-springs P Q, as and for the purpose described.

4. The combination, with the alarm-detent of the bolt C, projecting through an opening in the casing, and adapted to have a vertical and lateral movement upon the edges of said opening as a fulcrum, and alarm-detent arranged in the path of the releasing projection N upon the bolt, and an operating knob or handle, S, provided with means for lifting the free end of the bolt, so that when the bolt is thrown back the alarm will not be sounded.

5. The combination, with an alarm mechanism, of the bolt C, confined at one end within an opening in the casing and free to move vertically and horizontally at its other, the spring W, the catch Y, and the operating knob or handle for lifting the free end of the bolt.

6. The combination, with the bolt C, arranged in the manner described, to move vertically and horizontally at its inner end, of the alarm-detent arranged in the path of the operating-projection N, the springs P Q W, applied as shown, stop Z, plate V, and catch Y.

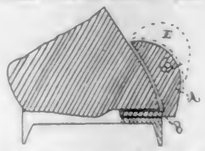
7. The combination of a spring detent-arm mounted on mainspring-arbor of an alarm mechanism, means for holding said detent, and a laterally-movable bolt, as and for the purpose set forth.

8. The combination, with the stop or shoulder for the detent-arm, of a yielding guard-plate normally projecting above said shoulder and adapted to allow said arm to pass the shoulder in either direction.

9. The combination, with the plate L, having a stop or shoulder, and the detent secured to the mainspring-shaft, of the yielding guard-plate M, rounded upon one side, so as to allow the detent to pass the shoulder in running down.

293,691. SELF-WINDING WATCH. HERMANN VON DER HEYDT, Chicago, Ill. Filed May 16, 1883. (No model.)

Claim.—1. In a watch, the self-winding mechanism, consisting of the pendulum A, suspended by means of a rod, A', from the axis of the pinion *b'* of the ratchet-wheel B, spring C, engaging with the rivet *v*,



non-flexible pawl *u*, secured to the rod A', to engage with the teeth of the ratchet-wheel B, non-flexible detent *t*, ratchet-wheel B, supporting the pinion *b'*, wheel D, supporting the pinion *d*, and the wheel E on the barrel, the whole being constructed and arranged to operate substantially as described.

2. In a self-winding watch, the combination, with the pendulum which operates the winding mechanism, and is provided with a recess, *p'*, of the pivoted catch-click L, provided with a projection, *p*, and mechanism for causing the said projection to enter the said recess when the watch is wound to a given degree, thus preventing further vibration of the pendulum, and for releasing it at the end of a given time, substantially as described.

3. In a self-winding watch, in combination with the pendulum A, mechanism to prevent overwinding of the mainspring, said mechanism consisting of a cam-wheel, G, on the barrel containing the mainspring, intermittent wheel H, having the tooth *r* to press against the finger *q*, the latter being pivoted to the wheel K, and having a continuation to form a spring, *q'*, to force the wheel K around in the direction of the revolving barrel when the mainspring is unwinding, and catch-click L, engaging at its point with the teeth of the wheel K, and held in position by means of the spring *n*, and provided with a projection, *p*, to fit into a recess, *p'*, in the pendulum, substantially as described, and for the purpose set forth.

4. In a self-winding watch, the band M, fitting within recesses, one on each inner face of the two plates of a watch, and formed near the edges of the said plates, and having its ends project into the pendulum-chamber to allow the pendulum to strike against them in its vibrations, thus preventing clattering noise and operating to accelerate the vibrations of the said pendulum, substantially as described.

293,692. FOOT-WEIGHT. GEORGE W. WEMPLE and BRAINERD W. CHILD, Boston, Mass. Filed June 28, 1883. (Model.)

Claim.—1. In combination with a shoe having slots D D, the weight A in sections, as described, having the forks B, as and for the purpose set forth.

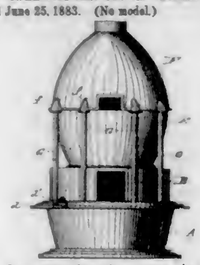
2. An attachable piece, *e*, having a projection, E', in combination with a weight provided with a recess for the reception of the projection E', and a transverse screw-hole for securing the same, as and for the purpose set forth.

293,693. HASP-LOCK. BYRON D. WEST, Chicago, Ill. Filed July 7, 1883. (No model.)

Claim.—1. The combination of the hasp A, provided with a slot therein for the staple lock-piece B, secured rigidly thereto, and broken ring C, mounted in a concentric arc groove or hole in said lock-piece, said ring standing parallel to said hasp, so as always to be in position to engage the staple, substantially as specified.

2. The combination of the ring C, provided with opening *c* therein, with lock-piece B, and lock-bolt *b'*, provided with prongs *d d'*, for clasping the ends of said ring C together when the same is locked, substantially as specified.

293,694. MATCH-SAFE. JOHN M. WHEELER, Toledo, Ohio. Filed Apr. 9, 1883. (No model.)



Claim.—1. A match safe or receptacle composed of an open-backed pocket and a marginal back piece, said pocket and back piece being adapted to be nested in packing, the surface to which said back piece is applied forming a back for said pocket, as set forth.

2. The combination, in a match-safe, of a flat back piece, a pocket or receptacle on one side of said back piece, and an adhesive coating on the opposite side, whereby said back piece and pocket may be attached to a wall or other support, as set forth.

3. An open-backed match-safe, composed of a flat piece of material slotted transversely to form the mouth of a pocket, embossed below said slot to form the body of the pocket, and provided with a flat marginal portion entirely surrounding the pocket and having an adhesive coating on its rear surface, as set forth.

293,695. RAILWAY-CAR STOVE. ALONZO P. WINSLOW, Cleveland, Ohio. Filed June 25, 1883. (No model.)

Claim.—1. In a water-base for a stove, the sides sloping upward and outward, and adapted to prevent the base from breakage when water is frozen therein, substantially as and for the purpose set forth.

2. In a stove provided with a water-base, the plate *d*, provided with a depression and ribs, as shown, and adapted to retain a layer of ashes to protect the plate from heat, substantially as shown and described.

3. The combination, with a stove made in two sections, the lower supporting the upper one, and the upper one provided with the bosses and perforations, of the water-base and pipes connecting the water-base and bosses of the upper section, substantially as set forth.

4. The combination, with the dome provided with the bosses *f* and perforations *f''*, of the section E, provided with the portions *e*, which latter form seats for the bosses and receive the upper ends of the pipes G.

293,696. GREENHOUSE. EDMUND MORTIMER WOOD, Natick, Mass. Filed May 17, 1883. (No model.)

Brief.—Light trusses have braced "right-angular ties" or brackets supporting tubular rock-shafts, to which the centers of the sashes are secured, and by which the sashes are tilted through devices operating to open or close the tiers collectively. The lower sash-edges lap the upper edges of the next tier below, and drip-water is conveyed to the interior of the rock-shaft from gutters on such edges. Pivoted latches have lips to engage lugged plates on the sash-edges to lock them closed, such latches being connected to operate collectively. The sashes of the upper tier are locked closed by turn-buttons (all on one side operated through arms by one connecting-rod) supported by "saddle-plates" protecting the openings in the sashes through which the buttons pass. The ridge of the roof may be inverted and provided with conductors to carry off the water collected.

Claim.—1. In greenhouses, and as a support to the roof, light metal trusses of suitable shape to permit of tilting of the sashes, either individually or collectively, in combination with a series of sashes adapted to swing at about their centers upon their supports, substantially as explained.

2. In combination with the side walls, the roof-trusses composed of the longitudinal side bars, right-angular lateral ties, and diagonal braces, which latter permit tilting of the sashes, substantially as explained.

3. In greenhouses, a series of sashes adapted to swing at about their centers either laterally or longitudinally upon their supports, and operated by suitable mechanical means, whereby they may be swung collectively and simultaneously upon their supports.

4. In greenhouses, a tier of sashes swinging at about its center, collectively, upon its supports, a rock-shaft supporting such tier, and light metal trusses supporting such rock-shaft and adapted to permit of swinging of the tier.

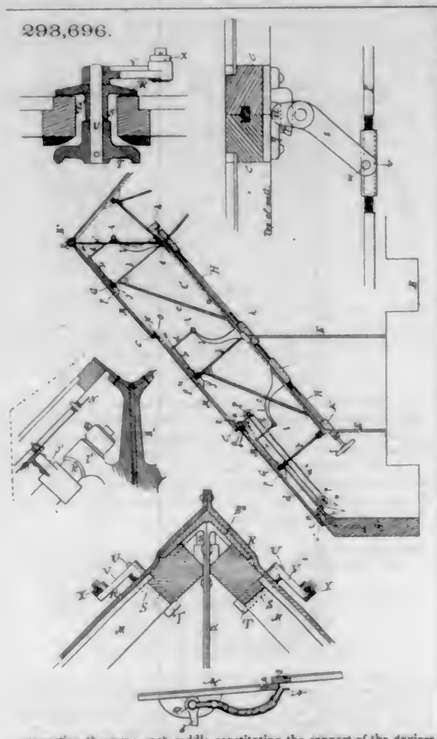
5. The inverted ridge crowning the roof of the house, and operating as a gutter to collect water.

6. The inverted ridge, in combination with conductors for conveying off the water arrested by such ridge.

7. In combination with a sash adapted to swing at about its center, a tubular shaft, constituting the pivotal support of such sash, and provision for conducting drip-water from the sash to the interior of such shaft.

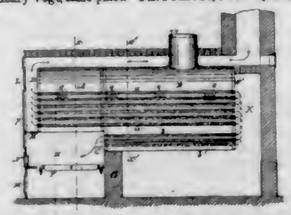
8. The saddle, in combination with the pivotal sashes and the trusses supporting the same, such saddle constituting the support or bearings of the devices for locking the upper sashes.

9. The saddle, in combination with the pivotal sashes and the trusses supporting the same, such saddle constituting the support of the devices for locking the upper sash and a covering for the openings in or between such sashes, through which the said locking devices operate to fasten the sash.



10. The device herein explained for locking the upper sash consisting of the shafts U and turn-buttons T, the shaft being mounted in the saddle R, and provided with the arms V, which are connected and operated by the rod X.

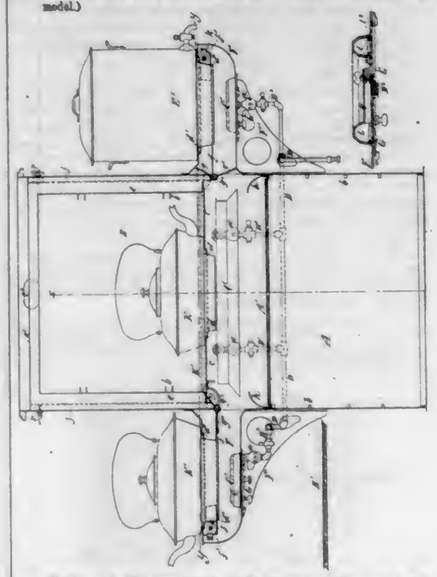
11. The openings S' in the sashes, in combination with the saddle R, or its equivalent.



12. The device herein shown and explained for locking the sashes, consisting of the latches *s*, with their lips *u*, and the plates *q*, with their lugs *r*, the latches being preferably connected and operated by the rod P.

13. In greenhouses containing two or more tiers of sashes so arranged that the lower edge of one tier overlaps the upper edge of the tier next below, a series of devices for locking such edges together, when such series of devices are operated collectively by mechanical means.

293,696.



293,697. STEAM-BOILER. WILLIAM D. ADAMS, Brooklyn, N. Y., assignor to Henry Vogt, same place. Filed June 29, 1883. (No model.)

Claim.—The combination, with a boiler the shell of which is composed of the two cylindric sections A B of different diameter, and having their upper sides in line, and a crescent-shaped plate, C, uniting said sections, of long tubes *a*, extending through both said sections, shorter tubes *b*, extending through the section B, a furnace, E, below the section A and forward of the section B, and a bridge-wall, G, at the front end of said section B, extending upward to the under side thereof, whereby the heated products of combustion are caused to pass from said furnace directly through the tubes *b*, substantially as and for the purpose herein described.

293,698. GAS-STOVE. JOHN ALDENSLEY, New York, assignor of one-half to William N. Milsted, Brooklyn, N. Y. Filed July 31, 1883. (No model.)

Claim.—1. The combination, with an upper baking-oven and a lower roasting or cooking chamber, of a gas-burner arranged between the two, and non-conducting shields or partitions removably fitted to the oven and chamber, substantially as and for the purpose described.

2. In a gas-stove, the combination, with a chamber containing a burner and a superposed oven surrounded by heating flues or spaces, of a lateral extension furnished with one or more pot-holes, and a damper for directing the heat from the burner through said lateral extension, or through the flues or spaces around said oven, substantially as and for the purpose described.

3. In a gas-stove, the combination, with a burner and a superposed oven surrounded by heating flues or spaces, of a lateral extension provided with one or more pot-holes, and dampers whereby the heat may be caused to pass directly upward around the oven, or first through the lateral extension and then around the oven, substantially as herein described.

4. In a gas-stove, the combination of a chamber containing a main burner, a lateral extension provided with one or more pot-holes, a damper for directing the heat from the burner through said lateral extension, and one or more auxiliary burners arranged in the lateral extension, substantially as herein described.

5. In a gas-stove, the combination, with a chamber containing a main burner, and a lateral extension through which the heat from the main burner may be directed, of an auxiliary burner in said extension, and a draft plate or valve controlling the admission of air to the auxiliary burner, and adapted to be closed when the extension is heated by said main burner, substantially as herein described.

6. The combination of a chamber containing the main burner C, the lateral extension F, having the horizontal partition *f*, and a damper for directing the heat from the burner C under and then over the partition *f*, substantially as described.

7. The combination of the oven B with its surrounding heating-space *e*, a burner, C, arranged in a chamber below the oven, the lateral extension F, with its partition *f*, and the dampers *g g'*, substantially as described.

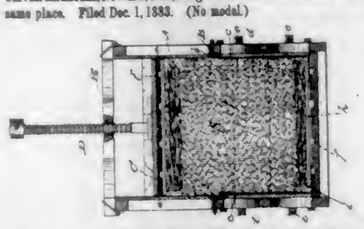
8. The combination of the oven B with its surrounding heating-space *e*, a burner, C, arranged in a chamber below the oven, the lateral extension F, with its partition *f*, the dampers *g g'*, and the shaft *g²*, to which both dampers are attached, substantially as described.

9. The combination of the chamber containing the main burner C, the lateral extension F, with the partition *f*, and having a pot hole or holes extending through said partition, and the damper *g'*, substantially as described.

10. The combination of a chamber containing the main burner C, and the lateral extension F, constructed with the horizontal partition *f* and the vertical partition *f'*, and having pot-holes on opposite sides of the partition *f'*, substantially as described.

11. The combination, with the lateral extension F, constructed with the horizontal partition *f*, the vertical partition *f'*, and two pot-holes, *d'*, of auxiliary burners C' on opposite sides of said partition *f'*, and the hinged guard or damper plate *k*, substantially as herein described.

12. The combination, with a chamber containing the main burner C, of the lateral extension F, and the checks or guards A, for confining the products of combustion, substantially as described.



13. The combination, with the oven B, having the heating-space *e* at the sides and back, of the burner C, the dampers *g* at the sides of the oven, the damper *l* at the back of the oven, and connections between one of the dampers *g* and the damper *l*, whereby both said dampers can be opened by manipulating the damper *g* only, substantially as described.

14. The combination, with the baking-oven B, the main burner C, and flues or heating-spaces *e* around the oven, and having a main outlet-flue at the top, of the lateral extensions F, containing auxiliary burners C', and an outlet-flue, *j*, leading upward from each extension to the main outlet-flue, and provided with a damper *j'*, substantially as described.

15. The combination, with the extension F, of the auxiliary burners C', each consisting of a bottomless shell secured upon the bottom of the extension, the said bottom of the extension forming the bottom of the burner, substantially as described.

293,699. PROCESS OF AND APPARATUS FOR BALING BRAN.

OLIVER AMSTELL, Newark, N.J., assignor of one-half to Andrew Allbright, same place. Filed Dec. 1, 1883. (No model.)

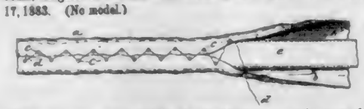
Claim.—1. The process herein described of preparing bran for transportation—to wit, of arranging the end, side, and bottom covering of the bale within a suitable press before pouring in the bran, of pouring in the bran and placing the material to form the top covering upon the same, of compressing the whole to the required dimensions, and securing the covering of the bale while under pressure.

2. A bran-press having removable doors on each of the four sides thereof, and a single movable follower, C, actuated by suitable mechanism.

3. In combination, a press the upper portion of which is boarded, and provided with four doors in the lower portion thereof, a single follower or compressing-cover, C, a screw, D, and removable dog E.

4. In combination, a press provided with four doors, and having grooves *f* in the floor thereof, and a compressing cover or follower, C, having grooves *f'* therein, all substantially as set forth.

5. In combination, a press provided with four doors, and having grooves *f* in the floor thereof, a compressing-cover, C, having grooves *f'* therein, and means for holding the canvas *c* in position while the bran is being compressed.



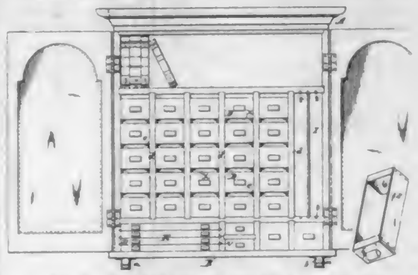
6. In combination, a press provided with four doors, and having grooves *f* in the floor thereof, a compressing-cover, C, having grooves *f'* therein, an iron strip, *b*, secured by bolts to the frame, and the canvas *c*, all substantially as and for the purposes herein set forth.

7. In a press for baling bran, the combination of a grooved compressing-cover, C, screw D, and an adjustable dog, E.

8. In combination with a bran-press, a frame composed of uprights *a* and hinged cross-pieces, for the purpose set forth.

293,700. HARNESS-COVERING.

HOLLAND C. BABCOCK, Hartford, Conn., assignor of one-half to P. Jewell & Sons, same place. Filed Nov. 17, 1883. (No model.)



Claim.—1. As a new article of manufacture, a wool-covered harness-protector made in strips of any desired length and width, with hooks, studs, or equivalent devices secured on opposite edges, in combination with the lacing, whereby the whole is attached in place on the harness, all substantially as described.

2. In combination, the wool-covered protector *a*, the re-enforce *b* the hooks or studs *c*, and the lacing *d*, with the enveloped harness, all substantially as described.

293,701. BOOK AND FILE CASE.

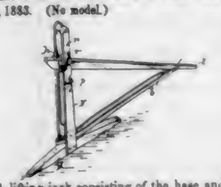
JACOB BAKER, Greenville, Ohio. Filed May 11, 1883. (No model.)

Claim.—1. The main body or frame of the case, in combination with partitions and drawers, said partitions being provided with supporting-strips for the drawers at intervals, substantially as described, whereby a space is left above each drawer, for the purpose specified.

2. The receptacle for file-cases, consisting of a block, G, rabbeted block F, and a strip, *u*, of metal, bent to form the sides and bottom of the box, inclosing the block G, and fitted to the rabbeted edge of the block F, substantially as set forth.

293,702. SIGN.

WALTER E. BANNING, Syracuse, N. Y. Filed Oct. 11, 1883. (No model.)



Claim.—1. In combination with a street-lamp and its frame, a stencil sign-plate having extended from its end two strips wound spirally around the guards of the lamp, the one upward and the other downward from the strip, substantially as described and shown.

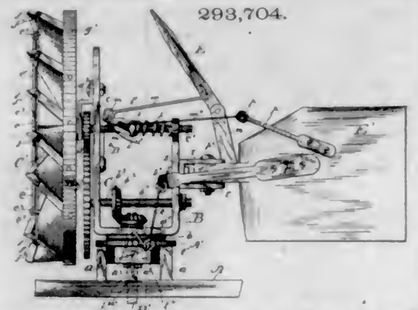
2. In combination with a street-lamp and its frame, two stencil sign-plates arranged in line with each other, and provided at their adjacent ends, respectively, with a strip disposed in a different plane and wound around the lamp-guard in a different direction from the strip of the adjacent plate, substantially as described and shown.

293,703. LIFTING-JACK.

JOSEPH F. BAHLL, Christiansburg, Ohio. Filed July 31, 1883. (No model.)

Claim.—1. A lifting-jack consisting of the base and standards provided with notches, a lever, *l*, the clamping-rod *b*, and the clevis *r*, secured to the lever, substantially as shown and described.

2. The combination, in a lifting-jack, of the base and standards with the lever *l*, having the securing-rod *b* attached thereto, the pawl *d*, clevis *r*, and lifting-rod *k*, substantially as and for the purpose set forth.

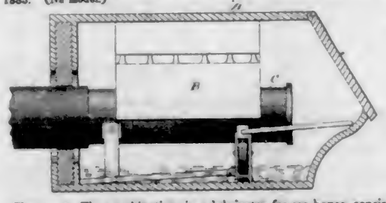


293,704. WINDMILL.

HERMANN BENNEMANN, Minster, Ohio. Filed Aug. 17, 1883. (No model.)

Claim.—1. The combination, in a windmill, of the wheel-blades *f' f'*, connected to one another by the rods e^2 e^2, having eyes in each and to engage the studs *f'' f''*, the arms *d' d'*, secured to the rods e^2 e^2, and disk *a* on the end of the shaft *c'*, which latter is provided with the groove *h*, to engage the pin *h'* in the hub of the wheel C', of the pivoted slotted bar *l'*, shaft *c'*, spring *i'*, connecting-rods *m' m²* *i*, gear-wheel C, pinions *c b' b²*, wing E, vane E', U-shaped frame B, and stationary table A', as shown and described.

2. The combination, in a windmill, of the U-shaped frame B, provided with bearings for the horizontal shafts *c' b²* of the stationary table, supported upon the posts *a a*, the vertical operating-rod *w*, bent at its upper and lower ends at right angles thereto, of the connecting-rods,



293,704.

gear-wheels, pinions *c b' b²*, slotted bar *l'*, shaft *c'*, spring *i'*, wing E, vane E', and wind-wheel C', constructed as described, the whole as shown and set forth.

293,705. LUBRICATOR.

ADDISON BRADFORD, Brooklyn, N. Y.; Wm. W. Blackman, Administrator of said Addison Bradford, deceased, assignor of five-thirteenths to Theodore C. Wiggins, same place, Aaron R. Smith, New Brighton, and Albert S. Comstock, New York, N. Y. Filed July 25, 1883. (No model.)

Claim.—1. The combination, in a lubricator for car-boxes, consisting of the yielding lubricating-rollers, pivoted as described, and adapted to be in contact with the journal-bearing for the supply of oil, of the vertical spring-supports having the rubbers, also adapted to be in contact with the journal-bearing, for preventing the waste of oil, as set forth.

2. The lubricator for car-axles and the like, consisting of the carrying-frame D D', horizontal frame E, pivoted as set forth, and the spring-rubbers, the former having lubricating-rollers, as set forth.

3. The combination, in a lubricator having the upright frame-head and the horizontal frame, the former having the elongated slot adapted to receive the horizontal moving bearings of the oilers, of the springs, whereby the oil-rollers may approach to and recede from each other, as shown and described.

4. A lubricator for railroad-car axles, consisting of the hinged frames having the oilers and rubbers, in combination with the bail and brace, as described.

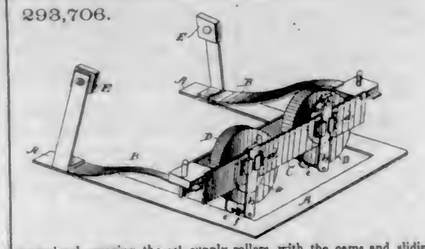
5. A lubricator for car-axles, having the hollow head forming an oil-box, said box being provided with oil-inlet apertures for the supply of oil to the rollers, whereby only sufficient lubricant is fed to the axles, and with the movable spring-operating journal-bearings for said rollers, as described.

6. The combination, with a journal-box, of an oil-receptacle therein, and adapted to have one or more lubricating-rollers, said box being provided with controlling oil-inlet aperture, for the purpose set forth.

7. In a lubricator, one or more journaled rollers in a suitable box or device, to prevent said rollers from running in the oil outside of said box or device, the said box or device being provided with controlling oil inlet or apertare, for the purpose set forth.

8. A lubricator provided with spring-armed oil wiper or rubber, as set forth.

293,706. LUBRICATOR.



ADDISON BRADFORD, Brooklyn, N. Y.; Wm. W. Blackman, Administrator of said Addison Bradford, deceased, assignor of five-thirteenths to Theodore C. Wiggins, same place, Aaron R. Smith, New Brighton, and Albert S. Comstock, New York, N. Y. Filed July 25, 1883. (No model.)

Claim.—1. A lubricator having the base-frame adapted to rest on the bottom of the journal-box, and having springs secured thereto, which are adapted to sustain a lubricating device, which device is kept in contact by the resiliency of said springs, substantially as described.

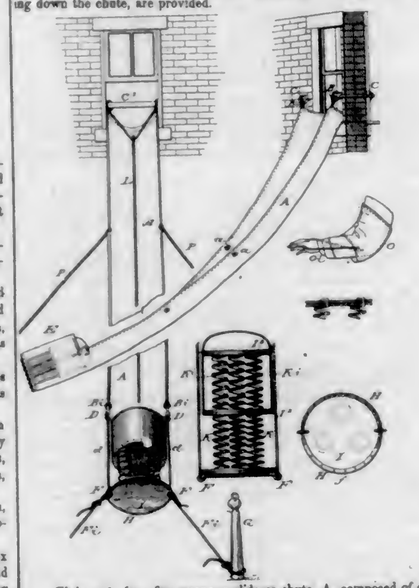
2. The combination, in a lubricator, of the frame A, the supporting-springs, and the lubricating-rollers, mounted as shown, and operating as described.

3. The combination, in a lubricator, of the frame, the springs, and

293,706.

cross-head carrying the oil-supply rollers, with the cams and sliding yokes or their equivalents, and oiling device, operating as set forth.

4. The combination of the frame, the supporting-springs, and oil-supplying devices with the wipers for wiping off the surplus oil, substantially as described.



5. A lubricator having the base-frame, the supporting-springs, the frame carrying the rollers, said rollers having eccentrics or cams or their equivalents for operating oil-supply devices, for the purpose set forth.

6. A lubricator having one or more rollers adapted to be operated by a journal, said roller or rollers being provided with eccentrics, cams, or their equivalents for operating oil-supply devices.

293,707. FIRE-ESCAPE.

ROBERT W. BRADLEY, Denver, Colo. Filed Mar. 5, 1883. (No model.)

Brief.—The bottom of the chute is formed into a cylindrical spring-receiver. Cuffs, with fastenings, for the protection of the arms in sliding down the chute, are provided.

Claim.—1. In a fire-escape, a slide or chute, A, composed of canvas or other flexible material, having its edges strengthened by ropes provided with loops B B and loops B' B', and having its lower end formed into a cylindrical-shaped spring-receiver, E, the hooks D D, ropes *d d*, loops F F, stationary bottom I, springs *k k k*, partition-board I', springs *k' k' k'*, and board I², having the cushion and cover attached, as specified and described.

2. The combination, with a fire-escape, of the slide or chute A and cylindrical spring-receiver E, the ropes H and F', and posts G, fully as set forth.

3. The combination, with a fire-escape, of the cuffs O, having straps *o'*, for the purpose of protecting the elbows from injury while descending, fully as set forth and described.

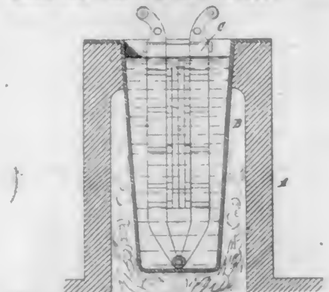
293,708. METAL-MOLD-LUBRICATING MATERIAL.

CHARLES F BRUSH, Cleveland, Ohio. Filed Oct. 24, 1883. (No specimens.)

Claim.—1. As a material for lubricating or coating molds, a non-

oxygenous or non-saponifiable oil incapable of complete evaporation at or approximately at the melting-point of lead, substantially as set forth.

2. As a material for lubricating or coating molds, a non-oxygenous or non-saponifiable oil capable of liquefying and incapable of complete evaporization at or approximately at the melting-point of lead, substantially as set forth.



3. As a material for lubricating or coating molds, the combination of a non-oxygenous non-saponifiable oily substance and a suitable diluent, substantially as set forth.

4. As a material for lubricating or coating molds, a non-oxygenous or non-saponifiable substance incapable of complete evaporation at or approximately at the melting-point of lead, and a diluent rapidly evaporating below said temperature, substantially as set forth.

5. As a material for lubricating or coating molds, a non-oxygenous or non-saponifiable oily substance and a non-oxygenous or non-saponifiable diluent, substantially as set forth.

293,709. PROCESS OF CASTING METALS.

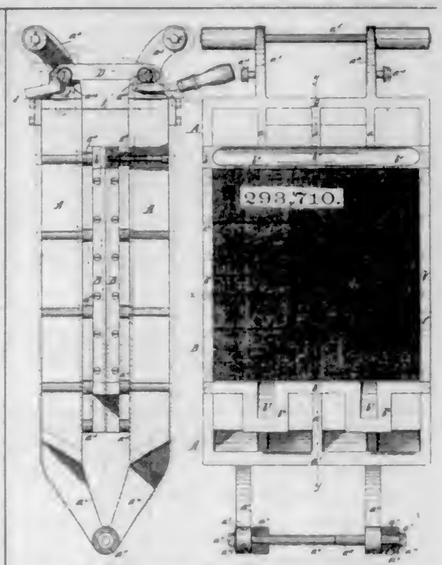
CHARLES F. BRUSH, Cleveland, Ohio. Filed Oct. 24, 1883. (No model.)

Claim.—1. The herein-described method of casting metals, which consists in submerging a jointed or divided mold in a bath of molten metal, allowing the mold to fill while two or more of its opposite walls or parts are separate, and then closing the same while still submerged, substantially as set forth.

2. The herein-described method of casting metals, which consists in submerging a tightly-closed jointed or divided mold in a bath of molten metal, separating the opposite parts thereof, and reclosing the same while still submerged, substantially as set forth.

3. In the process of casting by the submergence of a jointed or divided mold in the molten metal, the combination of the following steps: first, the heating of the mold to a point above that at which the metal flowing therein on or after submergence would chill too rapidly, but below the melting-point of such inflowing metal; second, submerging the mold in the molten metal; third, allowing the mold to fill while two or more of its opposite parts are separated; fourth, closing the same while still submerged; and, fifth, withdrawing the same from the molten metal, substantially as set forth.

4. In the process of casting by submergence of a jointed or divided mold in the molten metal, the combination of the following steps: first, the heating of the mold, substantially as described; second, submerging the closed mold, substantially as described; third, opening and filling it, substantially as described; fourth, reclosing the same, excluding surplus metal, and packing the joints with chilled metal, substantially as described; and, fifth, withdrawing the same from the molten metal, substantially as set forth.



5. In the process of casting by the submergence of a jointed or divided mold in the molten metal, the process of simultaneously pressing the molten metal into the smaller cavities of the mold, expressing the excess of metal, and packing the joint or joints of the reclosed mold by clamping the meeting walls of the mold onto and so chilling a film of metal between such walls on the closing movement of the previously-separated parts of the mold while still submerged, substantially as set forth.

6. In the process of casting by the submergence of a jointed or divided mold in the molten metal, the method of packing the joint or joints of the mold by closing the meeting walls thereof on a film of the escaping metal and simultaneously solidifying such film by the lower temperature of such walls before the emergence of the mold from the bath, substantially as set forth.

293,710. MOLD FOR CASTING METALS.

CHARLES F. BRUSH, Cleveland, Ohio. Filed Oct. 24, 1883. (No model.)

Claim.—1. In a mold for casting metals, the combination of a surrounding frame and a series of spaced strips arranged within said frame, the frame and strips constituting the casting faces or walls of the mold, substantially as set forth.

2. In a mold for casting metals, the combination of surrounding frame and series of properly-spaced strips arranged longitudinally within said frame, each strip being notched at one or more points, as at c^2, along its face edge, substantially as set forth.

3. In a mold for casting metals, the combination of a surrounding frame and a series of transversely-beveled strips arranged within said frame, the frame and strips constituting the casting faces or walls of the mold, substantially as set forth.

4. In a mold for casting metals, the combination of a surrounding frame, a series of transversely beveled and notched strips arranged within said frame, and a series of narrow strips arranged between and separating the other strips, substantially as set forth.

5. In a mold for casting metals, the combination of a surrounding frame consisting of top, bottom, and side bars, the top bar being provided with a longitudinal filling-head recess and slots connecting said recess with the matrix of the mold, a series of transversely beveled and notched strips arranged within the frame, and a series of narrow spacing-strips, substantially as set forth.

6. In a mold for casting metals, the combination of a surrounding frame consisting of top, bottom, and side bars, the top bar having a longitudinal recess and slots connecting said recess with the upper transverse groove in the matrix, and the lower bar having recessed lugs connecting with the lower transverse groove of the matrix, a series of strips being transversely beveled on their sides and ends, and a series of narrow spacing-strips, substantially as set forth.

7. A mold for casting metals, consisting of two parts hinged or jointed together, as described, each of said parts having a series of transverse and longitudinal grooves formed in its surface, the transverse grooves in one part being somewhat deeper than the like grooves in the other part, substantially as set forth.

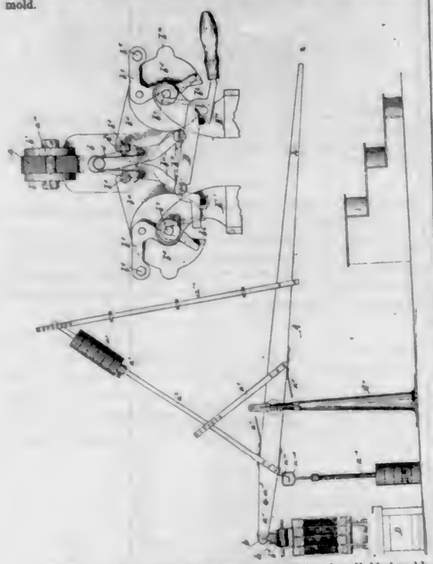
8. A mold for casting metals, consisting of two parts hinged or jointed together, as described, one of said parts having a series of transverse and longitudinal grooves in its surface, and the other part having transverse grooves, substantially as set forth.

9. A mold-structure the casting-faces of which are composed wholly or in part of parallel or approximately parallel strips having beveled sides, said strips being arranged with their beveled sides facing in opposite and outward directions, substantially as set forth.

10. The combination of the two parts of a flask, each part being provided with two perforated lugs, one of said lugs on each part having an adjustable sleeve within its perforations, and a pintle, substantially as shown and described.

11. The combination of the two parts of a flask, each part being provided with two perforated lugs, one of said lugs on each part having an adjustable sleeve within its perforations, a pintle passing through the perforations and sleeves of the lugs of each part, and a pipe extending between the inside lugs and surrounding the pintle, substantially as shown and described.

12. The combination of the two parts of a flask, having arms with pins thereon, a locking-bar, D, having at one end the pin *d*, the plain portion d', the vertical part d^4, and recess d^5, and at the other end the horizontal slot d^2 and the vertical and curved slot d^3, said parts being constructed and arranged substantially as shown and described.



13. In combination with the two parts of a divided mold, a locking mechanism suitably constructed to permit of the opening of the mold, and thereby be shifted to a locking position, and to automatically lock the mold in a closed position on the closing thereof, substantially as set forth.

14. In combination with the two parts of a divided mold, a locking mechanism suitably constructed to permit of the opening of the mold, and thereby be shifted to a locking position to limit the opening movement, and to automatically lock the mold in a closed position immediately on the closing thereof, substantially as set forth.

293,711. APPARATUS FOR MANIPULATING MOLDS IN CASTING.

CHARLES F. BRUSH, Cleveland, Ohio. Filed Oct. 24, 1883. (No model.)

Brief.—Two cylindrical blocks, each provided with lugs which are pivoted to an arm that is in turn pivoted to the forward end of a lever, are lowered over the handles of the closed mold. The handles enter the slots in the blocks, and are locked therein by gravitating bell-crank hooks. The mold is swung over the metal bath and lowered therein. After the mold reaches the bottom of the vessel, the downward motion of the lever is continued, forcing the lugs down to and beneath a horizontal position. Their adjacent cam-surfaces roll against each other and force the blocks outward and open the mold. A further downward movement of the lever causes the lugs to turn on the handles as a center, their inner ends to be depressed, and their outer ends and the blocks to be brought toward each other, closing the mold. Spring-hooks slide outward over the top of the mold and catch into the notches on the sides, thus locking the mold; or the hand-tool shown may be used to lock the mold.

Claim.—1. An apparatus for manipulating jointed or divided molds in casting metal, having in combination a mechanism for taking hold of the opposite parts of said mold, mechanism for lowering and raising the mold, and mechanism for opening and closing the mold, substantially as set forth.

2. An apparatus for manipulating jointed or divided molds in casting metal, having in combination a mechanism for taking hold of the opposite parts of said mold, mechanism for moving the mold vertically and horizontally, and mechanism for opening and closing the mold, substantially as set forth.

3. An apparatus for manipulating jointed or divided molds in casting metal, having in combination mechanism for taking hold of the opposite parts of said mold, mechanism for lowering and raising the mold, mechanism for opening and closing the mold, and mechanism for locking the mold when closed, substantially as set forth.

4. An apparatus for manipulating jointed or divided molds in casting metals, having in combination mechanism for taking hold of the opposite parts of the mold, mechanism for raising and lowering the mold, and mechanism for opening and closing the mold, all constructed and arranged to be operated in lowering, opening, and closing the mold by a continuous movement in one direction, substantially as set forth.

5. An apparatus for manipulating jointed or divided molds in casting metal, having in combination mechanism for taking hold of the opposite parts of the mold, mechanism for raising and lowering the mold, mechanism for opening and closing the mold, and mechanism for locking the parts of the mold when closed, all constructed and arranged to be operated in lowering, opening, and closing the mold by a continuous movement in one direction, substantially as set forth.

6. The combination of the parts of a jointed or divided mold provided with suitable handles, two pivotally-mounted blocks provided with radial slots and a catch device for holding the mold-handles in said slots, and mechanism connected to said blocks whereby the mold may be raised and lowered and opened and closed, substantially as set forth.

7. The combination of the parts of a jointed or divided mold provided with suitable handles, a pair of pivotally-mounted blocks provided with radial slots and a catch device for holding the mold-handles in said slots, a pair of pivotally-mounted hooked dogs, and mechanism suitably connected with said blocks and dogs, whereby the mold may be raised and lowered, opened and closed, and locked when closed, substantially as set forth.

8. The combination, with a bath of molten metal for the casting of metals by the submergence of a mold therein, and a lever mechanism for the raising and lowering of the mold, of a weight, a^7, suitably arranged to counterbalance, wholly or in part, the weight of the mold before submergence, but to aid submergence as the latter takes place, substantially as set forth.

9. The combination of the handles of a jointed or divided mold, the lever A, the arm *b*, pivoted to the end of said lever, and provided with horizontal slots, the cylindrical pieces b^2, having radial V-shaped slots b^3, and provided with lugs b^4, having cam-shaped ends, said lugs b^4 being pivoted in the horizontal slots in the arm *b*, and the hooked bell-crank levers b^5, substantially as set forth.

10. In combination with the halves or parts of a divided mold, and with a lowering mechanism for immersing the same in a bath of molten metal, a toggle-joint mechanism suitably arranged to open and reclose the mold without stopping the lowering mechanism, substantially as set forth.

11. In combination with the halves or parts of a divided mold, and with a lowering mechanism for immersing the same in a bath of molten metal, a toggle-joint mechanism suitably arranged to open and reclose the mold without stopping the lowering mechanism, and a locking mechanism for preventing the reopening of the molds as they are lifted from the bath, substantially as set forth.

12. The combination of the lever A, the arm *b*, pivoted to the end of said lever, and provided with horizontal slots b^2 and the hooked spring-dogs b^{10}, the cylindrical pieces b^2, having radial V-shaped slots b^3, and provided with lugs b^4, having cam-shaped ends, said lugs being pivoted to the arm *b* in the slots b^2, the hooked bell-crank levers b^5, and a divided or jointed mold provided with suitable handles, and having the groove or notch *e*, substantially as set forth.

293,712. DEVICE FOR EXTRACTING CASTINGS FROM MOLDS.

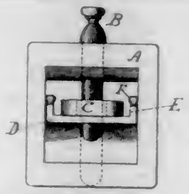
CHARLES F. BRUSH, Cleveland, Ohio. Filed Oct. 24, 1883. (No model.)

Claim.—1. In an apparatus for extracting castings from the mold, the combination of a gripping mechanism for taking a firm hold on the casting and a mechanism suitably arranged for forcing asunder the grippers and the mold in which the casting is made while the grippers retain their hold on the casting, substantially as set forth.

2. In an apparatus for extracting castings from molds, the combination of the frame A, transverse bars a', pivoted bars *a*, and mechanism for causing said gripping mechanism to take a firm hold on the casting, substantially as set forth.

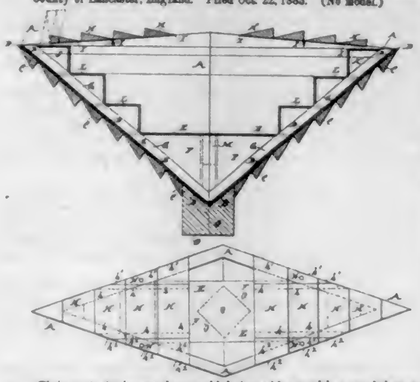
3. In an apparatus for extracting castings from molds, the combination of the frame A, transverse bars a', provided with flanges a^4, pivoted bars *a*, provided with recess a^5, and mechanism for lifting the frame from the mold, substantially as set forth.

4. In an apparatus for extracting castings from molds, the combination of a frame provided with mechanism for grasping and holding the casting, the levers *b*, and the handles B, substantially as set forth.



5. In an apparatus for extracting castings from molds, the combination of the frame A, transverse bars a', provided with bars *a*, the levers *b*, and the handles B, substantially as set forth.

293,713. CAR-COUPLING.



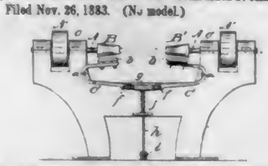
GEO. BRYAN, Chicago, Ill., assignor of one-half to Alphonso Goodrich, same place. Filed June 11, 1883. (No model.)

Claim.—In combination with a draw-head of a car-coupling, the self-adjusting link-supporter D, as and for the purpose shown.

293,713.

293,714. CONSTRUCTION OF BOATS. FRANCIS BYRNES, Liverpool, County of Lancaster, England. Filed Oct. 22, 1883. (No model.)

Claim.—1. An inverted pyramidal-shaped boat, with one axis longer than the other, and having on its sides a series of inverted steps, and provided with a folding covering, H, substantially as herein set forth.



2. The boat-sides formed of a series of inverted steps, with an inner backing of wood, and lined with india-rubber, gutta-percha, or like material, substantially as herein described.

3. In combination with a boat, a covering formed of wooden blocks or steps, with their vertical faces facing from the center line of the boat toward the sea, attached to a gutta-percha, india-rubber, or canvas backing capable of being easily folded up, substantially as herein set forth.

4. A boat having the form of an inverted pyramid, with a series of inverted steps extending longitudinally on the outer surface.

5. In an inverted pyramidal-shaped boat, the steps L, placed along its sloping sides, for standing upon, substantially as herein set forth.

293,715. HAT-POUNCING MACHINE. FREDERICK F. CAMPBELL, Newark, N. J. Filed Nov. 26, 1883. (No model.)

Claim.—1. A hat-pouncing machine provided with pouncing-blocks having the shape of truncated cones placed between bearings with the truncated portion more nearly adjacent.

2. The combination, in a hat-pouncing machine, of pouncing-blocks B B′, arranged on a shaft or shafts between bearings, as O O′.

3. A hat-pouncing machine provided with two independent shafts, each of which has attached thereto a pouncing-block.

4. In a hat-pouncing machine provided with two independent shafts, the combination of the shafts A, pouncing-blocks B B′, and mechanism adapted to press the hat-bodies against said blocks.

5. In combination, in a hat-pouncing machine, the shafts A, pouncing-blocks B B′, and curved arms C, all substantially as set forth.

6. In combination, in a hat-pouncing machine, the shafts A, pouncing-blocks B B′, and curved levers C, having secured thereto supporting-blocks *b*.

7. In combination, in a hat-pouncing machine, the shafts A, pouncing-blocks B B′, and levers having secured thereto automatically-adjustable supporting-blocks.

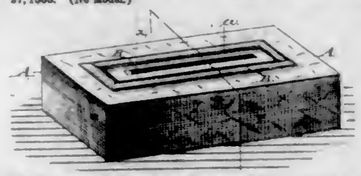
8. In a hat-pouncing machine, an automatically-adjustable supporting-block capable of accommodating itself to the varying thickness of the hat-bodies.

9. In combination, in a hat-pouncing machine, a pouncing-block, B, and an automatically-adjustable supporting-block adapted to press the hat-bodies against said block.

10. The combination, in a hat-pouncing machine, with a block, *b*, and an arm, C, of means adapted to secure an elastic support, all substantially as set forth.

11. In combination, in a hat-pouncing machine, a block, *b*, arm C, and an elastic backing, *c*.

12. In combination, in a hat-pouncing machine, a block, *b*, arm C, elastic pieces *c*, and means whereby the amount of elasticity may be increased or diminished.

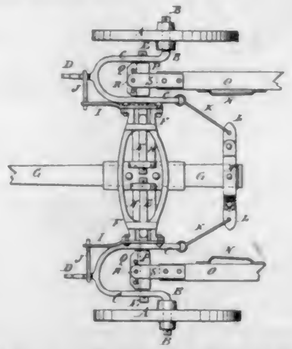


13. In combination, in a hat-pouncing machine, a block, *b*, arm C, elastic pieces *c*, and bolts *d*.

14. In combination, in a hat-pouncing machine, the shaft A, pouncing-blocks B B′, and curved levers C, having attached to one end an elastic supporting-block, the other end being provided with a slot, *f*.

15. In combination, the shaft A, pouncing-blocks B B′, curved levers C, having attached to one end supporting-blocks *b*, the other end being provided with slots *f*, and a connecting piece or link, *g*.

16. In combination, the shaft A, pouncing-blocks B B′, curved levers C, having attached to one end a supporting-block, *b*, the other end provided with a slot, *f*, a link, *g*, having pins working in said slots, and mechanism whereby said curved levers and link may be raised.



293,716. BRICK. WILLIAM E. CARLETON, Boston, Mass. Filed Dec. 27, 1883. (No model.)

Claim.—As an improved article of manufacture, a brick having a tapering slot or opening, *a*, and provided with a beading, B, surrounding the slot and raised above the face of the brick, substantially as and for the purpose herein set forth.

293,717. SULKY-CULTIVATOR. READING L. CARVER, Pre-emption, Ill. Filed Sept. 7, 1883. (No model.)

Brief.—The wheel-spindles are made upon the curved draft-frames. These are pivoted upon the sectional arch or axle, and have each independent forward and back movement. They are upheld and braced by link-connection in front to the top of the arch, and in the rear by like connection to an evener on the rear end of the tongue.

Claim.—1. In a cultivator, the combination, with the cranks E, connected to the draw-bars having the wheels and shovel or plow-beams connected thereto, of the cross-frame F, with the upper portions of the cranks bearing therein, and the plate H, pivoted on the under side of the said frame, and having slots at its ends which receive the side bars of the cranks, substantially as and for the purpose set forth.

2. In a cultivator, the combination, with the cranks E, frame F, and the draw-bars C, pivoted on the lower ends of the cranks, and having apertured projections at about their central forward ends, of the arms I, affixed to the ends of the frame F, and the rods or chains J, substantially as and for the purpose set forth.

3. In a cultivator, the combination, with the frame F, having the end slotted, pivoted bar H, and the cranks E, bearing in the former, of U-shaped draw-bars C, pivoted upon the lower arms of said cranks, and connected at their forward ends, by rods or chains J, to the arms I of the frame F, and at their opposite ends to the tongue G by the rods or chains K and pivoted bar M, substantially as and for the purpose set forth.

4. In a cultivator, the combination, with the frame F, having the end slotted, pivoted bar H, and cranks E, pivoted thereon, of the U-shaped draw-bars C, pivoted upon the lower arms of the cranks, the rods or chains J, arms I, secured to the frame F, rods or chains K, bars M, sleeves P, disposed upon the cranks between the arms or sides of the draw-bars, and the cultivator-beams O, substantially as and for the purpose set forth.

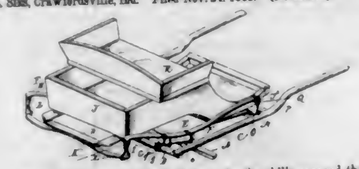
293,718. POCKET IMPLEMENT. ALLISON N. CLARK, Plainville, Conn. Filed May 19, 1883. (No model.)

Claim.—1. The herein-described pocket implement, consisting of the spring-tweezers, the nail-cutter, the nail-cleaner, file, and ear-spoon, arranged to slide between the body of the tweezers, substantially as described, and for the purpose specified.

2. The combination of the spring-tweezers having slotted blades, the slide having a suitable tool at the end, which is adapted to be projected from the tweezer end of the blades, suitable projections rigidly connected to said slide and extending through the slotted blades, and caps at the ends of said projections, which move with the slide and close the spring-blades upon the slide when said slide is projected, substantially as described, and for the purpose specified.

3. The combination of the tweezer-blades *a*, having longitudinal slot *c*, the ear-spoon *d*, and nail-cleaner *e*, arranged to slide between the slotted blades, substantially as described, and for the purpose specified.

4. The spring-tweezers having a U-shaped portion at one end, sharpened upon the edge to form a nail-cutter, substantially as described, and for the purpose specified.

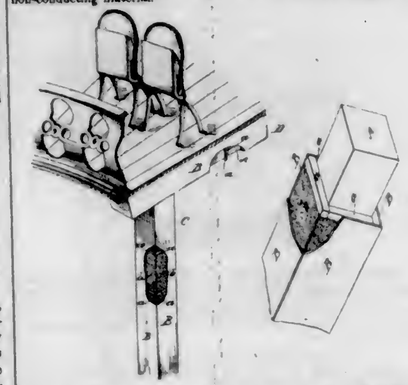


293,719. BREECH-LOADING FIRE-ARM. NATHAN RUSSELL DAVIS, Freetown, Mass. Filed Dec. 11, 1883. (No model.)

Claim.—1. The combination of the stationary breech, the barrel or barrels having a pivotal and locking projection, as described, the two arms extending from such breech and recessed, and having a connection rivet or screw, as explained, and the tubular pivot arranged between such arms, and provided with end projections to enter their recesses, all being substantially as represented.

2. The combination of the pivot-sustaining arms of the breech, having in them a connection rivet or screw and cylindrical recesses, as explained, with the tubular and cylindrical pivot arranged on the said rivet or screw, and having end projections to enter the said recesses, and with pins extending into the pivot and arms, all being substantially as represented.

293,720. TWO-WHEELED VEHICLE. FISHER DOHERTY and ENOS L. SIMS, Crawfordsville, Ind. Filed Nov. 24, 1883. (No model.)



Claim.—1. The combination of the axle, the thills secured thereto and projecting in rear thereof, a cross-bar connecting the rear end of the thills, blocks carrying the body, and plates secured to the under sides of these blocks and bearing upon the axle at their front ends, and adjustably connected to the cross-bar at their rear ends, substantially as set forth.

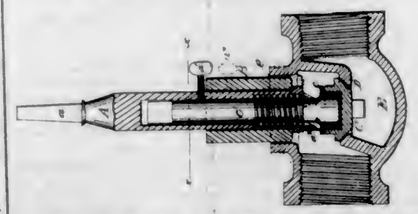
2. The combination of the axle, the thills secured thereto and projecting in rear thereof, a cross-bar connecting the rear ends of the thills, the plates having their front ends bearing upon the axle and provided with the slotted rear extensions, and the set-screws securing these plates to the cross-bar, substantially as set forth.

3. The combination of the axle, the thills, plates having a bearing on the axle and connected with the thills and adjustable on said bearings, the body, and devices connecting the body with the plates, substantially as set forth.

293,721. FIRE-PROOF TIMBER. WILLIAM H. DOLMAN, New York, N. Y. Filed Sept. 26, 1883. (No model.)

Brief.—Timbers are provided with narrow spacing-strips, which, with a metallic casing surrounding the timber, form spaces filled with non-conducting material.

Claim.—The combination, with a joist, rafter, or other piece of timber, of the narrow strips *a* and metallic sheets B, arranged to form pockets or chambers, and non-conducting material filling said spaces between the iron and the wood, as shown and described.

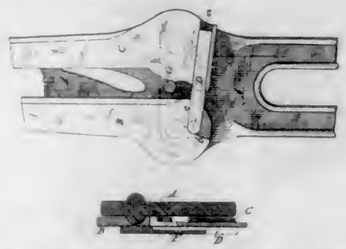


293,722. DRESS-PROTECTOR. ELIZABETH M. DOWNING, Grant City, Pa. Filed Nov. 7, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the combined dress pad and protector, consisting of a wadded case comprising a straight central portion and upwardly-curved front and rear ends, substantially as described, in combination with an impervious flap secured to the inner edge of the front portion, as and for the purpose set forth.

2. The combination, with a dress-waist, of the herein-described improved pad and protector, the same consisting of a wadded case comprising a straight central portion and upwardly-curved front and rear ends, and an impervious flap secured to the inner edge of the front end, said pad or protector being secured in the said dress-waist under and around the sleeve, as herein described, for the purpose set forth.

293,723. GLOBE-VALVE GRINDER. JOHN EDWARD DOYLE, Richmond, Ind. Filed Oct. 20, 1883. (No model.)

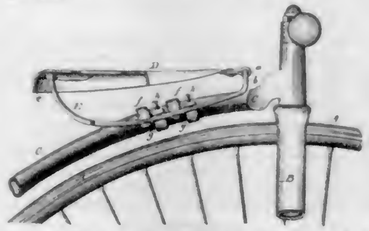


Claim.—1. The socket A, constructed, substantially as described, with teeth adapted to engage the valve or its washer, as set forth.

2. The combination of the socket A, provided with teeth a^2, with bushing B and means for securing said bushing to the socket, substantially as set forth.

3. The combination of the toothed socket A a^2, provided with the annular flange a^3, with the bushing B, resting against said flange, and a set-screw for securing said bushing to the socket, substantially as set forth.

293,724. OPERA-CHAIR. EDWARD G. DURANT and ELI SHUPE, Racine, Wis.; said Shupe assignor to Thomas Kane, Chicago, Ill. Filed July 6, 1883. (No model.)



Claim.—1. In a folding seat, a supporting-standard, in combination with a pivoted back-arm and a pivoted seat-arm, one of said arms being provided with a recess, as set forth, and a bar pivoted to one of said arms and fitted to slide in the recess in the other arm, substantially as described and shown.

2. In combination with the supporting-standard, the pivoted back-arm and the pivoted seat-arm, the back-arm being provided with the groove or recess, as set forth, and the bar D, having its forward end pivoted to the seat-arm, and its opposite end fitted loosely in the groove or recess in the back-arm, as shown.

3. In combination with a supporting-standard, the pivoted back-arm provided with the groove, as set forth, the pivoted seat-arm provided with shoulders, as described, and the bar pivoted to the seat-arm and fitted loosely in the groove in the back-arm, as and for the purpose described.

4. In combination with the standard and the pivoted seat-arm provided with the opening, as described, the pivoted back-arm provided with the open groove, as set forth, the bar D, provided with the circular lug loosely seated in the opening in the seat-arm and fitted loosely in the groove of the back-arm, and the plate F, applied, as shown, to retain the bar in its proper relation to the back and seat arms.

293,725. BICYCLE-SADDLE. CHARLES E. DURYEA, St. Louis, Mo., assignor of one-half to Richard Garvey, same place. Filed Dec. 3, 1883. (No model.)

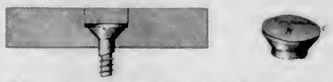
Claim.—1. The improved saddle for a bicycle, consisting of a flexible seat or saddle proper, and a supporting-spring having two substantially parallel arms with upturned ends attached to the seat, and adapted, as described, to apply a longitudinal tension thereto.

2. In combination with the flexible seat of diminishing width toward its front end or neck, the supporting-spring consisting of a single elastic rod doubled and bent upon itself, and having its ends upturned and connected to the extremities of the seat, substantially as described.

3. In a bicycle-saddle, the combination of a flexible seat having a widened rear end, and a supporting-plate attached to the rear edge of the seat, and two parallel spring-arms attached to the plate, and extended thence downward and forward to the forward extremity of the seat.

4. In combination with the backbone of a bicycle, a flexible seat or saddle, two longitudinal springs located on opposite sides of the backbone and connected to the extremity of the seat, to maintain a longitudinal tension thereof, and means, substantially as described, connecting said springs with the backbone.

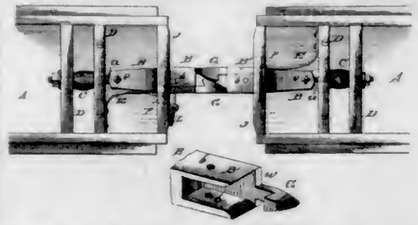
5. In combination with the backbone of a bicycle, a flexible seat or saddle, two spring-arms extending lengthwise of the saddle on opposite sides of the backbone and acting, as described, to strain the seat longitudinally, and clips or fastening devices adjustable longitudinally with respect to the backbone, whereby the saddle may be adjusted forward and backward without affecting its tension.



6. In combination with the backbone of a bicycle, clips or fastening devices applied thereto, and a saddle having two longitudinal springs connected to the extremities of the seat and adapted to strain the same longitudinally, said springs being adjustable longitudinally with respect to the clips, whereby the saddle may be adjusted forward and backward and its tension or stiffness modified at the same time.

7. In combination with the backbone and two saddle-supporting arms on opposite sides thereof, the clips applied to the upper and lower sides of the backbone, and the adjusting-screws, applied substantially as shown.

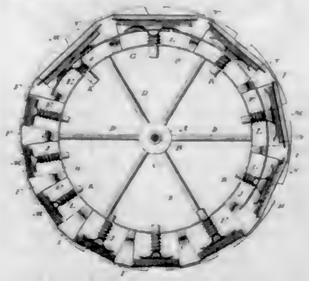
8. In combination with a backbone and two saddle-supporting arms on opposite sides thereof, clips applied to the top of the backbone and engaging at their ends beneath the arms, and secondary clips applied beneath the backbone and engaging at their ends above the arms, as described.



293,726. WOODEN PLUG. ROMAN I. FANCHER, Baldwinsville, N. Y. Filed July 27, 1883. (No model.)

Brief.—A wooden plug having an overlapping beveled rim, in connection with a countersunk hole cut into wood, so as to receive the plug and form a perfect joint.

Claim.—A wooden plug having an overlapping beveled rim or lip, in combination with a countersunk hole cut into wood in such a manner as to receive the plug and make a perfect joint between the wood into which it is inserted and the rim or lip of the plug, for the objects and purposes herein set forth and described.



293,727. CAR-COUPLING. ALPHEUS FAY, Columbia, Tenn., assignor of one-fourth to Zillmon Smith, Maury County, Tenn. Filed June 5, 1883. (No model.)

Claim.—1. The combination of a pivoted draw-bar, a three-sided flaring-mouth draw-head, and a coupling-hook formed on the end of the vertical side of this head, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. Vibrating spring-actuating draw-bars having three-sided draw-heads and coupling-hooks formed on them, in combination with the side springs, E, beams J, in which the draw-bars are guided, levers L, connected to the draw-bars, and springs acting on said levers, all constructed and adapted to operate substantially in the manner and for the purposes described.

293,728. PAPER-BAG HOLDER. GEORGE NEWTON PENN, Prophetstown, Ill. Filed Dec. 19, 1883. (No model.)

Claim.—1. In a paper-bag holder, the series of compartments or receptacles of varying sizes, the larger sizes being provided with means attached to the top of bag-holder for supporting the upper projecting ends of the bags, as set forth.

2. In a paper-bag holder, the series of compartments or receptacles

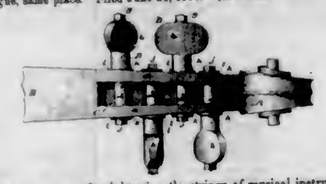
of varying sizes, in combination with a ring and bail extending over the compartments containing larger sizes of bags, the upper projecting ends of the latter fitting between the ring and bail, as set forth.

3. In a paper-bag holder, the series of compartments or receptacles having spring-pressed clamps, and an opening formed in the bottom plate or compartment to receive the fingers in withdrawing the bag, as set forth.

4. In a paper-bag holder, a series of compartments or receptacles, in combination with spring-pressed clamps working in the same, said clamps having an operating-rod extending backward through the inner plate, and a spring coiled on said rod, as set forth.

5. In a paper-bag holder, a series of compartments or receptacles of various sizes, the bottom plate of the compartments being formed with an opening to receive the fingers in withdrawing the bag, as set forth.

6. In a paper-bag holder, the compartments formed of partitions having an inner plate, bottom plate, and two or more hoops attached to outer face of partitions, as set forth.



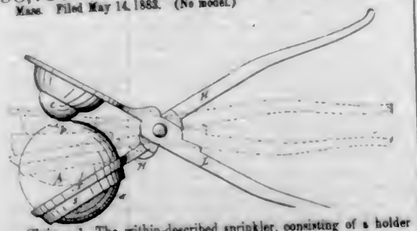
7. In a paper-bag holder, the series of compartments of varying sizes, formed with hoops as an outer wall for the same, means for pressing the bags against said hoops, and openings formed in the bottom plate of the compartments to receive the fingers in withdrawing the bags, as set forth.

8. In a paper-bag holder, the series of compartments, in combination with spokes connected to the same and radiating from a hub, as set forth.

9. In a paper-bag holder, the compartments arranged in a circular series, in combination with spokes connected to the same and radiating from a hub, and a pipe fitted in the hub and journaled on a suitable suspending-rod, as set forth.

10. In a paper-bag holder, the pipe journaled on a suitable suspending-rod, in combination with the circular series of compartments around the pipe and connected to the same, as set forth.

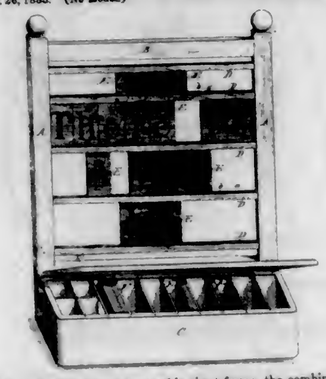
293,729. TUNING-PEG FOR MUSICAL INSTRUMENTS. ROBERT F. FLEMMINGS, Jr., Melrose, Mass., assignor of one-half to Charles Lamson Sprague, same place. Filed June 21, 1883. (No model.)



Claim.—1. A peg for tightening the strings of musical instruments, consisting of the shank *c*, the sliding head *b*, the screws *e* and *f*, and the nuts *g* and *h*, all adapted to operate substantially as and for the purposes described.

2. A peg for tightening the strings of musical instruments, consisting of the shank *c*, the sliding head *b*, the screws *e f*, the nuts *g j*, and the washers *i k l*, all adapted to operate substantially as and for the purposes described.

3. A peg for tightening the strings of musical instruments, consisting of the head *b*, shank *c*, screw *f*, nut *j*, and sleeve *d*, substantially as and for the purposes described.

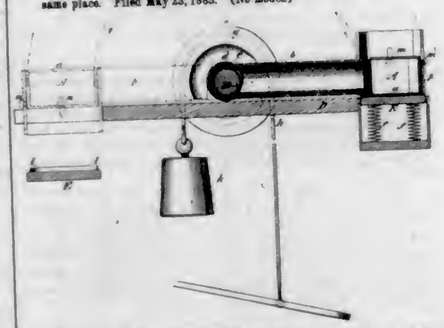


293,730. SPRINKLER AND ATOMIZER. MOSES GOLDMAN, Pittsfield, Mass. Filed May 14, 1883. (No model.)

Claim.—1. The within-described sprinkler, consisting of a holder having a ring, a hollow elastic ball secured in said ring, and having one of its protruding sides provided with perforations for throwing a spray, and the other protruding side provided with an induction-port, and a plunger connected with the holder and adapted to compress the ball and simultaneously close the induction-port thereof, substantially as set forth.

2. In combination with the holder provided with a ring, the compressible hollow ball seated in said ring, and provided underneath the same with a ledge or shoulder, substantially as and for the purpose shown and set forth.

293,731. INTERCHANGEABLE CHART-FRAME. JAMES E. HAMILTON, Two Rivers, Wis., assignor to Hamilton & Katz, same place. Filed Nov. 26, 1883. (No model.)

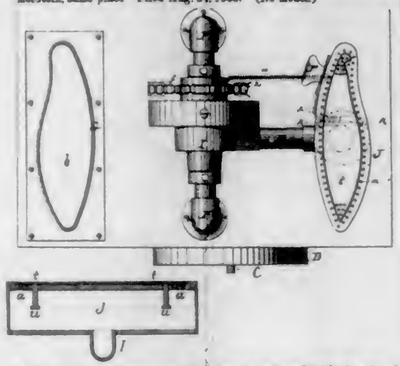


Claim.—1. In an interchangeable chart-frame, the combination of the side bars, A A, and top and bottom bars, B B', forming a skeleton frame, with the transverse supports D and the letter or symbol blocks E E, the contiguous surfaces of the parts D and E being held together by means of horizontal grooves in one of them receiving the edges of the other, both above and below, and each alternate groove being of different depth from the groove immediately above and the groove immediately below it, whereby every block E shall be firmly held at its upper and lower edge, and yet be capable of removal, interchange, or replacement without disturbing the block on either side of it, substantially as set forth.

2. In an interchangeable chart-frame, the combination of the skeleton frame A A B B', the base C, forming part of the frame, and divided into compartments to retain the letter-blocks, the transverse supports D, and the blocks E E, substantially as set forth.

3. In an interchangeable chart-frame, the combination of the skeleton frame A A B B' and the transverse supports D, having rear extended flanges, *b*, of greater height or depth than their front flanges, and having between said front and rear flanges the shallow grooves *a* and the deeper grooves *a'*, with the letter or symbol blocks E E, substantially as set forth.

293,732. MACHINE FOR MANIPULATING CIGAR-WRAPPERS. OSCAR HAMMERSTEIN, New York, N. Y., assignor to Malvina Hammerstein, same place. Filed May 23, 1883. (No model.)



Claim.—1. The combination of the hollow table A, having perforated suction-plate *a*, with the hollow arm *b*, hollow supporting-shaft B, having aperture *c*, and with means for revolving the hollow table A and its appurtenances around said hollow shaft, substantially as and for the purpose specified.

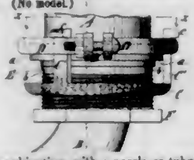
2. The combination of the hollow suction-table A, with mechanism, substantially as described, for moving it, with the sliding sleeve F and receiving-table, substantially as described.

3. The table E, resting on the spring *f*, in combination with the hollow suction-table A, having perforated plate *a*, and with means, substantially as described, for moving said table A, as specified.

4. The table F, in combination with the hollow suction-table A, having perforated face-plate *a*, and with mechanism for moving said suction-table, and with the cutter *l*, substantially as described.

293,733. MACHINE FOR CUTTING AND PILING CIGAR-WRAPPERS. OSCAR HAMMERSTEIN, New York, N. Y., assignor to Malvina Hammerstein, same place. Filed Aug. 24, 1883. (No model.)

Claim.—1. The combination of the suction-box J with the pipe I and mechanism, substantially as described, for moving the same, with the box-shaped receiver G, having upper cutting-edge, and with the movable bottom *b*, substantially as specified.



2. The movable suction-box J, combined with the spring-clamp P, for operation substantially as herein shown and described.

3. The movable suction-box J, having perforated face-plate *a*, in combination with the movable portion *t* of said face-plate, for disengaging from the suction-box the part cut out thereon, as specified.

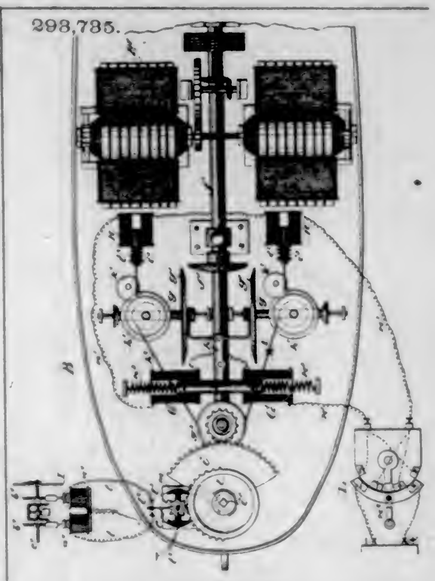
4. The combination of the movable suction-box J and means, substantially as described, for moving it, with the perforated face-plate *a*, movable portion *t* of said face-plate, and with a cutter which is adapted to cut the leaf of tobacco placed against the face-plate *a*, as specified.

5. The combination of the shaft C and its spur A with the levers L M, chains *f f'*, swiveled tube I, and suction-box J thereon, substantially as and for the purpose specified.

293,734. WATER-CLOSET. CHARLES HARRISON, New York, N. Y. Filed Sept. 1, 1883. (No model.)

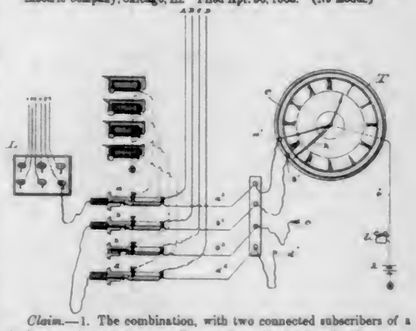
Claim.—1. The combination, with a nozzle or tubular portion of a water-closet bowl or hopper, having a flange at the outer end, and a pipe provided with a flange, of a coupling-ring having arms, a band embracing the arms of the said coupling-ring, and adapted to secure this coupling-ring to the nozzle or tubular portion of the water-closet bowl or hopper, another coupling-ring engaging with the flange of the pipe, and means whereby the coupling-rings may be united, substantially as specified.

2. The combination, with a nozzle or tubular portion of a water-closet bowl or hopper, having a flange at the outer end, and a pipe provided with a flange, of a coupling-ring having externally-shouldered arms, a band embracing the arms, abutting against the shoulders thereof, and provided with lugs that lap over the back of the flange of the nozzle or tubular portion of the water-closet bowl or hopper, another coupling-ring engaging with the flange of the pipe, and means whereby the coupling rings may be united, substantially as specified.



293,735. MARINE ELECTRIC MESSENGER. JOHN C. HENDERSON, New York, N. Y. Filed May 21, 1883. (No model.)

Claim.—1. The combination, with the drums A' A', of the cams *k'*, bearing against said drums, the armature i^2, operating said cams, the spiral springs i^3, and the axial magnets H in circuit with the magnets G, as and for the purpose specified.



2. The combination of the shaft *f*, friction-wheels *f' g'*, shafts *g g*, drums A', ropes h^2, magnets G G, the armature *k*, and the lever *h*, substantially as described, for effecting the operation by electricity of the rudder of the pilot-vessel.

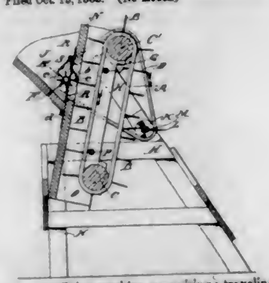
3. The combination of the electric cable *a*, windlass *b*, having a hollow shaft, rings *d*, and brushes *d'*, substantially as described, for allowing the winding and unwinding of the cable upon or from the windlass without breaking the electrical connection.

293,735.

293,736. TIME-SIGNAL FOR TOLL-LINES OF TELEPHONE-EXCHANGES. ANGUS S. HIBBARD, Milwaukee, Wis., assignor to the Western Electric Company, Chicago, Ill. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination, with two connected subscribers of a telephone-exchange, of a normally-open branch circuit, and a time-piece adapted to automatically close said branch circuit to the circuit of the connected subscribers, and thus send a signal to line at the expiration of a given time, substantially as set forth.

2. The combination, with two subscribers' lines connected together, of a normally-open branch circuit to ground, including a signal-bell and battery, and a time-piece, whereby said branch circuit may be closed automatically at the expiration of a given time, substantially as and for the purpose set forth.



3. The combination, at a telephone-exchange, with toll-lines and connecting apparatus, of independent branch lines, one branch line from each toll-line, a normally-open earth-circuit, including a battery and signaling device, and means whereby the said earth-circuit may be connected automatically at different times to the independent branch lines, substantially as and for the purpose specified.

4. The combination, at a telephone-exchange of two or more telephone-lines and their spring-jacks, of branch lines provided with terminal plugs or clasps, one branch line from each spring-jack, a time-piece adapted to support said terminal plugs or clasps about its dial, and means for automatically sending a signal on a telephone-line when the hand of the time-piece arrives at the plug connected to said line, substantially as and for the purpose set forth.

5. The combination, with a telephone-line, of a time-piece having an extra hand placed at a given distance behind the minute-hand and moving with said minute-hand, and a normally-open branch circuit adapted to be closed to said telephone-line by said extra hand when it has advanced

a distance equal to the distance between it and the minute-hand, substantially as specified.

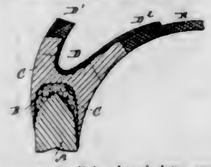
293,737. CORN-SILKING MACHINE. WILLIAM SAMPSON HORN, Mill Green, Md. Filed Oct. 15, 1883. (No model.)

Claim.—1. A corn-silking machine comprising a traveling belt provided with points or fingers, a brush for cleaning the fingers, a hopper, and a feeder, F *c*, arranged to operate substantially as described.

2. The combination, with the hopper J and the feeder F *c*, of the slotted plate R and shield S, arranged above the feeder in the hopper J, substantially as and for the purposes set forth.

3. The inclined endless traveling apron A, provided with points B, in combination with hopper J, feeder F *c*, and slotted plate R, arranged in the hopper, substantially as and for the purposes set forth.

4. In a corn-silking machine, the inclined endless apron A, provided with fingers B, in combination with hopper J, feeder F *c*, slotted plate R, arranged in the hopper, the shaft M, having pulley K, and the brush L, connected to shaft M, substantially as and for the purpose set forth.

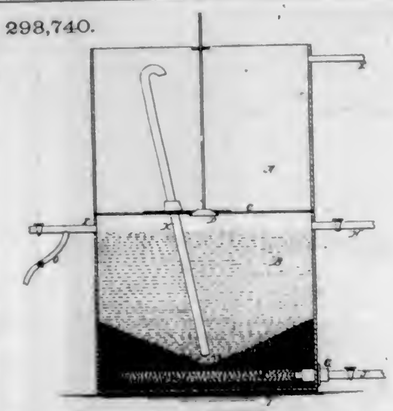


293,738. WEATHER-STRIP. JAMES H. HUMBL, New York, N. Y. Filed Aug. 24, 1883. (No model.)

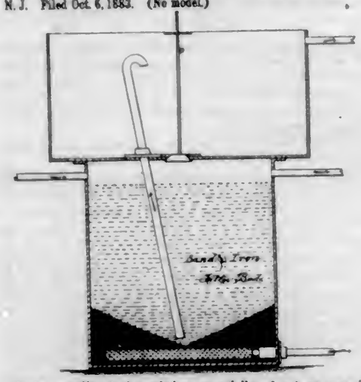
Brief.—A weather-strip consisting of a rubber strip folded in part fourfold, the fourfold part being held in the under bent margin of the metallic strip, and the two raw edges being held by the underbent other margin of the said metallic strip, all adapted to be secured to the door-jamb by nails.

Claim.—The elastic strip folded once upon itself along the center and back again from the raw edges part way the width of the double portion, in combination with the metal strip formed concavo-convex in cross-section, and having its edges folded into the cavity part way toward the center thereof, and embracing, respectively, the raw edges and fourfold edge of the elastic strip, substantially as described and shown.

293,739. RELINING RUBBER DENTAL PLATES. FRANK T. HYATT, Norwalk, Conn. Filed Oct. 2, 1883. (Model.)



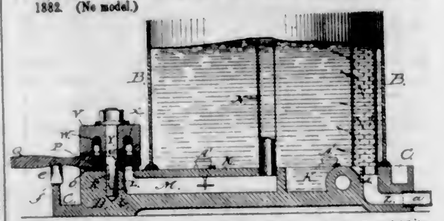
Claim.—The process of relining dental plates, consisting in first cutting away a portion of the roof-plate, and in notching the remaining portion containing the gum and teeth, applying a thin coating of rubber in the grooved upper portion of the gum-frame, and forming the roof-plate and the ridge above the gums, the new ridge and roof-plate being connected by said thin coating and tenoned to enter notches in the original gum-frame, substantially as set forth.



293,740. METHOD OF PURIFYING WATER. ISAIAH SMITH HYATT, Morristown, N. J. Filed Sept. 20, 1883. (No model.)

Claim.—The method hereinbefore described of arresting and removing the impurities from water during an uninterrupted passage of same from a supply-pipe into a filtering apparatus, thence through a filter-bed contained therein, and out through a delivery-pipe leading therefrom, which method consists in introducing into the water simultaneously with its passage to or into the filter a substance which will sufficiently coagulate or separate the impurities to facilitate their arrest and removal by the filter-bed, thus obviating the necessity of employing settling-basins.

293,740.

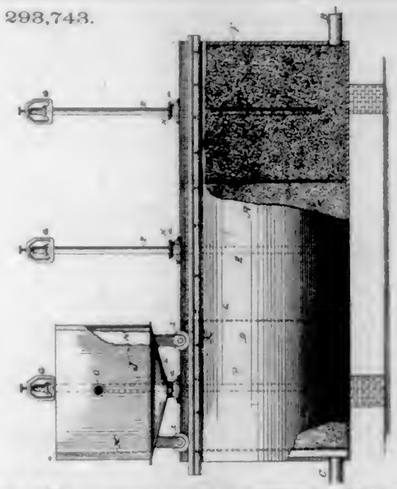


293,741. FILTERING MATERIAL. ISAIAH SMITH HYATT, Morristown, N. J. Filed Oct. 6, 1883. (No model.)

Claim.—A filter-bed consisting, essentially, of an inert material and metallic iron in comminuted form thoroughly commingled, substantially as set forth.

293,742. FILTER. JOHN W. HYATT, Newark, N. J. Filed Dec. 28, 1882. (No model.)

Claim.—1. In a filter, the base having the passages G, J, and M, in combination with a valve by which the water may be caused to flow either through the passage G or through the passage J and return-passage M, substantially as set forth.



2. In a filter, the valve consisting of the movable plate P, placed between the blocks V D, the plate having ports R S T, the block V, having ports W X, and the block D, having the ports E, F, and L, in combination with the base having passages leading therefrom into the filter, substantially as set forth.

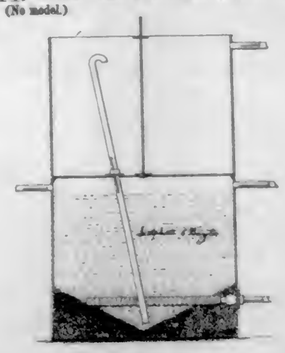
3. In a filter, the escape-passage M and central pipe, N, having a perforated cone on its upper portions, substantially as set forth.

293,743. FILTER. JOHN W. HYATT, Newark, N. J. Filed Aug. 11, 1883. (No model.)

Claim.—1. A filter subdivided by the vertical partitions G into a series of compartments, the upper part of the partitions being imperfo-

293,743.

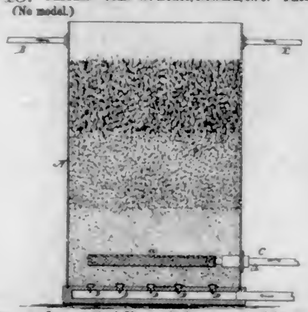
rate, and the compartments containing beds of filtering material in comminuted form and graded as to the size of the particles thereof, the finer being in the compartment adjacent to the outlet and the coarse elements in the compartment adjoining the inlet, the water being caused to pass through the partitions and separate filter-beds from the inlet to the outlet, substantially as set forth.



2. A filter consisting of a receptacle subdivided into two or more compartments containing separate beds of filtering material in comminuted form and graded as to size, the finer particles being in the chamber adjacent to the outlet, in combination with an auxiliary receptacle arranged over the compartments containing the filtering material, and means for transferring the filtering material from each compartment of the main into the auxiliary receptacle by a current of water, the particles of the filtering material being washed in transit substantially as set forth.

3. A filter consisting of a receptacle subdivided into two or more compartments containing beds or filtering material, in combination with an auxiliary receptacle mounted thereon, and the transfer-pipes for discharging the contents of each of the compartments by means of a current of water into the said auxiliary receptacle, substantially as set forth.

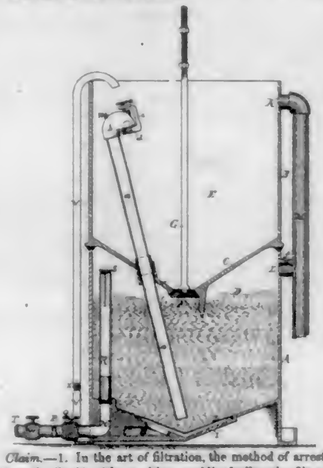
4. A filter containing an inlet and an outlet, and consisting of two or more compartments inclosing beds of filtering material, in combination with an auxiliary receptacle mounted thereon, and pipes for transferring the contents of each of the compartments by means of a current of water into the auxiliary receptacle, the upper part of each compartment being provided with means of communication with the lower part of the said auxiliary receptacle, substantially as set forth.



5. A receptacle subdivided into two or more compartments by perforated partitions, each compartment containing a bed of filtering material, in combination with an auxiliary receptacle mounted over the same upon tracks, and the transfer washing-pipe for each of said compartments, the auxiliary receptacle containing a lining of perforated metal or wire-cloth and a waste-outlet, substantially as set forth.

293,744. FILTER. JOHN W. HYATT, Newark, N. J. Filed Aug. 21, 1883. (No model.)

Claim.—A filter-bed consisting, essentially, of natural sulphate of baryta or heavy-spar in comminuted form, substantially as set forth.

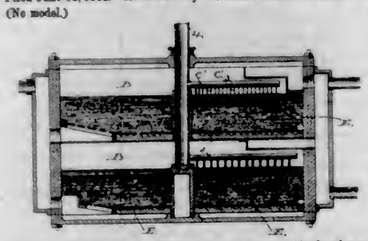


293,745. FILTER. JOHN W. HYATT, Newark, N. J. Filed Aug. 21, 1883. (No model.)

Claim.—1. In a vertical filter, a bed composed of layers of material of varying specific gravity, the layers being placed one directly upon another, and the heavier material being adjacent to the outlet, substantially as described.

2. A filter-bed consisting of comminuted sulphate of baryta, sand, and coke, or equivalent substances, the material being arranged in well-defined layers, one upon another, the baryta being at the bottom and the coke at the top, substantially as set forth.

293,746. ART OF FILTRATION. JOHN W. HYATT, Newark, N. J. Filed May 28, 1883. (No model.)

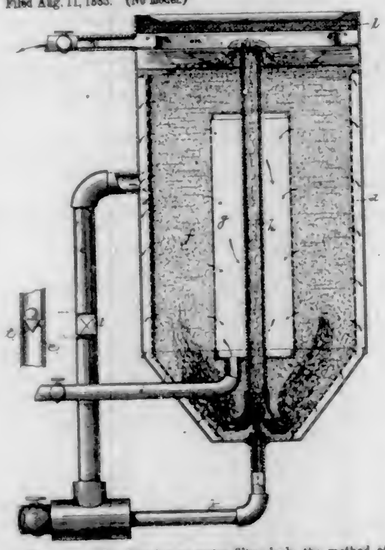


Claim.—1. In the art of filtration, the method of arresting impurities from the liquid without either rapidly fouling the filter-bed or permitting the more minute particles of foreign matter to escape, and of cleansing the filter-bed by discarding such portions thereof as have become intimately united with the impurities and washing the remaining portions, which method consists in passing the liquid through a bed composed of fine and coarse agents commingled together, and then agitating the bed and causing the finer elements thereof, together with the impurities, to be carried away by a current of the liquid, substantially as set forth.

2. In the art of filtration, the method of arresting impurities from the liquid without either rapidly fouling the filter-bed or permitting the more minute particles of foreign matter to escape, and of cleansing the filter-bed by discarding such portions thereof as have become intimately united with the impurities and washing the remaining portions, which method consists in passing the liquid through a bed composed of material of varying specific gravity thoroughly commingled, and then agitating the bed and causing the lighter elements thereof, together with the impurities, to be carried away by a current of the liquid, substantially as set forth.

3. In the art of filtration, the method of arresting impurities from the liquid without either rapidly fouling the filter-bed or permitting the more minute particles of foreign matter to escape, and of cleansing the filter-bed by discarding such portions thereof as have become intimately united with the impurities and washing the remaining portions, which method consists in passing the liquid through a filter-bed composed of comminuted charcoal and sand commingled together, and then agitating the bed and causing the charcoal, together with the impurities, to be carried away by a current of the liquid, substantially as set forth.

293,747. ART OF FILTRATION. JOHN W. HYATT, Newark, N. J. Filed June 18, 1881. Renewed May 11, 1882. Renewed Aug. 16, 1883. (No model.)



Claim.—1. In the art of filtration by means of beds of granular material, the method of preventing the deposition of silt and other obnoxious substance, which consists in agitating the upper part of the bed to a sufficient depth without disturbing the lower part of the bed or interfering with its functions as a filtering agent, substantially as set forth.

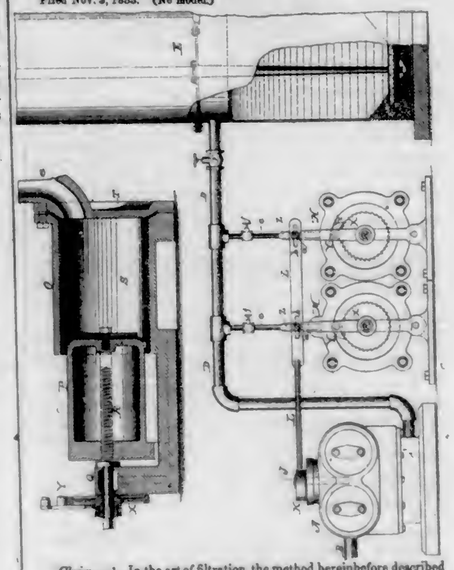
2. In the art of filtration by means of beds of granular material, the method of preventing the deposition of silt and other obnoxious substance, which consists in the frequent or continuous agitation of the upper surface of the bed by raking without disturbing the lower part of the bed or interfering with its operation as a filtering agent, substantially as set forth.

3. A device for effecting the agitation of the upper layer of a filter-bed composed of material in reduced or granular form, consisting of the pipes 4, 3, 2, and 1, the last being adapted to be moved through the surface of the filter-bed and to issue jets of water therein, substantially as set forth.

293,748. ART OF FILTRATION. JOHN W. HYATT, Newark, N. J. Filed Aug. 11, 1883. (No model.)

Claim.—1. In cleansing granular filter-beds, the method of removing the impurities therefrom in such manner that a small portion only of the whole body of the filtering medium is subjected to the cleansing process at the same time, which method consists in moving a current of the filtering substance, together with a stream of water, from the lower to the upper part of the filter-bed, whereby the particles are separated and washed in transit and the impurities are carried off with the escaping water, substantially as set forth.

2. In cleansing granular filter-beds, the method of removing the impurities therefrom by a continuous washing without interfering with the filtering process, which method consists in moving a current of the filtering substance, together with a stream of water, from the lower to the upper part of the bed without checking the flow of the liquid to be purified, whereby the particles are separated and washed in transit, and the impurities are carried off by the escaping water without interfering with the filtering process, substantially as set forth.



3. A filter consisting of the outer casing having a supply and delivery, a filter-bed composed of material in granular or comminuted form, and a pipe or tube passing through the bed adapted to transfer the material from the lower to the upper part thereof by means of a stream of water, whereby all of the elements of the bed are displaced and cleansed, the impurities being allowed to escape with the waste water, substantially as set forth.

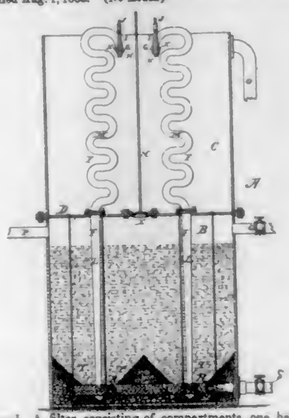
4. A filter consisting of the outer casing, the bed of filtering material in granular or comminuted form, a supply and delivery, a transfer pipe or tube, and means for moving the elements of the filter-bed, together with a stream of water, from the lower and depositing it upon the upper part of the same, through said pipe or tube, in process of washing the bed, substantially as set forth.

5. In a filtering apparatus containing a bed of filtering material in granular or comminuted form, and a supply and delivery, a transfer pipe or tube, and a jet-pipe placed directly below the lower end of said pipe or tube, by which a current of water carrying the elements of the filter-bed is induced upward through the tube, substantially as set forth.

6. In a filtering apparatus, the outer casing, the bed of filtering material in granular or comminuted form, the central transfer pipe or tube, the jet-pipe placed directly below the lower end of transfer pipe or tube, and overflow-trough, substantially as set forth.

293,749. ART OF FILTRATION. JOHN W. HYATT, Newark, N. J. Filed Nov. 3, 1883. (No model.)

Claim.—1. In the art of filtration, the method hereinbefore described of coagulating and arresting the impurities and of preventing any of the coagulating agents in solution passing off with the filtered water, which method consists, first, in introducing into the water prior to or at its entrance into the apparatus a substance which will produce coagulation, and then a substance which will operate to precipitate the excess of the coagulant and prevent any of the same in solution from passing off with the water, and finally allowing the water to pass through a bed of filtering material.



2. In the art of filtration, the method hereinbefore described of coagulating and arresting the impurities and of preventing any of the coagulating material from passing off in solution with the filtered water, which method consists in introducing iron and lime, substantially as described, into the water prior to or at its entrance into the apparatus, and then allowing the water to pass through a bed of filtering material.

3. The combination of a filter, an ejector consisting of a cylinder and piston, and being in communication with the supply-pipe of the filter, and a motor for actuating the piston of the ejector, substantially as set forth.

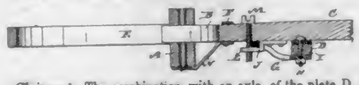
4. The ejector consisting of the cylinder, piston, screw, and escape-pipe, in combination with a filter and means for actuating the screw simultaneously with the flow of water to the filter, substantially as set forth.

5. The ejector consisting of the cylinder, hollow piston, flexible bag or diaphragm, screw, pawl, and ratchet, substantially as set forth.

293,750. APPARATUS FOR FILTERING. JOHN W. HYATT, Newark, N. J. Filed Aug. 1, 1883. (No model.)

Claim.—1. A filter consisting of compartments, one having inlet and outlet ports and containing a bed of filtering substance, and being connected with another compartment by a transfer washing pipe or pipes arranged within the filter, substantially as set forth.

2. A filter consisting of compartments, one having inlet and outlet ports and containing a bed of filtering substance, and being connected with another compartment by a transfer washing pipe or pipes, cone-shaped formations being provided upon the base of the filter, to direct the elements of the filter-bed to the mouth of the transfer pipe or pipes during the process of washing the same, substantially as set forth.



3. A filter consisting of compartments provided with suitable inlet and outlet ports, one of the compartments containing a bed of filtering substance, and being connected with the adjacent compartment by a transfer washing pipe or pipes, and provided upon its base with cone-shaped formations composed of coarse and finer stone or gravel, substantially as set forth.

4. A filter consisting of compartments, one containing a bed of filtering substance, and being connected with the other compartment by a transfer pipe or pipes, that portion of same outside of the compartment containing the filtering substance being bent into a serpentine coil, substantially in the manner and for the purposes expressed.

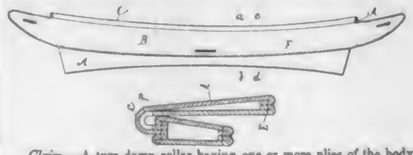
5. A filter consisting of compartments, one containing a bed of filtering substance, and being connected with the other by a transfer pipe or pipes arranged within the filter, the pipe in the compartment containing the filter-bed being tapered, and that within the other compartment being coiled or bent, substantially as and for the purpose set forth.

6. A filter consisting of compartments connected by one or more transfer washing-pipes arranged within the filter, a portion of the pipe being formed into a serpentine coil, substantially as set forth.

293,751. WAGON-TONGUE SUPPORT. NATHANIEL JOHNSON, Harrisburg, Ill. Filed Nov. 17, 1883. (No model.)

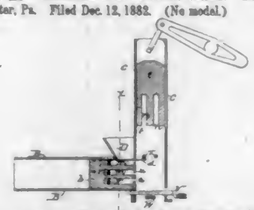
Claim.—1. The combination, with an axle, of the plate D, held in front of the same, the fork or slotted plate G, secured beneath the tongue to the said plate D, the clip L on the under side of the tongue, the bolt or wrench M, and the hounds B, secured to the axle and on the plate D, substantially as herein shown and described.

2. The combination, with an axle, of the plate D, held on the front ends of yoke E, secured on the axle, the hounds B, secured to the axle and to the bar D, the cross-plate F, the fork or slotted plate G, having cross-bar J, connecting its forked ends, and which plate is held to the plate D, the clip L on the under side of the tongue, and of the bolt or wrench M, substantially as herein shown and described.



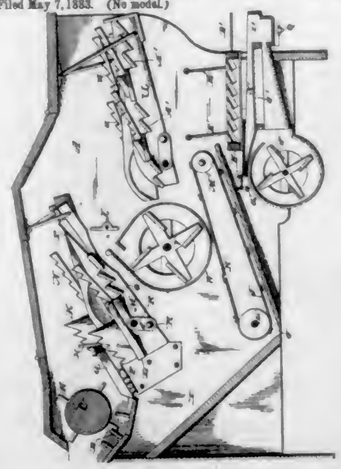
3. The combination, with the axle, the yoke C, secured upon the axle, and having an attached plate, D, the hounds B, secured to the axle and to the plate D, and provided with a cross-plate, F, of the fork G, having its ends connected by a cross-bar, J, the tongue C, having the angular clip L, secured upon its under side, and of the bolt or wrench M and bolt H, the said bolt serving as a connection for the plates D G and as a pivot for the axle-tree I, located between said plates, substantially as shown and described.

293,752. COVERING FOR STEAM BOILERS, PIPES, AND OTHER HEATED SURFACES. EDWARD KRAHNSTEHL and PAUL RECK, Allegheny, Pa. Filed Oct. 10, 1883. (No model.)



Claim.—A covering for steam boilers, pipes, &c., consisting of layers of paper firmly united together, or paper-pulp, the said covering being lined or coated on its inner surface with asbestus, and the said lining and covering being fluted or corrugated longitudinally, whereby air-spaces are formed between the boiler and covering, substantially as set forth.

293,753. COLLAR. FREDERICK R. LEWIS, Troy, N. Y., assignor to Wood, Lewis & Hawley. Filed June 15, 1883. (No model.)



Claim.—A turn-down collar having one or more plies of the body part punctured to form a row of small apertures longitudinally of the collars, substantially as described, and for the purposes set forth.

293,754. MACHINE FOR MINCING MEAT. DANIEL H. LINTNER, Lancaster, Pa. Filed Dec. 12, 1882. (No model.)

Claim.—In combination with the slotted plungers *b* and *c*, the cleaning-rods *v v*, substantially as and for the purpose specified.

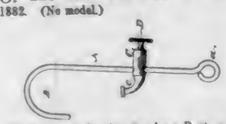
293,755. THRASHING-MACHINE. DAVID LIPPY, Mansfield, Ohio. Filed May 7, 1883. (No model.)

Claim.—1. In a thrashing-machine, the combination, with a thrashing cylinder and concave, of a grate arranged to incline toward the rear end of the concave, said grate consisting of longitudinal and cross bars, a portion of the longitudinal bars being provided with shields on their rear ends, substantially as set forth.

2. In a thrashing-machine, the combination, with a grate provided with shields at its rear end, of vibrators provided with straw carrying and elevating devices located between the bars of the grate, and arranged and adapted to carry the straw rearwardly and lift it over said shields, substantially as set forth.

3. The combination, with the concave, a grate in rear of the concave provided with upwardly-projecting shields and vibrators, and an independent set of vibrators, of an air-forcing device arranged to deliver a blast of air to the straw at a point between said shields and the rear set of vibrators, substantially as set forth.

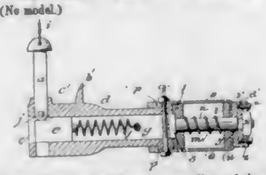
4. In a thrashing-machine, the combination, with the vibrators, of an air-forcing device arranged close beneath the rear ends of said vibrators, and adapted to force the blast directly against the under side of said rear ends, substantially as described.



5. In a thrashing-machine, the combination, with the vibrators and air-forcing device, arranged as described, of the deflector, the hand-lever for adjusting the deflector, and the rack to secure the hand-lever after adjustment, substantially as described.

6. The combination, with two sets of independent vibrators, an air-forcing device for delivering air to the straw before its delivery to the rear set of vibrators, of a hopper bottom located beneath the concave and vibrators adjacent thereto, and endless carrier located in close proximity to said hopper, substantially as set forth.

7. The combination, with the concave, grate, two sets of vibrators, and the fan, of the hopper bottom and carrier and screen located beneath said vibrators, substantially as set forth.



8. The combination, with the grate, of the forward set of vibrators, consisting of the longitudinal frame-bars, the transverse slats secured thereon, the serrated elevators and serrated carriers mounted above said slats, and the rearwardly-projecting fingers, substantially as described.

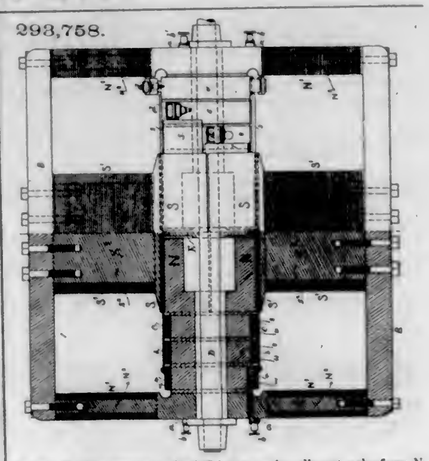
293,756. KEY-FASTENER. NELSON B. LITTLE, Chicago, Ill. Filed Sept. 5, 1882. (No model.)

Claim.—The wire A, having the loop B at one end and the loop *a* at the other, in combination with the hub C, having hook *c*, said hub having a transverse opening, *d*, for the passage of the wire, and a screw-threaded longitudinal opening for the reception of a set-screw, and the set-screw D, substantially as described.

293,757. CAR-COUPLING. JOHN J. LLOYD, Streator, Ill. Filed May 22, 1883. (No model.)

Claim.—1. The combination, in a car-coupling, of the draw-bar *d*, yoke-bar *o*, draw-bolt *n*, buffer-spring *m*, and washers *l*, the yoke being connected to the draw-bar by the shoulders *p* and bolt *q*, and the bolt *n* being extended through the bar *o* and secured by nut *x*, substantially as described.

2. The draw-bolt connected to the plate *d'* by a square shank, *y*, and secured by the nut *x*, having a lock-plate, *z*, held to the plate *d'*, and also fastened to it with a screw or screws, substantially as described.



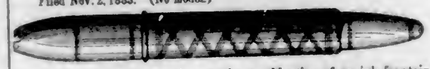
3. The link *b*, having a slot increasing in width from the rear to the front end thereof, to adapt it for self-coupling on a curved track.

4. The combination, with the draw-bar, buffer-spring, and bolt *n*, of the flat bent bar *o*, connected by shoulders *p* with said draw-bar, the fastening-bolt *q*, passing through the rear end of draw-bar in front of the head of bolt *n*, and the washers *l l*, arranged at the head and back end of said bar, whereby the buffer-spring and bolt are secured, as described.

293,758. DYNAMO-ELECTRIC MACHINE. ADOLPH E. GUSTAV LIEBE, New York, N. Y. Filed Nov. 12, 1883. (Model.)

Claim.—1. The external electro-magnets, having pole-faces S, the internal poles, N, and back bars or frames connecting the cores and poles, in combination with the shaft D, passing through the tubular portion of

293,758.

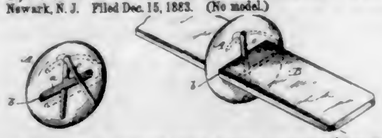


the pole N, the armature-wheel E between the adjacent pole-faces N, and the armature-cage C, connected to the edge of the wheel E, and passing between the pole-faces N S, substantially as set forth.

2. The field-magnets and pole-faces N S, arranged substantially as described, in combination with the central shaft, D, to which power is applied to rotate the same, the disk E, the armature-cage composed of metal plates connected at the edge of the disk E and passing between the pole-faces N S, the rings 4 6, connecting the plates of the armature-cage, the insulated rings 41 61, and circuit-connections, substantially as set forth.

3. The field-magnets and pole-faces N S, arranged substantially as described, in combination with the central shaft, D, to which power is applied to rotate the same, the armature-disk E upon such shaft, the cage C, connected to the edge thereof and passing between the pole-faces, the rings connecting the end portions of the armature-cage, and brushes applied to maintain metallic contact between the revolving and stationary parts, substantially as set forth.

293,759. FOUNTAIN-PEN. HERMANN MADEHEIM, Brooklyn, N. Y. Filed Nov. 2, 1883. (No model.)



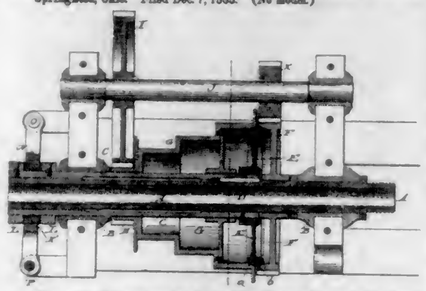
Claim.—1. In a fountain-pen, the combination of an ink-fountain having a discharge-spout, a fixed exterior handle-section surrounding the ink-fountain, and a telescoping extension that is guided between the ink-fountain and the main handle-section, substantially as set forth.

2. In a fountain-pen, the combination of an ink-fountain having a discharge-spout and a stop-shoulder at each end, a fixed handle-section inclosing the ink-fountain, and a telescoping extension-handle having a shoulder at its inner end, by which it is guided between the ink-fountain and handle-section, substantially as specified.

3. The combination of the ink-fountain having a valved ink-discharge spout, a piston having a hollow piston-rod, and a detachable extension piston-rod adapted to be screwed into a socket at the end of the hollow piston-rod, or placed in inverted position into the same when not in use, substantially as set forth.

293,760. BUTTON FOR DRIVING-REINS. STEPHEN A. MARKER, Newark, N. J. Filed Dec. 15, 1883. (No model.)

Claim.—1. A driving-rein button having a transverse slot or opening through it for the reception of the rein, and provided with a self-closing slit or opening extending from said transverse slot or rein-opening to the periphery of the button, in combination with a device for securing said button to the rein, substantially as and for the purpose specified.



2. A driving-rein button having interposed or embedded between its sides a bent wire or brace, substantially as and for the purpose described.

3. A driving-rein button having a transverse opening through it for

the reception of the rein or strap thereof, a slit extending from said opening to the periphery of the button, and a tongue suitably connected directly thereto, substantially as and for the purpose set forth.

4. The combination of a driving-rein button having a transverse slot or opening for the reception of the rein, and a slit or opening extending from said transverse slot or rein-opening to the periphery of the button, with a bent wire or brace interposed or embedded between the sides of said button, and a fastening device for securing the rein thereto, substantially as and for the purpose specified.

293,761. CHANGEABLE-SPEED GEARING. SAMUEL W. MARTIN, Springfield, Ohio. Filed Dec. 7, 1883. (No model.)

Claim.—1. The rotary spindle, and the double friction-wheel movable lengthwise thereof, but fixed against rotation thereon, in combination with the driving-gear F, and the cone-pulley and its pinion, both arranged to revolve loosely on the spindle, and the gears connecting the cone-pulley and gear F, substantially as described, whereby the friction-wheel and spindle may be driven directly from the cone-pulley or from the gear F, or permitted to remain at rest.

2. The rotary spindle, the sleeve arranged to rotate therewith and slide thereon, the double conical friction-wheel secured to said sleeve, the gear F, mounted loosely on the spindle and adapted to engage with the friction-wheel, and the cone-pulley mounted loosely on the sleeve and provided with the pinion H, in combination with the differential gear connecting the gear F and pinion H.

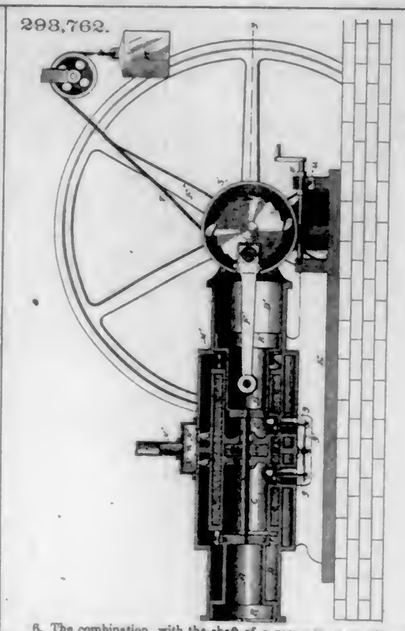
3. In combination with the spindle, the sleeve, the friction-pulley, the gear F, the cone-pulley, and the connecting-gear, the collar encircling the spindle, the lever engaging with said collar, and the eccentric to operate the lever.

4. In combination with the spindle, the two toothed wheels arranged to revolve loosely thereon at different speeds, the friction-wheel having tapered surfaces adapted to connect with the two gears alternately, and means, substantially as described, for effecting the lateral movement of the friction-wheel.

5. In combination with the spindle, the loose pulley G and its gear H, the loose gear F, the intermediate connecting-gear, and the friction-pulley connected to the spindle to revolve therewith, and arranged for engagement with the cone-pulley or the driving-gear at will by a lateral movement.

293,763. GAS-MOTOR. HIRAM S. MAXIM, Paris, France. Filed Mar. 9, 1883. (No model.)

Claim.—1. In a gas motor or engine operating by explosions of gas or gaseous mixtures, the combination of two working-pistons, two exhaust-pistons, valve mechanism, and igniting devices, all substantially as described, these parts being constructed for operating conjointly as a double-acting engine, as set forth.

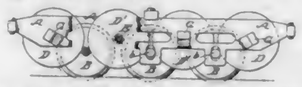


2. In a gas motor or engine operating by explosions of gas or gaseous mixtures, the combination, with two sets of cylinders placed end to end, of two working and two exhaust pistons connected together and working in said cylinders, valve mechanisms connected with the cylinders, and igniting mechanism operating conjointly as a double-acting engine, as set forth.

3. In a double-acting gas-engine, the combination, with two sets of cylinders and connected pistons working therein, of two sets of exhaust-air-inlet and gas-inlet valves, and an igniting mechanism for exploding the charges in the cylinders alternately, as set forth.

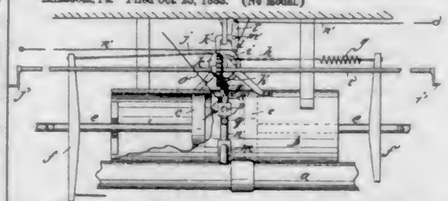
4. The combination, with cylinders C C' and connected pistons A A', of valve mechanism for admitting charges of air and gas into the cylinders alternately, mechanism for igniting the charges, and mechanism for withdrawing the products of the combustion of the charges, these parts being constructed and arranged for conjointly operating as a double-acting engine, as set forth.

5. The combination, with the shaft of a gas engine or motor, of a loose belt or fly-wheel, means for locking it to the shaft, and a starting device for imparting a rotary movement to the shaft, as and for the purpose set forth.



293,762.

6. The combination, with the shaft of a gas engine or motor, of a winding-drum, a cord, and a weight arranged for imparting a rotary movement to the shaft for starting the engine, as set forth.



7. The combination, with the shaft of a gas engine or motor, of a loose belt or fly-wheel, an adjustable friction-clamp, a winding-drum, a cord, and a weight, these parts being constructed to operate as a starting device for the engine, as set forth.

293,768. CAR-TRUCK. ALEXANDER E. MCCONNELL, New Orleans, La. Filed June 27, 1883. (No model.)

Claim.—The combination, in a railroad-car truck or frame, A, of the axles C and running-wheels B thereon, the superimposed wheels D D', arranged to run upon opposite sides of the journals *b* of said axles, and so that each intermediate wheel, D', bears against the journals of two adjacent axles, C, and the axles E arranged to connect the superimposed wheels D D' upon opposite sides of the truck or frame, substantially as specified.

293,764. AIR OR LIQUID BRAKE. ROBERT MARSHALL MCKINNEY, Elizabeth, Pa. Filed Oct. 25, 1883. (No model.)

Claim.—1. The combination, in a fluid-brake apparatus, of one or more springs, *g*, to apply the brakes to the wheels, cylinder *b*, pistons *c*, and a fluid substance under pressure to force back the springs and release the brakes, and a balanced valve, *o*, to open the exhaust and close the same, according as the pressure is increased or diminished in the supply-pipe to the cylinder, substantially as described.

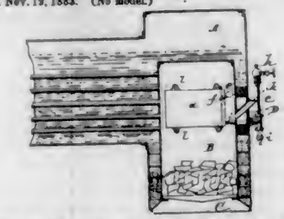
2. The combination, in a fluid-brake apparatus, of the cylinder *b* and pistons *c*, to release the brakes from the wheels by the effect of fluid pressure on the pistons, and allow said brakes to act when the fluid-

pressure is diminished, the pipe *a*, for supplying the liquid under pressure to the cylinder, check-valve *l*, and slide-valve *t* in the branch *m*, connecting said pipe *a* and cylinder, and the balanced exhaust-valve *o* in stand-pipe *n*, connecting with the cylinder and supply-pipe, said exhaust-valve *o* being connected with the slide-valve *t*, substantially as described.

3. The combination, in a fluid-brake apparatus, of the supply-pipe *a*, cylinder *b*, pistons *c*, one or more springs, *g*, scroll-pulleys *i*, and concentric pulleys *k*, and means for closing and opening the exhaust of said cylinder, the said supply-pipe being charged with fluid under pressure, substantially as described.

4. The combination of a spring, *y*, with the balanced valve *o*, said spring being adapted to vary the balance of pressure on the different sides of the valve *o*, and said valve being arranged in the pipe *n*, and with relation to the supply-pipe *a*, cylinder *b*, exhaust *q*, and the slide-valve *t*, substantially as described.

5. The combination of the adjusting-screw *b'* with the spring *y* and the balanced valve *o*, said valve being arranged in the pipe *n* and in relation to the supply-pipe *a*, cylinder *b*, slide-valve *t*, and the exhaust-passage *q*, substantially as described.



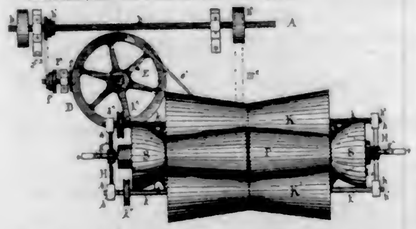
6. The adjusting-shaft *z'*, adjusting-screw *b'*, and spring *y*, in combination with the balanced valve *o*, said valve being arranged in the pipe *n* and with relation to the supply-pipe *a*, cylinder *b*, exhaust *q*, and the slide-valve *t*, substantially as described.

7. The adjusting-screw *b'*, hollow stem *c'*, disk *z*, spring *y*, and bar *x*, in combination with the balanced valve *o*, said valve being arranged in the pipe *n* and with relation to the supply-pipe *a*, cylinder *b*, exhaust *q*, and the slide-valve *t*, substantially as described.

8. The combination of the conductor's cord *c'* with the spring *y* and valve *o*, said valve being arranged in the pipe *n* and with relation to supply-pipe *a*, cylinder *b*, exhaust *q*, and the slide-valve *t*, substantially as described.

9. The combination, in a brake apparatus having springs to apply the brakes, of the pistons *c*, cross-heads *f f'*, springs *g*, chains *h*, scroll-pulleys *i*, chains *j*, and concentric pulleys *k*, substantially as described.

293,765. SMOKE-CONSUMER. THOMAS J. MCLAUGHLIN, Chicago, Ill. Filed Nov. 19, 1883. (No model.)



Claim.—1. The pipe or tube *d'*, having two or more discharge-nozzles, *f*, in combination with the case *a* and a steam-coil, *d'*, forming the superheater, located in the interior of the fire-box, substantially as described.

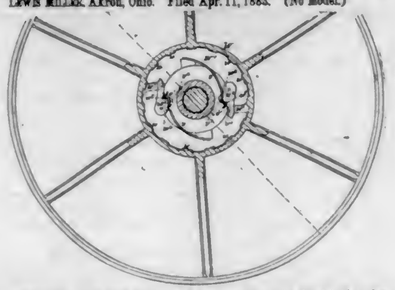
2. The combination of the coil or superheater *d'*, casing *a*, located in the interior of the fire-box, discharge-pipe *e e'*, and nozzles *f*, substantially as described.

3. The combination of the pipes *c d* and valve *A* with the superheating coil *d'*, casing *a*, inclosing the coil and located in the interior of the fire-box, delivery-pipe *e e'*, and nozzles *f*, substantially as described.

293,766. MACHINE FOR FORMING FELT BOOTS OR SHOES. DANIEL F. MESSER, Baltimore, Md., assignor to the Merino Shoe Company, Kennebunk, Me. Filed Dec. 22, 1883. (No model.)

Claim.—1. In a machine of the kind described, a rectilinearly-reciprocating former-frame, as set forth.

2. In a machine of the kind described, a former-frame combined with means for imparting rectilinear reciprocating motion to the frame, as set forth.



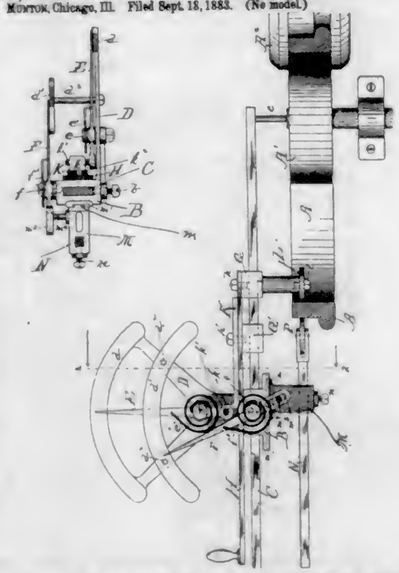
3. In a machine of the kind described, a rectilinearly-reciprocating former-frame having main former-rollers K K' and ancillary former-rolls L L, as set forth.

4. A cone having a body and end pieces, in combination with main former-rolls K K' and ancillary former-rolls L L, as set forth.

5. In a machine of the kind described, the former-rolls K K', one of which is in a plane below the other, as set forth.

6. A former-frame provided with main former-rollers K K' and ancillary former-rolls L L, as set forth.

293,767. PAWL-AND-RATCHET MECHANISM FOR HARVESTERS. LEWIS MILLER, Akron, Ohio. Filed Apr. 11, 1883. (No model.)



Claim.—1. The combination of the pawl provided with the elongated hub or lug, the plate to which it is pivoted, and the spring provided with the angle or shoulder and acting on the pawl-lug to hold the pawl in either of two positions according to adjustment, substantially as hereinbefore set forth.

2. The combination of the rotated ratchet, the shaft upon which it is loosely mounted, the pawl-carrier fastened to said shaft, the adjustable pawl, and the spring by which the pawl is held in or out of action, substantially as hereinbefore set forth.

3. The combination of the slotted pawl-carrier, the shaft to which it is keyed, the rotating hub having the internally-toothed peripheral flange and loosely mounted on said shaft, the pawl, the pin or arm secured thereto and projecting through the slot of the pawl-carrier, the pawl-lug, and the spring provided with the angle or shoulder and acting on the pawl-lug, substantially as described, for the purpose hereinbefore set forth.

293,768. INDICATOR FOR TIRE-ROLLING APPARATUS. JAMES MOYTON, Chicago, Ill. Filed Sept. 18, 1883. (No model.)

Claim.—1. In a tire-rolling indicator, the combination of a device for indicating the interior diameter of the tire as it is being rolled with

a device for simultaneously indicating its exterior diameter, substantially as specified.

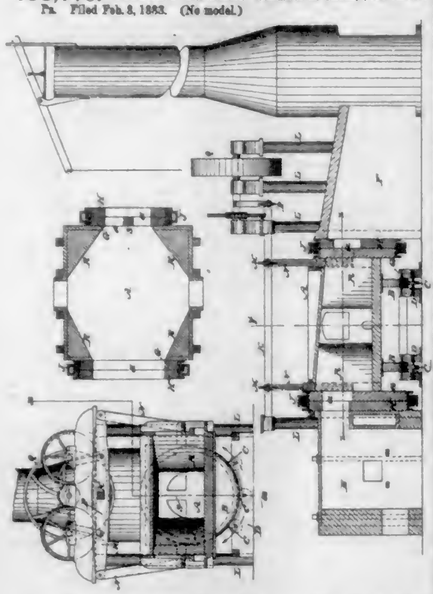
2. The combination of a pair of index-fingers with movable slides or arms adapted to bear against the interior and exterior surfaces of the tire, and mechanism connecting said slides or arms with said index-fingers, so as to simultaneously indicate both the interior and exterior diameters of the tire, substantially as specified.

3. The combination of rod C, provided with pin e, adapted to be fixed at the center of the roll or other point from which measurements may be taken, and adjustable slide B, provided with dial-arcs *d* and *d'*, index-levers E and F, pivoted to said slide, slide G, furnished with roller L, handle-bar H, and plate K, secured to slide G, for operating said index-lever E therefrom, slide M, mounted on slide B, and connected with index-lever F, rod N, and roller P, substantially as specified.

4. The combination, with rollers L and P, mounted on movable slides or arms and adapted to bear against the interior and exterior surfaces of the tire, of the index-levers E and F, for indicating the interior and exterior diameters of the tire, and operated from said rollers L and P through suitable connecting rods or devices, substantially as specified.

5. In a tire-rolling indicator, the combination, with a roller adapted to bear against the surface of the tire and mounted on a movable slide, of a dial-arc and a movable index-lever connected with said movable slide to indicate the diameter of the tire, substantially as specified.

6. In a tire-rolling indicator, the combination of rod C, adjustable slide B, dial-arc *d*, index-lever E, slides G, provided with roller L, and means for operating said index-lever from said slide G, substantially as specified.

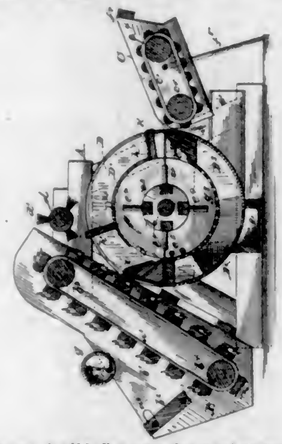


7. The combination of rollers L and P with movable slides or arms on which they are mounted, the index-levers E and F, dial-arcs *d* and *d'*, and means for operating said index-levers from the movable slides or arms on which said rollers are mounted, substantially as specified.

293,769. MUFF. PHILIPP NORDEN, Leipsic, Germany. Filed May 25, 1883. (No model.)

Claim.—In combination with a muff, A, the pocket or bag-shaped opening S, with the elongated part V, and projection or strap w, arranged to operate as and for the purpose substantially as described.

293,770. PUDDLING-FURNACE. RICHARD H. OATES, Port Clinton Pa. Filed Feb. 8, 1883. (No model.)



Claim.—1. The furnace E and flue F, each with a boss, H, in combination with an intermediate puddling-chamber, A, having segmental shoes B, and a saddle, D, with rollers C, said chamber having on its inner corners deflectors R, and at opposite ends divisional bridges S and hollow trunnions G, substantially as set forth.

2. The furnace E and flue F, each with a boss, H, in combination with an intermediate puddling-chamber, A, having segmental shoes B, flanged annuli J, and a saddle, D, with rollers C, said chamber having interior deflectors, R, and at opposite ends divisional bridges S and hollow trunnions G, having flanges which are embraced by the flanged annuli J, substantially as set forth.

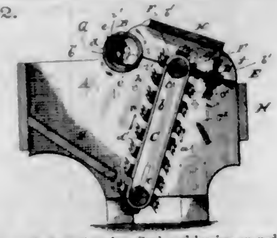
3. The furnace E and flue F, each with a boss, H, in combination with an intermediate puddling-chamber, A, having segmental shoes B, divisional bridges S, deflectors R, hollow trunnions G, the saddle D, with rollers C, the annuli J, shaft K, cross-heads M, arms N, cross-head P, and operating mechanism, substantially as and for the purpose set forth.

293,771. SELF-FEEDING COTTON-CLEANER AND GIN-FEEDER. JAMES WOOD OGLESBY and ZENOS WEB OGLESBY, Kingston, Ga. Filed May 25, 1883. (No model.)

Claim.—1. A self-feeding cotton-cleaner and gin-feeder consisting of a frame, an endless receiving-belt provided with projecting saw-teeth, a revolving brush, a perforated cylinder having feed and discharge openings, a cylinder provided with arms working within said perforated cylinder, revolving exhaust-fans at the ends of said perforated cylinders, suitable exhaust and discharge flues, an endless apron, and suitable operating mechanism, substantially as and for the purpose set forth.

2. In a cotton-cleaner, the combination of a frame, a perforated cylinder provided with openings for the reception and discharge of the cotton, a series of projecting arms mounted on a revolving shaft working within said cylinder, a pair of exhaust fans, exhaust and discharge flues, means for feeding to and carrying away the cotton from said cylinder, and suitable operating mechanism, substantially as and for the purpose set forth.

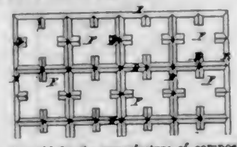
3. A cotton-cleaner comprising a frame, a cleaning-cylinder the lower half of which is perforated, a revolving shaft working centrally through said cylinder, said shaft having projecting arms and fan-blades mounted thereon, suitable fan-casings, exhaust and discharge flues, a revolving brush journaled above said cylinder, an endless apron, said apron being adapted to deliver the cotton against said brush and into said cylinder, and suitable operating mechanism, substantially as and for the purpose set forth.



4. In a cotton-cleaner, the cylinder D, having an inlet-opening, *j*, inclined metal projection *i*, stop-board projection *h'*, discharge-opening *l'*, incline g^3, perforated bottom g^2, and projection K, in combination with the shaft *b*, fan-blades *c*, drum c^2, arms c^4, fan-casings, and discharge-flues d' d^3, substantially as and for the purpose set forth.

293,772. COTTON-GIN FEEDER. JAMES WOOD OGLESBY and ZENOS WEB OGLESBY, Kingston, Ga. Filed June 2, 1883. (No model.)

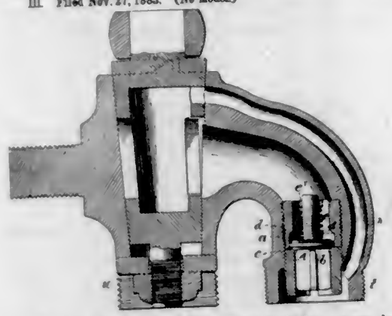
Claim.—1. In a cotton-gin feeder, the combination of a box or frame, A, endless saw-toothed apron C, inclined feed-board *g*, adapted to feed the cotton to said saw-toothed apron, hollow retarding-roller B, having slots *i'*, and eccentric-rod *d*, provided with plates or tongues *c* and loop *h*, substantially as and for the purpose set forth.



2. The combination of the box or frame A, retarding-roller B, having journals G, and an eccentric bent rod, *d*, within said roller, provided with hinged tongues *c*, one end of said rod extending out through the hollow journal G of roller B, and connected to box A, with the endless apron C, having saw-teeth *a*, shaft F, rollers *c c'*, shaft E, carrying brush

293,772.

D, and the cover H, formed as described, and having curved wire screen *f*, substantially as shown and described.



293,773. FIRE-KINDLER MOLD. CHARLES E. PADDACK, Richmond, Ind. Filed Oct. 9, 1883. (No model.)

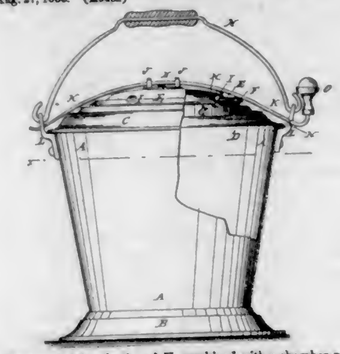
Claim.—1. A mold for the manufacture of composition fire-kindlers, consisting of an exterior case, E, having attached to it cross-partitions D, having broad bases, all in the plane of the lower edge of the mold, for shaping and partly dividing the cake, combined with a flat bottom board, B, and a follow-board, C, provided with lateral flanges, which arrest its descent into the mold at a distance above the partitions D, as and for the purpose set forth.

2. A mold, E, having attached to it cross-partitions D, extending upward from the plane of the lower edge of said mold, and its upper edges beveled outwardly, as shown, combined with a removable bottom board, B, and a solid follower, C, tapering to conform to the top of the mold E, and a laterally-extended flange, to be arrested by and rest upon the edge of said mold, as and for the purpose set forth.

293,774. COCK FOR AIR-BRAKES. NORMAN J. PARADISE, Auburn, Ill. Filed Nov. 27, 1883. (No model.)

Claim.—In combination with a cock for air-brakes, a spring double-faced valve arranged in the branch connecting with the main reservoir, and seats provided therefor, substantially as and for the purposes set forth.

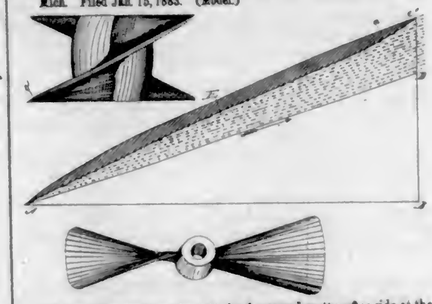
293,775. TELEGRAPH-CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 15, 1883. (No model.)



Claim.—1. The combination, in a telegraph-cable, of special test-wires of different lengths, whereby faults may be located approximately substantially as and for the purpose specified.

2. The combination, in a telegraph-cable, of special test-wires, the wires in a given section differing in length by a common difference, whereby faults may be located approximately, substantially as and for the purpose specified.

3. The combination of two sections of telegraph-cable, each provided with special test-wires, said test-wires being all accessible at the test-station between said sections, whereby both sections may be tested from said station, as and for the purpose specified.



293,776. CHAMBER-PAIL. CHAS. H. PAULIN, Irvington, N. J. Filed Aug. 27, 1883. (Model.)

Claim.—1. The elastic rod K, combined with a chamber-pail cover and ears having recesses N, whereby a bail may be used for carrying said chamber and the cover be readily fastened or unfastened, as described.

2. In a chamber-pail, the combination, with the cover E, of the separable flange G, having lugs H, the packing-ring F, and the bolts I, substantially as herein shown and described, whereby a close joint will be formed between the said cover and its seat, as set forth.

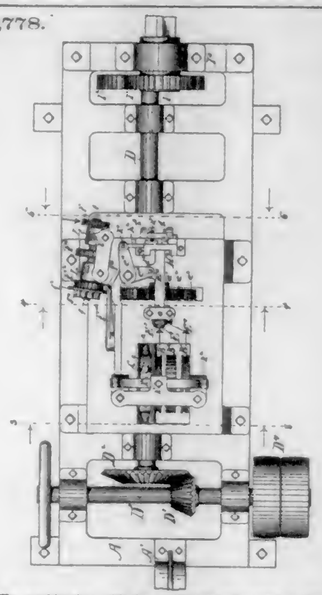
293,777. SCREW-PROPELLER. HARRISON C. PEARSONS, Ferrysburg, Mich. Filed Jan. 15, 1883. (Model.)

Claim.—A propeller-wheel blade sharpened on the after side at the forward or leading edge, and having its forward side constructed with a convex surface, so as to make it tangent to the "line of motion" at the forward edge of the blade, substantially as and for the purpose set forth.

293,778. BARB-WIRE-FENCE MACHINE. MARK A. PENNEY, Des Moines, Iowa, assignor to William L. Carpenter, same place. Filed Apr. 16, 1883. (No model.)

Brief.—The wrapping-sleeve is reciprocated by a sliding bar. The spindle is retracted by the sleeve and advanced by a spring. The upper knife is swung into position after the barb is coiled and the lower knife is reciprocated past it.

Claim.—1. In a barb-fence machine, a sliding coiler and oscillating knife-head, both combined with and connected to the same bell-crank lever, substantially as specified, whereby when the coiler is advanced the head is oscillated to make room for the coiler.



2. In a barb-fence machine, the severing devices, consisting of an oscillating knife and a reciprocating knife, combined and operating substantially as specified.

3. The combination of the sliding spindle, the sleeve carrying a coiler, and secured upon the spindle so as to rotate therewith, the gear rotating the spindle, and the bar retracting both sleeve and spindle, substantially as specified.

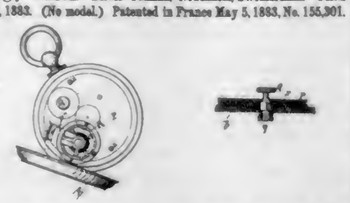
4. The combination, with the coiler and spindle, of the bar E^5, crank-arm e'', spindle e^3, crank e^4, and cam E^4, substantially as specified.

ratus, whereby the material to be treated can be subjected to jets of hot or cold air, as occasion may require, as and for the purpose set forth.

293,778.

5. The combination, with the oscillating knife-head, of the sliding bar b^3, crank-arm c', spindle c^2, crank c^3, and cam E^2, substantially as specified.

6. The spindle, actuated in the forward direction by a spring, and having a shoulder, c^{23}, and a sliding sleeve mounted on said spindle and engaging with said shoulder, and actuated in both directions by the sliding bar, in combination with the spring and sliding bar, substantially as specified.



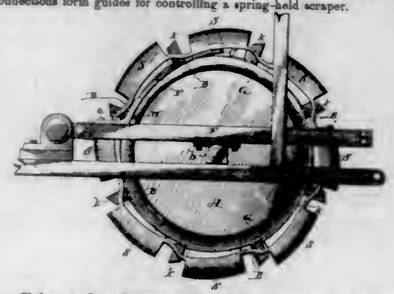
7. The forked bar F^2 and its actuating devices, in combination with the coiler, the spindle, and the spring E^3, substantially as specified.

8. The combination, with the lower knife-head, of the barb-guide g^3, substantially as specified.

9. The combination, with the lower knife-head, of the barb-guide g^3, provided with the adjusting-screw g^{23}, substantially as specified.

10. The combination, with the lower knife-head and the guide carried thereby, of the cam G^2 and the connecting-bar, whereby said head and guide, after the cutting off of the barb, are first lowered, then raised partially, and then raised completely for the severance of the next barb, substantially as specified.

293,779. WATCH. DAVID PERRET, Neuchatel, Switzerland. Filed Nov. 14, 1883. (No model.) Patented in France May 5, 1883, No. 155,301.



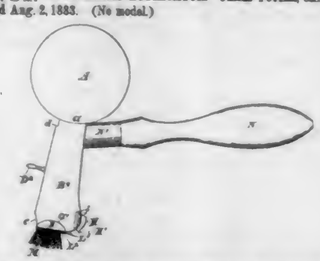
Claim.—1. The wheels R r and plate P, the wheel r having a square opening at its center, and the plate P having an opening for the stem of the setting-key, in combination with the setting-key having a squared portion, q, a cylindrical portion next to said squared portion, and a knob or button outside the plate P, substantially as and for the purposes specified.

2. The combination of the plate P, having two openings, one at F S, to give access to the regulator, and the other over the balance O, in order that said balance may be visible, a glass, v, covering the last-mentioned opening, the key Q, and wheels R r, substantially as and for the purposes specified.

3. The combination, with the winding or setting portion in a watch, of a key, Q, having the squared or prismatic end, the head, and the cylindrical portion between the square end and the head, substantially as and for the purposes set forth.

293,780. DITCHING-MACHINE. FAWCETT PLUMB, Streator, Ill. Filed Oct. 17, 1883. (No model.)

Brief.—Open-ended scoops secured to a wheel, with cutters between the adjacent scoop ends, are connected to each other, so that the connections form guides for controlling a spring-held scraper.



Claim.—1. In a ditching-machine, the cutting-wheel thereof consisting, essentially, of a series of open ended scoops attached to the periphery of the wheel, and cutters situated between the adjacent ends of the scoops.

2. The combination, with a series of scoops bound together at their outer corners, so as to form a continuous scoop, the said connections between the scoops forming a guide for the spring-actuated scraper, of a spring-actuated scraper adapted to move in contact with the inner surfaces of the scoops, substantially as set forth.

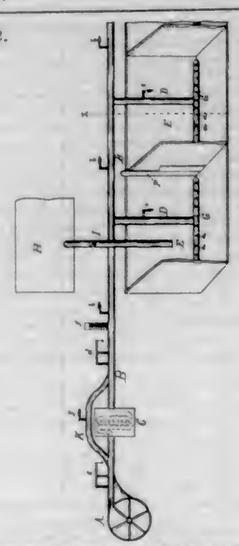
3. In a ditching-machine, the combination, with a series of open-ended scoops provided with bands uniting their outer corners, and cutters located between the adjacent ends of the scoops, of a pivoted spring-pressed scraper, substantially as set forth.

293,781. UNIVERSAL LUBRICATOR. JAMES POTTER, Chicago, Ill. Filed Aug. 2, 1883. (No model.)

Claim.—1. In a lubricator, the combination of the reservoir A, the receiver B, the blanks B^2, provided with flanges B^3, and shoulders c and d, the feed-slide D, and teeth D', the thumb-piece D^2, the springs E with a wick, M, the whole operated as described and set forth.

2. In a lubricator, the combination of the reservoir A, the receiver B, the blanks B^2, provided with flanges B^3, the springs F, the rod G, the thumb-piece f, the cams H, the points H', the clamps I, provided with screw J, the cover K, and openings K', with clamps L and L', provided with lip L^2, and wick M, all for the purpose described and set forth.

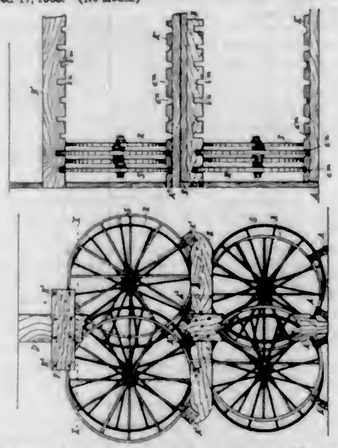
3. In a lubricator, the reservoir A, the receiver B, the handle N, the cap N', the indenture k, in combination with clamps L and L', the flange L^2, the openings L^4, and wick M, the whole operating as described and set forth.



4. In a lubricator, the wick M, provided with loop O, the points O', in combination with clamps L and L', and the indenture L^2, all for the purpose described and set forth.

293,782. APPARATUS FOR EVAPORATING SIRUPS, &c., AND FOR CLARIFYING THE SAME. DANIEL DAVIDSON POWERS, Ozark, Kans. Filed Mar. 31, 1883. (No model.)

Claim.—1. The method herein described of evaporating and clarifying saccharine juices, sirups, and other material, which consists in passing streams or jets of heated and atmospheric air alternately through the material, as and for the purpose set forth.



2. An evaporating apparatus in which the material to be treated is subjected to streams or jets of heated and cold air, the main air-pipe B, leading into a heated chamber or any suitable device for heating, and the branch pipe K, leading from the main pipe B in front of heating-chamber, and with branch pipes joining hot-air pipes in front of sections of evaporators, in combination with a blower or other air-forcing appa-

293,782.

3. An evaporating apparatus in which the material to be treated is heated or boiled by sprays or jets of heated air, the compartments D, having the perforated air-pipe in the lower corner, in combination with an adjustable partition, I, on the opposite side from the perforated pipe, whereby the scum and other impurities are driven over at varying heights, as set forth.

293,783. RACK FOR WHEELS. HIRAM W. RANSOM, Cincinnati, Ohio, assignor of one-half to the Emerson & Fisher Company, same place. Filed Dec. 17, 1883. (No model.)

Claim.—1. In a rack for wheels, the combination of the two lower rack-rails and the upper rack-rail, each provided with transverse slots, substantially as and for the purposes specified.

2. The combination of the two lower rack-rails and the upper rack-rail, each provided with transverse slots, the upper rack-rail being located behind the vertical central plane between the lower rails, substantially as and for the purposes specified.

3. The combination of the lower rack-rails and upper rack-rail provided with slots whose bottoms are alternately nearer to and farther from the axial center of the particular rack to which said slots belong, substantially as and for the purposes specified.

4. The combination of the lower rack-rails provided with slots a' m a' n, and upper rack-rail provided with slots b' m b' n, the slots a' m of the forward lower rail and the slots b' n in the upper rail and a' n in the lower rear rail being in the same transverse plane, and the slots a' n of the forward lower rail and the slots b' m of the upper rail and a' m of the rear lower rail being in the same transverse plane, substantially as and for the purposes specified.

5. The combination of a lower rail, A, and an upper rearwardly-placed rail, B, provided with transverse slots, substantially as and for the purposes specified.

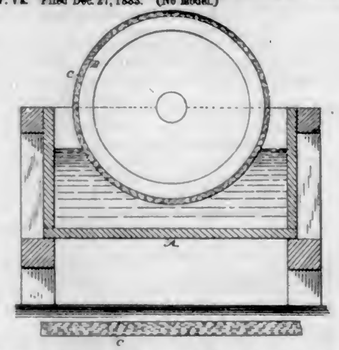
6. Two contiguous racks having lower rails and upper rails provided with slots, the bottoms of the slots on rack-rail alternating in height, substantially as set forth, and the planes of the slots of one rack passing between the planes of the slots on the other rack, substantially as and for the purposes specified.

7. The combination of two contiguous racks, the rails being provided with transverse slots, the planes of the slots in one rack passing between the planes of the slots in the other rack, substantially as and for the purposes specified.

8. The combination of the four racks having the rails A A A' A' B B' A^2 A^2 A^4 A^2 B^2 B^2, provided with transverse slots, substantially as described, and uprights D and cross-pieces E F, substantially as and for the purposes specified.

9. The combination of the four racks, two above and two below, placed back to back, and the rails thereof being provided with transverse slots, the upper racks being adapted to receive hind wheels, and the lower racks to receive front wheels, substantially as and for the purposes specified.

10. The combination of an upper and lower rack having rails provided with transverse slots, the upper rack being adapted to receive hind wheels, and the lower rack to receive front wheels, substantially as and for the purposes specified.



11. In a rack, the combination of the separate blocks K, having slots a' m or b' m, and the rack-rail, the ends of the adjacent blocks forming the slots a' n or b' n, substantially as and for the purposes specified.

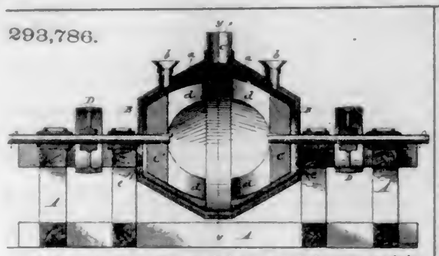
12. In a rack, the rails A A and B, provided with transverse slots having inclined sides, substantially as and for the purposes specified.

293,784. PULP CASTER-WHEEL. WALTER S. RAVENSCROFT, Parkersburg, W. Va. Filed Apr. 23, 1883. (No specimens.)

Claim.—As a new article of manufacture, a caster-wheel made of paper or wood pulp, as set forth.

293,785. MANUFACTURE OF ARTICLES FROM WOOD PULP. WILLIAM R. RAVENSCROFT and WALTER S. RAVENSCROFT, Parkersburg, W. Va. Filed Dec. 27, 1883. (No model.)

Claim.—1. A bat or felt composed of wood pulp or fiber and silicate of soda, formed by depositing on a roller repeated layers of the composition as it is taken from the mixing vat or tank, as set forth.



2. The method herein described of forming articles from wood fiber or pulp and silicate of soda, the same consisting in forming bats or felts of the composition, cutting from said bats or felts blanks of the desired form and configuration, and then subjecting one or more of said blanks to the requisite pressure to form the article, as set forth.

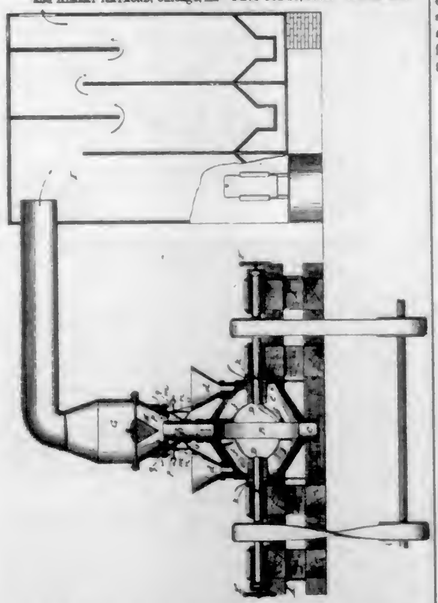
3. A wheel composed of layers or blanks cut from a bat or thick web of wood fiber and silicate of soda, substantially such as described, said layers being joined together by pressure and by strengthening bars and disks, as set forth.

293,786. MACHINE FOR REDUCING ORES, &c. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill. Filed July 2, 1883. (No model.)

Claim.—1. In a machine for reducing refractory materials by impact and attrition between the fragments, the combination of a horizontal body or casing enlarged from its two ends toward the middle, and two oppositely-revolving heads located in the respective ends of the body, each head provided with a series of spiral curved arms following the inner conical surface of the body and overhanging the central space therein, substantially as described.

293,786.

2. In combination with an inclosing case or body, two oppositely-revolving heads, each head having a series of overhanging spiral arms projected toward but terminating at a considerable distance from the arms of the other, substantially as described.



3. The head for an ore-reducing machine, consisting of a hub provided with the series of thin overhanging arms or blades extending both laterally and outwardly therefrom in curved lines, whereby an open central space is left between the arms, as and for the purpose described.

4. In an ore-reducing machine, the combination, with an external case or body, substantially as described, of two oppositely-rotating heads located in its respective ends, each head having on its inner side a series of spiral arms or blades with smooth surfaces and overhanging disconnected ends, substantially as described, whereby the ore is permitted to pass over the faces of said arms and escape at their ends.

5. In an ore-reducing machine, the body, of a double conical form, with ore and air inlets at the two ends and the outlet in the middle, in combination with the oppositely-revolving heads having radially and laterally curved arms or blades overhanging a central space or chamber, as described, whereby the blades are caused to serve the double purpose of propelling the ore fragments violently against each other, and of producing a strong blast of air through the machine for the delivery of the pulverized material.

6. In an ore-reducing machine, a circular body or casing enlarged from its two ends toward the middle, combined with oppositely-revolving heads mounted in the respective ends of said body, each head consisting of a central hub at the outer end of the body, provided with peripheral disconnected arms following the inner surface of the body and extending toward the middle of the same, substantially as described.

293,787. MACHINE FOR REDUCING ORES, &c. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill. Filed Oct. 23, 1883. (No model.)

Claim.—1. In an ore-reducing machine, the body or casing, of decreasing diameter toward its ends, and the rotary heads having the divergent overhanging arms, combined with means, substantially as described, for adjusting said heads in the line of their axes.

2. In an ore-reducing machine, the combination of the body or casing of the form described, and the two revolving heads, each consisting of a hub provided with spiral laterally-projected arms, and with peripheral surfaces forming continuations of the faces of said arms.

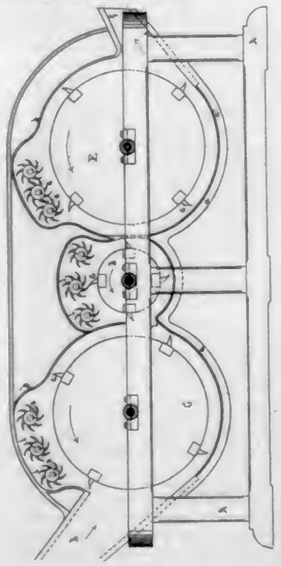
3. The rotary heads having hubs with laterally-extending divergent arms overhanging the central space between them, and with peripheral surfaces forming continuations of said blades across the hubs, in combination with the body or casing, with feed-openings, arranged as described, to deliver material upon the peripheries of the hubs.

4. The rotary heads, each provided with disconnected overhanging blades, substantially such as described and shown, in combination with the body or casing provided with annular air-inlets at the ends and an air-outlet at the middle.

5. The combination of the body or casing, having the central air-inlets at the ends, and the rotary heads, as described, adjustable in the line of their axes, whereby the air-admission may be varied as required.

6. In combination with the body and the rotating heads, adapted, as described, to produce an outward blast, the receiving-chamber and deflector, the hopper, and the spouts for returning the coarse material to the machine.

7. In combination with the reducing and blast-producing mechanism, substantially as described, the discharge-tube *b*, the chamber, the deflector, the hopper having an air-inlet around its top, and the return-spouts from the hopper to the machine.



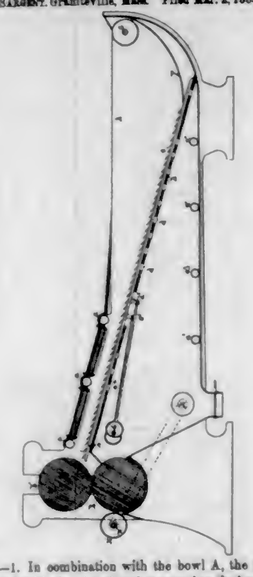
8. In combination with the reducing and blast-producing mechanism, the discharge-spout, the hopper, the receiving-chamber adjustably connected with the hopper, and the deflector.

9. In combination with the reducing and blast-producing mechanism, substantially as described, the discharge-spout, the receiving-chamber, the hopper, the automatic discharge-valves, and the conductors for returning the material to the reducing mechanism.

10. In combination with the body and the revolving heads, as described, the discharge-spout, the settling-chamber I, connected therewith, and a deflector and hopper located in said discharge-spout between the reduction mechanism and the settling-chamber, as described, whereby the coarse material delivered from the machine is arrested, and the fine material only delivered to the settling-chamber.

293,788. MACHINE FOR CLEANING WOOL. FREDERICK GRANDISON SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Oct. 21, 1881. (No model.)

Brief.—Two or more cone-duster cylinders, so located that the larger end of one cylinder is beside the smaller end of the next, are operated in connection with toothed workers located with their surfaces substantially parallel with the said cone-cylinders, all being covered with a closed bonnet. A delivery-passage leading from the larger end of the first cylinder to the smaller end of the second, &c., is provided, whereby the fiber is conducted through the machine.

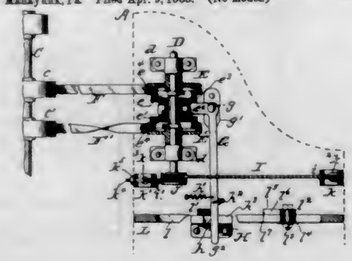


Claim.—1. The combination, with a cone-duster cylinder, of one or more toothed worker-rolls and a bonnet, the said rolls having their surfaces substantially parallel to and working with the conical face of the cylinder and inclosed within said bonnet, substantially as described.

2. The combination of the cone-duster C with the cone-duster D, and the fiber-delivery passage *l*, leading from the larger end of the former to the smaller end of the latter, substantially as described.

3. The combination of two cone-dusters in one machine having their axes placed parallel to each other, and the larger end of one alongside the smaller end of the other, with a fiber-passage, *l*, connecting said ends and adapted to conduct the fiber from the one of said cone-dusters to the other, substantially as described.

293,789. WOOL-WASHING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Mar. 2, 1883. (No model.)



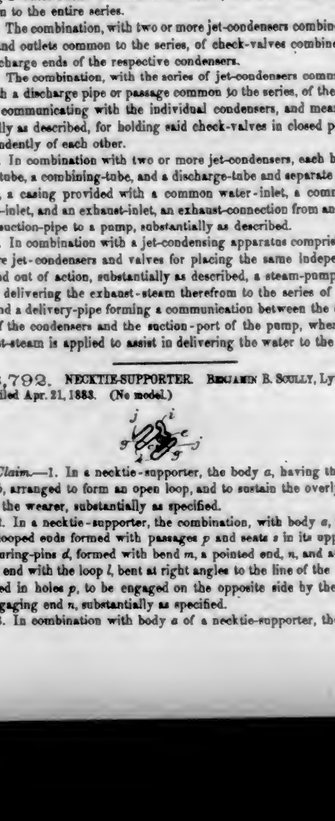
Claim.—1. In combination with the bowl A, the perforated feed-roll *c*, connected with the pipe c^3, and arranged on the bowl, substantially as described.

2. The perforated doffer-roll N, connected with the pipe n^3, in combination with the squeeze-rolls B B′, substantially as described.

3. In combination with the bowl A, squeeze-rolls B B′, and bottom D, the alternately-reciprocating sets of bars e e^3, extending from the bottom of the bowl at the feed-in end entirely below the surface of the liquid to said squeeze-rolls above the surface of the liquid at the delivery end, and upon an incline partly below and partly above the surface of the liquid in the bowl, and adapted to convey the fiber from the feed-in end to the delivery end of the bowl upon said bars, substantially as described.

4. In combination with the bowl A, the bars e e^3, extending partly below and partly above the surface of the liquid in the bowl, and adapted to convey the fiber thereon through the same, one or more perforated pipes, *a*, extending over the portion of the carrier above the liquid in the bowl, substantially as described.

293,790. AUTOMATIC REVERSING MECHANISM FOR LAPPING-MACHINES. WM. SCHOFIELD, Philadelphia, assignor to Ellen Schofield, Manayunk, Pa. Filed Apr. 9, 1883. (No model.)



Claim.—1. The combination of a driving-shaft, a driven shaft connected to the driving-shaft and having a revolving wheel upon one of its ends, and mechanism for reversing the motion of said wheel, and a carriage moved backward and forward by the wheel on the end of the driven shaft, and having means for shifting the reversing mechanism.

2. The combination of a driving-shaft, a driven shaft connected to the driving-shaft and having a revolving wheel upon one of its ends, and mechanism for reversing the motion of said wheel and carriage, moved backward and forward by the wheel on the end of the driven shaft, and having adjustable means for shifting the reversible mechanism.

3. In combination with shaft D, carrying wheel J, the carriage A, having band I in gear with wheel J, which moves the carriage backward and forward, means for applying tension to said band, and mechanism for reversing the rotation of said shaft D, substantially as shown and described.

4. The combination of shaft D, reversing mechanism therefor, lever G, bracket H, having one or more shoulders, A, and springs A′ and A², substantially as shown and described.

293,791. JET-CONDENSER. LOUIS SCHUTTE, Philadelphia, Pa. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination of two or more water-jet condensers, each comprising a water-tube, a condensing-tube, and a discharge-tube, with sources of water supply and delivery common to the series, and means, substantially as described, whereby the condensers may be thrown into and out of action independently.

2. In combination with two or more jet-condensers, each comprising a water-tube, a combining-tube, and a discharge-tube, a pipe or discharge forming a water-inlet common to the series, a pipe or discharge forming a water-outlet common to the series, and an exhaust-inlet also common to the entire series.

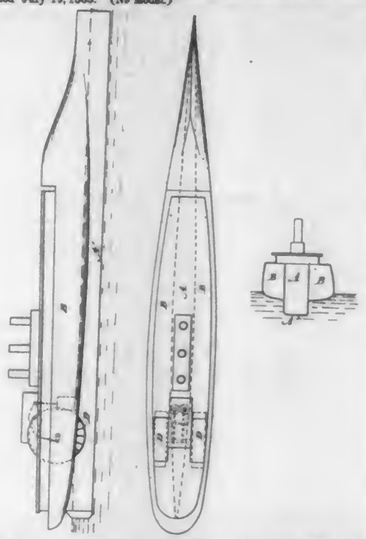
3. The combination, with two or more jet-condensers combined with inlets and outlets common to the series, of check-valves combined with the discharge ends of the respective condensers.

4. The combination, with the series of jet-condensers communicating with a discharge pipe or passage common to the series, of the check-valves communicating with the individual condensers, and means, substantially as described, for holding said check-valves in closed positions independently of each other.

5. In combination with two or more jet-condensers, each having a water-tube, a combining-tube, and a discharge-tube and separate closing-valves, a casing provided with a common water-inlet, a common discharge-inlet, and an exhaust-inlet, an exhaust-connection from an engine, and a suction-pipe to a pump, substantially as described.

6. In combination with a jet-condensing apparatus comprising two or more jet-condensers and valves for placing the same independently into and out of action, substantially as described, a steam-pump, a conductor delivering the exhaust-steam therefrom to the series of condensers, and a delivery-pipe forming a communication between the delivery ends of the condensers and the suction-port of the pump, whereby the exhaust-steam is applied to assist in delivering the water to the pump.

293,792. NECKTIE-SUPPORTER. BENJAMIN B. SCULLY, Lynn, Mass. Filed Apr. 21, 1883. (No model.)



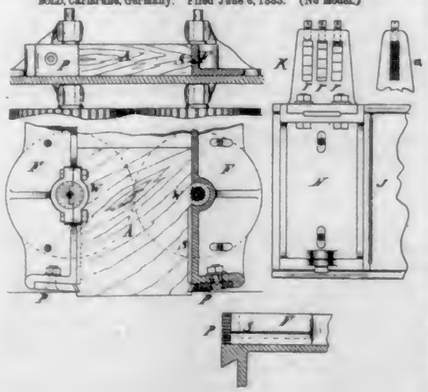
Claim.—1. In a necktie-supporter, the body *a*, having the turned ends *b*, arranged to form an open loop, and to sustain the overlying collar of the wearer, substantially as specified.

2. In a necktie-supporter, the combination, with body *a*, provided with looped ends formed with passages *p* and seats *s* in its upper edge, of securing-pins *d*, formed with bend *m*, a pointed end, *n*, and at the opposite end with the loop *l*, bent at right angles to the line of the wire and inserted in holes *p*, to be engaged on the opposite side by the pointed tie-engaging end *n*, substantially as specified.

3. In combination with body *a* of a necktie-supporter, the attach-

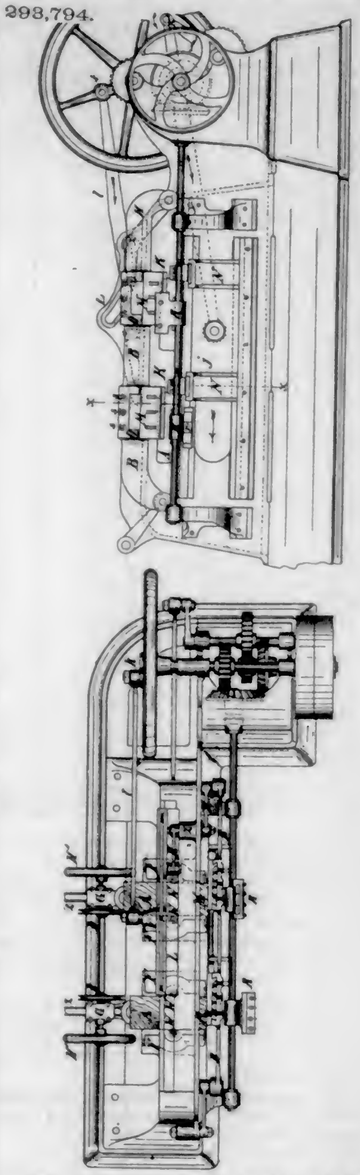
ing-loop *e*, formed of a single piece of elastic wire bent centrally, as at *i* and also as at *h h*, to form four nearly parallel parts or members, *g g*, and with said central part, *i*, and ends *j j*, bent hook-like and inserted and secured in said body, substantially as specified.

293,793. MARINE VESSEL. AMÉDÉE M. G. SEBILLOT, Paris, France. Filed July 19, 1883. (No model.)



Claim.—1. A marine vessel divided into three longitudinal compartments by partitions or walls extending from the bottom of the hull to the deck, the side compartments being formed on the sides of the middle compartment and the latter projecting below the side compartments, as set forth.

2. A marine vessel constructed with three longitudinal compartments, the middle compartment being tapered toward the front and rear, and the side compartments gradually increasing in width from the front of the vessel to about the middle, and then running at a uniform width toward the rear of the vessel, substantially as herein shown and described.

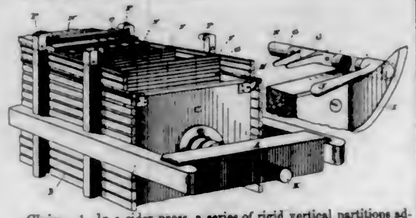


3. A marine vessel constructed with three longitudinal compartments, the middle compartment projecting below the bottoms of the side compartments, and the side compartments having flat bottoms, substantially as herein shown and described.

4. A marine vessel constructed with three compartments, of which the middle compartment projects below the bottoms of the side compartments, each side compartment containing a paddle-wheel, substantially as herein shown and described.

293,794. MACHINE FOR MAKING MATCH-SPLINTS. GEORG SEBOLD, Carlsruhe, Germany. Filed June 6, 1883. (No model.)

293,794.



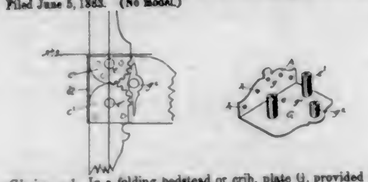
Claim.—1. In a machine for cutting match-sticks, the sliding carriage J, provided with slitting-knives *r*, the swinging knife-bar B, and shearing-knife M, the slide L, provided with a cam-slot, the lever H, fulcrumed at Z', and having one arm connected with said knife-bar B and the other engaging with the cam-slot in the slide L, the cranks *k k'*, connected by gearing, and rods connecting the crank *k* with the slide L and the crank *k'* with the sliding carriage J, substantially as herein described, whereby the shearing-knife M is caused to cut at each movement of the carriage J and its slitting-knives.

2. In a machine for cutting match-sticks, the combination of the sliding carriage J, the knife-head K, and the slitting-knives *r*, arranged in two or more vertical tiers, the knives in each vertical tier being set opposite the spaces between the knives in the other tier or tiers, substantially as and for the purpose herein described.

3. The combination, with the sliding carriage J and slitting-knives *r*, and the shearing-knife M, of the adjustable guides F, between which the blocks are fed to said knives, the sharp-toothed plates arranged vertically at the inner ends of said guides, and the horizontal knife-edges S S, secured in the inner faces of said guides F, all substantially as and for the purpose herein described.

293,795. CIDER-PRESS. HUGH SELLA, Toronto, Ontario, Canada. Filed Oct. 1, 1883. (No model.)

Claim.—1. In a cider-press, a series of rigid vertical partitions adjustably fitted into the press between the stationary and movable ends, having passages for the escape of the liquid, substantially as and for the purpose specified.



2. In a cider-press having a series of partitions arranged between the stationary and movable ends, two rods, journaled one on each side of the press, and having fingers attached to them for the purpose of holding the partitions, as specified, in combination with lugs attached to the movable end, and so shaped and situated that upon the inward movement of the head the lugs come in contact with fingers attached to the rods, causing the said rods to roll in their journals sufficiently to move the holding-fingers clear of the partitions, substantially as and for the purpose specified.

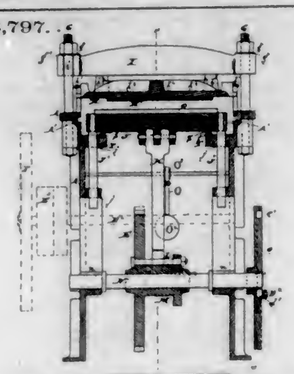
3. In a cider-press provided with a movable cover, blocks fixed upon each side of the top of the cover, in combination with wedge-shaped lugs fixed to the side of the press, and located substantially as and for the purpose specified.

4. In a cider-press, a movable hollow partition, F, made of a series of horizontal strips, *f*, tacked on each side of the vertical strips *g*, having a space between each horizontal strip, and an open space being left between the two rows of horizontal strips by the vertical strips, in combination with devices for holding the same in position in the press and then releasing the same as the press is operated, substantially as and for the purpose specified.

5. The combination, with the frame A and press B, having movable end C and stationary end D, of the wedges E, fitted into notches made in the frame A, and adapted to hold the end D away from the frame, substantially as and for the purpose specified.

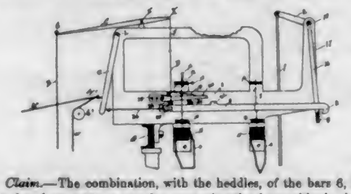
293,796. FOLDING BEDSTEAD AND CRIB. CHARLES T. SHEPARD, Albany, N. Y., assignor of one-half to William Appleton, Jr., same place. Filed June 5, 1883. (No model.)

Claim.—1. In a folding bedstead or crib, plate G, provided with pivot *e'*, and wear-plates F and *f*, in combination with bed-frame A and leg C, substantially as and for the purpose set forth.



2. In a folding bedstead or crib, plates G, provided each with pivots *e* and *e'*, set relatively on the same vertical line, and having perforated stud *g*², in combination with bed-frame A, an end board having end brackets provided with gear, and leg C, provided with gear, as described, substantially as and for the purpose set forth.

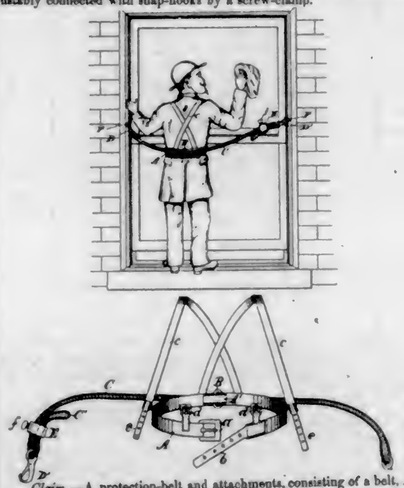
3. In a folding bedstead or crib, the combination, with a bed-frame, of plate G, provided with a perforated right-angular flange, *g*, and with pivots *e e'* and perforated stud *g*², an end board having brackets, and folding legs, both provided with gears, as set forth; and pivoted upon pivots *e e'*, substantially as and for the purpose described.



293,797. CASE PRINTING AND EMBOSSING MACHINE. HENRY F. SHEPHERD, Philadelphia, Pa. Filed Feb. 2, 1883. (No model.)

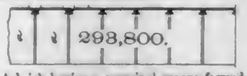
Claim.—The combination of the impression-plate, its guide-pins, guide-lugs, and stop-pins, substantially as and for the purpose specified.

293,797.



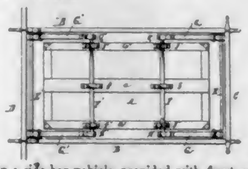
293,798. SHEDDING MECHANISM FOR LOOMS. THOS. SHILLOCK, Paterson, N. J. Filed Feb. 24, 1883. (No model.)

Claim.—The combination, with the heddles, of the bars 6, having hooks 8 and stops 21, means for connecting the bars with the heddles, the pawls 20, springs 19, pins 7 and 14, the pattern-cards for acting upon said needles, means for presenting the cards to the needles, the bar 9, means for operating the same, the bar M, wire D, link F, lever C, cord B, and handles A, substantially as set forth.



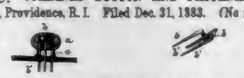
293,799. PROTECTION-BELT AND ATTACHMENT. GEO. B. SIMKIN, Chicago, Ill. Filed Apr. 25, 1883. (No model.)

Brief.—A belt is united by a ring to a rope passed behind the person at work. The belt is sustained by shoulder-braces. The rope is adjustably connected with snap-hooks by a screw-clamp.



Claim.—A protection-belt and attachments, consisting of a belt, A, the ring B, the buckle *a* and strap *b*, the shoulder-braces C, the buckles *d*, and straps *e*, in combination with rope C, the snap-hooks D and collar E, the thumb-screws *f*, and support-staples F, substantially as and for the purpose described.

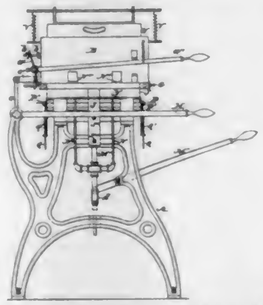
293,800. BRICK. GEO. W. SIMONDS, Boston, assignor of two-thirds to James F. Emerson, Wakefield, and George O. Carpenter, Boston, Mass. Filed June 9, 1883. (No model.)



Claim.—A brick having a marginal groove formed in one or more of its sides in close proximity to one of its vertical faces or ends, said grooves being formed to constitute a space between the proximate surfaces of two bricks of suitable form to receive and secure mortar, as set forth.

293,801. VEHICLE-SPRING. EDWARD S. SMITH, Ovid, Mich. Filed May 29, 1883. (No model.)

Claim.—In a side-bar vehicle provided with front and rear equalizers, the combination, with the vehicle-body, of front and rear torsion-springs rigidly secured to the body intermediate of their length, and provided with loose bearings *f'* at the edges of the body, and a front and rear pair of side springs, having one of their ends connected with the ends of the torsion-springs, their opposite ends being connected with the equalizer, substantially as described.



293,802. COMBINED BUTTON AND FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Dec. 31, 1883. (No model.)

Claim.—1. A leather, leather-board, or analogous button provided with three or more substantially-straight integral prongs partially embedded in the button and projecting from its bottom, substantially as and for the purpose set forth.

2. The button *a*, provided with the metallic fastening consisting of a head-bar, *b*, and the straight prongs *b'*, the head-bar *b* wholly, and the prongs *b'* partially, embedded in the button, and said prongs projecting from the bottom of the button, and the tube or annulus *c*, all substantially as and for the purpose set forth.

293,803. CANDY-DROPPING MACHINE. JOHN SMITH, Philadelphia, Pa., assignor to Croft, Wilbur & Co., same place. Filed Dec. 7, 1883. (No model.)

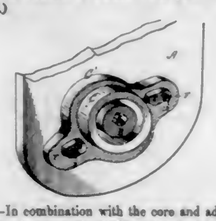
Claim.—1. In a confectionery-dropping machine, a material-box provided with a bottom and a false bottom, both perforated, and having between them a perforated slide or cut-off, substantially as and for the purpose set forth.

2. In a confectionery-machine, a horizontally and vertically moving material-box, and a cut-off below the same, substantially as and for the purpose set forth.

3. Cut-off wires connected with a supporting-frame, whereby they may be relieved of strain, or subjected thereto, as desired, substantially as and for the purpose set forth.

4. Cut-off wires connected with the supporting-frame by means of adjustable plates, substantially as and for the purpose set forth.

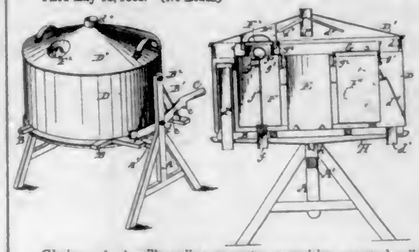
5. In a confectionery-dropping machine, a material-box and a cut-off device, in combination with a rising and falling table having a clamp for the pan or sheet on which the confectionery is dropped, substantially as and for the purpose set forth.



6. In a confectionery-dropping machine, a rising and falling table and a clamp, the latter being raised by the table, substantially as and for the purpose set forth.

7. In a confectionery-dropping machine, clamping-wires mounted freely on the frame of the machine, and a rising and falling table located below said wires, whereby a pan or sheet may be placed on the table and clamped by the wires when the rising table comes in contact with the wires, the table and the wires then advancing to the pendent material on the bottom of the supply-box, substantially as and for the purpose set forth.

8. In a confectionery-dropping machine, a material-box and a rising and falling table provided with stops which abut when the table is elevated, substantially as and for the purpose set forth.



9. A sliding box with a perforated bottom and sliding cut-off, a wire cut-off, a rising and falling table and clamp controlled thereby, and means for operating said box and table, combined and operating substantially as and for the purpose set forth.

293,804. TILE-MACHINE. JOHN S. SMITH, Jackson, Mich., assignor of one-half to Theodore G. Bennett, same place. Filed Nov. 30, 1883. (No model.)

Claim.—In combination with the core and adjustable sleeve of a tile-machine die, the eccentrics E E', acting in holes in the base-plate of the sleeve to adjust its position in relation to the core, substantially as set forth.

293,805. MILK-COOLER. JULIUS G. SMITH, Margaretville, N. Y. Filed May 18, 1883. (No model.)

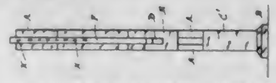
Claim.—1. A milk-cooling apparatus comprising a central cylindrical ice or water receptacle, a contentric encircling milk-receptacle, and an outer encircling water-receptacle connected to the central ice or water receptacle by a passage radially through the milk-receptacle, substantially as specified.

2. The combination of a main exterior water-receptacle and a circular milk-receptacle having a water-passage radially therethrough, each of the receptacles having an inlet and an outlet, substantially as specified.

3. The combination of the cover D', pipe d^2, and divergent pipes d^4, having one end projecting within the pipe d^2, substantially as shown and described.

4. The combination of the receptacles D and F, the cover D', provided with flange D^2, surrounding and depending from an opening therein, with the cover G, having upward flanges g^2 g^4, and cover F^2, substantially as shown and described.

5. The combination of the water-receptacle D, milk-receptacle F, having a radial passage, F', and the central ice-receptacle, E, substantially as described.



6. The combination of the uprights A, pendent bent rods B', platform B, suspended therefrom, water-receptacle D, supported on said platform and containing milk and ice receptacles, with the lever C, provided with notches *c c*, substantially as described.

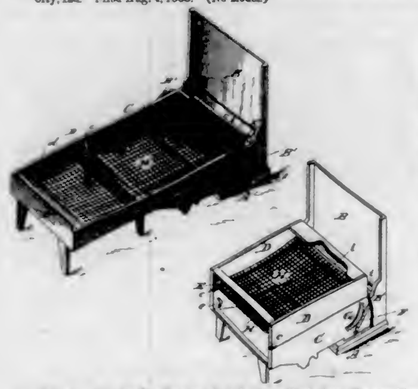
7. In a milk-receptacle having a discharge-opening, the annular cover G, provided with upward flanges g^2 and g^4, in combination with a plug, and the handle or rod f' thereof, provided with a branch, f^3, to rest upon the flange g^2, substantially as and for the purpose described.

8. The combination of a water-receptacle, an annular milk-receptacle therein, and an ice-box within the latter, with a drip-pan under the water-receptacle, having openings for the passage of the water and milk discharging pipes, substantially as and for the purpose described.

9. The combination of water and milk receptacles provided with stuffing-boxes, with a pipe, I, passing through the latter, its slotted bracket i^2 and cover i^3, having a stem extending through the bracket, and lug i^5, substantially as and for the purpose set forth.

293,806. WAGON-JACK. NICHOLAS SMITH, Perry, N. Y. Filed May 19, 1883. (No model.)

Claim.—1. In a wagon-jack, the combination of slide E, having axle-rest D, with the follower-block M, as described, and for the purposes set forth.

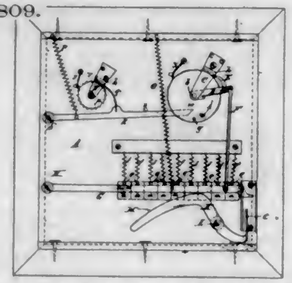


2. In a wagon-jack, the standards A, base B, braces C C', block G, slide E, having axle-rest D, follower-block M, and strap F, having slots K, in combination with lever H, having hook H', as described, and for the purposes set forth.

293,807. TRACE-CARRIER. WILLIAM M. SMITHER, Keene, Ky. Filed Nov. 12, 1883. (No model.)

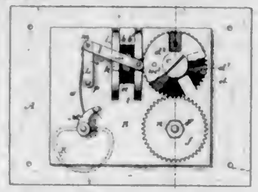
Claim.—As an article of manufacture, a trace-carrier constructed, as herein described, of a single piece of metal having formed upon it a corrugated tongue, two unbroken supporting-loops, and its lower end curved under and projecting upward, and adapted to be secured to the body of the carrier and to the back-band of the harness by the same rivets, substantially as described.

293,808. WARDROBE-BEDSTEAD. WILLIAM D. SNYDER, Columbia City, Ind. Filed Aug. 4, 1883. (No model.)



Claim.—In a folding bedstead of the described class, the combination of the stationary frame or casing having ways or supports F F, the bed-section C, having segments or side bearings, G G, traveling upon the fixed supports F, the bed-section D D', hinged to the outer end of the inner section, C, the spring-actuated fastenings E *e*, and the flexible bed-bottom fixed at one end in the foot-board, and attached at the other end to the fixed back of the stationary frame or casing, as and for the purpose shown and set forth.

293,809. ADDING-MACHINE. CYRUS G. SPALDING, Springfield, Mass. Filed Oct. 10, 1883. (Model.)

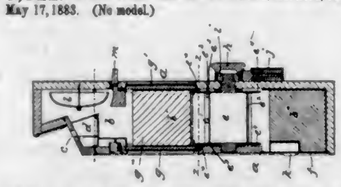


Claim.—In an improved adding-machine, the combination of the slides or keys, each provided with a projection on its rear side, the pivoted controlling-bar G, against which the said projections have a bearing, and a pivoted stop-lever, K, against one arm of which said projections strike, and against whose other arm the said pivoted controlling-

293,809.

bar strikes when the said slides are moved downward, whereby the limit of the downward movement of the said slides and said bar is made coincident and positive, substantially as described.

293,810. PERMUTATION-LOCK. DAVID R. STEDMAN, Elizabeth, N. J., assignor of one-half to George H. Horning, same place. Filed June 19, 1883. (Model.)



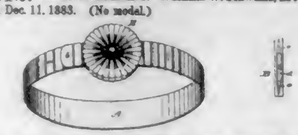
Claim.—1. In a permutation-lock, a bolt having its actuating or throwing lever or levers operatively united with a cam operating independently of the dial or tumbler mechanism, in combination with a yielding connection between said lever or levers and cam, whereby the force of the cam is compensated, substantially as herein set forth.

2. In a permutation-lock, the combination of a series of notched tumblers, a bolt, one or more levers for moving or throwing said bolt, the cam M, and the spring *o*, united to said lever or levers at one extremity, and having a free end projecting in the path of said cam, substantially as and for the purpose set forth.

3. In a permutation-lock, the combination, with the lever mechanism for throwing the bolt, of a cam, for operating said mechanism, and a pendent handle attached to the spindle of the cam, and so arranged that a sufficient amount of its weight to overbalance the cam will normally hang below the axis of said spindle, substantially as herein set forth, whereby the cam may be normally maintained in engagement with said lever mechanism, substantially as herein shown and described.

4. In a permutation-lock, the combination, with the plate B, having projections *i i*, of the series of notched tumblers, the bolt A, mounted in or upon said projections, the lever *l*, pivoted to said bolt at one extremity, the lever L, pivoted to said plate at one end and pivoted to the lever *l* at its other extremity to form a toggle-joint, the cam M, and the spring *o*, united at one end to the lever L, and having its free end projecting in the path of said cam, substantially as herein set forth.

293,811. FARE-BOX. TIMOTHY B. STEWART, Hartford, Conn. Filed May 17, 1883. (No model.)

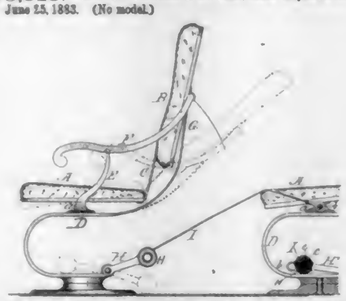


Claim.—1. In a fare-box, in combination, the frame *a*, having the receiving-section *b*, with trough *d* for guiding the fares, the inspection-section with side panes, *g g' g''*, and the vertical cross-partitions *g'''* of glass, the rotary cylinder *e*, with compartments at the bottom of the latter section, and the drawer *f*, having the vertical partition *b''*, all substantially as described.

2. In a fare-box of the within-described class, the rotary cylinder *e*, having peripheral compartments, and fast to its axis that projects through the side of the box the handle *h*, with the flat surfaces co-operating with

the spring-impelled broad-faced bolt *i*, whereby the cylinder may be held in place to receive the fares, or rotated in either direction to deposit them all substantially as described.

293,812. BAND-FASTENING. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Dec. 11, 1883. (No model.)



Claim.—1. A fastening for bands or straps, consisting of a movable clamp embracing the same, and provided with a slot or passage through it of sufficient width to admit two superposed layers or thicknesses of the band or strap, and with a lateral extension of said slot or passage, the thickness of which is less than that of the superposed layers of the band or strap, whereby, when the clamp is turned until the layers of the band or strap are forced into this lateral extension, they are pressed tightly together and so fastened, substantially as set forth.

2. The combination, with the end *a* of a band, of a clamp, B, pivoted thereto, and provided with a passage or slot, *d*, therethrough, and with a lateral contracted extension, *e*, of said passage, constructed and adapted to operate substantially as set forth.

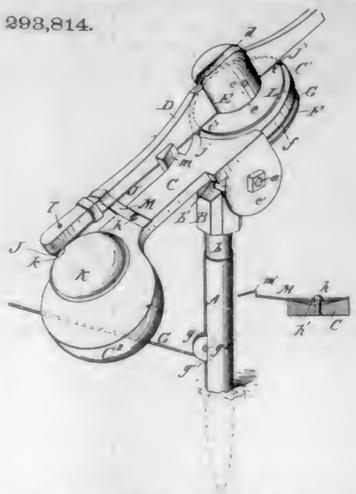
3. The combination of band A, the ends *a b* of which are corrugated with interlocking corrugations, with a clamp, B, connected to said band, and having a slot or passage, *d*, of sufficient thickness to admit the ends *a b* and permit them to be slid past each other therein, and a lateral extension, *e*, of said passage contracted to less thickness than the superposed ends *a b* when their corrugations are interlocked, adapted to operate substantially as set forth.

4. The combination of band A, clamp B, formed with passage *d* and contracted lateral extension *e*, and pivot *c*, joining the clamp to the band, substantially as set forth.

293,813. CHAIR. GARLAND B. ST. JOHN, Cedar Rapids, Iowa. Filed June 25, 1883. (No model.)

Claim.—1. The combination, in a reclining-chair, of a pivoted seat and an independently-pivoted back, with a connecting-webbing, pivoted arms F, having rack-teeth, the standard E, adapted to engage with said teeth, and a spring-frame, D, and the supporting-base therefor, all constructed substantially as described.

2. In a chair, the combination of the flexible web I, secured at one end to the seat-pivot *a*, and the other end to a winding-up spring-roller, and the pivoted arm H', and a supporting-base, substantially as described.



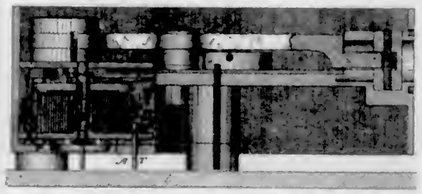
3. In a reclining-chair, the combination of the main frame, the centrally-pivoted back, the centrally-pivoted seat, and the flexible webbing connecting them, said webbing being secured to the lower part of the back, and extending across to the seat-frame, substantially as shown and described, whereby a continuous supporting-surface is formed between them, and they are made to fit the form of the occupant, as set forth.

293,814. BALL-TRAP. CHARLES F. STOCK, Peoria, Ill. Filed Aug. 14, 1883. (No model.)

Claim.—1. The combination, with the casting-arm, of the hollow post A, carrying the grooved pulley *g* in a slot, the head B, having hollow shank *b*, fitting into said post, the support C, hinged to said head at *a*, and having hole *e* in its end C', the hub E, turning in said hole, and having slot *d*, the edge-grooved pulley F, placed horizontally in the lower end of the hub, the pulley H on hinge-pin *a*, and the plates *b' c'*, forming recess *a'*, and respectively attached to head B and support C, with the cord G attached to the edge of pulley F, and passing between the plates and over pulleys H *g*, as shown and described.

2. The combination, with a throwing-arm, D, having the inclined

293,814.

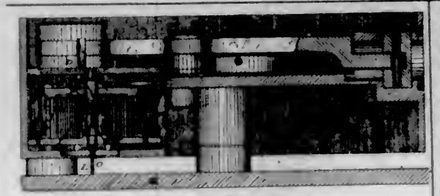


stud *l'* near one end, a supporting-standard, and suitable operative mechanism, of the under clamp-plate, J, having the front hole, *l*, and rear studs, *j j'*, the support C, having cam L, fitting between said studs and provided with the opposite projection and depression, *i i'*, whereby a clay pigeon may be thrown, as described.

3. The combination, with the throwing-arm D, of the support C, weighted at the end C², and provided with a stud, *m*, arranged to be struck by said arm, as described.

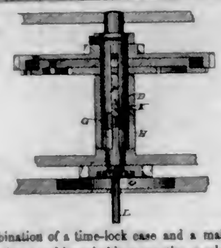
293,815. TIME-LOCK. EMORY STOCKWELL and HERBERT C. STOCKWELL, Stamford, Conn., assignors to the Yale & Towne Manufacturing Company, same place. Filed Sept. 25, 1883. (No model.)

Brief.—The object of the invention is to release the mainspring and allow it to uncoil without running down the clock-work, and thus unlocking the safe in case of an attack upon the latter, as by an explosion directed against it.



Claim.—1. In a time-lock, the combination of a spring-barrel set in bearings in which it may rotate, a movable pin or stop so constructed and arranged that it normally prevents the rotation of the barrel, but when moved longitudinally, by concussion or otherwise, will release the rotary barrel, and the mainspring within the barrel, which, when the barrel is thus released, will cause it to rotate, whereby the mainspring will be uncoiled from its outer end, substantially as and for the purpose set forth.

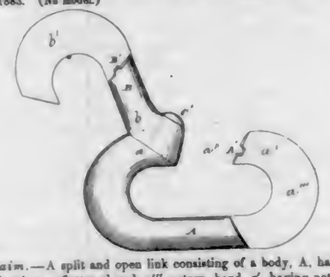
2. The combination of the mainspring, the flanged barrel, the ring provided with the hole or socket intersecting the flange of the barrel, and the shouldered pin T, all constructed and operated substantially as set forth.



293,816. TIME-LOCK. EMORY STOCKWELL and HERBERT C. STOCKWELL, Stamford, Conn., assignors to the Yale & Towne Manufacturing Company, same place. Filed Sept. 26, 1883. (No model.)

Brief.—The object is to disconnect the mainspring from the clock-work, so as to prevent the latter from running down in the event of its being broken by a blow, as of an explosion directed against the safe.

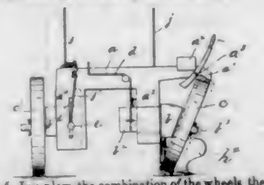
Claim.—1. The combination of the mainspring and winding-post of a time-lock and connecting mechanism between them, constructed and arranged to automatically disconnect the inner end of the mainspring from its operative connection with the post when the post is moved longitudinally by concussion or the like, substantially as described.



293,816.

2. The combination of a time-lock case and a mainspring detachably secured at its inner end by suitable connecting mechanism to a winding-post which projects from the back of the case, and is constructed and arranged to slide inward when struck on its projecting end, and to thereby release the connection between the inner end of the spring and the post, substantially as and for the purpose set forth.

3. The combination of the mainspring, the inner end of the winding-post having the annular and longitudinal grooves, and the sleeve with its stud and short spline, all constructed and operated together substantially as set forth.



293,817. OPEN LINK. THOMAS J. TERRY, Ashland, Mo. Filed June 26, 1883. (No model.)

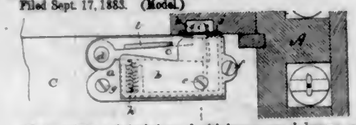
Claim.—A split and open link consisting of a body, A, having a return-bend, *a*, a flattened end, *a'''*, return-bend, *a'*, having notch A', and pivot-pin C, having head C', and the part B, hinged to the pivot-pin, having flattened end *b'*, and projection B', fitting the flattened end and recess in the body, as set forth.

293,818. WHEEL-PLOW. ROBT. A. THOMPSON, Montrose, Mo. Filed Dec. 14, 1882. (No model.)

Brief.—The furrow-wheel has a lateral adjustment by a lever to slide the spindle. An arm of the frame projects over the wheel to clear it, and has a side-cleaner; plow-beams attached to a forward-projecting bail, on which is a lever to hold the plow-beams down.

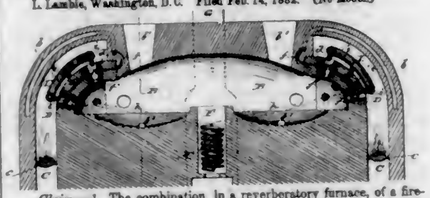
Claim.—1. In a plow, the combination of the wheels, the arch having its top bar extended over the furrow-wheel in position to scrape the periphery thereof, and the scraper *a⁶*, pivoted on the extension *a'*, and working in a line at right angles to the plane of the wheel, and adapted to be turned down against the edge thereof, and provided with a handle above its pivotal center, whereby it may be operated by the driver, substantially as set forth.

2. The improved sulky for plows, consisting of the arch having the depending arm *a⁴*, constructed with a vertical mortise, *b⁴*, open at its lower end and outer side, and having its inner portion made larger than its open side, the arm *a³*, having lateral opening *a⁴*, the wheel *c'*, having its axle *b'* fitted to and sliding vertically in the mortises *b⁴*, and the furrow-wheel *c*, spindled on the axle *b*, the shank *b³* of which is placed and adjustable laterally in the opening *a⁴*, and the levers *f* and *d*, connected with and operating, respectively, the wheel *c'* and the wheel *c*, as set forth.



3. In a wheel-plow, the combination, substantially as described, of the frame G, having its rear end pivoted to the wheel-frame and extended forward therefrom, the plow-standard having its forward end pivoted to the forward end of the frame G, the rack *i*, mounted on the plow-standard, the bar *g²*, secured to the frame G, and adapted to engage the rack *i*, and the lever *j*, pivoted to the frame G, and connected with the plow-standard, as and for the purposes specified.

293,819. REIN-HOLDER. JUDSON L. THOMSON, Syracuse, N. Y. Filed June 21, 1883. (No model.)

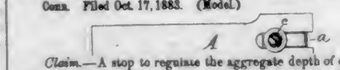


Claim.—The combination, with a whip-socket clamp, of an arm integral therewith and projecting laterally therefrom, and a rein-holding clamp secured to the free end of said arm, substantially in the manner described and shown.

293,820. SASH-FASTENER. SAMUEL M. TIMERAN, Taunton, Mass. Filed Sept. 17, 1883. (Model.)

Claim.—The sash-lock formed with base *a*, cap *b*, lever *c*, and spring *A*, said lever being pivoted at one end to plate *a*, and at its opposite end formed with angle *i*, and having a thumb-piece, *l*, by which to retract it, all as specified.

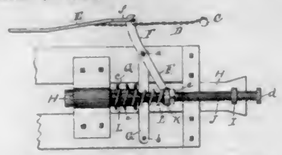
293,821. FURNACE FOR BURNING GARBAGE, ROASTING ORES, &c. GEO. B. M. TOWER, New York, N. Y., assignor of one-half to Edward L. Lambie, Washington, D. C. Filed Feb. 14, 1882. (No model.)



Claim.—1. The combination, in a reverberatory furnace, of a fire-place and a series of tapering tuyeres built in the walls and communicating with the reducing or smelting chamber, and pipes for conveying superheated steam, arranged therein, and having openings to discharge the steam in said tuyeres obliquely to their axes, whereby the gases from the fire place or places are intimately mixed with said steam, and mixture discharged into the reducing-chamber in a whirling manner, substantially as and for the purpose specified.

2. The tapering tuyere E, having openings through it to discharge air therein obliquely to its axis and the bridge-wall of the furnace, having an air-space surrounding the tuyere, in combination with a pipe arranged therein, and having openings for discharging superheated-steam jets obliquely to the axis of the tuyere, substantially as and for the purpose specified.

3. In a reducing-furnace, the combination, with the tapering tuyeres E, flue or flues D, and flue or flues G, of the coiled water pipe or pipes H, pipe or pipes I, having roses *i*, arranged to discharge in the tuyeres E obliquely to their axes, and connected with the pipe or pipes H, substantially in the manner as and for the purpose specified.

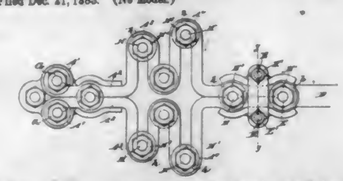


4. The pipe I, for conveying superheated steam, constructed in triangular shape, as shown, in combination with a steam-supply pipe and a series of tuyeres, substantially as and for the purpose described.

293,822. GAGE FOR PLANE-BITS. JUSTUS A. TRAUT, New Britain, Conn. Filed Oct. 17, 1883. (Model.)

Claim.—A stop to regulate the aggregate depth of cut, attached directly to the cutter of a matching-plane, with the body of the stop within the slot of the cutter, substantially as described, and for the purpose specified.

298,823. CAR-BRAKE. CHARLES TREPONING, Lead City, Dak. Filed Dec. 31, 1883. (No model.)



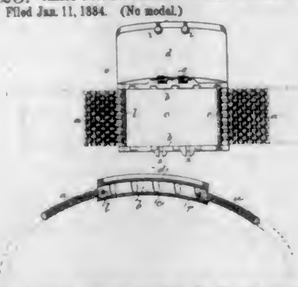
Claim.—1. The combination, with a car-brake having a hooked rod or its equivalent, forming part of the connection between the brake-lever and the brake-operating handle, a draw-head, and a spring therefor, of a buffer-rod hung to project beyond the draw-head, and a lever or levers connecting said buffer-rod with the aforesaid hooked rod, and having a pivotal connection with the draw-head, substantially as shown and described, whereby an inward movement of the buffer-rod will apply the brake, and an inward movement of the draw-head will release the brake, as specified.

2. The combination, with the hooked rod E, the draw-head H, having a pivot, *a*, attached to it, and the spring *c*, to force the draw-head outward, of the lever G, having a fixed pivot, *b*, and engaged by the pivot *a*, the lever F, pivoted to lever G, to engage the hooked rod E, the actuating-rod J, pivoted to lever F, and the spring L, substantially as and for the purpose specified.

3. The combination, with the draw-head H and the spring *c*, of the brake-actuating rod J, connected by levers and pivots with said draw-head and with the car-brake, said rod J being provided with a screw-thread, and a spring whereby the draw-head may be pushed out, and the actuating-rod may be still farther pushed out and may be adjusted relatively to the draw-head, as shown and described.

298,824. VEHICLE-SPRING. WILLIAM VAN ANDEN, New York, N. Y. Filed Dec. 21, 1883. (No model.)

Claim.—1. The carriage-spring described, having parallel or nearly parallel convolutions A^2 A^4, adapted to serve as herein specified.

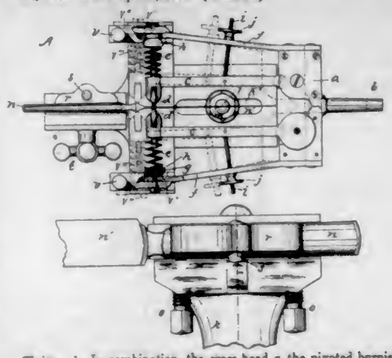


2. The carriage-spring described, having convolutions or folds A^2 A^4 increasing in length from the supporting-point A′ outward, as herein specified.

3. The carriage-spring described, having convolutions A^2 A^4, with the bends thickened by upsetting, so as to offer a greater cross-section at those points, substantially as herein specified.

4. A carriage-spring having convolutions A^2 A^4, in combination with re-enforcing clamps H H′, adapted to serve as herein specified.

5. The carriage-spring described, in two parts, having pairs of convolutions A^2 extending in opposite directions, and pairs of convolutions A^4, of greater length, extending also in opposite directions, combined and arranged to serve substantially as and for the purposes herein specified.



298,825. CLASP FOR BRACELETS. SAMUEL WALLACH, New York, N. Y. Filed Jan. 11, 1884. (No model.)

Claim.—1. The combination, with the flat bracelet-chain, of a clasp having a bottom, sides, and a hinged cover, there being grooves in the inner surfaces of the sides, and a cross-bar at the end of the chain passing into such grooves, substantially as set forth.

2. The bracelet-chain having a cross-bar at one end and an attaching-pin at the other end, in combination with a clasp that is provided with a movable cover, and inclined grooves in the opposite faces of the clasp to receive the ends of the cross-bar, substantially as set forth.

298,826. BURNISHING MACHINERY. WILLIAM O. WAY, Newington, Conn. Filed Sept. 15, 1883. (No model.)

Claim.—1. In combination, the cross-head *a*, the pivoted burnish-bearing arms *c*, the spiral springs *e*, and the arms *f*, wholly supported against the outward pressure of said springs by said cross-head, all constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

2. In combination, the cross-head *a*, the two pivoted burnish-bearing arms *c*, the spiral springs *e*, the arms *f*, wholly supported against the outward pressure of said springs by said cross-head, and the adjusting screws and nuts *i i*, all constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

3. In combination, the cross-head *a*, the pivoted burnish-bearing arms *c*, the arms *f*, the spiral springs *e*, and the rubber spring-beds *g*, all constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

4. In combination, the stock-holding standard *k*, bearing the clamp-jaw *k‴*, the pivoted clamp *r*, the bolt *s*, and the nut *t*, all constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

5. In combination, the stock-holding standard *k*, bearing the clamp-jaw *k‴*, the pivoted clamp *r*, the bolt *s*, the nut *t*, and the leveling-screws *o*, all constructed and arranged to operate substantially as shown and described, and for the purpose set forth.

6. The combination of the posts *v* and the pattern-plates *v′* with the pivoted burnish-bearing arms and suitable intermediate parts, substantially as described, and for the purpose set forth.

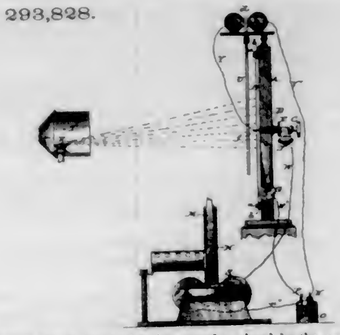
7. The combination of the adjustable posts *v* and the pattern-plates *v′* with the pivoted burnish-bearing arms and suitable intermediate parts, substantially as described, and for the purpose set forth.

298,827. ALLOY FOR AND PROCESS OF THE MANUFACTURE OF SILICIOUS COPPER AND SILICIOUS BRONZE. LAZARE WEILLER, Angoulême, France. Filed June 28, 1883. (No specimens.) Patented in France Oct. 31, 1882, No. 151,846; in England Nov. 7, 1882, No. 5,316, and in Italy Dec. 14, 1882.

Claim.—1. Sodium bronze, as a new composition of matter.

2. The method of making silicious copper or bronze by introducing sodium or sodium alloy and a decomposable compound of silicium—such as fluosilicate of potash—into melted copper or bronze, substantially as described.

3. In the manufacture of silicious copper or bronze, the improvement consisting in alloying the sodium with tin or bronze and afterward using the said alloy in the said manufacture, substantially as described.

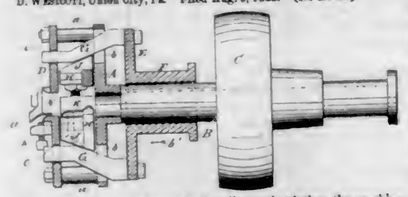


4. In the manufacture of silicious bronze, the improvement consisting in adding tin and sodium together with fluosilicate of potash to the melted copper or bronze, substantially as described.

298,828. THERMOSTATIC ELECTRIC REGISTERING APPARATUS. CHARLES W. WYNN, Brooklyn, assignor of one-half to Charles Kruse, New York, N. Y. Filed Oct. 10, 1882. (No model.)

Claim.—1. The method as herein described of opening and closing an electric circuit to produce a movement of the armature of an electro-magnet included in said circuit by the contraction of a sensitive strip or plate under the influence of an obstruction or interruption of constant heat-rays made to fall upon said plate, substantially in manner as set forth.

2. The combination, with a sensitive strip which will expand when submitted to heat and contract when the heat-rays are intercepted, of an



293,828.

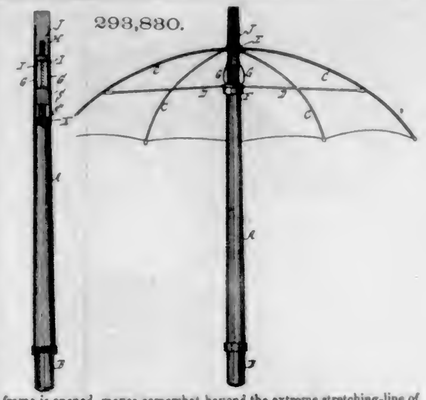
electric circuit arranged to be opened or closed by the expansion and contraction of said strip, an electro-magnet included in said circuit, and a registering device actuated by and indicating the movements of the armature of said electro-magnet, all substantially in the manner and for the purpose herein set forth.

3. The combination, with a burner or device, R, producing radiant heat, a sensitive strip, C, expanded by the projection thereon of the radiant heat and contracted by its interception, and an electric circuit, W W′, arranged to be opened by the expansion of said strip and to be closed by its contraction, and which includes therein an electro-magnet, S, actuating an indicating device, H K, of an auxiliary electric circuit, V V′, arranged to be closed by the expansion of said strip C and to be opened by its contraction, and electro-magnet *d*, included in said circuit, and a slide or shutter, U, arranged to pass between the strip and the burner to intercept the heat-rays when said auxiliary circuit is closed, and to drop away automatically from between the strip and burner when the circuit is opened, all substantially in the manner and for the purpose herein set forth.

293,829. CUTTER-HEAD FOR HANDLE-TURNING LATHES. JOHN D. WESCOTT, Union City, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. In a cutter-head for handle-turning lathes, the combination, with the tubular shaft B, provided with the apertured plate A and the apertured plate D, held in front of and some distance from the plate A, of the knife-carrying arms H, pivoted between the said plates, the sliding plate E, and the arms G, secured to said plate E, and passing through the apertures of the plates A D, substantially as herein shown and described.

2. In a cutter-head for handle-turning lathes, the combination, with the plates A D, attached to a tubular shaft, B, of the knife-carrying arms H, pivoted to the plates A D, the weight-blocks L, attached to the arms H, and of devices for adjusting the distance the arms H are to be separated by the centrifugal force, substantially as herein shown and described, and for the purpose set forth.

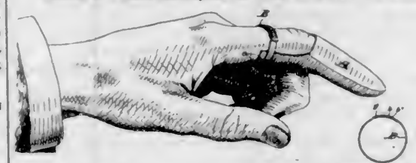


3. In a cutter-head for handle-turning lathes, the combination, with the plates A D, attached to a tubular shaft, B, of the knife-carrying arms H, pivoted to the plates A B, the beveled projections J on the ends of the arms H, and the adjustable beveled arms G, passing through the plates A D, substantially as herein shown and described, and for the purpose set forth.

4. In a cutter-head for handle-turning lathes, the combination, with the plates A D, attached to a tubular shaft, B, of the knife-carrying arms H, pivoted to the plates A D, the beveled arms G, passing through the plates A D, and the knives N and O, attached to the outer surface of the outer plate, D, substantially as herein shown and described, and for the purpose set forth.

293,830. COMBINED CANE AND UMBRELLA. HENRY A. WHITING, Brooklyn, and WILLIAM J. WINGHART, New York, N. Y. Filed Nov. 22, 1883. (No model.)

Claim.—1. The combination, in an umbrella-frame, of a series of ribs hinged to a crown-piece, and a series of stretchers hinged at their outer ends to the ribs and at their inner ends to a runner, which, when the



293,830.

frame is opened, moves somewhat beyond the extreme stretching-line of the stretchers, and when the frame is shut moves to a point beyond the extreme ends of the ribs.

2. The combination, with the cane and with the spring-stops which serve to arrest the runner when the umbrella-frame is opened, of a cap which is placed upon the cane to conceal and protect said spring-stops.

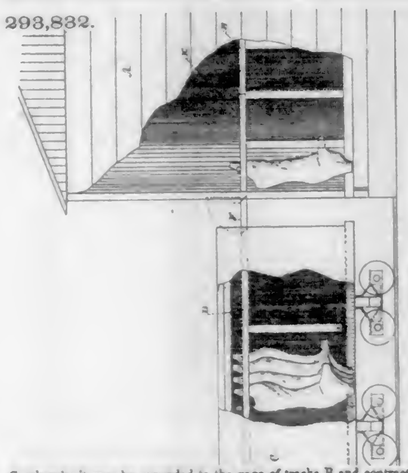
293,831. RING FOR SECURING FINGER-COTS IN POSITION. WILLIAM H. WICKERS, Indianapolis, Ind. Filed Oct. 3, 1883. (No model.)

Claim.—1. The combination of a finger-cot and a separable ring, the ends of said separable ring being adapted to be adjustably secured together, and said cot being adapted to be secured to said ring, whereby said cot may be readily secured in place, substantially as set forth.

2. The combination, with the cot A, its front part being extended downwardly, and said extended part being provided with slots, of the ring B, having a slot, *b*, in one end and a series of projections, *b′*, in the other, adapted to engage with said slot, substantially as set forth.

3. The combination of the cot A, having its back part extended down only to the middle joint of the finger and its front part extended down to the lower part of the finger, and provided with slots *a*, and the separable ring B, inserted through said slots, and adapted to fit around the finger and be adjustably secured together, substantially as described, and for the purposes specified.

293,832. REFRIGERATING CAR AND APPARATUS FOR SHIPPING MEAT. HERMAN G. WIDMAN, San Francisco, Cal. Filed Nov. 12, 1883. (No model.)



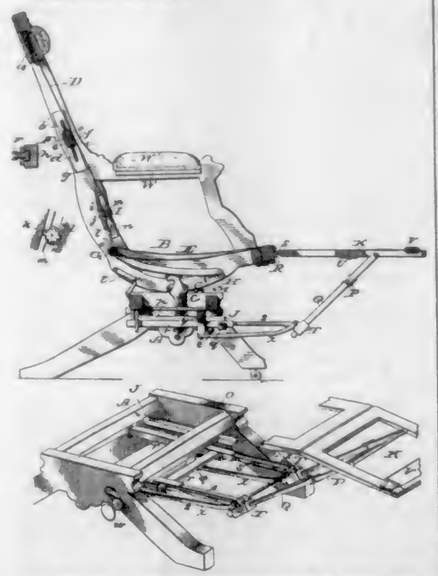
Claim.—1 An improved apparatus for shipping meat, consisting of a slaughter-house building having elevated tracks B, a meat-car having elevated tracks D, an elevated-track connection between said tracks, and gambrels fitted and traveling upon said tracks and adapted to suspend entire carcasses of slaughtered animals, whereby they may be pushed from the slaughter-house into the car, substantially as herein described.

2. In an apparatus for shipping meat, elevated tracks of a wide gage in the slaughter-house, elevated tracks of a narrow gage in the car, a switch-track connection between them, and an extensible gambrel adapted to travel on said tracks and to be switched from one to the other, substantially as herein described.

3. In an apparatus for shipping meat, the wide-gage tracks B in the slaughter-house, the narrow-gage tracks D in the car, the pivoted switch-track E, having a gage at its outer end corresponding with tracks D and connected therewith, and its inner end loosely in relation with tracks B, whereby its gage may be widened or contracted and an expanding gambrel adapted to travel on said tracks, substantially as herein described.

4. In an apparatus for shipping meat, the wide-gage tracks B in the slaughter-house, the narrow-gage tracks D in the car, the pivoted switch-track E, having a gage at its outer end corresponding with tracks D and connected therewith, and its inner end resting on inclined beams

293,832.



G, whereby it may be expanded to the gage of tracks B and contracted to the gage of tracks D, and an expanding gambrel traveling on said tracks, substantially as herein described.

5. In an apparatus for shipping meat, the tracks B D in the slaughter-house and car, of different gages, and the expanding switch-track E between them, as described, said tracks having grooves *a*, in combination with the gambrel H, constructed of telescoping sections, and having the studs *a'*, fitting said grooves, substantially as herein described.

6. In an apparatus for shipping meat, elevated tracks in the slaughter-house, elevated tracks in the car, and the tracks F connecting them, in combination with a gambrel mounted and traveling upon said tracks, substantially as herein described.

293,833. CHAIR. GEORGE C. WINCHESTER, New York, N. Y. Filed Sept. 30, 1882. (No model.)

Claim.—1. In a chair, the combination of a main frame, a flexible seat attached at its forward edge to said frame, links pivoted to the frame below the seat, in advance of its rear edge, and connected with said rear edge, substantially as shown, and springs, also connected with said rear edge, all substantially as shown and described.

2. In combination with a seat-supporting frame, seat E, attached at its forward edge to said frame, rod G; applied to the rear edge of the seat, links H, pivoted to the frame beneath the seat and forward of the rear edge thereof, and having rod G mounted in their free ends, and springs *a*, connected with the rod G, substantially as set forth.

3. In combination with a seat-supporting frame and a back-frame, back D, seat E, springs connecting the back-frame and the back, the seat connected at its front edge to the supporting-frame, a cross-bar, G, secured to the seat and back at the point of unison, and pivoted arm H, connected to the bar G and the seat-supporting frame, substantially as shown and described.

4. In combination with a chair-frame and a flexible back arranged therein, the support F, consisting of elastic strips *e*, connected to the back-frame, substantially as described, and rubber sheath or covering *f*, as and for the purpose explained.

5. In combination with frame B and flexible back D, the elastic support F, provided with heads or buttons *h*, and slotted plate *g*, substantially as and for the purpose described.

6. In combination with stationary base A and rocking body B, foot-rest K, jointed to the rocking body, supporting-legs Q, and pivotal supports for said legs applied to the base of the chair, substantially as shown and described, whereby the rest is permitted to move with and in substantially the same manner as the body of the chair.

7. In combination with frame B and back D, the elastic rod *i*, connected with the back-frame, substantially as described, and provided with rubber roll or sheath *j*.

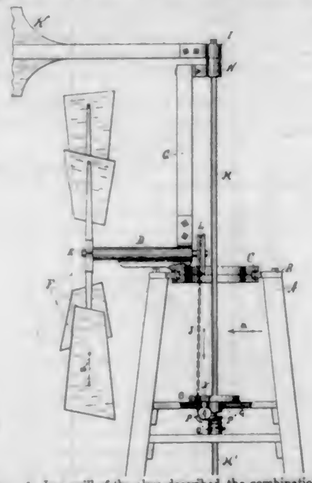
8. In combination with the back B, recessed and provided with racks *l*, the rod *i*, provided with pinions *k* and knob *m*, and flexible covering D, as set forth.

9. In combination with a chair, tubular guides *r*, toothed racks *s*, shaft *u*, provided with pinions *t* and knob *w*, cross-bar *y*, and links *z*, with rods *x* and slides *p*, all combined and operating as explained, whereby the turning of the knob causes the racks, links, and cross-bar to move in or out, according to the direction of rotation.

10. In combination with base A and with racks *s*, applied thereto, and provided with pivoted sockets T, the rocking body B, provided with hooks E, and the foot-rest K, provided with eyes S and with pivoted legs Q, all substantially as shown and described.

11. The herein-described folding foot-rest, for use in connection with a chair, provided with supports, such as shown and described, consisting of main frame K, jointed across its middle, frame P, hinged, substantially as shown, to fold within frame K, and legs Q, hinged, substantially as shown, to fold inward across frame P from opposite sides, as and for the purpose set forth.

293,834. WINDMILL. OSWALD E. WINGER, Freeport, Ill., assignor of one-half to Elam B. Winger, same place. Filed Aug. 27, 1883. (No model.)



Claim.—1. In a windmill of the class described, the combination of a horizontal wind-wheel shaft consisting of two independently-journaled parts, rotating uniformly in their bearings, but having independent rotation about the vertical axis of the mill, a wind-wheel mounted on one of said parts, gearing connecting the other of said parts with the vertical shaft of the mill, and a vane rigidly attached to the bearing of the part so geared to the vertical shaft, substantially as and for the purpose set forth.

2. In a windmill of the class described, the combination of two horizontal shafts lying in the same horizontal plane, and journaled in independent bearings rotating freely about the vertical axis of the mill, a flexible coupling connecting said shafts and adapted to secure their uniform rotation in their bearings, but at the same time to permit independent rotation of said bearings about the vertical axis, a wind-wheel mounted on one of said shafts, gearing connecting the other with the vertical shaft of the mill, and a vane rigidly attached to the bearing of said last-named horizontal shaft, substantially as and for the purpose set forth.

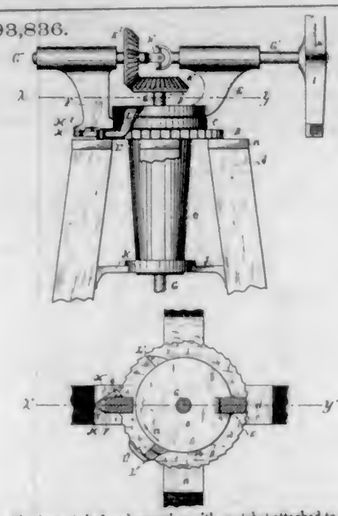
3. The combination of the sleeve K'', independent collars B'' A'', rotating freely about said sleeve, bearings B A, formed integrally with said collars, respectively, shafts E F, rotating in said bearings, respectively, universal coupling H, connecting said shafts, and vane N, rigidly attached to said bearing, and collar B B'', substantially as shown and described, and for the purpose set forth.

4. The combination of the bearings A B, shafts F E, rotating in said bearings, respectively, coupling H, connecting said shafts, and vane N, rigidly attached to the bearing B at an acute angle to the vertical plane of the shaft E, substantially as shown and described, and for the purpose set forth.

293,835. WINDMILL. OSWALD E. WINGER, Freeport, Ill., assignor of one-half to Elam B. Winger, same place. Filed Sept. 8, 1883. (No model.)

Claim.—1. In a mill of the class described, the combination of the horizontal shaft of the wind-wheel, the vertical power-transmitting shaft of the mill, a band adapted to transmit the motion of the wind-wheel shaft to the vertical shaft, intermediate pulleys for changing the direction of said band, an independently-rotating vertical shaft to which said intermediate pulleys are attached, and a vane rigidly attached to said vertical shaft, substantially as shown and described, and for the purpose set forth.

2. The combination of the horizontal wind-wheel shaft E, the vertical power-transmitting shaft M', the independent vertical shaft M, and vane K thereto attached, the band J, connecting the shafts E M', and intermediate means, substantially as described, connecting said chain J and shaft M, whereby the reaction of the work performed by the mill operates to throw the vane K into the wind, substantially as shown and described, and for the purpose set forth.

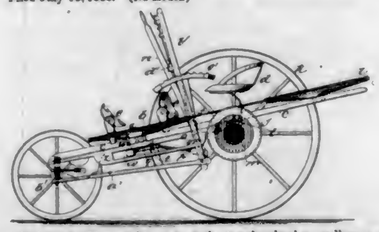


3. The combination of the shafts E M', chain-pulleys L P'', attached to said shafts, respectively, the vertical shaft M, block Q, rigidly attached thereto, and pulleys P P'', pivoted to said block, and the chain J, passing around said pulleys L P P' P'', and transmitting the motion of the shaft E to the shaft M', substantially as shown and described, and for the purpose set forth.

4. The combination of the turn-table C, bearing D, formed integrally therewith, vertical post G, rigidly attached to said bearing D, bracket H, rigidly attached to said post and vertically bored in the axial line of the mill, to serve as the bearing of the vertical shaft M, the shaft M, journaled and rotating in the bearing so formed, the vane K, rigidly attached to said shaft, and the pulleys P P'', connected with said shaft, substantially as shown and described, and for the purpose set forth.

293,836. WINDMILL. OSWALD E. WINGER, Freeport, Ill., assignor of one-half to Elam B. Winger, same place. Filed Dec. 6, 1883. (No model.)

Claim.—1. In a windmill of the class described, the combination of two horizontal shafts journaled in independent bearings and connected by means adapted to insure their simultaneous rotation in their bearings, but to permit limited independent rotation of their bearings about the vertical axis of the mill, a wind-wheel mounted on one of said shafts, gearing connecting the other of said shafts with the vertical power-transmitting shaft of the mill, a pawl attached to the bearing of said last-named horizontal shaft and engaging with a ratchet attached to the tower of the mill, said pawl and ratchet being adapted, when in engagement, to prevent the rotation of said bearing in a direction opposite to the direction of rotation of the vertical power-transmitting shaft, and means attached to the bearing of the wind-wheel shaft, whereby the rotation of said bearing beyond its prescribed limit shall disengage said pawl and ratchet and cause the rotation of the bearing to which said pawl is attached, substantially as shown and described, and for the purpose set forth.

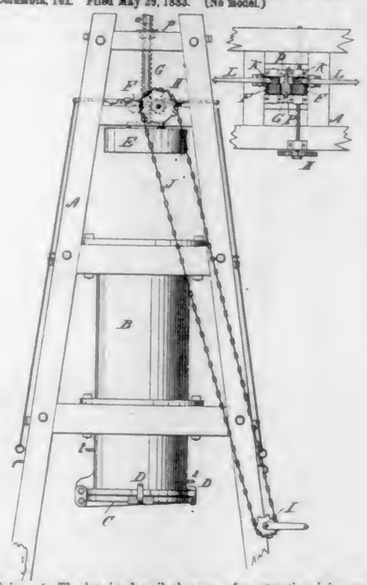


293,836.

2. In a windmill of the class described, the combination of two horizontal shafts journaled in independent bearings and lying in the same horizontal plane, a universal-joint coupling connecting said shafts, a wind-wheel mounted on one of said shafts, and a beveled gear mounted on the other and connecting it with the vertical power-transmitting shaft of the mill, a pawl attached to the bearing of said geared shaft and engaging with a stationary ratchet, and adapted to prevent the rotation of the bearing in the direction opposite to the direction of rotation of the vertical power-transmitting shaft, and means attached to the bearing of the wind-wheel shaft, whereby the rotation of said bearing, until it strikes the bearing to which said pawl is attached, disengages said pawl and ratchet, and causes the rotation of the bearing to which the pawl is attached, substantially as shown and described, and for the purpose set forth.

3. The combination of the bearings E F, ratchet-plate B, pawl M', attached to the bearing F and engaging with the ratchet-plate B, lugs L L', attached to the bearing E, and arm L'', formed integrally with the lug L, and adapted to disengage said pawl and ratchet, substantially as shown and described, and for the purpose set forth.

293,837. VELOCIPEDE. JOHN WESLEY WOODRUFF, Wise, W. Va. Filed July 18, 1883. (No model.)



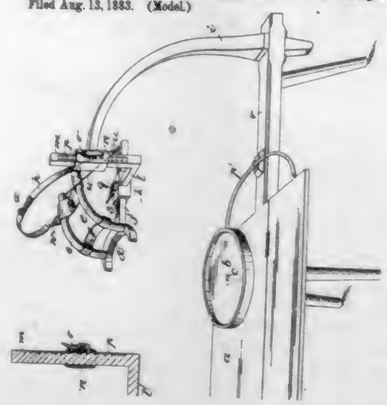
Claim.—1. The combination of the tread-wheel *a*, endless cord *f*, ratchet-drums *g j*, and the reversing-wheel *i* with the driving-wheels A and *k* of a road-vehicle, said tread-wheel being arranged with relation to the driver's seat, the ratchet-drums arranged with relation to the driving-wheels, and the reversing-wheel arranged on the rear of the bed-frame and in the plane of the tread-wheel *a*, substantially as described.

2. The combination of the hand-lever *n* with the tread-wheel *a*, said tread-wheel being arranged with relation to the driver's seat, and geared with the driving-wheels, substantially as described.

3. The steering-lever *y*, arranged on the left-hand side of the bed-frame, and connected with the front axle by a rod, *a'*, in a road-vehicle

having propelling mechanism consisting of tread-wheel *a*, geared, substantially as described, with the driving-wheels, and having a hand-lever, *n*, combined with it, and located on the right-hand side of said bed-frame, substantially as herein specified.

293,838. PROCESS OF AND APPARATUS FOR EXTRACTING CRYSTALLIZED SUGAR FROM BAGASSE. THOMAS BLOSSOM YALE, Columbia, Tex. Filed May 29, 1883. (No model.)



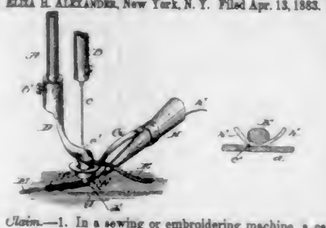
Claim.—1. The herein-described process for extracting juice and crystallized sugar from crushed saccharine material, consisting in subjecting said saccharine material in a closed vessel to the action of steam, and then extracting the juice and dissolved crystallized sugar from the saccharine material by means of a vacuum, as set forth.

2. In an apparatus for extracting juice from saccharine materials, the combination, with the cylinder B, having the hinged bottom C and clamps D, and provided with the air and steam pipes *s t*, of the piston E, rack G, pinions F, and means for operating said pinions, substantially as shown and described.

3. In an apparatus for extracting juice from saccharine materials, the combination, with the cylinder B, having the hinged bottom C and clamps D, and provided with the air and steam pipes *s* and *t*, of the piston E, rack G, pinions F, ratchet-wheels K, pawls L, and means for operating the pinions and pawls, substantially as shown and described.

293,839. SHEEP-SHEARING TABLE. JOS. LEE ADDISON, Quaker City, assignor to himself, and Malancthon R. Patterson, Cambridge, Ohio. Filed Aug. 13, 1883. (Model.)

Claim.—1. In a sheep-shearing table, the combination, with the bench *a* and the revolving seat *b*, of the breast-support *d*, provided with the vertically-curved bars *e*, the cross-straps *f g*, and the neck-strap *h*, the said support being vertically and horizontally adjustable, substantially as herein shown and described.



2. In a sheep-shearing table, the combination, with the bench *a*, provided with the beam *v*, the revolving seat *b*, and the curved standard *i*, of the breast-support *d*, having the curved arms *e*, provided with supporting and fastening straps *f g h*, and vertically and horizontally adjustably connected to said arm, substantially as herein shown and described.

3. In a sheep-shearing table, the combination, with the curved standard *i*, provided with the box *n*, having the catch-pawl *o*, of the notched angle-bar *l m*, the box *k*, having catch-pawl *q*, and the breast-support *d*, having notched bar *j*, substantially as herein shown and described.

4. In a sheep-shearing table, the combination, with the bench *a* provided with the beam *v* and the revolving seat *b*, of the curved standard *i*, provided with the box *n*, having the catch-pawl *o*, the notched angle-bar *l m*, the box *k*, having the catch-pawl *q*, and the breast-support *d*, provided with the notched bar *j*, and the curved bars *e*, having the cross-straps *f g*, and the neck-strap *h*, substantially as herein shown and described.

5. In a sheep-shearing table, the combination, with the bench *a*, provided with the beam *v* and the revolving seat *b*, of the curved rod *p'*, substantially as herein shown and described.

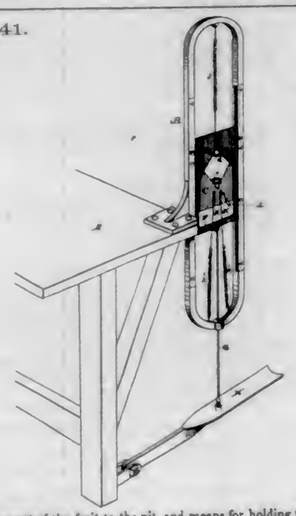
293,840. APPARATUS FOR AND METHOD OF EMBROIDERING. ELIZA H. ALEXANDER, New York, N. Y. Filed Apr. 13, 1883. (No model.)

Claim.—1. In a sewing or embroidering machine, a carrier for an embroidering material or thread, combined with a former about which the embroidering material only is wound or wrapped, and from which the successive coils are delivered to be stitched upon a fabric by a needle-thread passing through the former independently of the embroidering material, substantially as described.

2. In a sewing or embroidering apparatus, a former or presser-foot made hollow to receive a cord or core, combined with an embroidering-thread carrier adapted to wrap embroidering material or thread about the said cord or core outside of the former preparatory to attaching the said combined core and embroidering material to a fabric by sewing-machine stitches, substantially as described.

3. The former or presser-foot provided with an opening for the passage of a cord or core, and a carrier adapted to carry embroidering material or thread, and adapted to be revolved about the opening in the said former or presser-foot, and also about the cord or core carried by said opening to wind the said embroidering material or thread about the cord or core, combined with a sewing-machine needle adapted by its thread to secure the cord or core and embroidering-thread upon the fabric, substantially as described.

4. That improvement in the art or method of producing embroidery on fabrics which consists in closely wrapping a core of one material with a thread of the same or another material, and confining the said core and embroidery-threads upon a fabric by stitches made as the embroidering-thread is being wrapped about the said core, the said stitches being concealed from view, substantially as described.

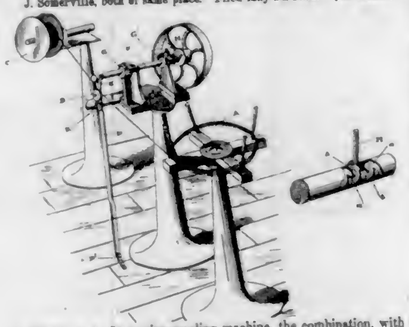


293,841. FRUIT CUTTING AND PITTING MACHINE. CHARLES ALBON, San Francisco, Cal. Filed Nov. 5, 1883. (No model.)

Claim.—1. In a fruit cutting and pitting machine, the knives having V-shaped cutting-edges inclosing a space for the reception of the fruit, each knife having a socket in the angle of its cutting-edge for fitting the points of the pit, and a means for bringing the knives together until their cutting-edges meet the stone and their sockets fit its points, substantially as herein described.

2. In a fruit cutting and pitting machine, the frame A and stationary knife C, having a V-shaped cutting-edge in its top and a thimble or band, *c*, in the angle thereof, in combination with the knife D, fitted to slide in guides in said frame, and having an inverted-V-shaped cutting-edge in its bottom, with a thimble or band, *d*, in its angle, the arms *f* on said knife, having cross-head F, the rod G and treadle H, and the return-spring J, substantially as herein described.

3. In a fruit cutting and pitting machine, knives for encircling and cutting the meat of the fruit to the pit, and means for holding the pit, in combination with a flexible line for encircling each half of the fruit and cutting it from the pit, substantially as herein described.

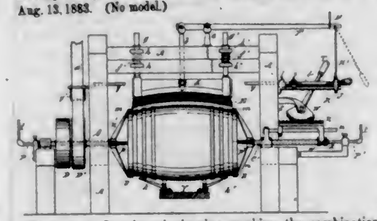


293,841.

4. In a fruit cutting and pitting machine, the frame A, stationary knife C, having a V-shaped cutting-edge, with a thimble or band, *c*, in its angle, and the reciprocating knife D, having an inverted-V-shaped cutting-edge, with a thimble or band, *d*, in its angle, in combination with the flexible lines K K, passing through the stationary knife, one from back to front, the other from front to back, and the springs *k k*, securing them to the frame, substantially as herein described.

5. In a fruit cutting and pitting machine, the knives C D and thimbles *c d*, arranged and operating as herein described, in combination with the flexible lines K K, arranged as shown, the springs *k k*, and the fine-pointed handles L on the ends of the lines, substantially as herein described.

293,842. WIRE-SPOOLING MACHINE. THOMAS S. BAYLES, Toronto, Ontario, Canada, assignor of two-thirds to Thomas R. Wood and Andrew J. Somerville, both of same place. Filed May 24, 1883. (No model.)



Claim.—1. In a wire-spooling machine, the combination, with a wire-guide and a spindle carried in suitable bearings constructed to give motion to said wire-guide, and having a right and left hand thread cut on it, so that the end of one thread shall intersect with the other, of a pin, H, fixed in the spindle-bearings fitting into the threads, so that the spindle, when revolving, shall have a reciprocating longitudinal movement imparted to it and impart the same to the wire-guide, substantially as and for the purpose specified.

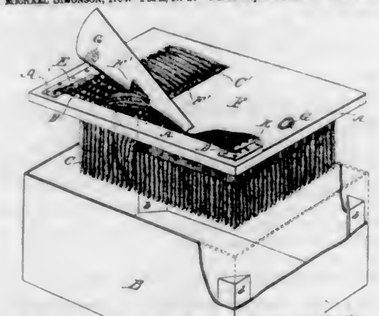
2. In a wire-spooling machine, the combination of a guiding-pulley, B, interposed between the coil and spool, and mechanism arranged to impart a reciprocating movement to the said pulley in such a manner that the wire passing around it shall be guided onto the spool in regular convolutions, substantially as and for the purpose specified.

3. In a wire-spooling machine, a pulley, B, grooved to receive the wire being guided, and journaled on a spindle fixed to the pivoted bar D, in combination with mechanism arranged to rock the said bar for the purpose of guiding the wire in regular convolutions onto a revolving spool, substantially as and for the purpose specified.

4. In a wire-spooling machine, a pulley, B, journaled on the pivoted bar D, and grooved to receive the wire as it passes from the coil A to the spool C, in combination with the pin H, fixed in the spindle-bearing, and the revolving spindle F, having a right-hand thread, *a*, cut on it, and intersecting with the left-hand thread *b*, so that the end of the pin H, fitting into the threads, will impart a reciprocating longitudinal movement to the revolving spindle, substantially as and for the purpose specified.

293,843. BARREL-CLEANING MACHINE. WILLIAM W. BEACH, Brooklyn, assignor to the Standard Oil Company, New York, N. Y. Filed Aug. 13, 1883. (No model.)

Claim.—1. In a barrel-cleaning machine, the combination of a brush, E, shaped to conform to the contour of a barrel, and suspended by a rod, *b*, connected with a lever, F, for raising said brush, a pair of rotating chucks, B B', each constructed, as described, to clamp the barrel, the rack-bracket R, toothed segment, W, and lever T, for operating said chucks, and the guide-rods *g g'* and springs *f f'*, connected with said brush, for bringing the same in contact with the barrel, the whole constructed as described, for the purposes set forth.



2. In combination with the brush E and the chucks B and B', each constructed and operated as described, the brushes N and N', fitted upon the shafts P and P' within the cavities of said chucks and kept in contact with the heads of the barrel, as and for the purpose set forth.

3. In combination with the chucks B and B', the brush E, attached to the rod *b*, which is pivoted to the end of the lever F, the guide-rods *g g'* and springs *f f'*, cords H and H', rod K, ring J, and weight I, as and for the purpose set forth.

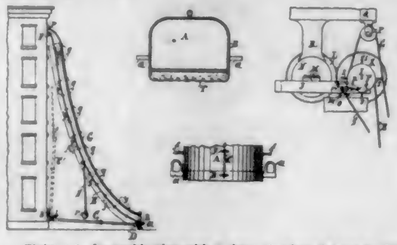
4. The combination, with the chucks B B' and their shafts C C', each constructed as described, of the devices for rotating and stopping said chucks, said devices consisting of the lever L, rod K, ring J, pulleys D D', and belt-shifter *y*, fixed upon the rod *y'* and operated by said lever L, all constructed as shown and described.

5. In combination with the chuck B' and its shaft C', the latter provided with the grooved flange *x*, the rack-bracket R, provided with pin *w*, the toothed segment W, and lever T, said rack-bracket being fitted to slide on the bar *u*, as and for the purpose set forth.

293,844. SHOW-BOX FOR TRIMMINGS. SAM. GUST. BERNSTEIN and MICHAEL SIMONSON, New York, N. Y. Filed Sept. 18, 1883. (No model.)

Claim.—1. In a show-box for trimmings, the combination, with the frame A, having the series of hooks D D, of the box B, provided with supports *b b*, for holding the frame above the bottom and within the box, as set forth.

2. The frame A, having hooks D, in combination with the backing F, secured to the frame, and slotted, as shown at F', substantially as and for the purposes set forth.



3. The combination, with box B, provided with posts *b b*, of the frame A, having holding devices or hooks D, the backing F, slotted at F', and the lifting devices G, substantially as and for the purposes set forth.

4. In a show-box for trimmings, the combination, with the frame A, having the series of hooks D, and the backing F, of the box B, provided with supports *b b*, for holding the frame above the bottom and within the box, substantially as set forth.

5. In a show-box for trimmings, the combination, with the frame A, having the flexible straps E, the series of hooks D, secured to said straps, and the backing F, of the box B, provided with supports *b b*, for holding the frame above the bottom and within the box, substantially as and for the purpose set forth.

293,845. FIRE-ESCAPE. GEORGE M. BIRD, Boston, Mass. Filed Nov 23, 1883. (No model.)

Brief.—The chute is released when to be used and drops upon hinged supports which carry the lower end of the chute out from the building. The rapid falling of the chute is prevented by a suitable brake-shoe acting upon the rope-reels of the chute. An elastic cushion is applied to the straight side of the frame, to which the lower end of the chute is secured.

Claim.—1. In combination with a chute, A, pivoted supports C C, and means for dropping said chute to said supports, substantially as and for the purpose set forth.

2. The combination of chute A, having ring-bolts *a a*, pivoted supports C C, having V-hooks D D, and ropes E E, connecting said supports with rope-wheels, substantially as and for the purpose set forth.

3. The combination of chute A, pivoted supports C C, ropes E E and G, and rope-wheels F F and H, substantially as specified.

4. In a fire-escape, the combination of rope-wheels F F, shafts I M, gears K L, ratchet-wheel H, pawl *i*, brake-wheel N, and brake-shoe R, substantially as specified.

5. In a fire-escape, the combination of a frame, J, pivoted and bearing shafts I M, as specified, rope-wheels F F, gears K L, brake-wheel N, brake-shoe R, ratchet-wheel, and pawl, substantially as set forth.

6. In a fire-escape, a frame, J, bearing the hoisting or dropping mechanism, pivoted by means of trunnions *j j* to the building, substantially as and for the purpose specified.

7. The combination of the chute A, rope-wheels F F, rope S, stop-piece *p*, and pin *q*, substantially as and for the purpose set forth.

8. In a fire-escape, a frame, B, at the lower end of the chute, having ring-bolts *a a*, providing wrist-pins, substantially as and for the purpose set forth.

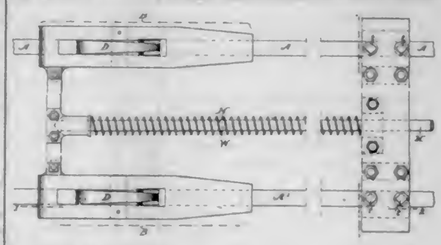
9. In a fire-escape, a chute having a frame, B, provided with a straight side and an elastic cushion, T, substantially as specified.

10. The combination of chute A, ring-bolts *a a*, supports C C, having V-hooks D D, and catches *d d*, substantially as specified.

11. The combination of chute A, supports C C, ropes E E, rope-wheels F F, gears K L, pivoted frame J, ratchet-wheel A, pawl *i*, brake-wheel N, and brake-shoe R, substantially as described.

12. In a fire-escape, the combination of a chute, A, rope G, rope-wheel H, pulley P, and suitable bearings for said rope-wheel and pulley P, to maintain them in the relation to each other specified, substantially as and for the purpose set forth.

13. A frame pivoted by means of trunnions and bearings therefor which serve as a fulcrum bearing two shafts—one on each side of said trunnions—said shafts geared together, one of said shafts having one or more rope-wheels thereon, and the other shaft provided with a brake-wheel, substantially as and for the purpose set forth.



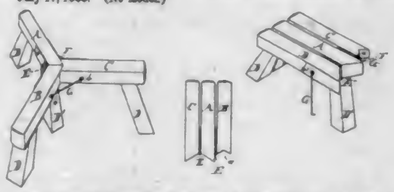
293,846. DEVICE FOR ARRESTING LOCOMOTIVES AND CARS. MAXIMILIAN F. BONZANO, Philadelphia, Pa. Filed Nov. 21, 1883. (No model.)

Brief.—Sliding shoes on rails have pivoted levers which receive impact of car, and through such levers acting upon the rails friction is imparted, which retards the moving vehicle.

Claim.—1. The combination of a shoe, B, adapted to a rail, with a lever, D, pivoted to the shoe, and serving with the same as a medium by which a locomotive or car will cause friction on the rail, substantially as set forth.

2. The combination of the shoe and its lever with counterbalancing mechanism, substantially as specified.

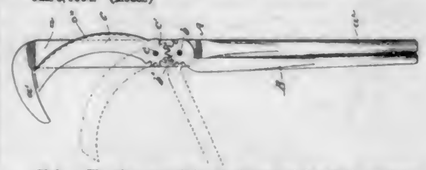
3. The combination of the shoe B, adapted to the rail, and the lever



293,846.

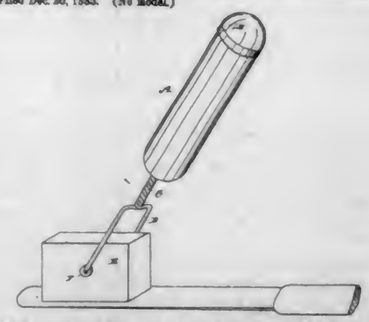
D, pivoted to the shoe, with a removable block, *i*, interposed between the arm *e* of the lever and the rail, substantially as specified.

4. The combination of the shoe B with the lever D, having a toe, *h*, for limiting the movement of the lever, as set forth.



5. The combination of two or more shoes, B, adapted to rails on a track, and each shoe having a lever, D, with a bar or bars for connecting the shoes together, substantially as described.

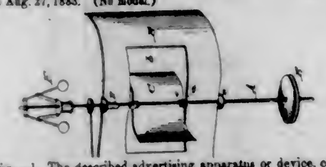
293,847. WASH-BENCH. HENRICH BREMER, Chicago, Ill. Filed July 17, 1883. (No model.)



Claim.—The combination, with hinged and beveled bars A B, and hinged and grooved bar C, of means for holding the several parts in position, substantially as described and shown.

293,848. PIPE-WRENCH. DANIEL S. BROWN, Burdette, N. Y. Filed Jan. 3, 1884. (Model.)

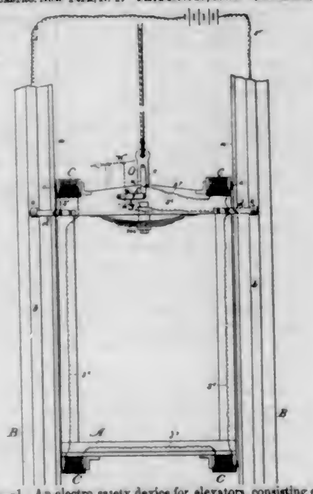
Claim.—The pipe-wrench herein shown and described, consisting of the main body A, formed with the recess *a*, jaw *a'*, and handle portion *a²*, and of the handle B and jaw C, pivoted in the recess *a*, the handle and jaw being geared together by the sectors *b' c'*, substantially as and for the purposes set forth.



293,849. KNIFE-SCOURER. CHARLES A. BRYANT, Wakefield, Mass. Filed Dec. 20, 1883. (No model.)

Claim.—1. In a knife-scourer, the combination, with the handle A, of the frame D, secured on the lower end of the same, the rubbing-block E, mounted on the cross-piece of the frame, and of the sleeve F, mounted on the said cross-piece, substantially as herein shown and described.

2. A knife-scourer consisting of the wire frame D, carrying the rubbing-block E, and provided with the tang C, formed by the upper twisted ends of the said frame, and a handle, A, substantially as set forth.



293,850. ADVERTISING DEVICE. JOHN WESLY CARLY, Mexia, Tex. Filed Aug. 27, 1883. (No model.)

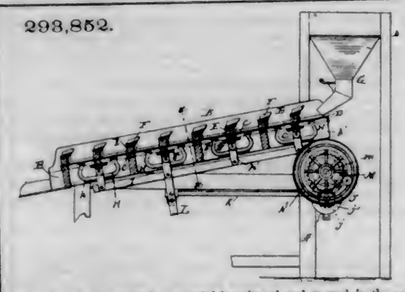
Claim.—1. The described advertising apparatus or device, consisting of the fixed staff or upright A, bent rotary vane B, having the opening *b*, and adapted for the display of advertisements, and inside bent rotary vane, C, substantially as set forth.

2. In an advertising apparatus or device, the combination of the fixed staff or upright A, having pulley E, bent rotary vane B, having the opening *b*, and adapted for the display of advertisements, inside bent rotary vane, C, and the governor F, adapted to regulate automatically the speed at which the vanes are to revolve, substantially as and for the purpose shown and set forth.

293,851. ELECTRIC SAFETY DEVICE FOR ELEVATORS. JACOB WM. DE CASTRO, New York, N. Y. Filed Nov. 27, 1883. (No model.)

Claim.—1. An electro safety device for elevators, consisting of iron strips upon or adjacent to the guides, electro-magnets, with the ends of their cores adjacent to said strips, a circuit-closer, and connections whereby, upon any undue increase of speed, the circuit is completed and the magnets excited, substantially as set forth.

2. The combination, with a cage supporting electro-magnets and connections, and a circuit-closer arranged to complete the circuit and excite the magnets should the cage part from its cable or attain undue speed, of iron strips arranged opposite the cores of the magnets to insure a magnetic retarding effect when the magnets are excited, substantially as set forth.



3. The combination of a movable cage carrying electro-magnets, safety-detents, and a circuit-closer, a stationary generator, and strips *b* in the electric circuit, and circuit-connections on the cage, moving in contact with said strips, substantially as set forth.

4. The combination of the cage, magnets, automatic circuit-closers, strip *a*, generator, and connections, as described, whereby to complete the circuit in case the cage attains undue speed, and to then insure contact between the cores and strips on the magnets becoming excited, substantially as specified.

293,852. PLACER-MINING MACHINE. RICHARD V. F. DE GUIDON, Chicago, assignor of one-half to John W. Parmelee, Englewood, Ill. Filed May 7, 1883. (No model.)

Claim.—1. A separating-box composed of a series of compartments arranged on an incline descending from the point where the material is received, and provided with flexible bottoms, in combination with mechanism for striking blows on the under side of the flexible bottom of each

293,852.

compartment, whereby the material is agitated and turned in the compartments, and the sand delivered from one to another, substantially as and for the purposes set forth.

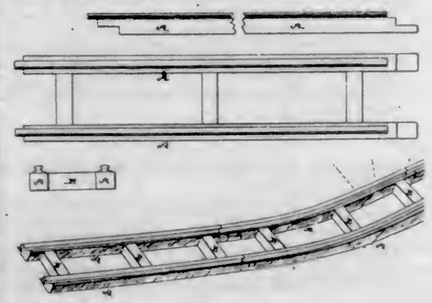
2. In a separating-machine for mining, a series of compartments arranged on an incline, in combination with a flexible diaphragm or bottom for the compartments, and a mechanism constructed and operating to deliver blows upon the under side of the flexible bottom of each compartment in the direction of curved lines, substantially as and for the purposes set forth.

3. The receiver B, divided into compartments, in combination with the diaphragm D, of suitable flexible material, the rocking agitators H, and mechanism for oscillating said agitators, substantially as and for the purposes set forth.

4. The receiver B, in combination with the cross-bars C, concave upon their upper faces, the cross-bars E, arranged above the bars C and conforming thereto, the caps F, provided with concave front faces *f*, and the flexible bottom D, substantially as and for the purposes set forth.

5. The receiver-compartments provided with a flexible bottom, in combination with the U-shaped agitators H, connecting-rod I, and mechanism whereby a reciprocating movement is given to said connecting-rod, substantially as and for the purposes set forth.

6. The flexible diaphragm D, constituting the bottom of the receiver-compartments, in combination with the U-shaped agitators H, the connecting-rod I, the pitman K, and the crank-wheel J, substantially as and for the purposes set forth.



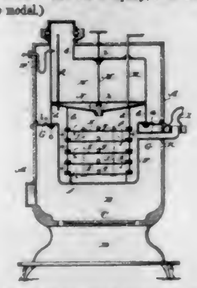
7. The inclined receiver B, in combination with the cross-bars C and E, the flexible diaphragm D, the hopper G, and the rocking agitators H, all arranged and operating substantially as and for the purposes set forth.

8. In a separating-machine for mining, an independent inclined frame, in combination with an independent separating-box composed of a series of compartments provided with a flexible bottom, and adapted to be applied to the said independent frame, an agitating mechanism mounted on the said frame independent of the separating-box, and adapted to strike blows upon the bottoms of the compartments, substantially as and for the purposes set forth.

9. The separating-box composed of a series of compartments provided with a flexible bottom turned up at the side edges on a curve, in combination with the agitators for striking blows on the under side of the flexible bottom, substantially as and for the purpose set forth.

293,853. PORTABLE RAILWAY. JOHN DOLBEER, San Francisco, Cal. Filed Sept. 25, 1883. (No model.)

Brief.—Consists of stringers permanently united by cross-timbers, and having their ends notched to overlap. Rails are secured upon the stringers, so as to project beyond one end and not reach the opposite end of the stringers. The inner and outer stringers of curved sections terminate on lines which are radii of the curves.



Claim.—1. A portable railway consisting of stringers permanently united by cross-timbers, and having rails secured upon them, so as to project beyond one end and not reach the opposite end, substantially as herein described.

2. A portable railway consisting of stringers permanently united by cross-timbers, and having their ends notched to overlap, in combination with rails fixed to the stringers, so that their alternate ends extend upon the succeeding stringer, the rails being united by fish-plates, substantially as herein described.

3. A portable railway consisting of stringers having straight or curved rails secured to them, and permanently united, as shown, the inner and outer stringers of curved sections, terminating on lines which are radii of the curves, substantially as herein described.

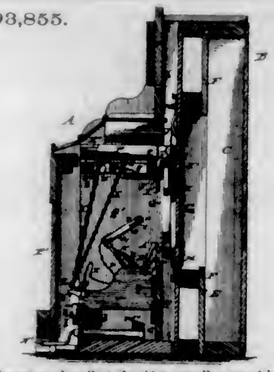
293,854. APPARATUS FOR THE MANUFACTURE OF ILLUMINATING-GAS. WILLIAM H. DOUGLASS, Philadelphia, Pa., assignor to the North American Petroleum Gas Company, New York, N. Y. Filed May 25, 1883. (No model.)

Claim.—1. The casing having at or near its center a ring or flange provided with perforations, a retort suspended from such ring and containing a series of plates having alternating openings, a pipe leading from the retort for carrying off the gas, a reservoir having a rim forming a cover to the retort, and having a bottom provided with a valve-opening, a valve for controlling said opening to regulate the supply of gas-producing material to the retort, a reticulated false bottom in the reservoir above its main bottom, and means for charging the reservoir, substantially as described.

2. In a hydrocarbon-gas generator, a retort provided with a seal-cup at its upper end, a series of communicating vaporizing-chambers, and an evacuating-tube communicating therewith, in combination with a reservoir fitting in the seal-cup of the retort, and provided with a valved opening communicating with the retort, a supplemental grated or reticulated bottom, and means for supplying either liquid or other gas-producing substances thereto, substantially as described.

3. In a hydrocarbon-gas generator, the retort provided with a series of vaporizing-chambers, and a seal-cup to both the retort and partition-plate of the top chamber, in combination with the reservoir, provided with a pendent rim and flange to fit into said cups, substantially as described.

4. In a hydrocarbon-gas generator, the combination of a retort provided with a seal-cup around its top, a reservoir fitting into said cup, a pipe connecting the reservoir with the retort to equalize the pressure in both, and a siphon or trap overflow to the reservoir, substantially as described.



5. In a hydrocarbon-gas generator, the combination of the sectional casing, the retort provided with a seal-cup around its top, and the detachable reservoir fitting into the seal-cup of the retort and closing the top of the latter, substantially as described.

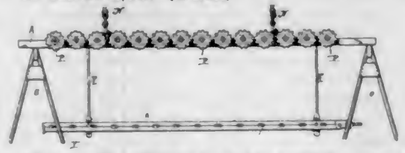
6. The combination of the retort provided with a seal-cup around its upper end, a series of communicating vaporizing-chambers formed of plates provided with cups and rims fitting together, as set forth, a detachable reservoir having a rim and flange fitting into the cup of the retort and top partition-plate thereof, and provided with the grated or reticulated bottom, the valve for regulating the flow of hydrocarbon into the retort, and the tubes for the introduction of liquid or other gas-producing substance, the equalizing-pipe, and the siphon or trap overflow, substantially as described.

293,855. PIANO-FORTE. JOSEPH DOYLE, Mount Liberty, Ind. Filed June 8, 1883. (No model.)

Claim.—1. In an upright piano-forte, the combination of the upright rectangular frame in the rear portion of the casing, the upright stanchions, the bridge and the wrest-plank, extending in two divergent curves from near the middle of the side piece of the frame at the treble side to near the ends of the side piece at the bass side, and having their rear surfaces connected with the upper and lower side pieces of the frame by

293,855.

the thin boards, as described, the thick sounding-board having the transverse series of perforations at its center, and the thin sounding-board fastened across the center of the thick sounding-board, as and for the purpose shown and set forth.



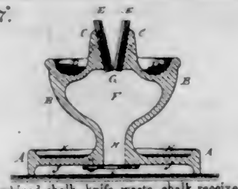
2. The bridges or agraffes, each consisting of a small strip of spring-steel bent to form a transverse bulge at the center, and adapted to support the strings at their ends, as and for the purpose shown and described.

3. The bridge or agraffe consisting of a small strip of spring-steel bent to form a transverse bulge at the center, and having the longitudinal notches upon the upper surface of the bulge, and adapted to support the strings at their ends, each string resting in one of the notches, as and for the purpose shown and set forth.

4. The combination of the upright casing, open at the top and at the front side, in which the action is pivoted, the straight hopper having the notch in its lower edge pivoted in the front portion of the upright casing, and having the felt strips upon the upper and lower edge of its inner end, the hammer having the eccentric cam at its lower end, at which it is pivoted, and having the wire spring bent double at its lower end, forming a projecting arm provided with a rubber head and fastened at the upper and lower end of the hammer, and having the strip of cloth attached to the top of the hammer and to the upper edge of one of the sides of the casing, the bent wire spring fastened to the front edge of one of the sides of the casing and passing under the outer end of the hopper, resting in the notch in the same, with its lined hooked free end, and the damper consisting of a straight stick pivoted at the upper edge of the upright casing, and having the zigzag-bent wire at its upper end, upon which the damper-pad is fastened, as and for the purpose shown and set forth.

5. The hammer having the straight head having the transverse notch or recess at its outer end and the transverse notch cut from its under side near the outer end, and provided with the roll of textile material placed in the transverse recess, and held in place by the string or cord passing through the center of the roll and into the notch in the under side of the head, as and for the purpose shown and set forth.

293,856. DYEING-MACHINE. ALEXANDER N. DUBOIS, Philadelphia, Pa. Filed Nov. 23, 1883. (No model.)

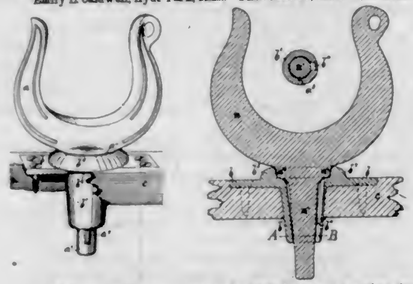


Claim.—1. The combination of a driving mechanism, a series of angular pulleys provided with wheels, a driving-chain, the frame A, and a lower swinging frame provided with pulleys, substantially as shown.

2. The combination of the frame A, tub B, angular rollers *a*, provided with wheels at one end, chain D, swinging frame A', provided with rollers, and a mechanism for imparting a rotary motion to the angular rollers, and a mechanism for reciprocating the frame A', substantially as described.

293,857. COMBINED IMPLEMENT FOR TAILORS' USE. CLAUDIUS EDLUND, Brooklyn, N. Y. Filed Aug. 6, 1883. (No model.)

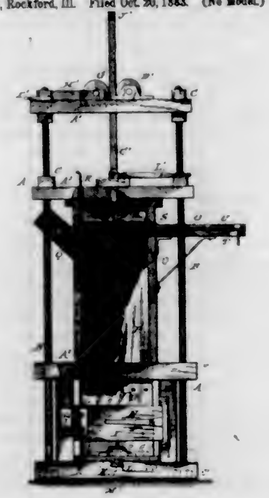
Claim.—1. A combined chalk-knife, waste-chalk receiver, pin-cup, and paper-weight constructed substantially as herein shown and described, and consisting of the base A, the hollow body B, having top and bottom openings and recessed top, and provided with outwardly-inclined recessed jaws C, the corrugated knives E, and the stopper I, as set forth.



293,857.

2. In a combined chalk-knife, waste-chalk receiver, pin-cup, and paper-weight, the body B, made hollow, having top and bottom openings and a recessed top, and provided with outwardly-inclined recessed jaws C, substantially as herein shown and described, to adapt the said body to receive chalk-shaving knives, and to serve as a waste-chalk receiver and as a pin-cup, as set forth.

3. In a combined chalk-knife, waste-chalk receiver, pin-cup, and paper-weight, the combination, with the outwardly inclined and recessed projecting jaws C, of the hollow body B, and of the knives E, having corrugated faces, substantially as herein shown and described, whereby the chalk can be readily brought to an accurate V-shaped edge, as set forth.



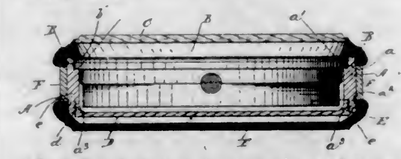
293,858. ROWLOCK. JACOB EDSON, Boston, assignor of one-half to Emily L. Caldwell, Hyde Park, Mass. Filed June 18, 1883. (No model.)

Claim.—1. The combination of the forked piece *a*, tapering shank *a'*, enlarged collar *a''*, and locking projection *a²*, with the socket consisting of plate *b*, tapering sleeve *b'*, having vertical groove *b''*, and upper annular bearing-ring, *b²*, adapted to receive the collar *a''* in a manner substantially as and for the purpose set forth.

2. The herein-described bearing-piece or socket for rowlocks, consisting of plate *b*, with its downwardly-projecting tapering sleeve *b'*, having internal vertical groove, *b''*, in combination with upper annular bearing-ring, *b²*, all combined and arranged as and for the purpose set forth.

293,859. PACKER FOR FLOUR, BRAN, &c. JACOB FRYSINGER and BENJAMIN CAUGHT FRYSINGER, Rock Island, assignor of one-third to George P. Frysinger, Rockford, Ill. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination of the platforms A^2 A^4, having openings through the same, the follower having the flat bar C', the roller D', mounted upon the stationary shaft E', the sliding frame H', carrying roller G', and the lever I', substantially as shown and described.

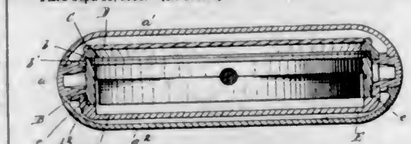


2. The combination, with the follower and its bar and the friction-rollers, of the spring-catches arranged on opposite sides of said bar and adapted to engage with notches in the bar, to hold the same at a given position, substantially as shown and described.

3. The press-box having a chute and slide in one side, and in another side an opening provided with a sliding apron for placing a head between the compressing-follower and the bran or material to be compressed, substantially as shown and described.

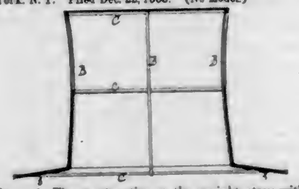
4. The frame having the grooved platform and hinged sides, combined with the ribbed slide having means for holding a packing-case, substantially as shown and described.

5. The packing-case having perforations to allow air to escape from the material being packed therein, and through which a head may be nailed in the case, substantially as shown and described.



293,860. WATCH-CASE. CHAS. K. GILES, Chicago, Ill. Filed Sept. 13, 1883. (Model.)

Claim.—1. A circular band adapted to receive a watch-movement, and provided with a threaded section at each edge, in combination with a bezel provided with a screw-thread, a back plate also provided with screw-thread, and an independent "center" adapted to be placed upon the band between the bezel and back plate, whereby both bezel and back plate are removably attached to the band by their threaded sections, and may be adjusted thereon at pleasure to fix the position of the center and firmly clamp it between the two, substantially as and for the purposes set forth.

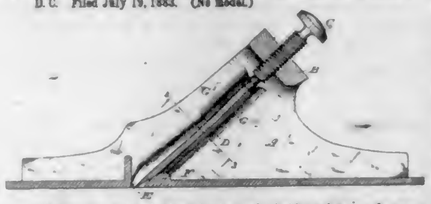


2. The circular band adapted to receive the movement of a watch, and threaded, as described, in combination with the screw-threaded bezel, the screw-threaded back cap, the screw-threaded back plate, and the independent center fitted to the exterior of the band, all constructed and operating substantially as and for the purposes set forth.

293,861. LINING FOR WATCH-CASES. CHAS. K. GILES, Chicago, Ill. Filed Sept. 13, 1883. (No model.)

Claim.—A lining-band for a watch, adapted to receive the movement, and provided at each edge with a threaded section, in combination with a "ring" case-center closely and accurately fitting the outside of the lining-band, a screw bezel or ring adapted to be turned on the front edge of the band, a screw back cap adapted to be turned upon the back edge of the band, and front and back case-pieces hinged to the center and adapted to be closed upon the latter outside of the bezel and back cap, whereby the case may be accurately adjusted to the lining and securely clamped in place, and the box formed by the lining, bezel, and back cap inclosed within the hinged portions of the case, substantially as and for the purposes set forth.

293,862. CAP OR OTHER HEAD-COVERING. PHILIPP GOLDMANN, New York, N. Y. Filed Dec. 22, 1883. (No model.)



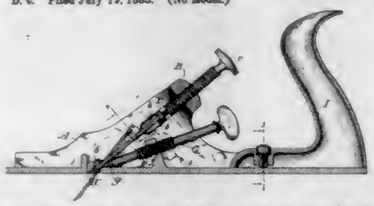
Claim.—1. The combination of the upright stays with the fixed horizontal rings—one on the upper end, one on the lower end, and one intermediate of the ends of the stays—substantially as described.

2. The combination of the upright stays, the horizontal ring on the upper end of the stays, and the horizontal band on the lower part of the stays, substantially as shown and described.

3. The combination of the upright stays, the horizontal rings—one on the upper ends, and one intermediate of the ends of the stays—and the horizontal band on the lower part of the stays below the intermediate ring, substantially as shown and described.

4. The combination, with a cap or hat having a flexible crown, of the horizontal ring intermediate of the top and bottom of the crown, and the band having the ring connected to its upper edge.

293,863. BENCH-PLANE. ARTHUR T. GOLDSBOROUGH, Washington, D. C. Filed July 19, 1883. (No model.)



Claim.—1. A bench-plane having a single bit, and means for moving the same longitudinally, and a stock provided with fixed projections arranged in the path of the cutting-bit, but on different lines, between which projections the bit is held when forced to its operative point, as set forth.

2. A bench-plane having a single bit and detachably-connected adjusting-screw, and a stock formed with cleats, between which said bit moves freely, and a deflector at or near the throat, over which the bit is forced to its operative point by its adjusting-screw, and between which deflector and cleats it is securely held, substantially as set forth.

3. In a bench-plane, the stock A, formed with a guiding-cleat extending from the point of insertion of the bit to and terminating at a deflector or raised portion at or near the throat, and a cleat arranged above and parallel to and only a portion of the length of the said guiding-cleat, between which short cleat and the deflector a cutting-bit may be securely held.

4. In a bench-plane, the combination, with the stock A, provided with slotted and screw-threaded bridge B, uniting the sides thereof, cleats G and G', extending inward from the sides of the slot, and deflector or projection F, at or near the throat of the plane, of the bit D and detachable adjusting-screw C, all constructed and operating substantially as shown and described.

293,864. BENCH-PLANE. ARTHUR T. GOLDSBOROUGH, Washington, D. C. Filed July 19, 1883. (No model.)

Claim.—1. A bench-plane having a single bit and a detachably-connected adjusting-screw arranged in line therewith, and adapted to move said bit longitudinally in its plane of adjustment, a stock provided with rigidly-fixed inward projections arranged on parallel lines on each side thereof, between which the bit is held and moved, and means for locking the adjusted bit by forcing it obliquely upward against the projections of the stock, as set forth.

2. A bench-plane having a single bit, an adjusting-screw detachably connected thereto, a stock formed with spaces or recesses leading obliquely upward from the throat and adapted to allow the upper end of said bit to be moved at right angles to its plane of adjustment while being connected to its adjusting-screw, and a set-screw arranged to exert pressure below said bit and lock it in its adjusted position.

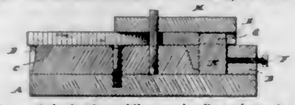
3. In a bench-plane, a stock formed with a bridge connecting the sides thereof on the line of the cutting-bit, and adapted to support a screw for controlling the longitudinal adjustment thereof, and a supplementary bridge located below the bit and adapted to support a set-screw operating between the bit and the inner side of the sole, cleats projecting inwardly from the sides of said stock, between which said bit moves and is adjusted, and a recess or space between the lower and upper cleats, within which the bit may be moved at right angles to its plane of adjustment, as set forth.

4. The stock A, formed with bridges B and F, the cleats *b* and *b'*, and recesses E or equivalent, substantially as shown and described.

293,865. COMPENSATING PENDULUM. FRANK CHARLES GREENLEAF, Apulia, N. Y. Filed Apr. 5, 1883. (No model.)

Claim.—1. The frame A, provided with an adjustable weight suspended upon a thermostatic bearing, and adapted to be adjusted vertically, substantially as described, and for the purpose set forth.

2. In a pendulum-weight, the open frame A, provided at its upper end with a thermostatic bearing having a free end adjusting-spring, C, and vertically-adjustable weight B, substantially as shown, and for the purpose set forth.



3. In a pendulum-weight, an open frame having attached at its upper portion a thermostatic bar and means for vertically adjusting one end of the same, said thermostatic bar having depending therefrom a rod which carries an adjustable weight, the parts being combined substantially as shown, and for the purpose set forth.

4. In combination with the open frame having a thermostatic bar secured to one side within the frame, and at the opposite side of said frame a means for vertically adjusting the free end of the bar, a screw-threaded rod attached to the under side of the bar and passing through a guide on the lower part of the frame, and a pointer secured to the frame, the parts being organized substantially as shown, and for the purposes set forth.

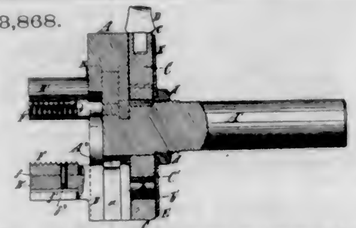
5. In a compensating pendulum-weight, the thermostatic bar having a weight or bob carrying rod secured to the under side of the same, and a frame and means for attaching said frame to the pendulum-rod, for the purpose set forth.

6. In a compensating pendulum-weight, the open frame A, having rigidly secured at one side of the same a thermostatic bar provided at its under central portion with a partially screw-threaded rod, I, which carries a vertically-adjustable weight, the free end of the thermostatic bar being vertically adjustable by means of a spring, C, and set-screw, and a guide, *d'*, located near the base of the frame, and pointer E, attached to the frame opposite the spring C, the parts being organized and combined substantially as shown, and for the purpose set forth.

293,866. DEVICE FOR WELDING STEEL CALKS TO HORSE-SHOES. JOHN D. HALL, Orrville, Ohio. Filed Sept. 4, 1883. (No model.)

Claim.—A device for welding steel calks to horseshoes, the same consisting of a bed-plate having a flange and set-screws at one end, a swiveled die-plate, and a removable die provided with an abutment serving as a guide for the shoe, the set-screws adapted to hold the die in position, and the upper die-plate, all constructed and arranged to operate substantially as specified.

293,867. PRESSER-FOOT FOR SEWING-MACHINES. SAMUEL HALLIWELL, New Haven, Conn., assignor of one-half to J. S. Sackett & Co., same place. Filed Sept. 19, 1883. (No model.)



Claim.—The herein-described presser-foot attachment for sewing-machines, consisting of the presser-foot A, constructed with the shank B, extending upward therefrom, the said shank constructed with a horizontal flange, *a*, combined with the socket C, constructed with a recess corresponding to the shank, said recess provided with a vertical bearing or shoulder, and with a transverse shoulder, *d*, corresponding to the flange *a* on the shank, and a device, substantially such as described, to secure the shank in said recess, all substantially as specified.

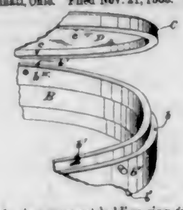
293,868. SCREW-CUTTING IMPLEMENT. WILLIAM HARGRAVE, New York, N. Y., assignor of one-half to James Gregory, same place. Filed Oct. 16, 1883. (No model.)

Claim.—1. The combination, with the body or stock piece, constructed with radial slots, of sliding blocks fitting in said slots, having

293,868.

projecting beyond the face of said body forward extensions provided with chasers, and having rearwardly-projecting studs extending beyond the back of said body, and a disk or plate at the back of the body, having cam-like or eccentric slots receiving said studs, substantially as and for the purpose described.

2. The combination, with the body or stock piece, constructed with radial slots, of sliding blocks fitting in said slots, and having forward extensions projecting beyond the face of the body and provided with chasers, and rearwardly-projecting studs extending beyond the back of the body, and a disk or plate at the back of said body, having cam-like or eccentric slots, which receive said studs, and are provided at the ends with concentric portions, substantially as and for the purpose described.



3. The combination, with the body A, having radial slots A^3, of the sliding blocks B, having forward extensions, B', with chasers, and rearwardly-projecting studs *b*, the disk or plate C at the back of said body, having cam-like or eccentric slots C', and the shield or guard-plate E, all substantially as described.

4. The combination, with the body A, having radial slots A^3, and the shank or spindle A', of the sliding blocks B, having chasers and rearwardly-projecting studs *b*, the disk or plate C at the back of the body, having cam-like or eccentric slots C', the shield or guard-plate E, and the nut *d*, all substantially as described.

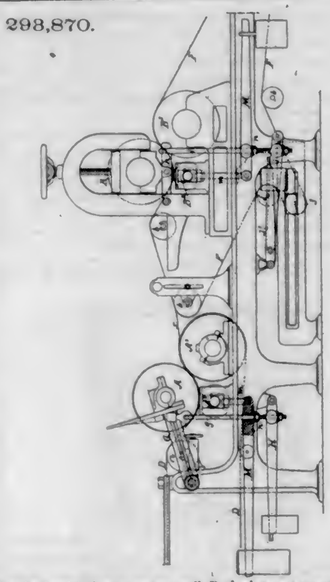
5. The combination of the sliding blocks B, constructed with forward extensions, B', in which are slideways *f*, the chasers F, and pins *f'*, for detachably securing the chasers in said slideways, substantially as described.

6. The combination of the sliding blocks B, constructed with forward extensions, B', in the outer and inner sides of which are slideways *ff*, the chasers F, and the pins *f'*, all substantially as described.

293,869. WATCH-CASE. C. WESLEY HARMAN and HORACE G. SKIDMORE, Cincinnati, Ohio. Filed Nov. 21, 1883. (No model.)

Claim.—1. A movement-holding ring for watches, adapted to be held from movement in the case-center, and having the bezel and back secured to it by being turned on, as by a screw or bayonet-joint connection, so that access can be had to the movement without removing it from the case-center, said ring being adapted for use as a movement-holding box, as set forth.

2. The watch-movement box or receptacle in three parts, consisting of annular body B, having rabbets *b b'' b'''*, the spiral grooves *b'*, the hole *b**, and the stud *b**, in combination with the separately-attached covers C D and C', having inwardly-extending studs *c*, as and for the purpose set forth.

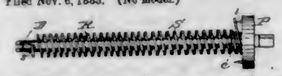


3. The combination of a watch-case center, A, having recess *a'* and lip *a*, a movement box or receptacle in three pieces, consisting of annular body B, having rabbets *b b'' b'''*, the spiral grooves *b'*, the hole *b**, and the stud *b**, and the covers C D and C', turned thereon independently of the case-center, having studs *c* to engage in the spiral grooves, as set forth.

293,870. PAPER-MAKING MACHINE. JOHN J. HARRIS, Wilmington, Del. Filed Nov. 30, 1883. (No model.)

Claim.—1. The combination of the upper couch-roll, A, of a Fourdrinier machine, the two lower rolls, A' and A^2, upon both of which the upper roll has a bearing, the press-rolls, and a conveyer, whereby the web of paper is caused to pass first between the rolls A A^2, then between the rolls A A', and thence to the press-rolls, as set forth.

2. The combination of the couch-rolls A, A', and A^2, arranged as

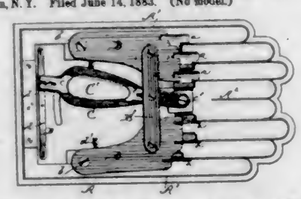


293,870.

described, with the upper press-roll, B, the lower press-rolls, B' and B^2, providing a double support for said upper roll, and a conveyer, whereby the web of paper is carried first between the couch-roll A and the rolls A^2 and A', and then between the roll B and the rolls B^2 and B', as set forth.

3. The combination, in couch or press roll mechanism of a paper-machine, of the upper roll and the two lower rolls, with a weighted rod for depressing said upper roll, and a weighted lever, M, having an opening for the passage of said rod fulcrumed on a nut, *n*, thereon, and acting on a rod, *m*, which presses upward upon the bearing of one of the lower rolls, as set forth.

293,871. SPRING SHADE-ROLLER. STEWART HARTSHORN, Millburn, N. J. Filed Nov. 6, 1883. (No model.)



Claim.—1. In spring shade-rollers, the combination, with the roller, of a slotted spindle or spring, the latter permanently or fixedly connected at one end to the spindle by the slot therein, and at the other end to the roller, substantially as and for the purposes set forth.

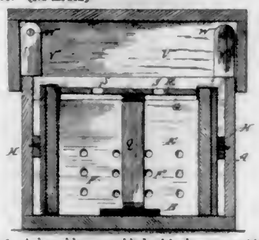
2. In spring shade-rollers, constructing the shaft or spindle on which the spring is mounted with an open slot or groove in its inner end, substantially as and for the purposes set forth.

3. In spring shade-rollers, the combination, with the spindle having a groove cut in its inner end, of the head end or end plate of the roller, and the spring attached by one end to the spindle by means of the groove therein, and by the other end to the head end or plate, substantially as and for the purposes set forth.

4. In spring shade-rollers, the combination of the spindle R, having a groove cut in its inner end, the plate P, having the collar C, and the spring S, attached to the spindle by means of the groove, and to the collar, substantially as described, and for the purposes set forth.

293,872. DIE FOR CUTTING GLOVES. GEORGE A. HATHORN, Johnstown, N. Y. Filed June 14, 1883. (No model.)

Claim.—1. In a glove-die adapted to cut either a right or left hand



glove, the combination, with the finger-cutting blades, of the two sets of hinged extensions, one adapted to be thrown up as the other is thrown down, substantially as shown and described.

2. In a glove-die, a shifting bar carrying a removable die for cutting the thumb-opening, in combination with two sets of hinged extension-blades, adapted to register with the finger-blades upon either side, substantially as described and shown.

3. In a die for cutting gloves, the extension-blades *a a*, each set secured in a pivoted operating-bar, and so connected that one set will be thrown up when the other is down, substantially as shown and described.

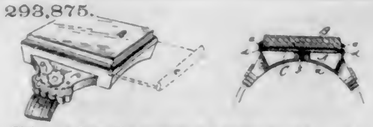
4. In a glove-cutter, the back plate, A, having the blades A′ A^2, in combination with the hinged extensions *a a*, pivoted plates B, cross-bar B′, shifting bar C, carrying the thumb-die C′, secured by adjustable plates *c c*, guide c^3, holding-spring D, and handles C^2 D′, all constructed and arranged to operate substantially as described and shown.

293,873. BEE-HIVE. WILLIAM E. HATTON, Clarksburg, Ind. Filed July 19, 1883. (No model.)

Claim.—1. A bee-hive provided with the removable perforated side, end, and top pieces covered with an absorbent and non-conducting material, and side pieces having metallic strips upon their exposed edges, as and for the purpose shown and set forth.

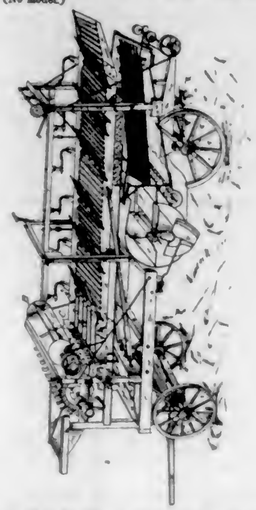
2. The combination, in a bee-hive, of the outer casing having a removable top, removable side, end, and top pieces lined with an absorbent and non-conducting material, and the removable perforated inner side, end, and top pieces, the said lined pieces being interposed between the sides, ends, and top of the outer casing and the removable inner perforated pieces, as and for the purpose shown and set forth.

3. The combination of the casing having removable top, removable lined-outer side pieces having perforations at their upper edges, inner side pieces having perforations at their lower ends and metallic strips at their upper edges, forming rabbets, removable outer end pieces having laterally-projecting lugs at their upper corners and perforations at their upper ends, inner end pieces perforated at their lower ends, having laterally-projecting lugs at their upper corners, lined edges, metallic strips upon the inner side of the upper edges, and pivoted strips at the side edges, transversely-slotted inner top piece, and lined outer removable top piece, as and for the purpose shown and set forth.



4. The herein-described bee-hive, consisting of the rectangular casing having the entrance-hole at the bottom, the lined perforated removable outer side pieces, the inner perforated removable side pieces having metallic strips or rabbets at their upper edges, the outer perforated lined end pieces having lugs at their upper corners, the inner perforated end pieces having strips of metal and textile fabric and lugs at their upper corners, the slotted inner top piece, the lined removable top piece, the comb-frames having projecting top pieces resting in the rabbets in the upper edges of the inner side pieces, and the honey-box fitting over the top of the casing, and having the cleats pivoted at their upper ends in the upper corners of the box, all constructed, arranged, and combined as and for the purpose shown and set forth.

293,874. FINGER-RING. HEINRICH HENRICH, New York, N. Y. Filed Nov. 3, 1883. (No model.)



Claim.—In a finger-ring, the combination of the head B, having the described recessed wing *b*, provided with orifice b^2, the segment A of the finger-band forked at one end, the sectional sleeve C, having exterior recesses, *c*, and an interior female screw-thread with conical countersink *c′*, and the screw D, having a conical-shaped head, d^2, all constructed and arranged to operate as and for the purpose described.

293,875. FINGER-RING. HEINRICH HENRICH, New York, N. Y. Filed Dec. 8, 1883. (No model.)

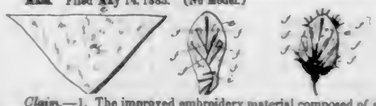
Claim.—A finger-ring or analogous article of jewelry containing a stone-setting wherein is combined the frame A and detachable plate C, retained in place in said frame by a removable screw, as and for the purpose described.

293,876. THRASHING-MACHINE. ANDREW J. HOAG, Battle Creek, Mich., assignor to Nichols, Shepard & Company, same place. Filed Dec. 4, 1883. (No model.)

Claim.—1. In a thrashing-machine, the combination, with the beater and with the teeth for guiding the grain from the concave to the beater, of mechanism for changing and holding the teeth at different inclinations in respect to the beater, substantially as described.

2. The combination, with the thrashing-cylinder and concave and the lower shaker or screen, of the vibrating shaker or straw-carrier provided with the open grating at its receiving end, running lengthwise of said screen, for permitting the free escape of the grain as discharged from the concave to the lower shaker or screen, substantially as described.

3. The combination, with the beater, of the open grating running lengthwise of the screen, and arranged in the shaker below the beater, substantially as and for the purpose set forth.



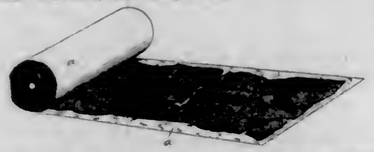
4. The combination, with the thrashing-cylinder, of the vibrating shaker or screen having the hinged grating connected thereto at its receiving end, substantially as and for the purpose set forth.

5. The combination, with the beater and with the adjustable fingers for directing the grain thereto, of the adjustable grating mounted in the vibrating shaker or screen, and operating substantially as and for the purpose set forth.

6. The vibrating shaking-screen having the adjustable grating mounted therein, and provided with the slotted side, for permitting the adjustment of the grating, substantially as and for the purpose set forth.

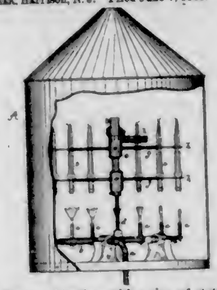
7. The combination, with the vibrating shaker or screen and the upright fixed frame-timber, of the bracket D, for closing the space between the vibrating shaker or screen and the fixed timber, and forming a bearing for the shaft of the rocking fingers, substantially as and for the purpose set forth.

293,877. RAISED EMBROIDERY. FREDERICK H. HOLBROOK, Boston, Mass. Filed May 14, 1883. (No model.)



Claim.—1. The improved embroidery material composed of a piece of fabric folded, as described, to form a series of plaits, *f f*, and a marginal backwardly-turned folded edge, *e*, said plaits being secured together at their outer ends, as set forth.

2. Raised embroidery composed of a piece of fabric, *a*, folded to form a series of plaits, *f*, and a backwardly-turned edge, *e*, and embroidery-stitches connecting said folded piece to the surface to be ornamented, as set forth.

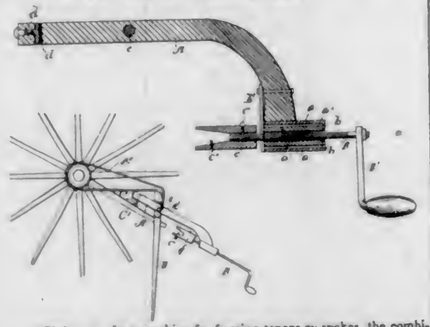


3. The raised embroidery, formed as described, and connected to the material to be ornamented by embroidery-stitches, combined with the molded or embossed ornament *a*, provided with means for attachment to said material, as set forth.

293,878. COMPOUND FABRIC. FREDERICK H. HOLBROOK, Boston, Mass. Filed Oct. 8, 1883. (No specimens.)

Claim.—An improved article of manufacture, the same consisting of a continuous piece of cloth and a veneering of leather secured thereto by a cement of gutta-percha, the leather being in separate pieces, as described, and the whole being rendered compact, as by pressure, substantially as described.

293,879. MANUFACTURE OF INCANDESCING ELECTRIC LAMPS. WILLIAM HOLZER, Harrison, N. J. Filed June 7, 1883. (No model.)



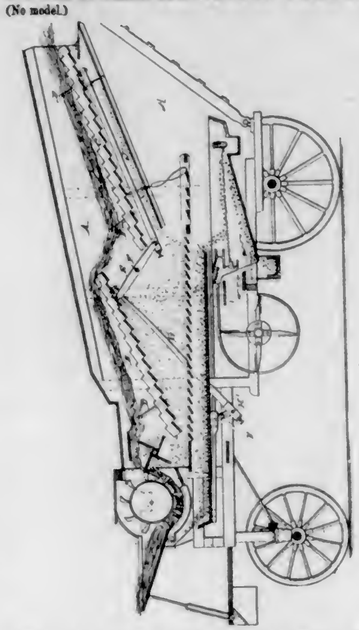
Claim.—1. The combination, with a ring of stationary burners of graduated relative intensity, of a circular frame revolving above the burners for supporting one or more incandescent-lamp stems, substantially as set forth.

2. The circular gas-pipe, provided with a series of gas-burners, but with a portion of its length unprovided with burners, substantially as and for the purpose set forth.

3. The combination of the stationary series of burners, the stationary stem, the revolving frame provided with spring-fingers, and the stop for limiting the revolution of the frame, substantially as set forth.

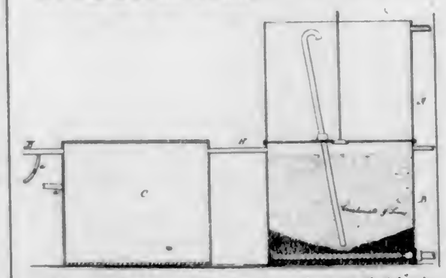
4. The combination of the inclosing-cage, the stationary ring of burners, and the revolving frame for carrying the lamp-stems, substantially as set forth.

293,880. MACHINE FOR BORING TENONS. WILLIAM W. HOSLER, Petoskey, Mich. Filed Dec. 27, 1883. (No model.)



Claim.—1. In a machine for forming tenons on spokes, the combination of the stock A, having one end curved downwardly, to which is secured cylinder-box *a* in sleeve *a′* by means of plate *b′*, chuck-holder *c*, in connection with spindle B, having handle B′, bar C, projected through slot *d* of stock A, and having rest C″, lever D for supporting stock A, and strap E for holding the parts to the wheel-hub, substantially as shown, and for the purpose described.

2. The combination of stock A, having tool or chuck holder spindle B, with handle B′, and holder *c*, secured to spindle B by plate *b′*, lever D, pivoted to stock A, bar C for supporting stock A, and strap E for securing the parts to the wheel-hub, substantially as shown and described.

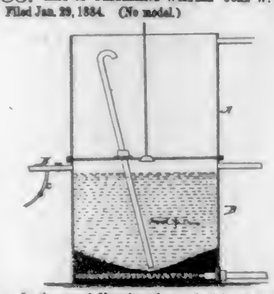


3. A tenon-boring machine consisting of a stock or brace, a chuck-holder comprising a spindle operated by a crank and secured to the stock by plate *b′*, bar C, having foot C″, lever D, and strap E, substantially as shown, and for the purpose described.

293,881. STRAW-CARRIER FOR THRASHING-MACHINES. EDWARD HUBER and FREDRICK STROBEL, Marion, Ohio. Filed Dec. 10, 1883. (No model.)

Claim.—In a straw-carrier of the described construction, the combination of the sections B C, hangers D, shaft H, having cranks H′, and provided with a pulley-wheel, I, pitman G, rock-levers E, connected by a shaft, F, shaft F, and pitman J, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

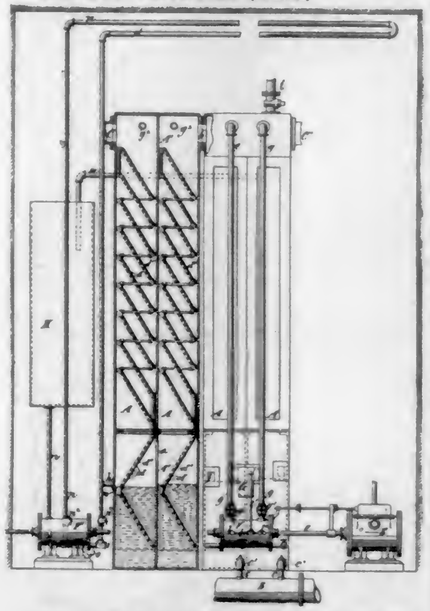
293,882. ART OF FILTERING WATER. JOHN W. HYATT, Newark, N. J. Filed Jan. 29, 1884. (No model.)



Claim.—1. In the art of filtration, the continuous method hereinbefore described of coagulating and arresting the impurities and of preventing any of the coagulating material from passing off in solution with the filtered water, which method consists in introducing a coagulant into

the unfiltered water, and then passing the same through a filter-bed containing carbonate of lime.

2. In the art of filtration, the continuous method hereinbefore described of coagulating and arresting the impurities and of preventing any of the coagulating material from passing off in solution with the filtered water, which method consists in introducing a coagulant into the unfiltered water, and then passing the same through an intermediate tank into a filter-bed containing carbonate of lime.



3. In the art of filtration, the method hereinbefore described of coagulating and arresting the impurities and of preventing any of the coagulating material from passing off in solution with the filtered water, which method consists, first, in introducing the coagulant and unfiltered water into a tank; second, allowing it to settle therein, and, third, passing it through a filter-bed containing carbonate of lime.

293,883. ART OF FILTERING WATER. JOHN W. HYATT, Newark N. J. Filed Jan. 29, 1884. (No model.)

Claim.—In the art of filtration, the method hereinbefore described of coagulating and arresting the impurities, and of preventing any of the coagulating material from passing off in solution with the filtered water, which method consists in introducing lime or equivalent substance into the unfiltered water, and then passing it through a filter-bed containing metallic iron in comminuted form.

293,884. CONDENSER-SCRUBBER FOR GAS. CHARLES W. IRRELL, New York, N. Y. Filed Feb. 9, 1883. (No model.)

Claim.—1. The improved method of scrubbing gas, consisting in causing both the gas and the scrubbing-liquor to pass in contact with artificially-cooled surfaces, substantially as and for the purpose herein described.

2. The improved method of operating a gas-scrubber, consisting in circulating or passing the gas and washing-water over surfaces contained in the scrubber, and in simultaneously and artificially cooling or refrigerating such surfaces and cooling or refrigerating the atmosphere surrounding the scrubber, substantially as and for the purpose described.

3. The combination, with a gas-scrubber containing a system of tubes or conduits, of means for producing the circulation of the scrubbing-liquor and gas over and in contact with the surfaces of said tubes or conduits, and means for simultaneously producing the circulation of a cooling or refrigerating fluid through said tubes or conduits, substantially as and for the purpose described.

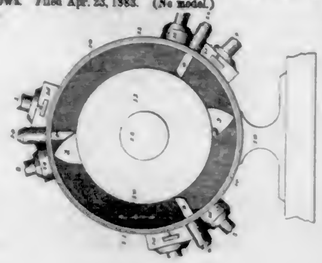
4. The combination, with a gas-scrubber containing a system of tubes or conduits, of means for producing the circulation of the scrubbing water or liquor over and in contact with the surfaces of said tubes or conduits, a system of tubes or pipes extending through the room containing the scrubber, and means for producing the circulation of a cooling or refrigerating fluid through both said systems of tubes or conduits, substantially as and for the purpose described.

5. The combination, with a scrubber containing a system of tubes or conduits partly immersed in the cooling water or liquor at the bottom of the scrubber, of means for producing the circulation of washing-water and gas over the surfaces of said tubes or conduits, and means for simultaneously producing the circulation of a cooling or refrigerating fluid through said tubes or conduits, substantially as and for the purpose described.

6. The combination, with a scrubber containing a system of tubes or conduits, of means for producing the circulation of the washing water or liquor and gas over the surfaces of said tubes or conduits, a cooler connected with the upper end of said system, a pump connected with the lower end of the system, and a suction-pipe leading from the cooler to the pump, substantially as and for the purpose described.

293,885. LOCK. MILTON JACKSON, Philadelphia, Pa. Filed Oct. 9, 1883. (Model.)

Claim.—1. The combination, in a lock, of the casing having a recess, *f*, and a shallower recess, *f'*, adjacent thereto, the cylinder carrying the locking-dog, the tumblers having notches for the entrance of the dog, and a cam, *m*, adapted to lift the dog before the action of the tumblers thereupon to force it into the recess *f*, as set forth.



2. The combination, in a lock, of the casing having the recess *f f'*, the cylinder having a dog, and a pivoted lever, J, connected thereto, the tumblers having notches for the entrance of the dog, and a cam, *m*, adapted to act upon the lever J, to effect the elevation of the dog prior to the action of the tumblers thereupon, as set forth.

3. The combination of the spindle B, slotted for the reception of the key, and having a wing, *n*, with the tumblers fitted to said spindle, and having openings with edges *y* for the action of said wing, and notched or bitted edges *y'* for the action of the key, as set forth.

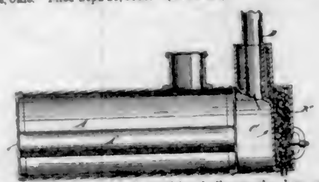
293,886. ALLOY FOR COATING METALS. JOHN B. JONES, Brooklyn, N. Y. Filed July 15, 1882. (No specimens.)

Claim.—An alloy for coating iron, consisting of lead, tin, and zinc, with metallic sodium added, substantially in the manner and proportions specified, whereby the alloy is rendered electro-positive to iron, its melting-point reduced, and oxidation destroyed, arrested, or prevented, as set forth.

293,887. ROTARY STEAM-ENGINE. THOMAS E. JONES, Fairfield, Iowa. Filed Apr. 23, 1883. (No model.)

Claim.—1. In a rotary engine, a revolving head to transmit the power driven by floats, which pass around a stationary drum.

2. In a rotary engine, a hinged valve permitting the floats to pass under it, and then holding the pressure of the steam against them.

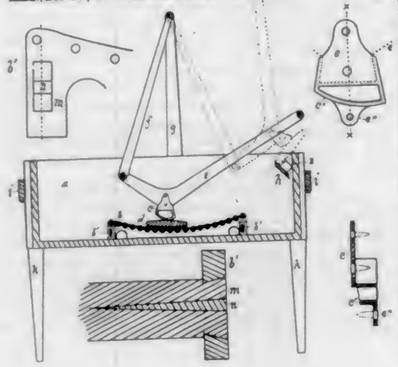


293,888. CHECK-ROWER. AMBROSE L. JORDAN, Ottawa, Ill., assignor of one-half to Richard C. Jordan, same place. Filed Nov. 21, 1883. (No model.)

Claim.—1. In a check-rower, the triangular-shaped piece centrally pivoted, having upon its two outer edges or sides, which diverge from the front, tubes or tubular flanges, which along their entire inner sides are open to allow free passage of the check-rower wire, but sufficiently closed to prevent the escape of the knots or obstructions, except through the tubes, (lengthwise of said tubes,) which receive them in front and discharge them in the rear through openings for that purpose, substantially as specified.

2. In a check-rower, the centrally-pivoted triangular piece, in combination with the cross-rod or long pitman, the clamp holding the short pitman and attaching it to the cross-rod, the friction-spring, the centrally-pivoted perpendicular lever, and the attaching device by which it is connected to the shake-bar, substantially as specified.

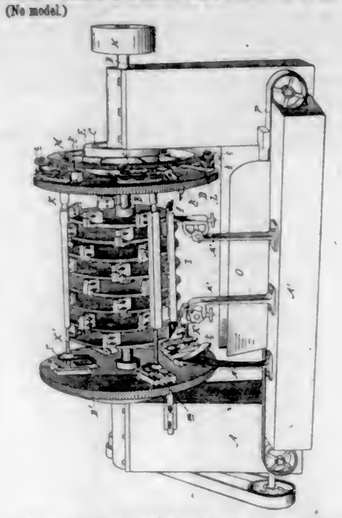
293,889. FEED-WATER HEATER. FRANK JAMES KORTE, Zanesville, Ohio. Filed Sept. 25, 1883. (No model.)



Claim.—1. The combination, with a boiler smoke-box, of a feed-water heater secured thereto, and composed of the chamber having partitions E', a filtering material arranged between the partitions, the inlet-port *e*, outlet-port *e'*, and blow-off port *e''*, substantially as and for the purposes described.

2. The combination, with a boiler, of a feed-water heater consisting of a chamber constructed to constitute a wall of the smoke-box, said heater hinged to the boiler at this point and serving as a door for gaining access to the tubes and flue, substantially as described.

3. The feed-water heater herein described, consisting of a chamber provided with partitions E', filtering material, and inlet and outlet ports, said heater constructed to fit within the boiler smoke-box and hinged to the boiler at this point, substantially as described.



4. The combination, with a boiler, of a feed-water heater consisting of a chamber constructed to constitute a wall of the smoke-box, said heater extended upward around the base of the smoke-stack and forming a part of said stack, substantially as described.

293,890. WASHING-MACHINE. WILLIAM C. KRIEG and JOSEPH T. ALEXR, Decatur, Ill. Filed Jan. 20, 1883. (No model.)

Claim.—The bracket *c*, provided with the rounded portion *c'* and projections *c''*, in combination with an operative lever-frame attached to the bracket, as described, and the rubber *d*, pivoted to the projections *c''*, as and for the purposes set forth.

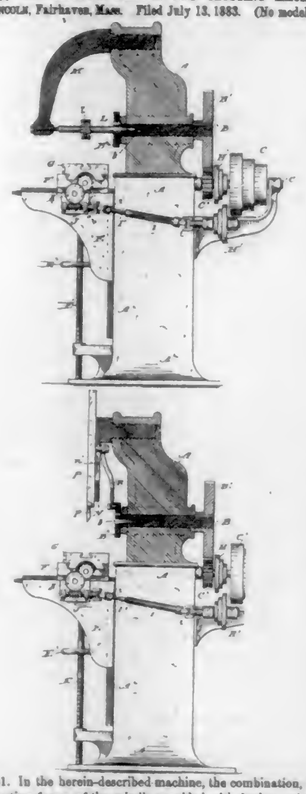
293,891. LATHE FOR TURNING ECCENTRIC OR POLYGONAL FORMS. WILLIAM H. LENHART, Defiance, Ohio. Filed July 14, 1883. (No model.)

Claim.—1. In a lathe for turning irregular forms, the rotating disks D D', carrying one or more pairs of spindles journaled in bearings eccentrically adjustable in said disks, in combination with cams secured upon the ends of said spindles, and bearing upon guide-plates or gages secured to the rotating disks, and radially adjustable thereon, substantially as and for the purpose specified.

2. The revolving disk D, having one or more vibrating plates, L, pivotally secured thereto at one end, and provided with a bearing for the spindle upon the opposite end, said bearing passing through a curved slot, *s*, in said disk, so as to allow the plate or plates to vibrate, in combination with means, substantially as described, for vibrating said plates, so as to produce an eccentric movement of the spindle, substantially as described.

3. One or more vibrating plates pivotally secured at one end to the rotating disk D, and provided with a bearing for a spindle upon the opposite end, said bearing passing through a slot of the disk, in combination with two revolving cams adapted to vibrate said plates by bearing successively upon guide-plates adjustably attached to the disk, for the purpose of imparting an eccentric motion to the spindle, substantially as described.

4. As a means for imparting a rotary motion to the eccentrically-movable spindle K, a vibrating plate pivoted at one end to the rotary disk D, and carrying the spindle upon the other end in a bearing passing through a curved slot in the disk, a pinion, *c*, secured at the pivotal point of the vibrating plate, and a train of intermeshing pinions connecting the same with a pinion upon the spindle and in combination with the stationary circular gear M, meshing into the pinion *c*, substantially as described and shown.



5. In a lathe for turning irregular forms, a series of cutter-heads which simultaneously work upon the stick, and in combination with one or more pairs of spindles revolving the stick, exchangeable cams secured upon the spindles, and radially-adjustable guide-plates secured to the disks which carry the spindles, whereby the size and shape of the work may readily be adjusted, substantially as described.

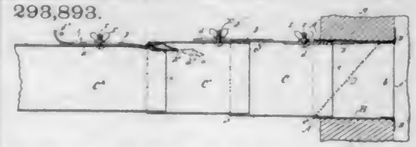
6. In a lathe for cutting irregular work, a series of cutter-heads revolving at a high rate of speed with the main shaft B, the spindle-carrying disks D D', revolving at a low rate of speed independent of the cutter-heads, but in the same direction and around the same line of motion, cams *i*, secured on the stub-shaft *w*, and geared with spindle K, rollers *o*, secured near the inner ends of the boxes *m*, cams *h*, secured upon the spindle K, and stops *n*, secured upon the spindle K', guide-plates *l*, adjustably secured to the disk D, and stationary guide-track *q*, secured to the frame A, and gages *k*, adjustably secured to the disk D, and gages *p*, secured to the disk D', all substantially as and for the purposes specified.

7. The combination, with the vibrating spindle-carrying plate L and disks D D′, having guides, as shown, of the revolving cam *i*, bearing upon the guide-plate *l*, and revolving cam *h*, bearing upon the guide-plate *k*, the eccentric cam *i* arranged to revolve slower than the cam *h*, and allow the other cam, during a portion of its movement, to gain a bearing, substantially as described.

8. The vibrating plate L, pivoted at one end to the disk D, and carrying a spindle at the other, in combination with the disks D D′, having guides, as shown, the stationary gear M, secured to the frame A, a train of pinions, *b f g u v c*, secured to the vibrating plate L, and the latter pinion meshing with the gear M, cams *h* and *i*, secured upon the spindle K and stub-shaft *w*, respectively, and driven by said train of pinions, and bearing-plates *k* and *l*, adjustably secured to the disk D, substantially as and for the purpose specified.

293,892. CONVERTIBLE MILLING AND SLOTTING MACHINE. Wm. O. Lincoln, Fairhaven, Mass. Filed July 13, 1883. (No model.)

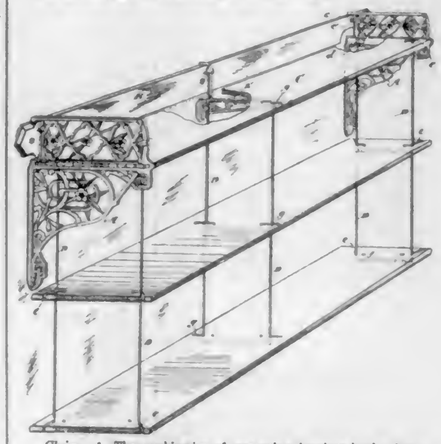
Claim.—1. In the herein-described machine, the combination, with the main supporting-frame, of the spindle provided with devices, substantially as described, whereby it may be connected with and actuate the milling-arbor or the slotter-slide, said frame being also adapted, as set forth, to support either the milling or the slotting tool holding attachments, substantially as described.



2. In the herein-described machine, the combination, with the main supporting-frame, of the spindle provided with devices, substantially as described, whereby it may be connected with and actuate the milling-arbor or the slotter-slide, said frame having an aperture for the reception of the milling-arbor support or the arm of the slotter-guide, substantially as set forth.

293,893. STOVE-PIPE. Jacob Z. Lindley and John V. Elder, Lamar, Mo. Filed Aug. 24, 1883. (No model.)

Claim.—1. The combination, with a pair of sections of stove-pipe, of a sliding slotted strap or extension provided with a wedge-shaped end for the purpose of holding the said sections in position, substantially as and for the purpose described.



2. The combination, with a pair of sections of stove or other similar pipe, of a sliding slotted strap held in position by a binding-screw or

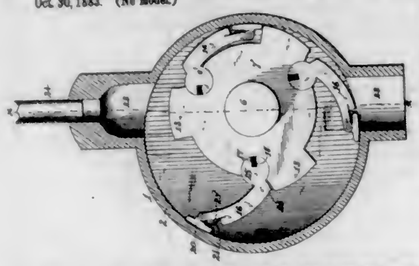
293,893.

equivalent means, and provided with an inclined spring extension or wedge, substantially as shown and described.

293,894. WALL-BRACKET EXTENSION-SHELF. Arthur Loomis, Jeffersonville, Ind. Filed June 16, 1883. (No model.)

Claim.—1. The combination of supporting-brackets having laterally-projecting shelf-supporting lugs provided with slots, a shelf having its ends supported by the lugs, suspending-wires passing through the shelf and the slots in the lugs, and having their upper ends hooked to clamp the upper shelf between the lugs and the upper ends of the wires, and a shelf suspended by the lower portions of the wires, substantially as described.

2. The combination of a horizontal strip, supporting-brackets having hooks engaging with the strip and provided with laterally-projecting slotted lugs, a shelf supported at its ends by the lugs, a suspending-wire having its upper end passing through the slotted lugs and the shelf and secured on the latter to clamp it on the lugs, and a shelf suspended by the lower portions of the wires, substantially as described.



3. The combination of supporting-brackets having laterally-projecting shelf-supporting lugs, a shelf having its ends supported by the lugs, suspending-wires passing through the shelf, and having hooks at their upper ends secured upon the upper surfaces of the shelf, and a shelf suspended by the lower portions of the wires, substantially as described.

4. The combination of supporting-brackets having inwardly-projecting slotted lugs and overhanging hooks, a horizontal bracket-supporting strip with which the hooks engage, a shelf having its ends resting on the slotted lugs, suspending-wires passing through the shelf and the slotted lugs, and having their upper ends provided with hooks resting upon the upper surface of the shelf to clamp the latter on the lugs, and a shelf suspended by the lower portions of the wires, substantially as described.

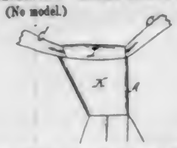
5. The combination, in wall-bracket shelves, of supporting-brackets having inwardly-projecting slotted lugs, a series of shelves having their ends provided with slots open at one end, and the upper shelf having its ends arranged on the lugs, and suspending-wires passing through the slots in the respective shelves and the slots in the lugs, and having their upper ends provided with hooks resting upon the upper surface of the shelf to clamp the latter on the lugs, substantially as described.

6. The combination, in a wall-bracket shelf, of a horizontal strip, supporting-brackets having laterally-projecting slotted lugs at their sides and downwardly-projecting hooks at one end to engage over the upper edge of the strip, a top shelf having its ends resting on the lugs, suspending-wires carrying a shelf at their lower ends, and having their upper ends passed through the slots in the lugs and attached to the top shelf to clamp the latter on the lugs, suspending-wires detachably secured to the ends of the shelf, suspended from the wires connected to the top shelf, and a shelf detachably supported by the said detachable wires, substantially as described.

293,895. MOTOR. Henry E. Marchand, Allegheny City, Pa. Filed Oct. 30, 1883. (No model.)

Claim.—1. The combination of the cylinder, the piston-head eccentrically journaled therein, and having cylindrical transverse sockets, and swinging pistons having cylindrical journals mounted in said sockets, and provided with longitudinal recesses, with the spring-plates arranged in said recesses, and the packing-strips arranged between the plates and the walls of the cylindrical sockets in the piston-head, substantially as described.

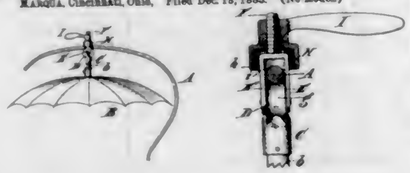
2. The combination of the cylinder, the piston-head eccentrically journaled therein, and constructed with radial projections 13, segmental recesses 26, and a transverse cylindrical socket at the base of each projection, the pistons having the cylindrical journals mounted in the sockets, and the packing-strips arranged in recesses in the journals of the pistons, to preserve a tight joint with the walls of the cylindrical sockets, substantially as described.



3. The combination of the cylinder, the rotating eccentrically-journaled piston-head, having transverse cylindrical sockets, the swinging pistons having cylindrical journals mounted in the sockets, and the shoes swiveled to the outer ends of the swinging pistons, substantially as described.

4. The combination of the cylinder, the piston-head, the oscillating pistons, and a hinged connection between the inner ends of the pistons and the piston-head, with the shoes swiveled to the outer ends of the pistons, and having their working-face turned to the circle of the cylinder, substantially as described.

5. The combination of the cylinder and the piston-head, the pistons swiveled to swing on said head in their travel around the cylinder, and having recesses at their outer ends, springs secured to said pistons, and shoes swiveled to the pistons, and adapted to turn at one end into the recesses of the pistons to compress the springs, substantially as described.

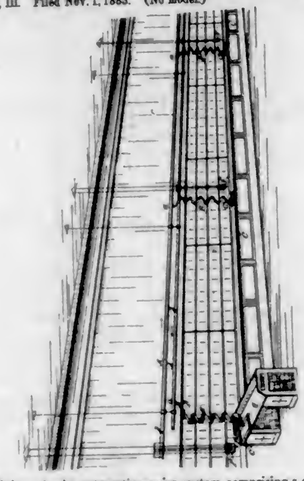


6. The combination of the cylinder and the eccentrically-journaled piston-head, having transverse cylindrical sockets, with the pistons, having at their inner ends cylindrical journals mounted to rock in the sockets, and shoes swiveled to the outer ends of the pistons, substantially as described.

293,896. NECKSCARF. Solomon Marcus, New York, N. Y. Filed June 14, 1883. (No model.)

Claim.—In a scarf of the character specified, the head A, composed of a strip folded to form a passage for the neckband, and the back section J of the strip, having an edge, *l*, extending diagonally from the lower to the upper edges of the back section J′, said diagonal edge of the back section J extending across the back section J′ and unattached thereto intermediate its upper and lower edges, whereby the neckband can be drawn through the heads at points along the width of the back J′, substantially as described.

293,897. DEVICE FOR SUSPENDING CARRIAGE-TOPS. Philip Marqua, Cincinnati, Ohio. Filed Dec. 18, 1883. (No model.)



Claim.—1. A device for suspending a parasol or top, composed of the block D, groove *g*, and clamp H and screws F and I, substantially as herein set forth.

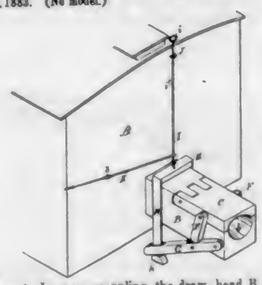
2. In combination with the grooved block D and clamp H, I, and F, the parasol B, secured thereto, substantially as herein set forth.

3. In combination with the grooved block D and clamp H, I, and F, the rod A, adapted to suspend the same over a carriage-seat, substantially as herein set forth.

4. A supporting device consisting of the grooved arc-block D, adapted to fit the supporting-rod A, and to be moved in the two right-angle circular paths, in combination with clamping mechanism for securing it in any fixed position, substantially as herein set forth.

293,898. AUTOMATIC CARRIER SYSTEM. Jacob M. Martin, Sterling, Ill. Filed Nov. 1, 1883. (No model.)

Claim.—1. An automatic carrier system comprising a substantially horizontal and direct main elevated track or tracks, means for raising the vehicles to said main tracks, and indirect descending subordinate tracks leading from said main tracks to the delivery-stations, substantially as herein shown and described.



2. An automatic carrier system comprising a substantially horizontal and direct main elevated track, A, the elevators F, and the indirect descending tracks B, arranged with reference to each other, and operating together substantially as herein shown and set forth.

3. The combination of the spiral track B, upright E, and arms *e*, substantially as described.

4. The combination, with the elevated track A, of the indirect descending track B and the box or equivalent receptacle, C², substantially as shown, and for the purposes set forth.

5. The combination, with the elevated track A, of an indirect descending track, B, constructed of longitudinal parallel wires *b′ b′*, substantially as described, and for the purposes set forth.

293,899. CAR-COUPLING. John Martin, Knight's Ferry, Cal. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a car-coupling, the draw-head B, hinged latch C, between which and said draw-head a chamber, *b*, having a front shoulder, *b′*, is formed, for the reception and engagement of a coupling-pin, as described, in combination with the means for raising the latch, con-

sisting of the pivoted arms F, levers G, bail H, and rod I, substantially as herein described.

2. In a car-coupling, the draw-head B, hinged latch C, between which and said draw-head a chamber, *b*, having a shoulder, *b'*, is formed for the reception and engagement of a coupling-pin, D, and the staple E in the latch, for the reception of the point of the pin, in combination with the means for raising said latch and staple to free the pin, consisting of the pivoted arms F, levers G, bail H, and rod I, substantially as herein described.

3. In a car-coupling, the draw-head B and hinged latch C, for receiving and engaging the coupling-pin, in combination with the arms F on the latch, the levers G on the draw-head, the bail H, upon the sides of which the rear ends of lever G loosely play, and the rod I, substantially as and for the purpose herein described.

4. In a car-coupling, the draw-head B and swinging latch C, forming a chamber, with a shoulder for the reception and engagement of the coupling-pin D and the staple E in the latch, in combination with the means for raising said latch from the side of the car, consisting of the arms F, levers G, bail H, rod I, and lever K, substantially as herein described.

293,900. PILLOW-SHAM HOLDER. FREDRICK T. MAYNARD, Detroit, Mich. Filed Nov. 21, 1883. (No model.)

Claim.—A pillow-sham holder consisting of two rectangular frames, A B, each formed from a continuous wire, one end of said wire being provided with a loop, *a*, adapted to hang the frame upon a bracket, and its other end formed with a loop, *b*, embracing and holding the end of the wire carrying the loop *a*, and adjustably secured together by the slides C D, embracing both wires at top and bottom, substantially in the manner and for the purposes specified.

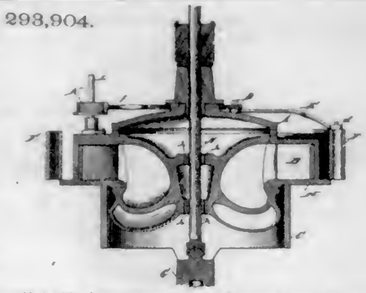
293,901. LOCK WIRE INSULATOR. THOMAS MCGROORY, Philadelphia, PA. Filed Dec. 14, 1883. (No model.)

Claim.—In an insulator having in one side a V-shaped groove, C, an oval inclined ledge, B, a bridge, *a*, with recess *c* at its inner end, and the upwardly-projecting grooves *d d* at the ends of the opening C, substantially as and for the purpose set forth.

293,902. ART OF SWEEPING CARPETS. EZRA MILLER, Hoboken, N. J. Filed Mar. 8, 1883. (No model.)

Claim.—The improvement in the art of sweeping carpets, the same consisting in distributing over the carpet moistened pieces of comminuted sponge, and moving the same over the carpet by a sweeping implement, whereby the said pieces of moistened sponge collect the dust, lint, &c., and prevent the same from rising, substantially as described.

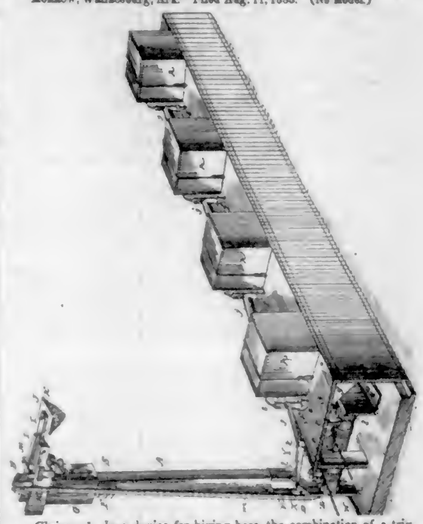
293,903. HARNESS-TUG SLIDE. JOHN G. MILLER, Champaign, Ill. Filed July 12, 1883. (No model.)



Claim.—The combination, with the rack-plate on the saddle-flap, of the adjustable metallic loops, the metallic tug-slide having end loops and center pin to engage the back-band, and slotted or recessed in its inner face to accommodate the rack-plate, substantially as specified.

293,904. TURBINE WATER-WHEEL. WILLIAM M. MILLS, Dayton, Ohio. Filed Aug. 3, 1883. (No model.)

Claim.—1. In a turbine water-wheel, the wheel proper, having spiral concavo-convex buckets substantially tangential to the hub, and surrounded by a projecting ring, in combination with the wheel-casing



293,904.

provided with chutes whose bottom walls extend over said projecting ring, and are beveled or rounded, substantially as described.

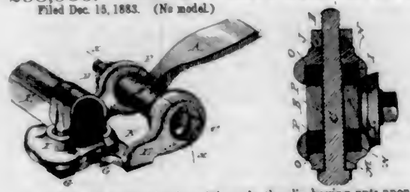
2. In a turbine water-wheel, the chutes having enlarged or flaring mouths or water-ways formed by the turned-up upper walls thereof, and the bent or curved ends of the gates pivoted therein, substantially as described.

293,905. DEVICE FOR HIVING BEES. FREDERICK CARPENTER MORROW, Wallacsburg, Ark. Filed Aug. 11, 1883. (No model.)

Claim.—1. In a device for hiving bees, the combination of a trigger having a head or block shaped and colored in imitation of a settled swarm of bees, a sliding case released by said trigger, and chutes having connection with hives adapted to receive the swarm dropped from the block, and having lids adapted to close the chutes, as and for the purpose shown and set forth.

2. In a device for hiving bees, the combination of an upright standard, a frame or casing sliding upon the standard, a lever or trigger releasing the said frame, and having a block upon its outer end shaped and colored in imitation of a bee settle, a sliding table or board having chutes for receiving the bees when dropped from the block, means for closing the chutes when the bees are in the same, and hives communicating with the chutes, and means for sliding the table and raising the sliding frame or casing after it has descended, as and for the purpose shown and set forth.

3. The combination of a standard having a rabbeted edge, forming a cogged rack near its upper end, a frame or casing fitting and sliding upon the standard, having laterally-projecting cross-pieces upon its upper end, a spring-operated revolving cylinder provided with a bail upon its surface, a lever pivoted between the cross-pieces, and having a block upon its outer end shaped and colored to imitate a bee settle, a spring upon its upper surface forcing the inner end down, and a catch upon its under side engaging the bail upon the cylinder, a spring fastened upon the side of the frame, and a block or bolt sliding in a perforation upon the side of the frame, bearing with its inner end against the side of the standard, and fastened at its outer end to the said spring, and means for raising the frame, as and for the purpose shown and set forth.



4. The combination of a standard, a frame sliding upon the said standard, having a trigger provided with a block for receiving the settling swarm of bees, releasing the frame by the weight of the bees, and having a downwardly-projecting bent rod upon its lower end, a chute having connection with a hive, a hinged lid covering the opening of the chute, a flat pointed arm hinged to the side of the lid, and a trigger or arm hinged to the base of the hive and scoop, projecting out to be struck by the rod upon the sliding frame when it descends, and having a notch upon the inner end of its upper surface for the reception of the flat point of the hinged arm, as and for the purpose shown and set forth.

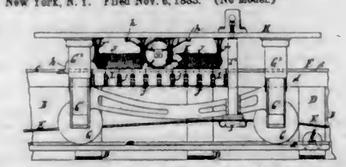
5. The combination of a standard, a frame sliding upon the standard, and having a trigger, releasing the frame by the weight of the bees settling upon a block upon its outer end, a drum having connection with a motor, and having pinions upon each end, a table sliding upon ways, having a series of hives and traps for receiving the bees, the said traps being operated by the descending sliding frame, and a rack-bar upon its under side meshing with the pinion upon the inner end of the drum, a wheel journaled in the lower end of the standard, having a pinion upon its shaft meshing with the pinion upon the outer end of the drum, and having a projecting lug upon its outer face, and a bar sliding upon the lower end of the standard, having a notch at its inner edge slightly above the point where the lug upon the wheel bears against it, and operated by the descending frame, as and for the purpose shown and set forth.

6. The combination of a standard, a frame sliding upon the standard, having a trigger, releasing the frame by the weight of the bees settling upon the outer end of the same, and having a horizontally-projecting bent arm upon one side, a drum having connection with a motor, and having a pinion upon its outer end, a sprocket-wheel journaled in the lower slotted end of the standard, having a pinion upon its shaft meshing with the pinion upon the drum, and having a lug projecting from its face, a bar sliding in bearings upon the lower end of the standard, having a notch slightly above the point where the lug upon the wheel bears against it, and operated by the descending frame, and a sprocket-chain or perforated belt passing over the sprocket-wheel and a pulley upon the upper end of the standard, and having a catch engaging the rod upon the sliding frame when ascending, as and for the purpose shown and set forth.

7. The bee-hiving device consisting of a standard having a pulley at its upper end and a slot at its lower end, a sliding frame or casing having a trigger provided with a block shaped and colored to imitate a bee settle upon its outer end, and a horizontally and a vertically projecting bent rod upon its sides, a sliding bar having a notch in its inner edge, a sprocket-wheel having a lug upon its outer face and a pinion upon its shaft, a drum having connection with a motor and having a pinion upon its inner and outer end, a sliding table having a rack-bar upon its under side, chute fastened in the table, hives fastened over one end of the chute, lids hinged over the open ends of the chute, flat pointed arms or props hinged to the lids, and triggers having notches upon their upper surfaces and hinged upon the outer edge of the sliding table, all constructed, combined, and arranged as and for the purpose shown and set forth.

293,906. THILL-COUPLING. FRANK P. MUNSER, Beaver Falls, Pa. Filed Dec. 15, 1883. (No model.)

Claim.—The combination of the axle, the clip having nuts upon its threaded ends, the upper shackle having forwardly-projecting perforated and female-threaded recessed bearing, the lower shackle having transverse slots and perforated and recessed forwardly-projecting bearing, the perforated rubber blocks, the leather washers, the thill-iron forming the eye, and the coupling-bolt having the nut upon its threaded end, all constructed to operate as and for the purpose shown and set forth.



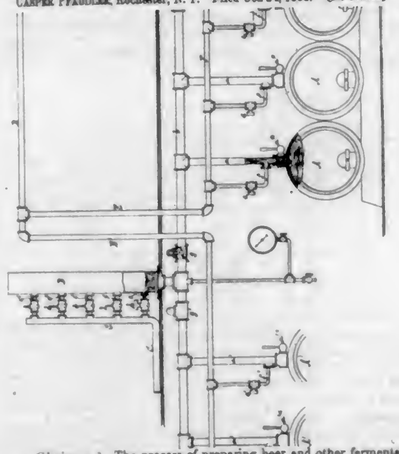
293,907. VEHICLE RUNNING-GEAR. JOHN I. NISSEN and CHRISTIAN F. NISSEN, Salem, N. C.; said C. F. Nissen assignor to C. F. Nissen & Co., same place. Filed Oct. 19, 1883. (No model.)

Claim.—1. The cap E, provided with the upper plate, *a*, lug *b*, wings *c*, having the diagonal portion, lips *f*, and horizontal flange *g*, in combination with the tongue A and hounds, all constructed as and for the purpose described.

2. The cap E, provided with lug *b*, wings *c*, lips *f*, and the horizontal flange *g*, in combination with the double-tree F, provided with the bent plate *i*, and the plate A, all constructed to operate substantially as and for the purpose set forth and described.

293,908. STREET-SWEEPER. OREL D. ORVIS and NELSON B. ADAMS, New York, N. Y. Filed Nov. 6, 1883. (No model.)

Claim.—1. The combination, in a sweeper for use upon a railway structure of the kind herein described, of a platform and wheels connected by vertical plates, a brush or brushes, and plates or guards arranged below the brush or brushes and serving to temporarily close the longitudinal slots as the brush or brushes sweep across them, substantially as herein described.



2. The combination, in a sweeper for use upon a railway structure of the kind herein described, of a platform and wheels connected by vertical plates, a brush or brushes, and plates or guards composed of hinged sections arranged below the brush or brushes and serving to temporarily close the longitudinal slots as the brush or brushes sweep across them, substantially as herein described.

3. The combination, in a sweeper for use upon a railway structure of the kind herein described, of a platform and wheels connected by vertical plates extending through longitudinal slots, and plows projecting in front of said plates, entering said slots, and serving to throw upward and out of the slots any obstructions by which they may be clogged, substantially as herein described.

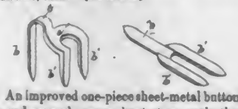
4. The combination, with the body or platform of a street-sweeper, of a yielding frame connected therewith, a driving-wheel supported in said yielding frame and by it held in frictional contact with the street-surface, a bevel-wheel at the side of said driving-wheel, and a brush provided with a bevel-wheel engaging with the first-mentioned bevel-wheel, substantially as herein described.

5. The combination, with the body or platform of a street-sweeper, of a yielding frame composed of springs *h h i i*, the springs *h h* having an upward flexure and being connected between their ends to the body or platform, and the springs *i i* having a downward flexure and being connected at their ends to the ends of the springs *h h*, a driving-wheel supported by the springs *i i*, and a brush or brushes receiving motion from said wheel, substantially as herein described.

293,909. PROCESS OF AND APPARATUS FOR PREPARING BEER AND OTHER FERMENTED LIQUIDS FOR THE MARKET. CASPER PFAUDLER, Rochester, N. Y. Filed Oct. 24, 1883. (No model.)

Claim.—1. The process of preparing beer and other fermentable liquids for the market, which consists in holding such beer or other liquid

during fermentation under a controllable hydrostatic pressure and carrying off the barm which rises from the fermenting mass by a current of liquid, substantially as set forth.



2. The combination, substantially as hereinbefore described, with a fermenting cask or vessel, of a pipe filled with water or other liquid, for holding the liquid in the cask under a hydrostatic pressure, the regulator for controlling this pressure, and the spout *f*, for passing a current of liquid through the hydrostatic pipe and the regulator.

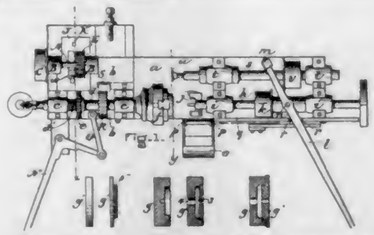
3. The combination, substantially as hereinbefore described, with a series of fermenting casks or vessels, a series of hydrostatic pipes—one for each cask—and the regulator for controlling the pressure in the hydrostatic pipes and in the casks.

4. The combination, substantially as hereinbefore described, with a series of fermenting casks or vessels, a series of hydrostatic pipes—one for each cask—the regulator for controlling this pressure, and the spouts *f*—one for each of the hydrostatic pipes.

5. The combination, substantially as hereinbefore described, with two series of fermenting casks or vessels, A A A A′ A′, of a series of hydrostatic pipes, *a a′*—one for each cask—the regulator B, connected to all the hydrostatic pipes by a pipe, *b*, the water-supply pipes E F, and spouts *f*, connected to the hydrostatic pipes *a*, and the water-supply pipes E′ F′ and spouts *f′*, connected to the hydrostatic pipes *a′*.

293,910. BUTTON-FASTENER. GEORGE W. PRENTICE, Providence, R. I. Filed Dec. 31, 1883. (No model.)

Claim.—1. An improved one-piece sheet-metal button-fastener, consisting of a table and several prongs bent at an angle thereto, with one of said prongs of thinner metal than the remaining prongs, and adapted to carry a button, for the purpose set forth.



2. An improved one-piece sheet-metal button-fastener, consisting of a table having different thicknesses of metal, and several prongs projecting from said table and bent at an angle thereto, with one of said prongs of the thickness corresponding to the thinnest portion of the table, and adapted to engage the shank-eye of a button, for the purpose set forth.

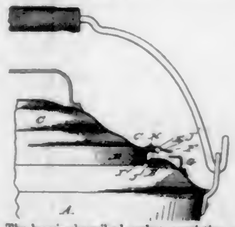
3. A button-fastener consisting, essentially, of a table having a plane upper surface and an uneven or corrugated under surface, and provided with several prongs integral therewith and bent at an angle thereto, and one of said prongs adapted to engage the shank-eye of a button, for the purpose set forth.

4. The herein-described button-fastener, consisting, essentially, of a table the metal of which varies in thickness, and a button-prong and two holding-prongs, the said button and holding prongs projecting from opposite sides of the table and bent at an angle thereto, with the button-prong of a thickness corresponding to the thinnest portion of the table, and the holding-prongs corresponding in thickness to the thickest portion of the said table, all as set forth, and for the purpose specified.

293,911. MACHINE FOR FORMING ANNULAR SURFACES AND CUTTING SCREW-THREADS THEREON. HARVEY REDDING, Everett, assignor to himself and Jerome Redding, Malden, Mass. Filed June 26, 1883. (No model.)

Brief.—The work-hold spindle is first held from rotating while a rotary cutter is moved lengthwise against the blank. It is then moved laterally to a gear-wheel, by which it is rotated, and at the same time fed longitudinally to a screw-cutter.

Claim.—1. The combination of a chuck or holder mounted on an arbor, mechanism, substantially as described, adapted to move said arbor both laterally and longitudinally from a normal position, a rotated primary cutter adapted to be presented to the article held by the chuck when the latter is in its normal position, a rotated thread-cutter or saw located at one side of the primary cutter, and automatic feeding devices, substantially as described, whereby when the chuck or holder is moved laterally from its normal position it is rotated and at the same time moved longitudinally and presented to the thread cutter or saw, as set forth.

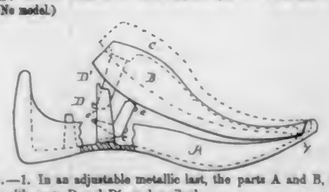


2. An organized machine for forming circular screw-threaded articles of wood or like material, the same consisting of a supporting-frame, a carriage movable laterally on guides on said frame, an arbor journaled in bearings on said carriage, provided with a threaded portion and with a pinion and capable of a limited endwise movement in its bearings, a chuck or holder on said arbor for the article to be formed, an arbor having a primary cutter for partially forming said article, and adapted to be moved endwise to present its cutter to the article, a rotary thread cutter or saw mounted on an arbor beside the primary cutter, a fixed arm at one side of the chuck-carrying arbor, having segmental threads adapted to engage with the threaded portion of said arbor when the latter is moved laterally from its normal position, and a positively-rotated arbor journaled in fixed bearings and provided with a pinion adapted to engage with the pinion of the chuck-carrying arbor when the same is moved laterally from its normal position, whereby when the chuck-carrying arbor is so moved the article held by the chuck is presented to the thread cutter or saw and the arbor is positively rotated and moved progressively endwise, thereby causing said cutter or saw to form a screw-thread on said article, as set forth.

3. The combination of the longitudinally-movable arbor carrying the primary cutter, the hand-lever *l*, pivoted to said arbor and having a pivotal connection with the frame of the machine, the slide *q*, engaged with said lever, and the shield *o*, forming, when covering the cutter, a stop or bearing for the end of said slide, and thus preventing the endwise movement of the arbor and cutter, as set forth.

4. The combination, with the slide or carriage *b*, supporting the chuck-holding arbor *d*, of the automatic feeding devices, substantially as described, the bracket J, supporting said devices, means for adjusting said bracket toward or from the normal position of said arbor, and means for positively securing said bracket in any position to which it may be adjusted, as set forth.

5. The combination, with a chuck carried by a laterally-movable arbor, of a fastening device, substantially such as described, which retains the arbor from rotation in one direction while in one of its lateral positions, and driving mechanism, substantially as described, which engages and rotates said arbor in the direction in which it is free to move when said arbor is shifted into its other position, substantially as set forth.

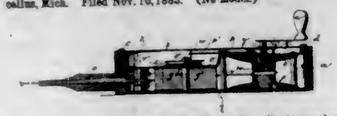


293,912. CHAMBER-PAIL. GEORGE L. REYNOLDS, Orange Valley, N. J. Filed Dec. 18, 1883. (Model.)

Claim.—1. The herein-described gasket, consisting of a flange projecting inward and a tapering downwardly-projecting flange, both flanges being at right angles to each other, the said gasket being adapted to be slipped with its normally inwardly-projecting flange over the downwardly-projecting flange of the cover of a vessel, with its normally downwardly-projecting flange projecting outward, as and for the purpose shown and set forth.

2. In a chamber-pail or similar vessel, the combination of a cover having a downwardly-projecting flange and an outwardly-projecting edge, with a gasket slipped with its normally inwardly-projecting flange upon the downwardly-projecting flange of the cover, and with its normally downwardly-projecting flange projecting outward and slightly downward beneath the outwardly-projecting edge of the cover, as and for the purpose shown and set forth.

293,913. LAST. GEORGE A. REYNOLDS, Utica, N. Y. Filed Dec. 20, 1883. (No model.)



Claim.—1. In an adjustable metallic last, the parts A and B, in combination with posts D and D′, as described.

2. In an adjustable metallic last, parts A and B, provided with posts D and D′, and support E, provided with extensions *e* and *d′*, as described.

3. In an adjustable metallic shell-last, parts A and B, provided with tongue F and groove F′, posts D and D′, and support E, provided with extensions *e* and *d′*, as described.

293,914. CLOTH-MEASURING DEVICE. WARNER J. SAMPSON, Marcellus, Mich. Filed Nov. 10, 1883. (No model.)

Claim.—The cloth-measuring machine described, consisting of the frame *e*, having rounded ends, and a removable cover secured thereto by screws, and provided with the hollow pointed nozzle *e*, the spool *f*, drum *g*, rubber tension-rollers *h h′*, and the guide-loops *u* and *v*, the base-plate *i*, and shoulder top plate, *k*, connected by posts and pins *l* and *m*, the dial-wheel *p*, pinion-wheel *r*, gear-wheel *r²*, rubber washer *s*, yard-dial *s′*, provided with the vertical stud *w*, and the crank *a*, provided with a threaded shank, all constructed and adapted to operate substantially as specified.

293,915. FLY-SCREEN. JAS. IRVING SPENCER, Chelsea, Mass. Filed Nov. 15, 1882. (No model.)

Brief.—A netting provided with a re-enforcing fold is wound upon a roller having a groove in its circumference. The roller is mounted in a longitudinally-slotted removable casing.

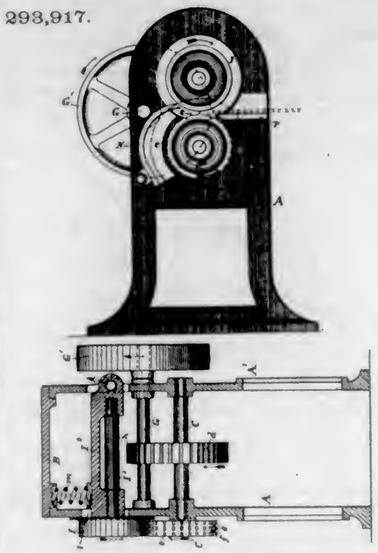
Claim.—The roller F, having rabbet K, in combination with a flexible extensible screen attached to said roller, and having re-enforcing bands or folds J, and adapted to be wound thereon, and a longitudinally-slotted cylindrical casing adapted to contain said roller and screen, and having said roller journaled in the ends thereof, said casing and its contents being readily removed from and attached to the wood-work as a single piece

293,916. HOOP. A. RENSSELAER SPROUT, Picture Rocks, Pa. Filed July 7, 1883. (No model.)

Claim.—1. A wood hoop provided on its inner side with scores *b*, cut crosswise of the fibers, and having the cut ends of the fibers pressed inward, as set forth.

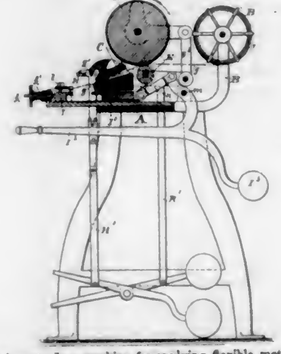
2. A wood hoop provided on its inner side with short scores *b*, cut crosswise of the fibers, said scores being arranged in rows extending lengthwise of the hoop, with a space or row, *d*, of uncut fibers between the rows of scores, also extending lengthwise, as shown and described.

3. A wood hoop having its lapped ends secured by a metallic fastener, consisting of a flat strip, E, provided on one side with raised edges *f*, and tightly wrapped about the hoop, with the raised edges embedded in the wood, as shown and described.



293,917. MACHINE FOR BENDING AND SCORING HOOPS. A. RENSSELAER SPROUT, Picture Rocks, Pa. Filed July 7, 1883. (No model.)

Claim.—1. In a machine for bending hoops, the combination of a scoring-wheel, C′, provided with cutting-teeth, a smooth wheel, I, adjoining the scoring-wheel, means to cause the smooth wheel to press against the scoring-wheel, a guide-bracket, *p*, at the front side of the scoring-wheel, and a bending-plate, N, which curves about the rear side of the scoring-wheel, as set forth.



2. In a machine for bending hoops, the combination of a scoring-wheel, C′, provided with cutting-teeth, a shaft, I′, having one end pivoted, whereby the other end may have play or movement, a smooth wheel, I, on the movable end and adjoining the scoring-wheel, means to cause the smooth wheel to press against the scoring-wheel, and means at the rear side of the scoring-wheel to bend the hoop, as set forth.

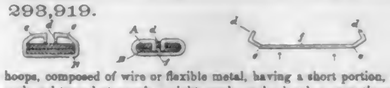
3. In a machine for bending hoops, the combination of a scoring-wheel, C′, provided with cutting-teeth, an arm, I², pivoted at one end, a shaft, I′, mounted on said arm, a smooth wheel, I, on the movable end of the shaft, and means to cause the smooth wheel to press against the scoring-wheel, as set forth.

293,917.

293,918. MACHINE FOR APPLYING FASTENERS TO HOOPS. A. RENSSELAER SPROUT, Picture Rocks, Pa. Filed July 7, 1883. (No model.)

Claim.—1. In a machine for applying flexible metal fasteners to hoops, the combination, substantially as set forth, of a pair of sinkers having shanks with two joints, one at a right angle to the other, whereby the sinker is adapted to yield to the irregularities of the wood, and means to tightly wrap the flexible metal about the lapped ends of the hoop.

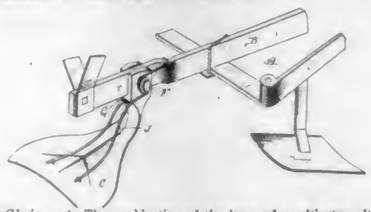
2. In a machine for applying flexible metal fasteners to hoops, the combination, substantially as set forth, of means to depress or sink the hoop upon the flexible metal, and a pair of jaws having in their confronting faces a right-angled recess, whereby to wrap the metal about the lapped ends of the hoop.



3. The combination, substantially as set forth, of means to feed and cut the flexible metal into given lengths, a pair of jaws having an opening and closing movement in a given direction, and another pair of jaws having a movement in a direction at right angles thereto.

4. The combination, substantially as set forth, of means to feed and cut the flexible metal into given lengths, means to depress or sink the hoop upon the flexible metal, and a pair of jaws having in their confronting faces a right-angled recess.

293,919. HOOP-FASTENER. ASA RENSSELAER SPROUT, Picture Rocks, Pa. Filed Jan. 7, 1884. (No model.)

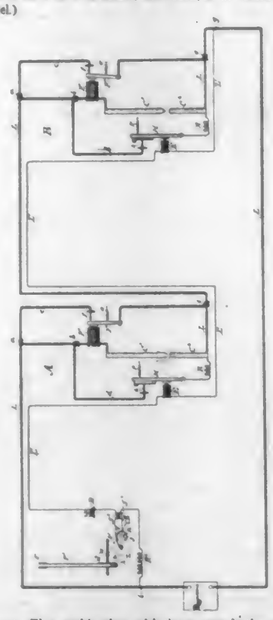


Claim.—As a new article of manufacture, the metal fastener for

293,919.

hoops, composed of wire or flexible metal, having a short portion, *d*, at each end turned at nearly a right angle, and a bend, *e*, near the right-angled ends, whereby the latter are inclined toward each other, as shown and described.

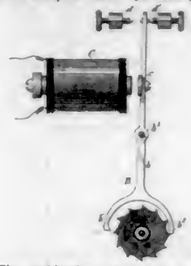
293,920. CULTIVATOR. GEORGE W. TAYLOR and SAMUEL TAYLOR, Smyrna, Del. Filed Dec. 14, 1883. (No model.)



Claim.—1. The combination of the beam of a cultivator with a presser-plate having a recess in its top, so as to catch over the beam, a pivotal bolt, and a spring for keeping the presser-plate pressed downward, substantially as described.

2. The combination of the presser-plate having a recess in its upper portion, and provided with the inclined surfaces at the bottom of the recess, and the lug I, with the pivotal bolt, the beam of the cultivator, and the spring which is applied to the beam and the plate, substantially as described.

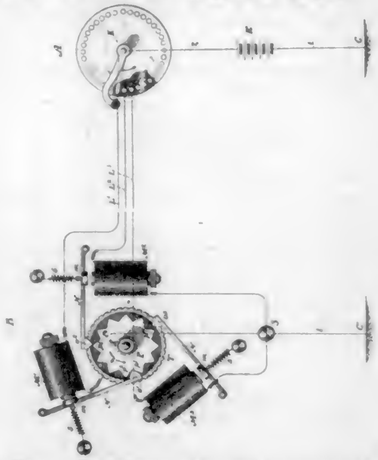
3. The combination of the presser-plate having a recess in its upper end, and provided with the lug I, with the pivotal bolt, the spring which is applied to both the beam and the plate, and the staples which are secured to the plate for holding the ends of the spring in position, substantially as specified.



293,921. CUT-OUT FOR ELECTRIC-ARC LAMPS. HENRY C. TOWNSEND and CHARLES L. BUCKINGHAM, New York, N. Y. Filed Dec. 1, 1883. (No model.)

Claim.—1. The combination, with the magnet in the arc branch, of a circuit-closer for intermittently or periodically closing a branch around said magnet and the arc, an electro-magnet in an auxiliary line for operating said circuit-closer, and a safety short or shunt circuit, which is closed by the armature-lever of the magnet in the arc branch when retracted.

2. The combination, with an arc branch electro-magnet, of a periodic or intermittent circuit-closer for diverting current from said magnet and the arc, an electro-magnet in an auxiliary line for controlling said circuit-closer, a periodic or intermittent circuit closer or controller in the auxiliary line, and a safety shunt or short circuit closed by the armature-lever of the arc-branch magnet when retracted.

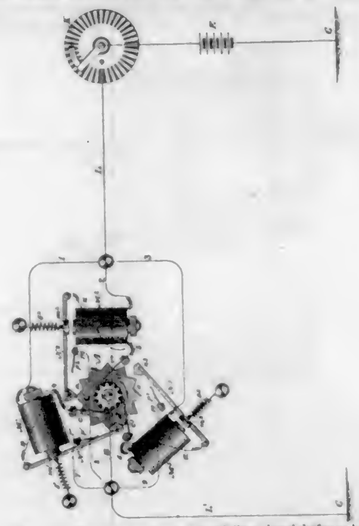


293,922. PRINTING-TELEGRAPH. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of an electro-magnet, a scape-wheel revolved in a given direction, under the influence of a constant force, and an escapement device for controlling the movements of said scape-wheel, which device is actuated in one direction by the force exerted through said scape-wheel and in the opposite direction by the action of said electro-magnet.

2. The combination, substantially as hereinbefore set forth, of an electro-magnet, a scape-wheel, and an escapement device for said wheel, consisting of a vibrating lever and two pallets, which pallets alternately engage the teeth of said scape-wheel, one through the instrumentality of said electro-magnet and the other through the instrumentality of the force exerted through the teeth of said scape-wheel impinging against said pallet.

293,923. ELECTRO-MECHANICAL MOVEMENT. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of a battery, a series of electric conductors, means for completing the circuit of said battery through each of said conductors in succession, and a series of electro-magnets, one included in the circuit of each of said conductors, an armature and armature-lever applied to each of said electro-magnets, a double-faced pawl or pallet carried at the extremity of said armature-levers, and a wheel having a series of beveled teeth against which said pallets are successively caused to impinge.

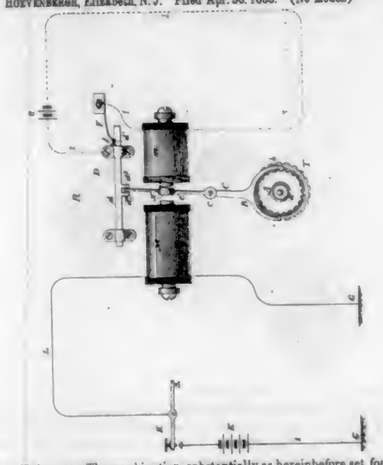
2. The combination, substantially as hereinbefore set forth, of a star-wheel, a series of electro-magnets, means for vitalizing said electro-magnets in succession, and a series of pallets successively engaging the teeth of said star-wheel, thereby causing the same to be revolved in one direction or the other, according to the order of succession in which said electro-magnets are vitalized.

3. The combination, substantially as hereinbefore set forth, of a star-wheel, a series of pallets, and a series of electro-magnets for causing each of said pallets to engage the teeth of said star-wheel in succession, thereby advancing the same in one direction or the other through a predetermined distance.

293,924. ELECTRO-MECHANICAL MOVEMENT. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with a main line, a battery, and means for transmitting electric impulses from said battery upon said main line, of a star-wheel, a series of electro-magnets respectively included in branch circuits of the main line, an armature and armature-lever for each of said electro-magnets, means for completing the connections of said main line through each of said branch circuits in succession, and for automatically severing said connections when the armature of the electro-magnet included in a circuit so completed has responded to the attraction of said electro-magnet, and means, substantially such as described, for automatically forming a second electrical connection through said electro-magnet before the first-named connection has been thus severed.

2. The combination, substantially as hereinbefore set forth, of an electro-magnet, its armature and armature-lever, a circuit-closing device acting to periodically and momentarily complete a circuit through the coils of said electro-magnet, and a second circuit-closing device operating, when said armature is actuated, to complete a circuit through the coils of said electro-magnet independently of the first-named circuit-closing device.



3. The combination, substantially as hereinbefore set forth, of an electro-magnet, a battery, means for transmitting an electric impulse from said battery through the coils of said electro-magnet, a circuit-closing device acting through the influence of said impulse to interrupt the connections of the circuit first traversed by said impulse, and a second circuit-closing device acting to keep the circuit of said battery closed through the coils of said electro-magnet until said circuit is interrupted at another point.

4. The combination, substantially as hereinbefore set forth, of a battery, a motor-wheel, a series of electro-magnets, a series of armatures and armature-levers respectively acting through the influence of said electro-magnets to actuate said motor-wheel, and two series of circuit-closing devices, the devices of one series acting to momentarily complete the circuit-connections of said battery through the coils of said electro-magnets in succession, and to automatically interrupt those connections, while the devices in the second series act, through the instrumentality of a current traversing the respective electro-magnets through the first-named circuit-closing devices, to independently complete the circuit-connections of said battery through said coils, respectively.

5. The combination, substantially as hereinbefore set forth, of a main line, a battery, means for transmitting electric impulses from said battery upon said main line, a motor-wheel, a series of electro-magnets, their armatures and armature-levers, and means, substantially such as described, for causing each electric impulse transmitted from said battery to rotate said motor-wheel in either direction a definite distance through the instrumentality of said armature-levers.

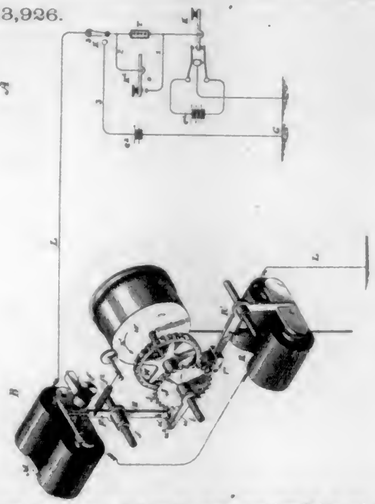
6. The combination, substantially as hereinbefore set forth, of a series of electro-magnets and means, substantially such as described, for vitalizing each of said electro-magnets in succession, and for causing each electro-magnet, when thus vitalized, to complete independent circuit-connections through itself and the succeeding electro-magnet.

293,925. ELECTRO-MECHANICAL ESCAPEMENT. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with a main battery and a transmitting device, of the type-wheel of a printing-telegraph instrument, an escapement-wheel, a lever for controlling the movements of said escapement-wheel, an electro-magnet included in the circuit of said main battery for actuating said lever in one direction, an electro-magnet included in a local circuit for actuating said lever in the opposite direction, and means, substantially such as described, for automatically completing the connections of said local circuit when said lever is actuated in response to the first-named electro-magnet.

2. The combination, substantially as hereinbefore set forth, of the escapement of a printing-telegraph, an armature and armature-lever for actuating said escapement, an electro-magnet vitalized by currents from a distant station for actuating said armature and armature-lever in one direction, and an electro-magnet included in a local circuit for actuating said armature and armature-lever in the reverse direction.

3. The combination, substantially as hereinbefore set forth, of a main battery, an armature and armature-lever, an electro-magnet included in the circuit of said battery and acting, when vitalized, to impel said lever in a given direction, a local battery, a second electro-magnet included in the circuit of said local battery and tending, when vitalized, to impel said lever in the opposite direction, a stationary contact-point in electrical connection with one pole of said local battery, and a movable point electrically connected with the remaining pole of said local battery, said contact-points serving to complete the circuit of said local battery in the course of the passage of said armature-lever from one limit of its excursion to the other, and to interrupt said circuit during the course of movement of said lever in the opposite direction.



293,926. PRINTING-TELEGRAPH. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Apr. 30, 1883. (No model.)

Brief.—Each reverse current effects two movements in the neutral armature of the type-wheel magnet, the residual magnetism in the latter causing it to be first repelled, releasing a tooth of the scape-wheel, after which it is quickly drawn up, catching the next tooth. A resistance is switched out of circuit for printing, and a weak battery, which repels without again attracting the armature of the type-wheel magnet, is used for unison.

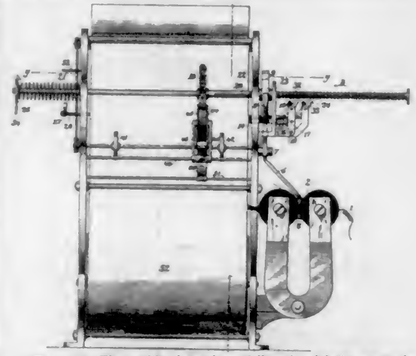
Claim.—1. The combination, substantially as hereinbefore set forth, with a main line, a source of electricity, and means for transmitting alternate positive and negative electric impulses upon said main line, of a type-wheel actuated by a constant force, a scape-wheel moving with said type-wheel, a detent for engaging the teeth of said scape-wheel, and an electro-magnet, its armature and armature-lever acting under the influence of each succeeding electric impulse to cause said detent to successively release and engage the teeth of said scape-wheel.

2. The combination, substantially as hereinbefore set forth, with a main line, and means, substantially such as described, for transmitting alternate electric impulses of a given strength upon said main line, of an electro-magnet included in the circuit of said main line and oppositely

293,926.

polarized by each succeeding impulse, an armature impelled to and fro by each succeeding impulse, a type-wheel impelled in a given direction by a constant force, a scape-wheel moving therewith, an escapement device controlled by the movements of said armature to permit the advance of said scape-wheel at each complete vibration, an arm moving with said scape-wheel, a detent caused to intercept the path of said arm when said armature is remote from said electro-magnet, and means, substantially such as described, for transmitting upon said main line an electric impulse of the requisite strength to impel said armature from said electro-magnet without again attracting the same into proximity thereto.

3. The combination, substantially as hereinbefore set forth, of a type-wheel impelled in a given direction under the influence of a constant force, a scape-wheel for controlling the movements of the same, a detent for engaging the teeth of said scape-wheel, an electro-magnet, means for reversing the polarization of said electro-magnet, and a soft-iron armature applied to said electro-magnet, which armature is successively repelled and attracted by said electro-magnet at each reversal of its polarity, and when so repelled and attracted permits a step-by-step movement of said scape-wheel.



4. The combination, substantially as hereinbefore set forth, of an electro-magnet, a neutral armature, its lever, and means, substantially such as described, for causing said armature to be alternately repelled and attracted by said electro-magnet, a detent carried upon said lever, a type-wheel actuated in a given direction by constant force, a scape-wheel moving with said type-wheel, an arm revolving with said scape-wheel, a detent carried by the movements of said neutral armature to alternately arrest and release said scape-wheel, and means, substantially such as described, for causing said electro-magnet to impel said armature without again attracting it.

5. The combination, substantially as hereinbefore set forth, with a main line, and means, substantially such as described, for transmitting upon said main line alternating electric impulses having a given strength, of a type-wheel and escapement device for controlling the movements of said type-wheel, an electro-magnet and its armature, which armature is successively repelled and attracted through the influence of each succeeding impulse of alternating polarity, thereby controlling the movements of said escapement device, means for increasing the strength of any one of said alternating electric impulses, a printing-platen, and a second electro-magnet acting through the influence of an electric impulse of increased strength to actuate said printing-platen.

6. The combination, substantially as hereinbefore set forth, with a main line, and means, substantially such as described, for transmitting upon said main line alternating electric impulses having a given strength, of a type-wheel, an escapement device for controlling the movements of said type-wheel, an electro-magnet and its armature, which armature is successively repelled and attracted through the influence of each succeeding impulse of alternate polarity, thereby controlling the movements of said escapement device, means for increasing the strength of any one of said alternating electric impulses, a printing-platen, and a second electro-magnet acting through the influence of an electric impulse of increased strength to actuate said printing-platen, means for transmitting upon said main line an electric current or impulse of less strength than that of said alternating impulses, an arm revolving with said type-wheel, and means, substantially such as described, for arresting the movement of said arm in a predetermined position under the influence of an electric current of the last-named character.

293,927. PAGE-PRINTING TELEGRAPH. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Aug. 16, 1883. (No model.)

Brief.—A page-printing telegraph having a platen the width of the sheet, and a shifting type-wheel, which is mechanically brought to unison at the end of its excursion, where the paper is automatically fed for the next line.

Claim.—1. The combination, substantially as hereinbefore set forth, in a printing-telegraph instrument, of a longitudinally-movable type-wheel shaft and a type-wheel rigidly fixed thereto.

2. The combination, substantially as hereinbefore set forth, of a longitudinally-movable type-wheel shaft or spindle, a type-wheel rigidly fixed thereto, and means, substantially such as described, for rotating said type-wheel and shaft.

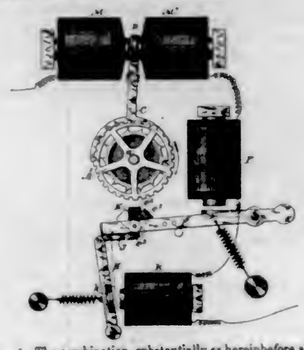
3. The combination, substantially as hereinbefore set forth, of a longitudinally-movable type-wheel shaft, a type-wheel rigidly fixed thereon, and means, substantially such as described, for impelling said type-wheel and type-wheel shaft to and fro.

4. In a printing-telegraph instrument, the combination, substantially as hereinbefore set forth, with the longitudinally-movable type-wheel and the armature-lever of the printing-magnet, of devices actuated by the movements of said armature-lever for both longitudinally and vertically spacing the impressions produced.

5. The combination, substantially as hereinbefore set forth, of a type-wheel shaft, a spring or equivalent device tending to move said shaft longitudinally in one direction, teeth formed upon said shaft, a dog engaging with said teeth, and mechanism for moving said dog in the direction to impel said shaft against the action of said spring.

6. The combination, substantially as hereinbefore set forth, of the armature-lever, the traction-bar, the beveled surfaces of said lever and bar, the dogs, the shaft, and the type-wheel, co-operating in the manner described.

7. The combination, substantially as hereinbefore set forth, of the type-wheel shaft, mechanism for moving it horizontally through succeeding steps corresponding to the succeeding letters in a horizontal line of characters, and mechanism actuated by its last step movement for returning it to a position to print the first letter of a horizontal line.



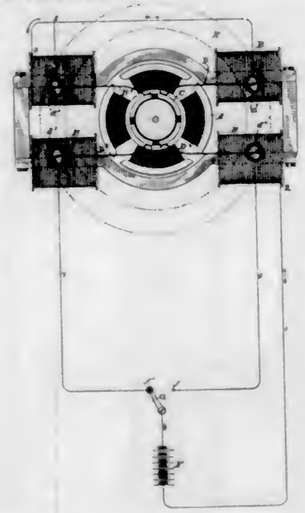
8. The combination, substantially as hereinbefore set forth, of the horizontally-moving type-wheel shaft, a subsidiary shaft advanced by the last step movement of said type-wheel shaft, and mechanism released by said subsidiary shaft for causing the return of said type-wheel shaft.

9. The combination, substantially as hereinbefore set forth, of the mechanism for printing characters in horizontal lines, the paper-feeding mechanism, including the ratchet, ratchet-wheel, and feed-rollers, the magnet-armature for actuating said ratchet and ratchet-wheel, and the detent for preventing the engagement of said ratchet with said ratchet-wheel, except on the completion of the printing of a horizontal line of characters.

10. The combination, substantially as hereinbefore set forth, of the type-wheel, the type-wheel shaft, and mechanism for vertically advancing the page upon which the impressions are received from said type-wheel, which mechanism is brought into position for operation by the last step movement of said shaft.

11. The combination, substantially as hereinbefore set forth, of the longitudinally-movable type-wheel shaft, the arm carried at one end thereof, a pin against which said arm is caused to impinge by the revolution of said shaft after the last character of a line has been printed, and the releasing device for said shaft brought into action after the type-wheel shaft has been arrested by said arm and pin.

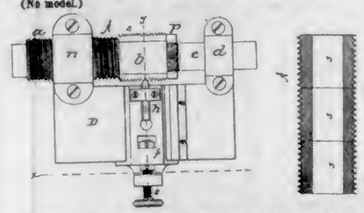
293,928. MEANS FOR PRINTING FROM EITHER OF TWO TYPE-WHEELS IN PRINTING-TELEGRAPHS. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Sept. 24, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of two type-wheels revolving in parallel planes, two platen-faces rigidly united with each other but situated in different planes, and supported upon a common axis, and an electro-magnet serving, when vitalized, to cause one of said platen-faces to confront one type-wheel, and when not vitalized to permit the other platen to confront the other type-wheel.

2. The combination, substantially as hereinbefore set forth, of two type-wheels, means, substantially such as described, for imparting an intermittent advance movement to said type-wheels, a printing-magnet, its armature and armature-lever, two platen-faces united with each other but situated in different planes, and an electro-magnet acting when vitalized to present one of said platen-faces to one type-wheel, and when not vitalized to present the other platen-face to the other type-wheel.

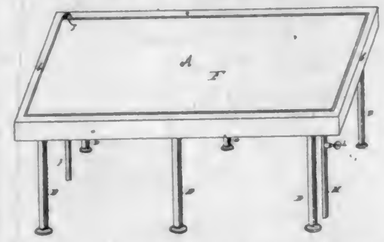
3. The combination, substantially as hereinbefore set forth, of a type-wheel axis, two type-wheels fixed thereupon and revolving in parallel planes, two platen-faces situated, respectively, in the planes of said type-wheels, and supported upon an independent axis parallel with said type-wheel axis, an electro-magnet, its armature and armature-lever, and a link connecting said lever with the platens, whereby the latter may be turned upon their common axis by the to-and-fro movements of said lever.



4. The combination, substantially as hereinbefore set forth, of a type-wheel axis, two type-wheels fixed thereupon and revolving in parallel planes, a printing-magnet, its armature and armature-lever, two platen-faces supported upon said armature-lever upon a common axis parallel to said type-wheel axis, and an independent electro-magnet for controlling the angular position of said platen-faces.

293,929. ELECTRIC MOTOR. WILLIAM T. WATERS, Atlanta, Ga. Filed Nov. 28, 1883. (No model.)

Claim.—In an electric moter, the combination of an outgoing circuit with two or more return-wires, a double set of commutator-brushes, each set being connected to one outgoing but to a different return wire, and an adjustable face-plate or frame upon which the said brushes are mounted, so as to be readily placed on the line of commutation, substantially as set forth.



293,930. MACHINE FOR THREADING SECTIONAL LEADING-SCREWS. CHARLES V. WORTH, Waltham, Mass. Filed Aug. 25, 1882. (No model.)

Claim.—1. The improved mechanism for threading the screw-sections, composed of an arbor, A, having a short leading-screw, *a*, and adapted to hold a section to be threaded, and a plate, D, engaged with the screw *a* and supporting a cutting-tool, as set forth.

2. The plate D, carrying the nuts *s d*, the adjusting-screw *s*, and the adjustable slide *f*, in combination with the arbor A, composed of the screw-threaded portion *a*, the work-holder *b*, and the cylindrical portion *c*, substantially as and for the purposes set forth.

293,931. TABLE FOR THE MANUFACTURE OF CANDY. CHAS. ADOLPH AILNEY, Portland, Oreg. Filed Aug. 13, 1883. (No model.)

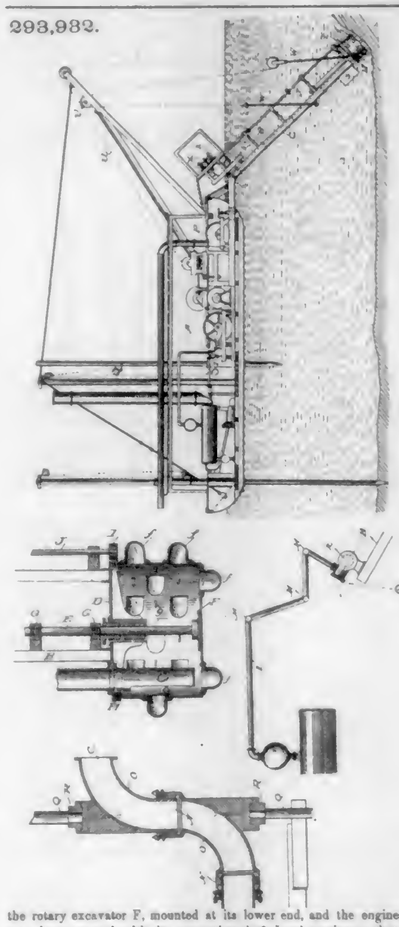
Claim.—1. In a table for manufacturing candy, the combination of the bottom B, sockets C C, and legs D, operating as shown, and for the purpose described.

2. In combination, bottom B, having right angles *b b c c*, and zinc lining E, located as shown, and inlet and exit pipes H A I *i*, for the purpose described.

3. In combination, top F, having pins or lugs *f f*, wedge-pieces G, and bottom B, provided with zinc lining E, and inlet and exit pipes suitably provided with valves, for the purpose described.

4. In combination with bottom B and exit-pipe I, the inner pipe, *i*, for the purpose shown.

5. A table for cooling candy, constructed with a hollow interior, N, whereby cold or hot water can be applied to the surface upon which the candy rests.



293,932. DREDGER. HORACE B. ANGELL, San Francisco, Cal. Filed Nov. 28, 1883. (No model.)

Brief.—A ladder-frame with a lightening-float hinged to the scow has at its lower end a fixed disk, through which passes a shaft, with bearings on the ladder, carrying an interiorly-spiked drum (with openings and scoops delivering the material inside the drum to a suction-pipe, also passing through the disk) driven by an exterior gear, a pinion, and a shaft from an engine having jointed steam-pipe on the upper end of the ladder. The suction-pipe has swiveled elbow-sections, from which extend the shafts forming the pivot of the ladder. Last elbow-section is swiveled to the pump-tube.

Claim.—1. In a dredging-machine, the hinged ladder swinging in a vertical arc, and having the rotary excavating-cylinder F at its lower end, and the suction-pipe C, extending from said excavator along the ladder and to a suction-pump, P, in combination with the driving-gear H, pinion I, shaft J, and the engine K, supported upon the upper end of the ladder, substantially as herein described.

2. In a dredging-machine, the ladder or frame B, hinged to the boat A, so as to have a movement in a vertical arc, in combination with

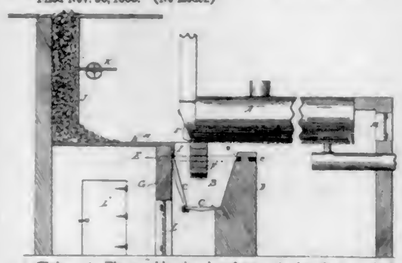
293,932.

the rotary excavator F, mounted at its lower end, and the engines K upon its upper end, with the connecting-shaft J and gearing, so that the whole moves together, and their relative positions remain unchanged, as herein described.

3. In a dredging-machine, the ladder B, hinged to the boat A, and having the rotary excavator F at its lower end, the suction-pipe C, leading to the pump P upon the boat, and the engine K, mounted upon and moving with the ladder, in combination with the elbows O O, rotary joint N, and shafts Q, substantially as herein described.

4. In a dredging-machine, the boat A, with the stationary boilers, in combination with the hinged ladder or frame B, supporting the rotary excavator F and driving-engine K, and the pipes L, with the extension-joints M, substantially as herein described.

5. In a dredging-machine, the ladder or frame B, hinged to the boat A, and having the excavator F and driving-engine K mounted upon it, in combination with the float S, substantially as herein described.



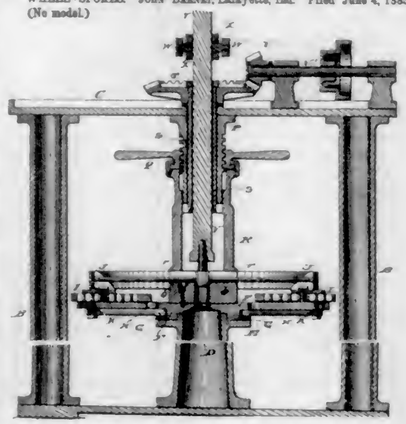
6. The rotary drum F, having the exterior excavating-openings *f*, by which material is carried into the drum, in combination with the inwardly-projecting spikes, stirrers, or cutters *g* and a stationary suction and discharge pipe, C, substantially as herein described.

7. In a dredging-machine, the ladder B, hinged to the boat A, and having the rotary excavator F at its lower end, the suction-pipe C, leading to the pump P upon the boat, in combination with the elbows O O, rotary joint N and shafts Q, and the supplemental joint N', whereby the pipe may be adjusted, substantially as herein described.

8. In a dredging-machine, a ladder hinged to a boat so as to swing in a vertical arc, a rotary excavator supported at its lower end, a suction and conveying pipe extending from the excavator to a pump upon the boat, with suitable connecting-joints, in combination with an engine upon the boat and a supplemental engine upon the ladder, whereby the pump and excavator may be driven independently and at different rates of speed, substantially as herein described.

9. A dredging device consisting of a fixed disk, D, a driven supporting-shaft, E, passing through such disk, a single hollow excavating-drum mounted upon said shaft, and having excavating openings or backets, and a suction-pipe passing through the disk.

293,933. BOILER-FURNACE. ABSALOM BACKUS, Jr., Detroit, Mich. Filed Nov. 30, 1883. (No model.)



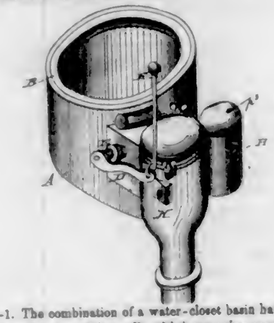
Claim.—1. The combination, in a furnace for burning sawdust and similar substances, of the boiler, the feeding-floor at or near the level of the boiler, the feeding-throat between the boiler and the edge of the floor, the grate, the combustion-chamber, the bridge-wall at the rear of the combustion-chamber, and the arch depending below the boiler over the grate and between the rear bridge-wall and combustion-chamber and the rear edge of the feeding-throat, for dividing said throat from the combustion-chamber proper, substantially as described.

2. The combination of the boiler, the feeding-floor at or near the level of the boiler, the feeding-throat between the rear edge of the floor and the boiler, the fire-grate composed of a horizontal section, and an upright section extending directly from the front edge of the same, the combustion-chamber, the bridge-wall at the rear thereof, and the pendent arch over the horizontal section of the grate, and arranged between the combustion-chamber and bridge-wall and the rear edge of the feeding-throat, for dividing said throat from the combustion-chamber proper, substantially as described.

3. The combination of the boiler, the front furnace-wall, G, the feeding-floor H over the latter, the feeding-throat I between the boiler and the rear edge of the floor, the fire-grate C, composed of the horizontal and upright sections between the bridge-wall and the front furnace-wall, the combustion-chamber B, and the pendent arch F, between the front wall and the bridge-wall, arranged to divide the feeding-throat from the combustion-chamber, substantially as described.

4. The combination of the boiler, the feeding-floor at or near a level therewith, the feeding-throat formed between the rear edge of the feeding-floor and the front end of the boiler, and the arch depending from the rear edge of the feeding-throat directly over the fire-grate, and between said throat and the bridge-wall, to divide said throat from the combustion-chamber and also direct the cold air downward, substantially as described.

293,934. MACHINE FOR MILLING OFF THE HUB ENDS OF WHEEL-SPOKES. JOHN BARNEY, Lafayette, Ind. Filed June 4, 1883. (No model.)



Claim.—1. In a machine for truing wheels before applying the hubs, the combination of a concentric series of radial tire-distending chucks, a center-block and spoke-clamp, and a drill cutter or reamer adapted for trimming the inner ends of spokes, all constructed and adapted to operate substantially in the manner and for the purposes described.

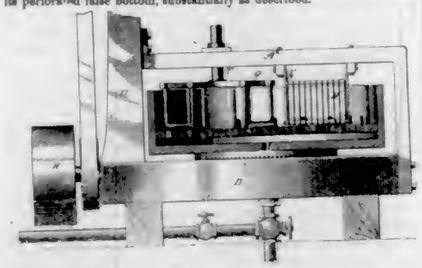
2. The combination of expanding chucks, a circularly-movable slotted ring, its lever-connections, and the links K, for adjusting said chuck, the central spoke-rest, the spoke-clamps, and a vertically-movable rotary spindle bearing a spoke-cutting tool, all constructed and adapted to operate substantially in the manner and for the purposes described.

3. In combination with the tire-distending chucks, the spoke-clamp, the spindle V, its balanced lever Z, for giving vertical movement to the spindle, the sleeve S, and the driving-wheels for rotating the spindle, all constructed and adapted to operate substantially in the manner and for the purposes described.

4. The combination of the face-plate, the central spoke-rest, the perforated slides T, and the adjustable chuck-jaws on said slides, all constructed and adapted to operate substantially in the manner and for the purposes described.

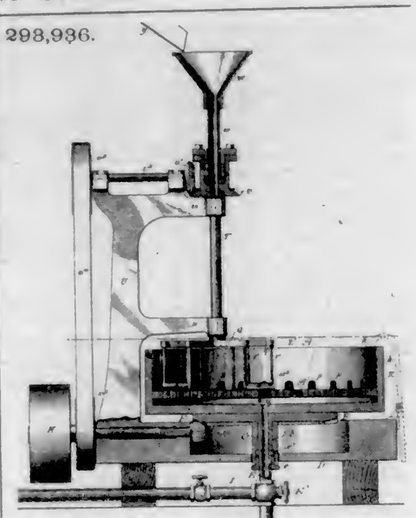
293,935. WATER-CLOSET. NICHOLAS BARRY, Jr., Muscatine, Iowa. Filed May 10, 1883. (No model.)

Claim.—1. The combination of a water-closet basin having broad ribs at the upper edge, curved inwardly with intervening spaces, and the flaring internal wall forming an annular chamber, and an inlet-pipe, whereby water is supplied and distributed to the basin in separate currents or ripples, substantially as specified.



2. The combination, with the basin A, and chamber H at one side of the valve S^2, located therein, and the mechanism for operating the same, the communicating chamber H, the float T, rod H, and angle-lever connecting with the hollow valve-rod V^4, the valve-chamber V, and guided valves V', and the supply-pipe, all arranged to operate substantially in the manner specified.

3. The combination, with the basin A, the chambers H H', and the float T, valve S^2, and hollow valve-rod V^4, and valve V', of the guide-chamber V^2 and piston-guide V^3, the whole adapted to operate substantially in the manner specified.

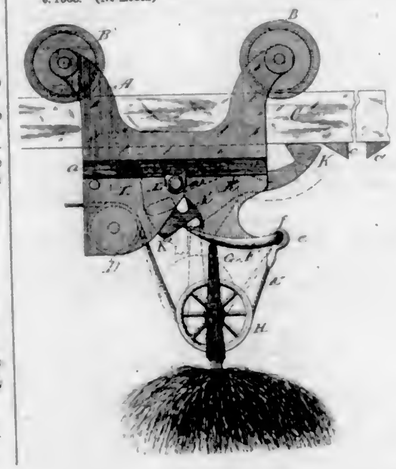


4. The combination, with the air-tight chamber H, of the basin A, the discharge-valve S^2, and the float-chamber H' and float T, the float-chamber being provided with a vent, p^3, substantially as and for the purposes set forth.

293,936. AMALGAMATOR. THEODORE H. BUCKER, Central City, Colo. Filed Nov. 9, 1883. (No model.)

Claim.—1. In an amalgamator, concentrator, and separator, the combination, with a rotary tub having a perforated false bottom and one or more copper plates, of an agitator arranged within said tub, and having an opposite rotary motion thereto, and suitable means for feeding ore or earth into the tub from the top and forcing water into the same through its perforated false bottom, substantially as described.

293,936.



2. The combination, with the rotary tub having a perforated false bottom and one or more metallic plates capable of amalgamation, of a rotary agitator arranged in the tub eccentrically to the same, means for rotating the agitator and the tub in opposite directions simultaneously, means for feeding water into the bottom of the tub, and means for discharging the material automatically from the tub at different levels, substantially as described.

3. The combination, with the rotary tub and agitator, of the series of siphons arranged to carry off the material from the tub at different levels, and means for communicating rotary motion to the tub, substantially as described.

4. The combination, with the rotary tub having the perforated false bottom provided with grooves for mercury and the concentric plates capable of amalgamation, of the pipe opening into the bottom of said tub, a suitable shaft and intermediate gearing for rotating said tub, the agitator Q, constructed substantially as described, and arranged within said tub eccentrically thereto, the hollow vertical shaft mounted in suitable bearings and supporting said agitator, a hopper arranged to discharge into said shaft, and suitable intermediate connections for transmitting to said vertical shaft and agitator rotary motion from the shaft which operates the tub, substantially as set forth.

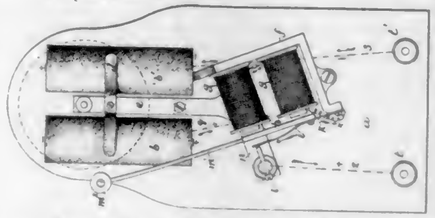
293,937. HAY-CARRIER. FRANK H. BOLTE, Milwaukee, Wis., assignor to the Egelhoff Manufacturing Company, same place. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination, with a carrying-frame, (as A,) of a removable and reversible latch-frame, (as I I,) substantially as described.

2. The combination, with carrying-frame A, having grooves *a'*, of removable latch-frame I I, having longitudinal flanges *i i*, adapted to engage said grooves, substantially as shown and described.

3. The combination, with the carrying-frame A, grooved as described, the latch-frame I I, having flanges adapted to engage said grooves, and the bolt L, which passes through both frames from side to side, so as to lock the two together, substantially as set forth.

4. The latch-frame I I, having a central notch in its under surface, and rigid hook or fork F, extending back into said notch to form a bearing for the bail of a hay-fork, substantially as shown.



5. The latch-frame I I, having a notch, as described, in its under surface, a rigid hook, F, extending partly across said notch, and a pivoted latch, K, having an inclined surface, K^2, which extends beyond said hook, all in combination, substantially as set forth.

6. The combination of the latch-frame I I, having hook F, and the pivoted latch K, having arm K', arranged relatively to said hook, substantially as shown and described.

7. The combination of the latch-frame I I, having a notch, as shown, the hook F, extending partly across said notch, the latch K, pivoted in said frame, and having the incline K^2 and arm K', arranged, as shown, relatively to said hook, all substantially as shown and set forth.

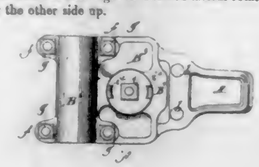
8. The combination of carrier A, reversible latch-frame I I, having rigid hook F, and latch K, constructed and arranged as shown, and the inclined catches *c c'*, all arranged and adapted to operate substantially as described.

293,938. ELECTRIC CALL-BELL. DAN BOYD, Manchester, England, assignor to the Domestic Electrical Manufacturing Company, Boston, Mass. Filed June 2, 1883. (No model.)

Claim.—1. As a new article of manufacture, the herein-described self-contained electrical call-bell, consisting of a base, an electro-magnetic bell and one or more battery-cells in circuit therewith, and two terminals or posts, all mounted on the said base, and the whole complete for use and operative on the closure of the circuit, substantially as set forth.

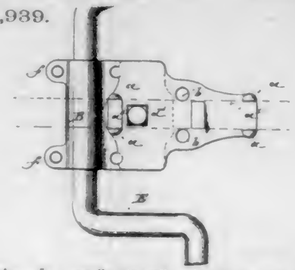
2. The combination of a base and an electro-magnetic bell with one or more detachable sealed cells of battery in circuit therewith, and binding-posts or terminals, the bell, cells, and posts or terminals being mounted on the said base, and the whole constituting a self-contained electric call-bell operative on the closure of the circuit, substantially as described.

3. The combination of an electro-magnetic bell and a detachable sealed cell of battery having terminals with a base carrying said bell and battery, and having circuit-connections and spring-contacts, substantially as described, whereby the connections are made on simply placing the said cell in position.



4. The combination of an electro-magnetic bell and base therefor with sealed cells of battery mounted on said base, and a retaining-yoke for said cells.

5. The combination of an electro-magnetic bell and sealed cells of battery with a base having recesses *c*, and contact-springs for the cells, substantially as set forth.



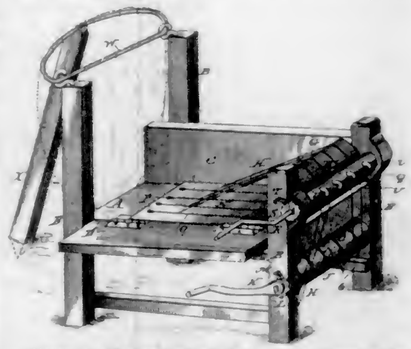
6. The combination of a base and a frame, *f*, carrying electro-magnet, armature, hammer, and circuit-breaker, and having an extension, *e*, with sealed cells of battery, and retaining-yoke carried by said extension of the frame.

293,939. SED-PLATE FOR SULKY-PLOW BEAMS. BYRON C. BRADLEY, Chicago, Ill. Filed Nov. 26, 1883. (No model.)

Brief.—A plate or washer in the coupling-plates having differing sides. The plow-beam is held rigid or allowed lateral rotation by turning the washer the other side up.

293,939.

Claim.—In a coupling for sulky-plow beams, the plate A and socket or box B B', having an extension, B^2, in combination with the reversible plate C and bolt D, substantially as and for the purpose specified.

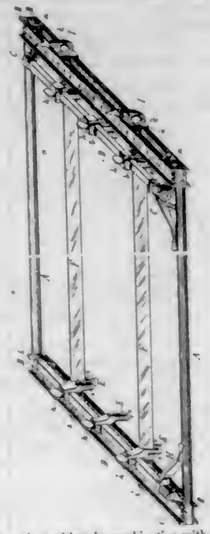


293,940. APPLE CORER, PARER, AND SLICER. WILLIAM E. BROCK, Dunellen, N. J., assignor to John H. Bell, Brooklyn, N. Y. Filed July 26, 1883. (No model.)

Claim.—1. The combined apple parer, corer, and slicer herein described, composed of the blade or barrel A, the upper and lower ends, *a* and *b*, of which are cylindrical or tubular, and the intermediate portion, *c*, of which is partially cut away longitudinally to form an opening, and having a cutting-edge, *e*, formed on its lower extremity, and a paring and slicing knife, B, formed or inserted longitudinally in said intermediate portion, *c*, as and for the purposes set forth.

2. In an apple-corer, the inclined plate or surface *m*, in combination with the blade or barrel A, the upper and lower ends of which said blade are cylindrical or tubular, and the intermediate portion, *c*, thereof is cut away to form an opening, said plate or surface *m* being located as described, for the purpose set forth.

293,941. WOOL-PRESS. DAVID F. BROOKS, Lampasas, Tex. Filed Dec. 15, 1883. (No model.)

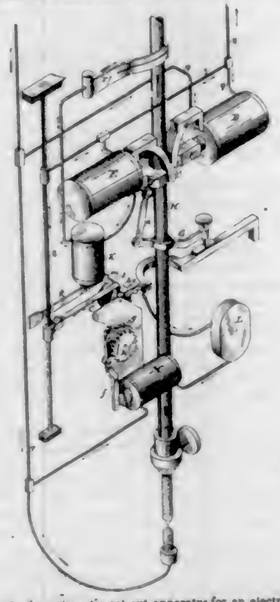


Claim.—1. The combination of the box or wool-receptacle provided with a hinged side and fixed concave end-gate, the slotted apron fitting in the bottom of the box, the drum or roller journaled below and at one end of the box, and having one end of the apron fastened to it, the upper roller provided with a series of hooks adapted to engage the free end of the apron, and means for rotating the rollers and holding the same fixed under tension, substantially as set forth.

2. The combination of the box or wool-receptacle having a series of slots in its bottom, and provided with a hinged side and fixed concave end-gate having notches registering with the slots in the bottom of the box, the slotted apron, the drum or roller journaled below and at one end of the box and having one end of the apron fastened to it, the upper roller provided with a series of hooks adapted to engage the free end of the apron, and means for rotating the rollers and holding the same in a fixed position under tension, substantially as set forth.

293,942. STONE-SAW RACK. JOHN P. BROUNSCOMBE, Wilkes-Barre, Pa. Filed May 1, 1882. (No model.)

Claim.—1. The fingers E, slotted to receive a saw or saws, and



293,942.

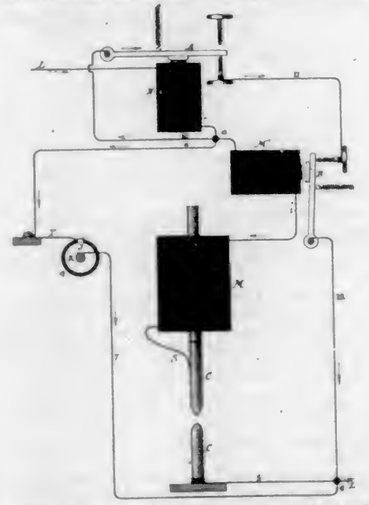
adapted to hold the same in position, in combination with the graduated bar D, and means for securing said fingers upon the said bar, substantially as herein set forth.

2. In a stone-saw rack, the graduated bars D D, capable of being rocked in their bearings, and carrying adjustable fingers, as E, each of the latter having one or more slots for receiving a saw or saws, in combination with the frame, and with means for securing the ends of the saws, substantially as described.

293,943. CUT-OUT FOR ELECTRIC LAMPS. CHARLES L. BUCKINGHAM and HENRY C. TOWNSEND, New York, N. Y. Filed Aug. 15, 1883. (No model.)

Claim.—1. An automatic cut-out apparatus for an electric lamp or other translating device, comprising a controlling electro-magnet in circuit with the lamp or such portion thereof as is liable to interrupt the flow of current on the general circuit, a branch circuit affording a continuous path for the current around the lamp in case of derangement, and means for intermittently diverting current from the electro-magnet and such portions of the lamp or other apparatus as are liable by a derangement to interfere with the flow of current upon the general circuit, as and for the purpose described.

2. The combination, substantially as described, of an electro-magnet in the main circuit with the carbons, an intermittent circuit-closer for intermittently and momentarily completing a branch around the electro-magnet and carbons, and means for holding said circuit-closer at the circuit-closing point when the main-circuit electro-magnet is weakened to a predetermined degree, owing to an abnormal resistance in the carbon-circuit.



3. In an electric lamp, a periodically-closed short-circuiting branch, in combination with means for holding said branch closed to form a continuing circuit around the arc of the lamp in case of abnormal resistance on the arc branch, substantially as described.

4. In a cut-out for an electric lamp, an electro-magnet in the same branch or circuit with the carbons, in combination with a normally-open shunt around said electro-magnet and the arc, and means whereby said shunt may be closed to cause the operation of said electro-magnet to effect a continued short-circuiting of the lamp.

5. In a cut-out for an electric lamp, and in combination with the arc branch or circuit, an electro-magnet therein, an armature therefor which in a retracted position causes the short-circuiting of the lamp, and a normally-open branch around the electro-magnet and arc, which effects the retraction of said armature, if closed, when the resistance of the arc is abnormally great.

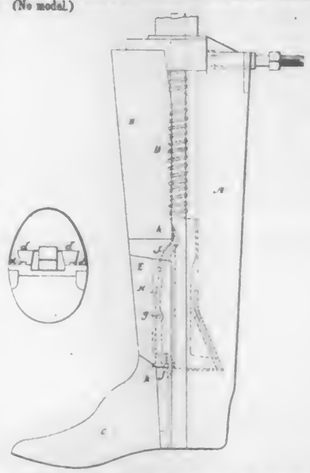
6. In an electric lamp, the combination of an electro-magnet in the arc branch or circuit, an armature therefor, a normally-open shunt, as specified, and a circuit-closer for closing the same provided with a stop so arranged that in the retracted position of the armature of the electro-magnet in the arc branch or circuit the circuit-closer will be arrested to retain the normally-open branch closed, substantially as described.

293,944. ELECTRIC-ARC LAMP. CHARLES L. BUCKINGHAM and HENRY C. TOWNSEND, New York, N. Y. Filed Aug. 15, 1883. (No model.)

Claim.—1. In an electric lamp, the combination of an arc branch including the coils of a circuit-controlling electro-magnet, a normally-open branch around the arc, having a circuit-closer for occasionally closing the same, and another branch for short-circuiting the lamp, and means for closing said short-circuiting branch, said means being brought into operation by a diversion of current from the arc branch through the branch of the periodic circuit-closer.

2. The combination of a periodic circuit-closer in a normally-open branch around the arc of an electric lamp, an electro-magnet in the arc branch, whose magnetism is weakened by a diversion of current through the periodically-closed branch, a second branch of low resistance for short-circuiting the lamp, and means brought into action to close said short-circuiting branch upon a diminution of magnetism in the arc-branch electro-magnet.

3. In an electric lamp, a safety short-circuit around the arc, and an armature-lever for closing the same when at back contact, an electro-magnet in the arc branch for controlling said circuit-closing arm, a periodically-closed branch to divert current from the arc branch and to there-



upon cause the closing of the cut-out branch, and means for causing the feed of the carbons by diversion of current from said arc branch.

4. In an electric lamp, a safety shunt-circuit around the arc, and an armature-lever for closing said shunt-circuit, an electro-magnet in the arc branch for controlling said armature-lever, another branch around the arc of sufficiently low resistance to divert enough current from the arc branch to permit the armature of the electro-magnet therein to close the short-circuiting or cut-out branch.

5. An electro-magnet, N, whose coils are in the main line, and its armature A forming part of the short-circuiting branch, an armature-lever, B, and electro-magnet M', whose coils are in the arc branch, for controlling armature-lever B, as and for the purpose described.

6. The combination, in a safety short-circuit for an arc-lamp, of an armature-bar forming a part of said short-circuit when on front contact, a second armature-bar also forming a part of said short-circuit when on back contact, substantially as described.

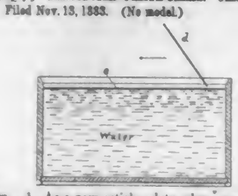
293,945. BOOT-TREE. JOTHAM H. BURBANK, North Brookfield, assignor of one-half to Alfred H. Batcheller, Boston, Mass. Filed Aug. 21, 1883. (No model.)

Claim.—1. A boot-tree having right and left detachable and changeable foot and front pieces, each of the latter being formed, as described, with the fullness upon their respective sides, so that they may be used with one tree to properly form both right and left boots, substantially as and for the purpose set forth.

2. In a boot-tree, the right and left changeable front pieces, E and F, one of said front pieces having the center and line of fullness upon that side which, when attached to the tree, presents the proper form for a right-foot piece, while the other having the center and line of fullness upon that side which, when attached to the tree, presents the proper form for a left-foot piece, substantially as and for the purpose set forth.

3. In a boot-tree, the combination, with detachable foot and front pieces, of a double-acting locking-lever adapted to be operated by the draw-bar, and having a T-head adapted to lock the said foot and front pieces alternately when the draw-bar is moved out and in, respectively, as described.

4. In a boot-tree, the combination of draw-bar D with the T-shaped lever H, having the spring-piece J, bearing upon its upper end, and provided with the lug *j* at its lower end, engaging in the recess *i* of the heel-piece *e* when straining, and provided also with the lug *k*, engaging under the projection *j'* when the strain is released, substantially as and for the purpose set forth.

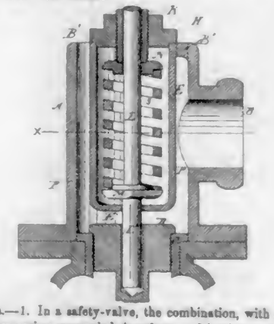


293,946. LIFTING JACK. WARD B. CARPENTER, West Topsham, Vt., assignor of one-half to John R. Abbe, Manchester, N. H. Filed Nov. 30 1883. (No model.)

Claim.—1. The combination, with the standard and a movable section, of an adjustable collar embracing the standard, an arm pivotally secured to the movable section, and a lever pivotally secured to the adjustable collar and to the arm, substantially as set forth.

2. The combination, with a telescopic standard, of a clamping-collar encircling the stationary section of said standard, an arm connected at its upper end to the adjustable section of the standard by a ball-and-socket joint, and a lever pivotally connected to the clamping-collar and the lower end of said arm, substantially as set forth.

293,947. DECORATED PLATE-GLASS. JAS. J. CARROLL, Baltimore, Md. Filed Nov. 13, 1883. (No model.)



Claim.—1. As a new article, plate-glass ornamented with colors, and having a back or protecting covering of slate, substantially as set forth.

2. The method of producing plate-glass ornamented with colors, consisting in applying the colors to one surface of the glass, then applying over the colors a plastic composition embracing slate-dust, and finally hardening the composition, as set forth.

3. The method of producing plate-glass ornamented with colors, consisting in distributing oil-mixed colors on the surface of water, immersing a glass plate into the water, so as to have the colors adhere to one surface of the plate, and then covering the colored surface with slate, as set forth.

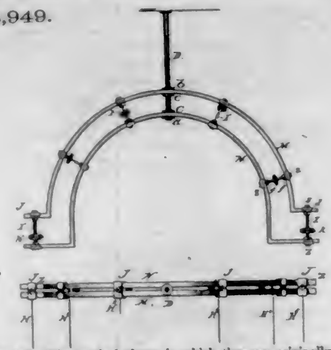
293,948. SAFETY-VALVE. JOHN O. CHENEY, Boston, Mass. Filed July 9, 1883. (No model.)

Claim.—1. In a safety-valve, the combination, with an outer casing, an inner casing suspended therefrom, and having an opening in the top for inserting the spring, of a spring, substantially as shown and described.

2. In a safety-valve, the combination, with an outer casing, an inner casing suspended therefrom, having a closely-fitting orifice for the valve-stem in its lower end, and opened at its upper end for the insertion of a spring, and means for adjusting the tension of the same, substantially as shown and described.

3. In a safety-valve, the combination of an outer casing having a steam-outlet, and adapted to fit the valve-seat, an inner casing suspended therefrom, and having an opening at its top, a cap for the opening of the inner casing, with a spring and means for adjusting the same, substantially as shown and described.

4. In a safety-valve, the combination, with an outer casing, an inner casing suspended therefrom, of openings at the top of the annular chamber formed by the casings, whereby the sound of the escaping steam is muffled, substantially as shown



293,949. STORE-SERVICE SYSTEM. MILTON CLARK, Baltimore, Md., assignor to the Continental Cash Car Company of Baltimore, same place. Filed Jan. 23, 1884. (No model.)

Claim.—1. A store-service system consisting of a series of wires radiating from a central or cashier's station to various salesmen's counters or sub-stations, and provided with means at the central station for varying the grade of any or all of said wires, substantially as described.

2. A store-service system consisting of a series of wires radiating from a central or cashier's station to various salesmen's counters or sub-stations, and provided with means for moving any or all the ends of the wires at the central station to different elevations or horizontal planes, substantially as described.

3. A store-service system consisting of a series of wires radiating from a central or cashier's station to various salesmen's counters or sub-stations, and provided with means for moving the ends of the wires to the

293,949.

right or left of the vertical planes in which they are originally placed, substantially as described.

4. A store-service system consisting of a series of wires radiating from a central station to various salesmen's counters or sub-stations, and provided with means for tightening or stretching each of the said wires.

5. In a store-service system, a central fixture provided with horizontally-movable attachments for the inner ends of the wires, substantially as described.

6. In a store-service system, a central fixture provided with vertically-adjustable attachments for the inner ends of the wires, substantially as described.

7. In a store-service system, a central fixture provided with horizontally and vertically adjustable attachment for the inner ends of the wires, substantially as described.

8. In a store-service system, a central fixture composed of guide-rails and connecting-bolts, substantially as described.

9. In a store-service system, the combination of guide-rails M N, having a central opening, with the adjustable bolts I I, provided with means for locking them in any position upon said rails, substantially as described.

10. In a store-service system, the guide-rails M N, having an upward curvature, in combination with the adjustable locking-bolts I I, substantially as described.

11. In a store-service system, the adjustable bolts I I, in combination with sleeve-clamps L, having means for attaching thereto the wire H, substantially as described.

12. In a store-service system, the bolts I I, in combination with sleeve-clamps L, having extended arms K K and transverse bar P, provided with key-head *r*, and lock-nut *n*, substantially as described.

13. In a store-service system, the combination of a wireway, adapted to be raised and lowered at the salesman's end, with upright standard T, sleeve-piece U, having lugs or balls V V, rope Q, and drum R, substantially as described.

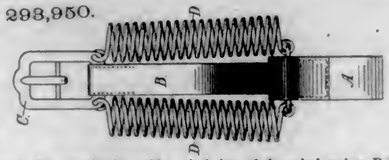
14. In a store-service system, the combination of a wireway, adapted to be raised and lowered at the salesman's end, with upright standard T, sleeve U, having lugs or balls V V, rope Q, and handles T' T'', substantially as described.

15. In a store-service system, the combination of a wireway, adapted to be raised and lowered at the salesman's end, with upright standard T, carriage Z, with wheels *l l*, rope Q, and drum R, substantially as described.

16. In a store-service system, the combination of a wireway, adapted to be raised and lowered at the salesman's end, with upright standard T, carriage Z, with wheels *l l*, rope Q, and handles T' T'', substantially as described.

17. In a store-service system, the combination of a wireway, adapted to be raised and lowered at the salesman's counter, with an upright standard, a piece sliding thereon, to which the end of the way is attached, a rope, and winding-drum, substantially as described.

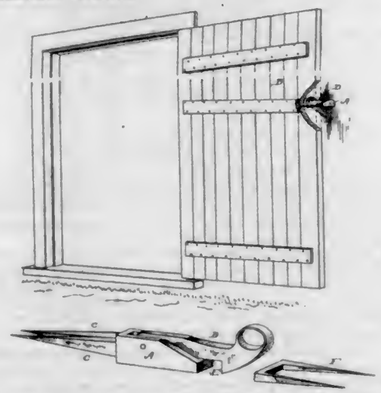
18. In a store-service system, a center plate at the cashier's desk, flat or horizontal throughout, and provided with a series of tightening-bolts, substantially as described.



19. In a store-service system, a center plate at the cashier's desk, flat or horizontal throughout, and provided with a series of tightening-bolts adjustable in the grooves of said plate, substantially as described.

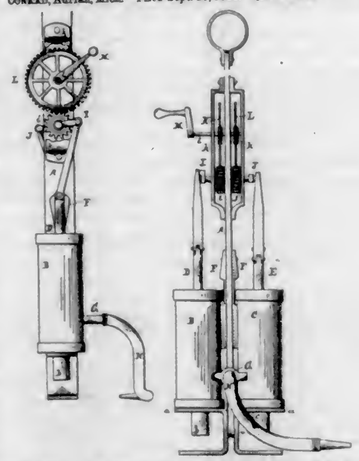
293,950. HARNESS. JOSEPH T. CLARKSON, Amesbury, Mass. Filed July 18, 1883. (No model.)

Claim.—1. The combination, with a shaft-lug, of the elastic connection shown and described, and the limit or safety strap, all substantially as set forth.



2. The combination, with the shaft-support A, provided with a suitable attaching-buckle, of the elastic connection, all substantially as shown and described.

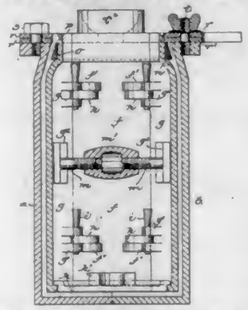
293,950.



3. The combination, with a shaft-lug, of the spiral springs D D, limit-strap B, and buckle C, all substantially as and for the purpose described.

293,951. DOOR-CHECK. JAMES CLELAND, Wales Centre, N. Y. Filed Dec. 3, 1883. (No model.)

Claim.—As an improvement in door-checks, the combination, with the door provided with a staple, F, projecting from its outer face, of a stirrup or box, A, secured by prongs C to the building, adjacent to the door, a latch or lever, D, pivoted within the stirrup or box and rounded at its rear end, and a spring secured to the box and projecting over so as to bear upon the latch or lever, the front end of the box being cut away, as at *e*, to allow the latch or lever to rest in a horizontal position upon the same, as set forth.



293,952. PUMP FOR FIRE-EXTINGUISHERS, &c. CHRISTOPHER F. CONRAD, Adrian, Mich. Filed Sept. 10, 1883. (No model.)

Claim.—The combination of the two cylinders B C, having the outflow-pipe G, connected with their sides, the frame A, the arms F, connecting the cylinders to the frame, the frame or housing *k*, attached to the said frame, the two crank-shafts I and J, journaled in the frame or housing, and provided, respectively, with the pinions *i* and *j*, the hand-

crank shaft *l*, journaled in the frame or housing and provided with two driving cog-wheels, K L, engaging, respectively, with the pinions, and the piston-rods D and E, connected, respectively, with the crank-shafts, substantially as shown and described.

293,953. MOLD. JOHN T. COFFINBERRY, Boston, Mass., assignor of one-half to Edward H. Stadley, same place. Filed Nov. 1, 1883. (No model.)

Claim.—1. The outer mold and the separable core, consisting of independent side pieces and means to fasten them together, they having, when thus fastened, an opening at their ends, combined with the removable bottom piece made in separable parts for closing the said opening, substantially as described.

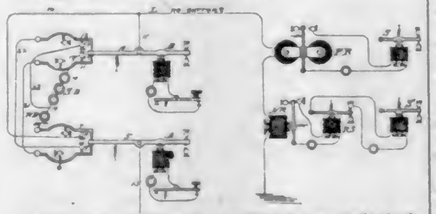
2. A separable core composed of side pieces, *f f* and *g g*, the latter capable of being drawn together or contracted, and thereby disengaged from the former, combined with fastening-links *h*, for holding the said part together in expanded position, and the independent threaded bottom or end piece, adapted to screw in a threaded opening at the end of the side pieces when fastened together, substantially as described.

3. A separable core composed of side pieces, *f f* and *g g*, the latter provided with sockets g^3, combined with the bolts *w* and nut *w'*, whereby the side pieces *g g* are withdrawn from the others, thus separating the core and permitting its parts to be removed from the casting, substantially as described.

4. The outer mold and the separable core, provided with a shoulder to receive the ring *o*, combined with the core-suspending device mounted in the outer mold, substantially as described.

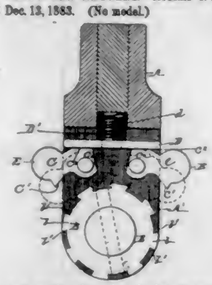
5. The core and the separable outer mold, combined with the core-supporting device *r r'*, hinged upon the outer mold, and adapted to engage and hold the core, the core-supporting device being provided with a pouring-cup and passage, substantially as described.

293,954. WHIP MOUNT OR BUTTON. WOLCOTT C. DANIELS, Westfield, Mass. Filed Apr. 6, 1883. Renewed Jan. 3, 1884. (No model.)



Claim.—A whip-mounting consisting of a metallic ferrule and an independent ring of rigid material mounted centrally thereon, and held in place by annular beads on either side of it, all substantially as set forth.

293,955. COMPOUND FOR PRESERVING WOOD. HERBERT C. DORR, San Francisco, Cal. Filed June 30, 1883. (No specimens.)



Claim.—The herein-described compound for preserving wood, the same consisting of the oil of tar, fifty gallons; sulphur, twenty-five pounds; and paraffine, twenty-five pounds, as specified.

293,956. QUADRUPLEX TELEGRAPH. BETTE K. J. ELIA, Washington, D. C. Filed Mar. 5, 1883. (No model.)

Claim.—The combination, substantially as before set forth, of a single main line, two unequal sections of battery normally both out of circuit, and two continuity-preserving keys or transmitters, one of which is directly and permanently connected to ground, and both being otherwise connected up, substantially as described, whereby if the electro-motive force of the weaker section of battery be represented by 1 and that of the stronger section by 3 the separate closure of one key will cause the flow of a current of strength 1 of a determinate—say positive—polarity, the separate closure of the other key one of strength 4 of negative polarity, and the closure of both keys one of strength 4 of positive polarity.

293,957. PAWL AND RATCHET. ROBERT C. ELLREN, Plantsville, Conn. Filed Dec. 13, 1883. (No model.)

Claim.—1. In a pawl-and-ratchet device, a pawl, C, having three flat faces, one of which comes against the ratchet, and one of the others is borne upon to hold the pawl in engagement, and the other to be borne upon to hold the pawl out of engagement, with the ratchet, as set forth.

2. The combination, with the ratchet, and either pawl having a means for engaging the ratchet and two flat faces, of a bar, as D, adapted to bear upon one of the faces to hold the pawl against the ratchet, and upon the other face to hold it away from the ratchet, as set forth.

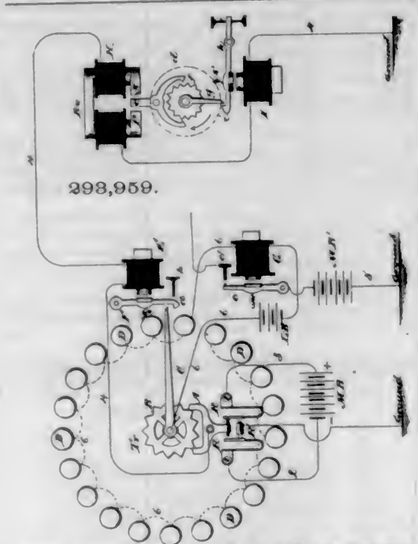
3. The combination of a ratchet-wheel, B, having teeth *b*, both sides of which are adapted to be engaged by the pawls, with two pawls, each of which has two flat faces, and means for throwing them into or out of engagement with the ratchet, separately or together, and a bar, D, having a spring, *d*, behind it, for holding the pawls in any position in which they are placed, by bearing on one or the other of the flat faces, as herein set forth.

4. In a pawl-and-ratchet device, the combination, with the ratchet and means for holding the pawl in or out of engagement therewith, of a pawl having two flat faces meeting each other at an angle, upon which the means for holding the pawl bears alternately, to keep the pawl in the position in which it is set, substantially as shown and described.

293,958. EAR-RING. MORRIS FALKENAU, New York, N. Y., assignor to Falkenau, Oppenheimer & Co., same place. Filed Oct. 25, 1883. (No model.)

Claim.—1. An ear-ring the ear-wire of which has an elongated slot at its upper front part and a transverse bridge that extends across the slot of the ear-wire, substantially as set forth.

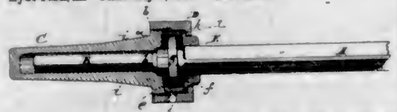
2. The combination of an ear-wire having a front part with an elongated slot and a transverse bridge extending across the slotted part, with a setting suspended by an eye from the bridge of the ear-wire, substantially as set forth.



293,959. UNISON MECHANISM FOR PRINTING-TELEGRAPHS. STEPHEN D. FIELD, New York, N. Y. Filed Jan. 14, 1884. (No model.)

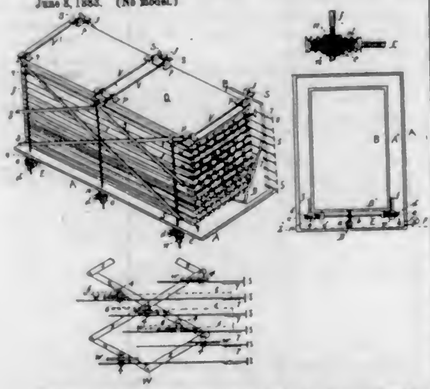
Claim.—1. In a printing-telegraph, the combination, with a receiver, a unison mechanism therefor, and means for controlling said mechanism by a prolongation of current, of a transmitter and means for automatically halting the same at definite intervals to prolong the pulsations or impulses upon the line, substantially as and for the purposes hereinbefore set forth.

2. In a printing-telegraph, the combination, with the transmitter and escapement or type-wheel circuit, of a magnet at the transmitter and a magnet at the receiver, both adjusted to respond only to prolonged pulsations, and controlling the unison mechanism by their conjoint action, substantially as set forth.



3. In a printing-telegraph system, the combination of a main battery, a transmitter adapted to send short or normal pulsations therefrom through the type-wheel or escapement-circuit, and means for halting or stopping the transmitter at definite intervals to transmit an abnormal or prolonged pulsation, substantially as set forth.

4. In a printing-telegraph system, the combination of one main line automatically controlled by the transmitter, and controlling in turn the printing mechanism, a second main line controlling the escapement or type-wheel mechanism, and independent magnets in the latter, adapted to arrest both the transmitting and receiving mechanism at definite intervals, and to release both upon a prolonged or abnormal current, substantially as set forth.

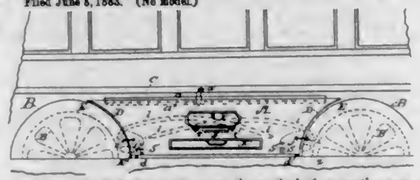


293,959.

293,960. AXLE-ATTACHING DEVICE. ALBERT FONTAINE, Chicago Ill., assignor to himself, ISAAC PFAUM, same place, and JOHN S. WILLIAMS, Hyde Park, Ill. Filed May 4, 1883. (No model.)

Claim.—The combination of the spindle B and collar *g* with the box C, having one or more notches, *c*, the cap E, having one or more projections, *d*, and the screw-coupling D, having the flange *k*, all constructed and operating substantially as described.

293,961. LUMBER-DRIER. DAVID GOODWILLIE, Oak Park, Ill. Filed June 8, 1883. (No model.)



Claim.—1. In lumber-driers wherein the lumber is treated under a following pressure, the drying-chamber B, inclosed within the exterior case, A, to form an outer chamber, A', and having an opening, *g*, at the rear end of the bottom thereof communicating with the chamber A', beneath the bottom of chamber B, in combination with the furnace H, having the superheating steam-chamber L above, also with the suction-fan F, placed at the front of chamber A' and below the chamber B, for treating lumber with superheated steam and hot air, as specified.

2. In lumber-driers which hold the lumber under a following pressure, the mechanism to attain such pressure, consisting of the central horizontal shaft, D, provided with worm-gear *a a a*, the shafts E, provided with gear *b b b*, worm-gear *d d d*, the nut-gear *e* on the rods *f*, levers *s*, rods *v*, pulleys T, and weighted ropes R U, in combination with the chamber B and follower Q, the latter being elevated and depressed, as specified.

3. The combination of a series of shelves, *w*, hung to adjusting devices W W, which are composed of levers 2, jointed, so that the entire length of the devices shall be shortened by the shrinkage of the lumber proportionately as one board will shrink, as specified.

4. The combination of the shelves *w*, hung to the levers 2 by pivoted straps 4, with the ratchet-rods 5 7, which are also pivoted to the straps, so that the shelves may be swung to the front and elevated, as and for the purpose specified.

293,962. STREET-CAR HEATER. JAMES F. GYLES, Chicago, Ill. Filed June 8, 1883. (No model.)

Claim.—1. In heating street-cars, the method of supporting combustion without the intervention of the usual chimney or smoke-pipe, which consists in utilizing the currents caused by the rotating car-wheels to supply air to the car-heater and to withdraw the smoke from said heater, substantially as herein explained.

2. In combination with the wheels and wheel-caps of a street-car, a car-heater provided with suitably-controlled induction and eduction end ports connecting with said caps, substantially as and for the purpose set forth.

3. In combination with the wheels and apertured semicircular wheel-caps of a street-car, a car-heater provided with concaved ends, carrying suitably-controlled inlet and outlet ports, and connecting with said caps, substantially as and for the purpose set forth.

4. In combination with the wheels and wheel-caps of a street-car, a heater-body or combustion-chamber provided with the vertical bars S and means for controlling the interstices formed thereby, separable end pieces, D, provided with controllable inlet and outlet ports, and suitable means for locking the combustion-chamber and end pieces together, substantially as herein set forth.

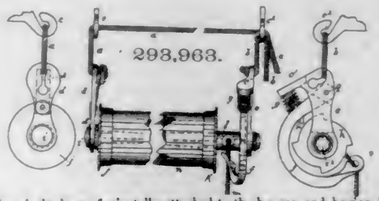
5. In a car-heater, the combustion-chamber, combined with the separable end pieces, D, provided with suitably-controlled inlet and outlet ports, and means whereby the combustion-chamber and end pieces are secured together, substantially as set forth.

6. In a car-heater, the combustion-chamber, combined with the separable end pieces, D D, having inlet and outlet ports, ledges G G, and legs *d d*, substantially as herein set forth.

7. In a car-heater, the combustion-chamber provided with concaved end walls, combined with the separable convexed end pieces, having suitably-controlled inlet and outlet ports, and means whereby the combustion-chamber and end pieces are secured together, substantially as herein set forth.

8. In a car-heater, the combustion-chamber provided with the vertical bars S and means for controlling the interstices formed thereby, combined with the end pieces, D, provided with suitably-controlled inlet and outlet ports, substantially as and for the purpose set forth.

9. In a car-heater, the combustion-chamber provided with the vertical bars S and slide-bars S', combined with the end pieces, D, having inlet and outlet ports E E', dampers *e e'*, and supporting-ledges G, substantially as herein set forth.



10. In a car-heater, the combustion-chamber provided with the vertical bars S, means for controlling the interstices formed thereby, and the diagonal tubes *l l*, combined with the end pieces, D, having suitably-controlled inlet and outlet ports, substantially as set forth.

11. In a car-heater, the combustion-chamber provided at its top with the open water-receptacle *a*, combined with means whereby the water may be gently sprinkled on the fire, substantially as and for the purpose set forth.

12. In a car-heater, the combustion-chamber provided with the water-receptacle *a*, combined with the valved tube *a'* and the perforated distributer *a''*, substantially as and for the purpose set forth.

293,963. CURTAIN-FIXTURE. MILTON B. HILL, Springfield, Mass., assignor of one-half to George W. D. Upton, same place. Filed July 1, 1882. (No model.)

Claim.—1. In a curtain-fixture, the hanger *c*, formed with the pro-

jection *c'*, the lever *f*, pivotally attached to the hanger, and having its free end projecting to carry the cord from a straight line, and provided with a pawl, *r*, spring *g*, ratchet-disk *h*, cylindrical portion *l*, arranged between the end of the roller and the ratchet-disk, a roller having a suitable hanger at its free end, and a cord passed through the free end of the lever and secured to the cylindrical portion, all constructed and arranged substantially as and for the purpose set forth.

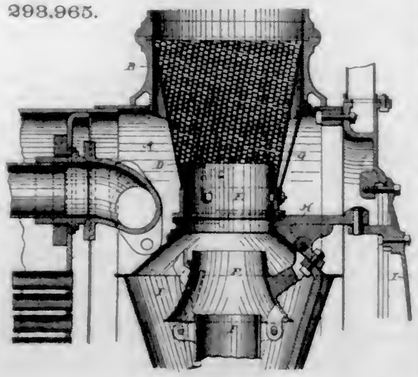
2. In a drop-curtain, the combination of two roller suspension cords, *a b*, a guide-bracket formed with projecting walls for the cords, and a lever having one arm centrally disposed between the walls of the bracket, substantially as and for the purpose set forth.

3. A suspension-roller curtain having an end bar bearing-plate or hanger, provided with a cord-retaining spring and an aperture for the reception of the cord, as and for the purpose stated.

4. In a curtain-fixture, the combination of a suspended roller-curtain hanger, a projecting journal-bearing, and a friction washer or ring attached to the journal of the roller between the hanger and the head of the journal, substantially as and for the purpose set forth.

5. The combination of the hanger *c*, formed or provided with projection *c'*, the ratchet-disk *h*, fixed to the journal-bar of the curtain-roller, the lever *f*, pivoted to the bracket, and formed or provided with a pawl adapted to engage with the ratchet-disk, and the spring *g*, substantially as and for the purpose set forth.

6. The bracket formed with the upward-projecting walls *z z*, in combination with a lever pivotally attached thereto, and having the upper arm projected inward and centrally disposed between said walls, and the lower arm provided with a perforation, substantially as and for the purpose set forth.



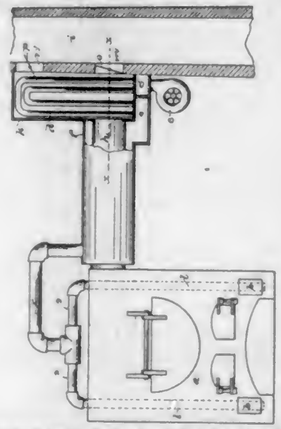
7. The bracket formed with upward-projecting walls *z z*, and a lever pivotally attached thereto, having the upper arm projected inward and centrally disposed between said walls, in combination with a spring adapted to sustain said lever in position, substantially as and for the purpose set forth.

293,964. CUTTING BOOT AND SHOE UPPERS. WILLIAM P. HOBSON and HIRAM A. RAGLEY, Haverhill, Mass., assignors of one-half to John L. Hobson and Fred B. Kingsbury, both of same place. Filed Apr. 14, 1883. (No model.)

Claim.—The within-described improvement in cutting uppers, consisting in dividing a piece of stock of suitable size for two portions upon an irregular line, *i j*, substantially as described, into two like sections each, thereby constructing without further shaping a portion of the upper.

293,965.

293,965. SPARK-ARRESTER. GEORGE D. HUNTER, Terre Haute, assignor of two-thirds to Morton C. Hunter and Thomas C. Van Nuys, Bloomington, Ind. Filed Dec. 11, 1883. (No model.)



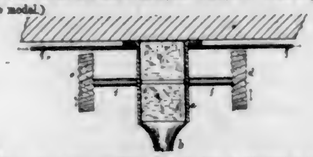
Claim.—1. In a spark-arrester, the screen for dividing the smoke from the more solid particles of combustion, in combination with the tubular section and the braces secured thereto and extending into apertures formed in the saddle.

2. In a spark-arrester, the conical screen for dividing the smoke from the more solid particles of combustion, having its upper end fitted against the inner wall of the stack or saddle, in combination with the tubular section fitted to its base and the braces secured to said section and extending into apertures formed in the saddle.

3. In a spark-arrester, the combination, with the tubular section having an angular shoulder, of the conical drum fitted thereon at its lower end and against the inner wall of the stack or saddle at its upper end, and the braces secured to the tubular section and extending into apertures formed in the stack.

4. In a spark-arrester, the tubular section of the exhaust-confining tube, in combination with a series of braces secured thereto and extending into apertures formed in the stack-saddle.

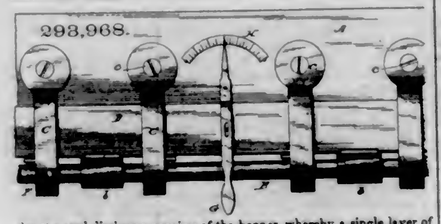
293,966. FURNACE. KINGSBURY M. JARVIS, Malden, assignor to the Jarvis Engineering Company, Boston, Mass. Filed May 22, 1883. (No model.)



Claim.—1. A furnace having the air-ducts *l*, the flue *h*, leading to the smoke-stack, and the air-circulating pipes *d*, interposed between the flue *h* and smoke-stack, and connected with the ducts *l*, combined with an air-forcing apparatus for said pipes *d*, substantially as shown and described.

2. A furnace having the heated-air ducts *l*, the flue *h*, to lead the products of combustion to the chimney or stack, the jacket *f* therefor, connected with the ducts *l*, combined with an air-forcing apparatus, substantially as described.

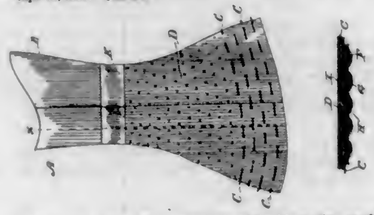
3. A furnace having the heated-air ducts *l*, flue *h* for the products of combustion, the air-circulating pipes *d*, interposed between the flue *h* and smoke-stack or chimney, and an air-forcing apparatus therefor, combined with the jacket *f*, chamber *k*, and dampers *o* and *p*, all substantially as shown and described.



293,967. CAR-VENTILATOR. OWEN H. JONES, Hartford, Conn., assignor of one-half to Frank C. Smith, New York, N.Y. Filed May 14, 1883. (No model.)

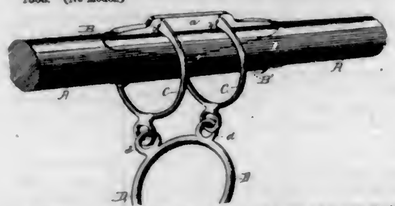
Claim.—As a car-ventilator, the air-box *a*, adapted to be secured to a car, in combination with tubes *g*, adapted to connect the interior of the car with the interior of the air-box, and the shaft *f*, having fan *e* and two wind-wheels, *d s*, all constructed and operating substantially as shown.

293,968. FEED-ROLLER FOR GRASS-SOWERS. JOHN F. KELLER, Martinsburg, W. Va. Filed Sept. 11, 1883. (No model.)



Claim.—1. The described overshot feed-roller, working directly un-

der the seed-discharge opening of the hopper, whereby a single layer of seed is delivered from the hopper without any sliding or rubbing friction and wear upon said roller or upon the seed, substantially as set forth.

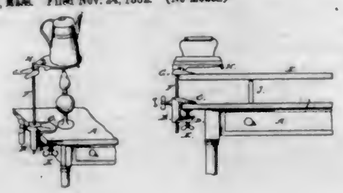


2. In combination with the overshot feed-roller, the adjustable slide having notches on the under side to regulate the amount of seed discharged at each feed-opening, substantially as and for the purposes specified.

293,969. CORSET. ELMER LEONARD, Bridgeport, assignor to L. Harvey Loomer and Andrew F. Loomer, both of Birmingham, Conn. Filed Sept. 28, 1883. (Model.)

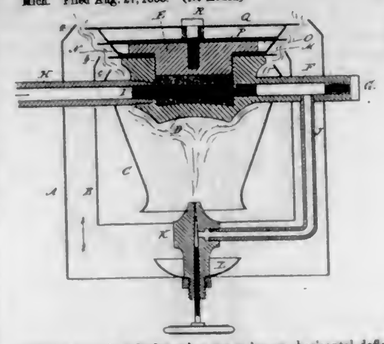
Claim.—In a corset, the central ply of the bip-section, perforated and corded transversely, as described, and secured within the outside and inside plies by stitches extending vertically, whereby vertical pockets are formed between the rows of stitches for the insertion of the bones, substantially as shown and set forth.

293,970. NECK-YOKE. JOHN JAMES LOONEY, Hazel Green, Wis., assignor of one-fourth to William H. Lightcap, same place. Filed July 14, 1883. (No model.)



Claim.—1. The combination, with a neck-yoke, of a pair of rings encircling the same, and secured thereto by means preventing said rings from turning upon the neck-yoke or moving in any direction but a lateral one, substantially as and for the purpose set forth.

2. The combination, with the neck-yoke and its rings, notched as set forth, of a metallic strip secured upon the top of the neck-yoke, and provided with notches fitting over those in the rings, substantially as and for the purpose set forth.



3. The combination, with the neck-yoke and its rings, provided with eyes or loops, as set forth, of a tongue-ring having eyes or loops interlocking with those of the neck-yoke rings, substantially as and for the purpose set forth.

293,971. LAUNDRY JACK OR BRACKET. FRANCIS LYFORD, Boston, Mass. Filed Nov. 24, 1882. (No model.)

Claim.—In a laundry-bracket, the combination of the clamp B, having projecting lips C and D and set-screws E and I, with the adjustable vertical rod F, formed to slide within bracket B, and the perforated bracket H, having projecting feet, and pivoted on the upper end of rod F by means of a recess in its angular end, said bracket forming a support for a sad-iron above the table, or a tea-pot over a lamp, substantially as shown and specified.

293,972. HYDROCARBON-BURNER. BRUNO MARTIN, East Saginaw, Mich. Filed Aug. 27, 1883. (No model.)

Claim.—1. In a hydrocarbon-vapor burner, horizontal deflectors overlapping each other in vertical series, in combination with shells and cup, substantially as and for the purposes described.

2. The combination, with a burner, of a cup provided with supply and exit pipes, a perforated pipe passing through said cup, connecting such supply and exit pipes, and refractory material around said perforated pipe, substantially as set forth.

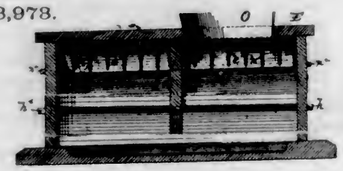
3. In a hydrocarbon-burner, horizontal deflectors in vertical series, with inclined deflectors interposed between them, in combination with a vaporizing-cup, substantially as and for the purposes described.

4. In a hydrocarbon-burner, a vaporizing-cup provided with suitable inlet and outlet pipes and a plug secured therein, performing the double function of forming a cover for the cup and holding the plates M and N between the projecting flange of said plug and top of the cup, substantially as specified.

5. In a hydrocarbon-burner, the combination of a vertical series of horizontal deflectors with vertical annular ducts, forming air-passages to the flame in its passage around said deflectors, substantially as described.

6. In a hydrocarbon-burner, a vaporizing-cup formed with a concave bottom and sides, in combination with an inclosing-shell, substantially as and for the purposes specified.

7. In a hydrocarbon-burner, and as a means for producing an undulating or tortuous flame, the combination of the horizontal deflectors, in vertical series, with the deflecting-flanges of the inclosing-shells, forming the air-ducts, substantially as set forth.



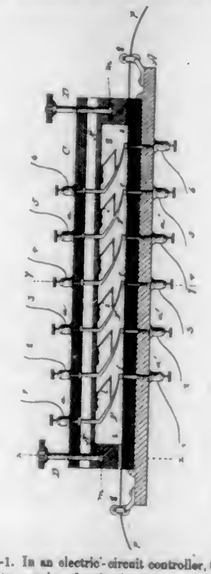
8. The combination, with a vaporizing-cup and hydrocarbon-burner, of the inner conical shell or ring-duct provided with a deflecting-flange, for the purpose of guiding and deflecting the flame against the bottom and side walls of such cup, substantially as described.

9. In a hydrocarbon-burner, a vaporizing-chamber filled with granulated refractory material, such chamber being arranged centrally over the burner, and communicating therewith by a pipe, and adapted to receive the hydrocarbon from any suitable source, substantially as specified.

10. In a hydrocarbon-burner, a series of annular air-ducts of graduated size, concentrically surrounding the burner, and each provided at top with an inwardly-projecting deflecting-flange, for the purpose of supplying oxygen at succeeding intervals to a flame, substantially as set forth.

11. A hydrocarbon-burner consisting of the shells A B C, with their flanges *a b c*, vaporizing-cup D, plug E, pipes F H I J, burner K, rings M N, and plates O P Q, the parts being constructed, arranged, and operating substantially as and for the purposes described.

293,973.

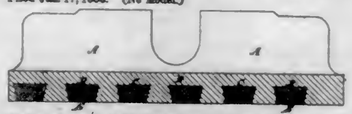


293,973. STOVE. CHRISTOPHER MATTER, Delhi, N. Y. Filed May 25, 1883. (No model.)

Claim.—In a stove, the top E, provided with a series of solid teeth, *e*, cast integral therewith, whereby the fuel is prevented from getting into the draft-passages, as set forth.

293,974. MULTIPLE CIRCUIT-CONTROLLER. WILLIAM FITZ CHARLES MASON MCCARTY, Moscow, Russia, assignor to JAMES F. PIERCE, Trustee, New York, N. Y. Filed Nov. 9, 1883. (No model.)

Brief.—Each perforation passes successively beneath each set of contacts, thereby sending the same signal to a multiplicity of main lines successively. The perforated strip has several series of perforations, so that each line of perforations may be adjusted to pass beneath the contacts.



Claim.—1. In an electric-circuit controller, the combination of a series of contacts, a series of main circuits therefor, a fillet or band perforated with a series of perforations, each forming a distinct and separate message, and means for guiding any desired line of perforations over and through the series of contacts, substantially as set forth.

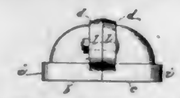
2. In an electric-circuit controller adapted to be controlled by a perforated paper fillet or band, the combination of the guide or interior casing, and means for adjusting said guide or casing, so that any desired line of perforations in said fillet or band may be passed through or between the contacts of the circuit-controller, substantially as set forth.

3. In an electric-circuit controller or transmitter, the combination, with a base, of a casing mounted thereon, a second or interior casing, and means of adjustment thereof relatively to the exterior casing, so that the proper or desired line of perforations may be guided over the series of contacts, substantially as set forth.

4. In an electric-circuit controller or transmitter, a series of contact-controlling devices, a guide for the perforated fillet controlling said devices, and means for adjustment of said guide, so that any desired line of perforations may be passed under the contact-controlling devices, substantially as set forth.

293,975. SLIDE-VALVE. EDWIN PEAR MONROE, New York, N. Y. Filed Jan. 17, 1883. (No model.)

Claim.—1. In a slide-valve, the combination of a cast-iron body, a face-plate of gun metal or analogous alloy, and plugs or blocks of anti-friction metal inserted and held in mortises or pockets in the face-plate, substantially as described.



2. A slide-valve having an iron body provided with a dovetail tenon, and a gun-metal or composition face-plate provided with a corresponding mortise, the body and face-plate being united by said tenon and mortise, substantially as described.

3. In a slide-valve, a face-plate of gun metal or analogous alloy, containing pockets of dovetail cross-section filled with Babbitt or other anti-friction metal, substantially as described.

4. In a slide-valve, and in the face-plate thereof, pockets containing Babbitt or other anti-friction metal, each pocket having two of its parallel outer edges placed at an acute angle to the longitudinal axis of the valve-face, substantially as described.

5. The method herein set forth of attaching Babbitt-metal plugs to and in the gun-metal face-plate of a slide-valve, consisting in forming said face-plate with pockets of dovetail cross-section larger at the base than at the orifice, tinning the interior of said pockets and filling the same with melted Babbitt metal, substantially as described.

293,976. PIPE-RETURN. ROBERT H. D. MORRISON, Winona, Minn., assignor of one-half to M. TOYE, same place. Filed May 19, 1883. (No model.)

Claim.—The pipe-elbow consisting of the sections *b* and *c*, cast with arched perforations, and flanges *d d* around the mouths of said sections, forming the adjacent faces of the sections, and perforated lugs for the fastening-bolts, and with base-flanges *i*, extending to the adjacent face-flanges and joining the same in angular form, the angles being solidly filled by the metal of the sections, all substantially as specified.

293,977. MANUFACTURE OF ARTICLES FROM GLASS. CHAS. T. MORTIN, Pittsburg, Pa., assignor to JOSEPH K. BROWN, Canton, Ohio. Filed Oct. 22, 1883. (No model.)

Claim.—1. The herein-described process of manufacturing glass seed-cups and water-holders for bird-cages, it consisting in first forming, by means of a press, a blank having the lower or receptacle portion proper formed with walls entirely around the vessel, and having an upwardly-projecting plate, and then, before the glass leaves the mold, bending said upwardly-projecting plate down to and upon the upper edges of the wall of the receptacle portion, substantially as set forth.

2. The herein-described seed-receptacle or water-holder for bird-cages, it having the lower or receptacle portion formed with the walls entirely around and integrally with each other, and with the top formed integrally with one of the walls and secured to the tops of the others by welding after being bent into proximity to them, substantially as set forth.

3. A seed-holder or water-receptacle for bird-cages, having the front slotted wall, A, the side walls, D D, whose upper edges incline downwardly and backwardly, the rear wall, B, formed integrally with the side walls, D D, and formed also with the upwardly-projecting extension E, which can be bent downward into the proximity to the upper edge of the side walls, D, and the front wall, substantially as set forth.

293,978. BUCKLE. JAMES A. PARK, Lansing, Mich., assignor of one-half to PHELLA E. PARK, same place. Filed Oct. 16, 1882. (No model.)

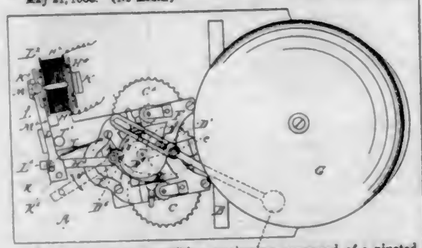
Claim.—1. A buckle consisting of a frame having curved sides *a a*, cross-bars D D, arranged, respectively, at the ends of the sides *a a*, downwardly-turned end loops, and a cross-bar, B, arranged centrally between the bars D D upon the curved sides, and provided with a pivoted tongue, substantially as set forth.

2. A buckle consisting of a frame having curved sides *a a*, cross-bars D D, arranged, respectively, at the ends of the sides *a a*, downwardly-turned end loops, E E, a cross-bar and pivoted tongue, and a rigid stud, substantially as set forth.

293,979. TELEGRAPH-KEY. CHAS. PLUMB, Buffalo, N. Y., assignor of one-half to O. P. BABCOCK, same place. Filed Feb. 18, 1881. Renewed Jan. 14, 1884. (Model.)

Claim.—1. A telegraph transmitting-key carrying a loosely-revolving contact-wheel, M, in combination with an anvil consisting of a loosely-suspended contact-wheel, N, with its axis parallel to that of the wheel M substantially as described.

293,979.



2. A telegraph-key provided with the wheel-hammer M, arranged in the shank, in combination with an easily-movable anvil-wheel, N, arranged in the same plane therewith, their axes being parallel, as and for the purposes described.

3. The combination of the anvil N, its supporting-base C', hard-rubber non-conducting base A, and an intermediate sheet of soft rubber or other soft material, *f*, for the purposes described.

4. A telegraphic key-lever supported on a shaft, D, and pivoted to the frame C, in combination with the spring J, contact-wheel hammer M, set-screws H, jam-nut L, and anvil N, the said anvil N being arranged to operate in the same plane with the wheel M, for the purposes described.

5. In a telegraph transmitting-key, a switch, O, and frame C, provided with a downwardly-projecting pin, R, adapted to pass through a hole in the switch, substantially as shown, in combination with a base, A, to which it is attached, as and for the purposes specified.

293,980. ELECTRIC GONG. JEROME REDDIE, Malden, Mass. Filed May 21, 1883. (No model.)

Claim.—1. A gong-striking mechanism composed of a pivoted hammer-lever having a longitudinal slot, a rotary crank or disk having a pin projecting into said slot, and thereby adapted during a rotation of the crank or disk to first retract and then throw forward the hammer, two driving-springs and intermediate gearing, substantially as described, to impel said disk or crank, and let-off mechanism, substantially as described, adapted to release the disk or crank and automatically arrest the same after it has operated the bell-hammer, as set forth.

2. In a gong-striking mechanism having as elements a motor composed of the two driving-springs and the gearing operated thereby, and electro-mechanical let-off mechanism adapted to alternately release and stop said motor, the combination, with said elements, of a pivoted hammer-lever having a longitudinal slot and a crank or disk impelled by said motor, and having a wrist-pin projecting into said slot, whereby when the motor is released the crank or disk is caused to alternately retract and throw forward the hammer, as set forth.

3. The combination of a slotted hammer-lever, the motor, the disk D^4, impelled by said motor, and provided with the pin D^5, projecting into the slot of the hammer-lever, and with the stop-pin D^6, the pivoted lever H H', having at one end the catch or shoulder adapted to arrest the pin D^6, and the curved end adapted to be acted on by said pin when the disk is in motion, and at the other end the pin L^2 and the lever L, having the pins R R', and controlled by an electro-magnet, as set forth.

4. The combination of the disk D^4, pin D^5, lever H H', and lever L with the polarized armature L' L^2, permanent magnet K K', and electro-magnets H^2 H^3, substantially as described, and for the purpose set forth.

5. A gong-striking mechanism composed of a pivoted hammer-lever, two driving-springs, intermediate mechanism, substantially such as described, and a let-off mechanism, all arranged in combination, substantially as stated.

293,981. WIRE-CLOTH SCENERY. FERDINAND W. ROEBLING and WILLIAM OER, Jr., Trenton, N. J., assignors to the New Jersey Wire Cloth Company, same place. Filed Nov. 3, 1883. (No model.)

Claim.—1. The process herein described of rendering stage-scenery incombustible or fire-proof, consisting in coating wire-cloth with a cement composed of asbestus or clay, one or both, combined with a suitable vehicle or vehicles therefor, as described, by subjecting said cloth and a body of said cement together to frictional drawing or rolling pressure, whereby the fabric so produced is given a smooth and durable surface, suitable for the artist's brush or scenic decoration, substantially as set forth.

2. As a new article of manufacture, a flexible incombustible fabric, consisting of wire-cloth and a cement formed of the materials described, compressed into the meshes of said cloth, thoroughly closing and coating the same, so that the surface of the material thus formed is rendered uniformly even and smooth and capable of receiving colors laid on with a brush or printed for purposes of ornamentation or scenic effect, substantially as described and set forth.

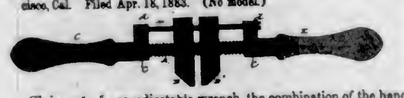
293,982. SHOE. WARNER ROGERS, Cincinnati, Ohio, assignor to the Warner Rogers Flexible Shoe Company, same place. Filed Apr. 5, 1883. (No model.)

Claim.—1. A shoe having the upper on the forward part of the shoe turned in and stitched upon the upper face of the sole, and the upper of the rear end of the shoe turned under and stitched upon the under side of the sole, in combination with the upper sole having midway between the ends, on both sides, slanting transverse slits, substantially as described.

2. In a shoe, the combination of a sole having a channel cut on its upper surface inside of and near its edge, providing a feather or leaf, with the upper having its front edge portion turned in and resting in and stitched in said channel, and having said feather or leaf turned down upon and pasted over the edge of the upper and line of stitching, substantially as described.

293,983. SEPARATOR. ALFRED W. ROPER, St. Louis, Mo. Filed June 5, 1882. (No model.)

Claim.—1. A screen-frame having a recess on its under side for the reception of the cloth, in combination with the cloth, a winding-rod, d^4, the ratchet d^4, and pawl e^3, as described, and for the purpose set forth.

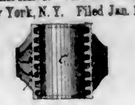


2. The combination of a screen-frame having stops *e*, and the disintegrating-frame E, suspended by links *e'*, the stops limiting the vibration of the disintegrating-frame, as set forth.

3. The combination of a vibrating screen, B, and an actuating-frame, C, loosely surrounding it, as set forth.

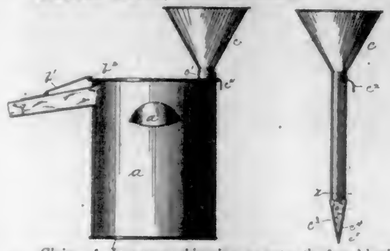
4. The combination of a vibrating screen, B, an actuating-frame, C, loosely surrounding it, and a spring, D, at the discharge end of the screen, as set forth.

5. The combination of the feeding-plunger F^2, the feed-hopper F, pitman *f*, pendulous lever *f''*, crank-disk F^4, and adjustable crank-pin f^5, as set forth.



293,984. ADJUSTABLE WRENCH. ALPHONSO B. SMITH, San Francisco, Cal. Filed Apr. 18, 1883. (No model.)

Claim.—1. In an adjustable wrench, the combination of the handle and double-screw-threaded shaft set in line with the handle, with the two jaws having oppositely-threaded apertures, and a means or device separate from the handle, by which the jaws are held in line as they are moved, as set forth.

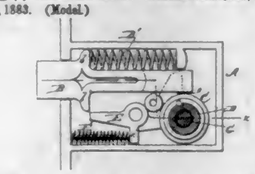


2. In an adjustable wrench, the combination of the double-screw-threaded shaft, jaws moving thereon, and means for operating said shaft, with the supports *d*, in which the screw-shaft is mounted, and the rod D, upon which the jaws ride, and by which they are held in place, as set forth.

293,985. FINGER-RING. CHRISTOPH STAIGER, Brooklyn, assignor to L. SAUTER & CO., New York, N. Y. Filed Jan. 17, 1884. (No model.)

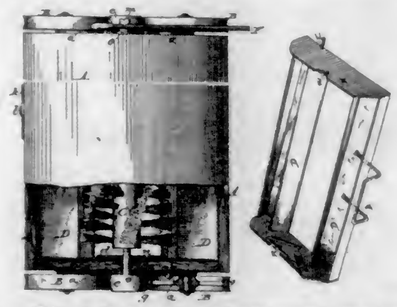
Claim.—As an improvement in finger-rings, the combination of the enlarged frame or setting having solid end walls and side cramps with a stone having straight ends and slightly-beveled sides, substantially as set forth.

293,986. CREAM-SKIMMING APPARATUS. DAVID STOVER, La Motte, Iowa. Filed July 27, 1883. (No model.)



Claim.—1. In a cream-skimming apparatus, the funnel having extended tube, the lower end of which is brought to a point or cutting-edge, and provided with side openings near its said end, substantially as set forth.

2. In a cream-skimming apparatus, the combination of the tube c', having its lower end cut away on opposite sides, forming the V or wedge shaped extension c, and the plate c^4, secured on said end, substantially as described, whereby the side openings, c^3, are provided, substantially as and for the purposes specified.



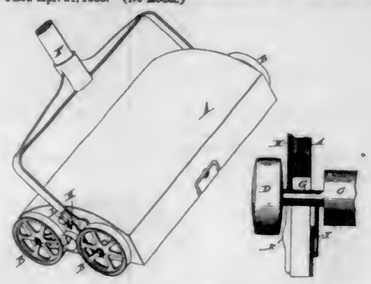
3. As an improved article of manufacture, the funnel c, provided with hook c^5, and having its lower end formed with plates c^3, and provided with plate c^4, all arranged and operating substantially as set forth.

293,987. LOCKING-LATCH. HENNING SUNDQUIST, Chicago, Ill. Filed Mar. 5, 1883. (Model.)

Claim.—In a locking-latch, the combination, with a latch formed with a lug upon one side and a hollow spindle or knob shank having a transverse slot formed in it, of a revolving slotted shaft within the hollow spindle, and a lever adapted to lock the latch by the turning of said shaft, substantially as and for the purpose set forth.

293,988. CARPET-SWEEPER. CHARLES L. TRAVIS, Minneapolis, Minn., assignor to the Wilton Manufacturing Company, same place. Filed Sept. 24, 1882. (No model.)

Claim.—1. In a carpet-sweeper, the combination of a case or body, a rotary brush therein, and a hinged dust-receiver constructed, substantially as described, to retain the brush in position within the body.



2. In combination with the case or body, the rotary brush having its journals seated in bearings therein, and the dust-receiver provided with spring arms or supports beneath the journals of the brush.

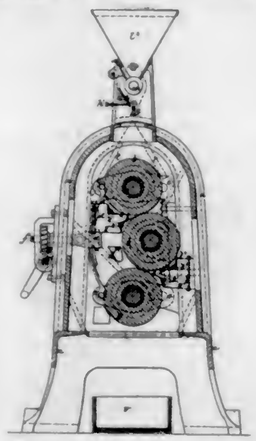
3. In a carpet-sweeper, the combination of the rotary brush and the case or body provided with the movable dust-receiver, having spring-supports to act upon the journals of the brush.

4. In combination with the slotted body and the removable rotary brush, the dust-receiver provided with notches to receive the journals of the brush and hold the latter in position to enter the slots of the body, as described and shown.

5. In a carpet-sweeper, the combination of the body provided with vertical slots, the removable rotary brush having journals to enter said slots, and a dust-pan removable from the under side of the body and arranged to bear against the journals of the brush, as described, whereby it is caused to retain the brush in position.

293,989. CARPET-SWEEPER. CHARLES LESLIE TRAVIS, Minneapolis, Minn., assignor to the Wilton Manufacturing Company, same place. Filed Apr. 21, 1883. (No model.)

Claim.—1. In a carpet-sweeper, the combination of the body provided with the vertical slots, the rotary brush having its journals mounted in said slots, and round sleeves or thimbles loosely encircling the journals within the slots, whereby the vertical adjustment of the brush is permitted and the winding of fibrous matters upon its journals prevented.



2. In combination with the vertically-slotted body, and the brush having pulleys D upon its ends, projections K on the ends of the body, substantially as described, to prevent the accidental escape of the brush.

3. In a carpet-sweeper, the body, and the handle F, having its arms pivoted to the body at one side of the middle, and having its handle thrown out of line with the arms, in the manner described and shown, in combination with the centrally-applied stops L upon the body, whereby the body is adapted to sustain the handle in an upright position when the machine stands upon the floor, and the handle caused to maintain the body in a horizontal position when inverted.

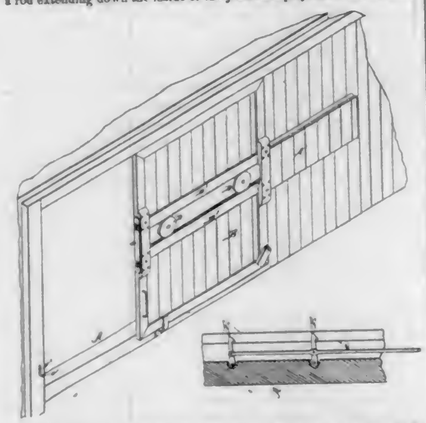
4. In a carpet-sweeper, the combination of the brush shaft or spindle, the wooden pulley applied thereto, a central metal pin, and the outer wooden pin.

5. The improved bearing-plate for a carpet-sweeper, having the central vertical slot, the projections K at its lower end, and the stop or projection L at its upper end, substantially as described.

293,990. ROLLER-MILL. EDWARD RUSH TURNER and FREDERICK TURNER, Ipswich, County of Suffolk, and JAMES HARRISON CARTER, London, England. Filed Aug. 9, 1883. (No model.) Patented in England June 28, 1879, No. 2,626.

Claim.—1. The combination of the adjustable rollers, the levers by which they are carried, and the springs by which the levers are coupled in pairs, substantially as and for the purpose hereinbefore set forth.

2. The combination of the frame, the adjustable rollers, the intermediate roller mounted in bearings of the frame, the levers carrying the adjustable rollers, and the springs acting upon the levers for drawing the adjustable rollers toward the intermediate roller, substantially as hereinbefore set forth.



3. The combination of the frame, the adjustable rollers, the intermediate roller mounted in fixed bearings, the springs, the spring-connected levers supporting the adjustable rollers, and adjusting mechanism acting upon said springs, substantially as and for the purpose hereinbefore set forth.

4. The combination of adjacent rollers one above the other, the pair of pivoted scrapers, also one above the other, and acting upon the respective rollers, the spring-arms of the scrapers, and their connecting screw-bolt, substantially as and for the purpose hereinbefore set forth.

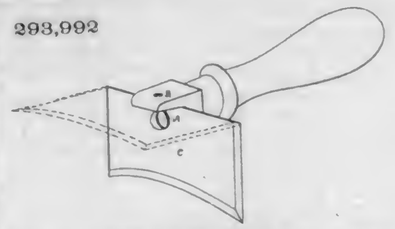
5. The combination of the hopper from which the material to be operated upon is supplied, the adjustable inclined board upon which the material falls as delivered from the hopper, and the angular or wedge-shaped bar, against which the material is directed by said adjustable board, as and for the purpose hereinbefore set forth.

293,991. SLIDING DOOR. WINFIELD S. VOORHIS and GEORGE H. HOUSER, Chicago, Ill. Filed July 26, 1883. (No model.)

Brief.—The door has rails across its longitudinal center which traverse grooved rollers on side of car-body, said rails moving in a protecting-housing when the door is opened. A slotted plate on edge of door is engaged by pivoted catches in door-jamb, said catches being operated by a rod extending down the inside of the jamb and projects outside thereof.

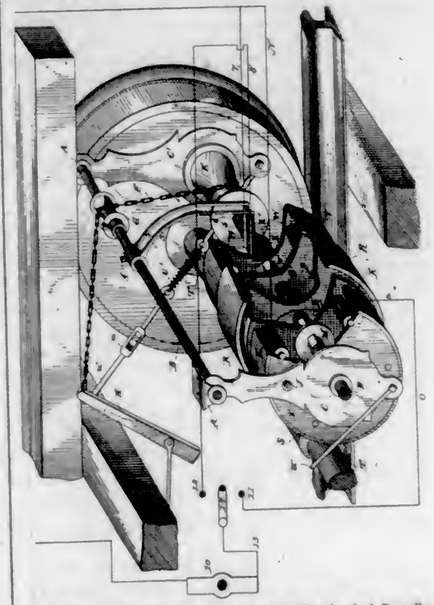
Claim.—1. A sliding door provided with tracks or bearings at its longitudinal center, in combination with two or more rollers journaled upon the frame of the car or building, whereby the door is equally balanced both above and below its hangers, substantially as and for the purpose set forth.

2. In a sliding door, a door having two bars provided with bearing-irons, extending across its longitudinal center and projecting in rear of the same, and covered in to exclude the weather, in combination with two or more grooved rollers journaled upon the side of the car or building and working between the bearing-irons, substantially as shown and described.



3. The combination, with the car or building A, provided with the plates C, having hollow studs C', and grooved rollers D, of the door B, having central bars, B', and bearing-strips b, closed or covered from the weather by boarding corresponding to those forming the side of the car, and extending somewhat in rear of the same, substantially as and for the purpose set forth.

4. In a car-door, the combination, with the door B, having a slotted plate, e, of the hinged or pivoted latches E, connected by a rod, e', extending through the side of the car, substantially as shown and described.

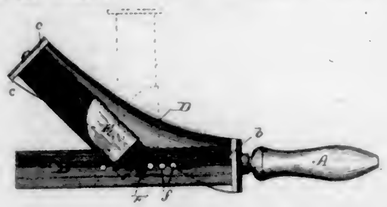


293,992. REVERSIBLE SCRAPER FOR SHIPS' SPARS. GEORGE WALL, Fall River, Mass. Filed June 9, 1883. (No model.)

Claim.—The combination, in a scraper, of a steel blade, C, having one concave edge, with the body B, which has two screw-holes to secure the blade in two positions, together with the handle, substantially as shown, and for the purpose specified.

293,992

293,993. ELECTRO-MAGNETIC CAR-BRAKE. JAS. E. WITHERS, Henderson, Ky., assignor to Robert A. Holloway, same place. Filed Nov. 21, 1883. (No model.)



Claim.—1. In an electro-magnetic car-brake, the shaft D, pulley R, disk L, the latter arranged to slide longitudinally on said shaft and to turn with it, the electro-magnet V W, its connections x x', fingers 5 6, and arm 3, the drum E, chain F, and brake-lever H, in combination with the rods U U', axle T, and friction-wheel S, substantially as and for the purpose set forth.

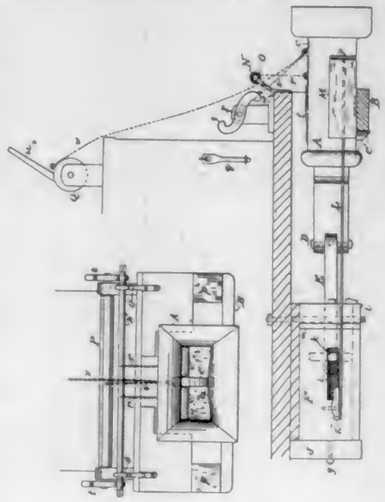
2. In an electro-magnetic car-brake, the pulley R, shaft D, magnet I K, armature-disk L, drum E, and chain F, in combination with the magnet V W, axle T, and pulley S, as set forth.

3. In an electro-magnetic car-brake, the shaft D, mounted in the swinging brackets C C', and provided with the rotating magnet V W, pulley R, and armature-disk L, in combination with the non-revolving magnet I K and friction-wheel S, as and for the purpose set forth.

293,994. RAZOR-STROP. PETER S. WOLD, Chicago, Ill. Filed Nov. 19, 1883. (No model.)

Claim.—1. In a razor-strop consisting of a belt of leather or other suitable material stretched upon a frame, a frame having two pieces of metal or other suitable substance, one of said pieces having a tongue or projection interlocking with a series of holes or depressions, or any one thereof, on the other of said pieces, all substantially as described, and for the purpose specified.

2. In a razor-strop consisting of a belt of leather or other suitable material stretched upon a frame, a frame composed of two parts, one of said parts consisting of handle A, cross-head *b*, and blade B, having holes *ff* therein, and the other of said parts consisting of blade C, having cross-heads *c*, fastened firmly at one end thereof, and tongue F, bent in suitable form at the other end thereof, with lip or projection E, bent or formed as here shown and described, in combination with the leather or other material D, attached to said parts or the cross-heads placed thereon, all substantially as described, and for the purpose specified.



293,995. CAR-COUPLING. FREDRICK M. WRIGHT, Fort Ridge, Mo. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a car-coupling, a draw-head connected with a draw-bar, E, with moving plate G, secured thereto, and connected with pivoted levers K, and the rods L, provided with buffing-plates *p*, the parts being properly supported, substantially as and for the purposes described.

2. In combination with a draw-head having a draw-bar, E, coupled thereto, a box, F, plate G, moving on guide-rods *g* within the box, pivoted levers K, connected with plate G, rods L, provided with plates *p*, and the buffers M, the parts being properly secured in position, substantially as and for the purposes set forth.

3. In combination with a draw-head and draw-bar loosely supported, as shown, the moving plate G, having arms *k*, connected with levers K, which are connected with buffing-rods L, the slotted box F, provided with a removable bottom, the guide-rods *g*, and springs *h*, the parts being constructed substantially as shown, for the purposes set forth.

4. In combination with a draw-head having a coupling-hook, a roller, P, journaled in bearings secured to the car and connected by chain with the hook, said roller being provided with the fixed handles *i*, each having one arm longer than the other, and constructed to bind against the car, as herein set forth, for the purpose specified.

5. In combination with draw-head loosely supported, as shown, a rotative shaft, N, having bearings fixed to the car, said shaft being connected by chains with the draw-head and provided with the removable handles *q*, substantially as set forth and described.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

BUSSEY *et al* v. THE EXCELSIOR MANUFACTURING COMPANY. THE EXCELSIOR MANUFACTURING COMPANY v. BUSSEY *et al*.

Decided January 21, 1884.

1. BUSSEY'S COOKING-STOVE PATENTS—FIRST FOUR CLAIMS OF SECOND REISSUE CONSTRUED AND LIMITED.

The first four claims of Reissue Letters Patent No 3,815, granted to Esek Bussey and Charles A. McLeod, February 1, 1870, for a cooking-stove, the original patent, No. 56,686, having been granted to said Bussey, as inventor, July 24, 1866, and reissued to him, as No. 3,649, September 28, 1869—namely "1. A diving-flue cooking-stove with the exit-flue so constructed as to inclose on the sides and bottom the culinary boiler or hot-water reservoir B; 2. A diving-flue cooking-stove with the exit-flue constructed across the bottom and up the rear upright side of the culinary boiler or hot-water reservoir B; 3. A diving-flue cooking-stove constructed with an exit-passage, F, below the top of the oven, and an exit-flue, E E', in combination with an uncased reservoir, B, attached to the rear of the stove, and placed just above such exit-passage, and so arranged that the gases of combustion, in passing through such exit-flue, will impinge upon or come in direct contact with said reservoir, substantially as and for the purposes hereinbefore specified; 4. An exit-passage, F, constructed in the rear of a diving-flue cooking-stove and below the top of the oven, in combination with an uncased reservoir, B, attached to the rear of the stove, the bottom of which reservoir is also below the top of the oven, and so arranged that the gases of combustion will come in contact with and heat such reservoir by a direct draft from the fire-box to the smoke-pipe"—are limited to a structure in which the front of the reservoir has no air-space in front of it, and in which the exit-flue does not expand into a chamber at the bottom of the reservoir, and in which the vertical part of the exit-flue does not pass up through the reservoir.

2. SAME—NOT INFRINGED.

Hence, those claims are not infringed by a stove in which, although there are three flues, and an exit-passage below the top of the oven, and a reservoir the bottom of which is below the top of the oven, no part of the rear end vertical plate is removed, so as to allow the gases of combustion to come into direct contact with the front of the reservoir, nor is any such plate employed as the plate *w w* of the patent, but there is a dead-air space between the rear plate of the flue and the front of the reservoir, and the exit-flue is not a narrow one, carried across the middle of the bottom of the reservoir, as in the patent, but the products of combustion, on leaving the flue-space, pass into a chamber beneath the reservoir, the area of which is coextensive with the entire surface of the bottom of the reservoir, and the vertical passage out of such chamber is not one outside of the rear of the reservoir, but is one in and through the body of the reservoir, and removable with it.

3. NATION AND LITTLE'S COOKING-STOVE PATENT NO. 142,933 VOID FOR WANT OF NOVELTY.

The claim of Letters Patent No. 142,933, granted to David H. Nation and Ezekiel C. Little, as inventors, September 16, 1873, for an improvement in reservoir cooking-stoves—namely, "1. The combination, with the back-plate I of the cooking-stove A, of the reservoir C, arranged on a support about midway between the top and bottom plates of the stove, and the air-chamber *b*, between the stove-back and reservoir-front, open at the top, and communicating with the air in the room, substantially as and for the purposes set forth; 2. The combination, with the stove A and reservoir C, of the small opening *a*, the sheet-flue G under the entire bottom of the reservoir, and the small exit passage or pipe E, all substantially as and for the purposes herein set forth"—are void for want of novelty.

4. NATION AND LITTLE'S COOKING-STOVE PATENT NO. 142,934 VOID FOR WANT OF NOVELTY.

The claims of Letters Patent No. 142,934, granted to said Nation and Little, September 16, 1873, for an improvement in reservoir cooking-stoves—namely, "1. The detachable base-pan or flue-shell D, attached to the body at a point near the center of the back-plate of the stove, by means of hooks *a a*, cast on the base-pan, and pins *b b* on the stove-body, substantially for the purposes herein set forth; 2. The portable reservoir F, with the flue E in the rear side, in combination with the portable base-pan or flue-shell D, substantially as and for the purposes herein set forth; 3. The combination, with a three-flue stove having damper H, arranged as described, of the portable base-pan or flue-shell D, and warming-closet G, all substantially as and for the purposes herein set forth"—are void for want of novelty.

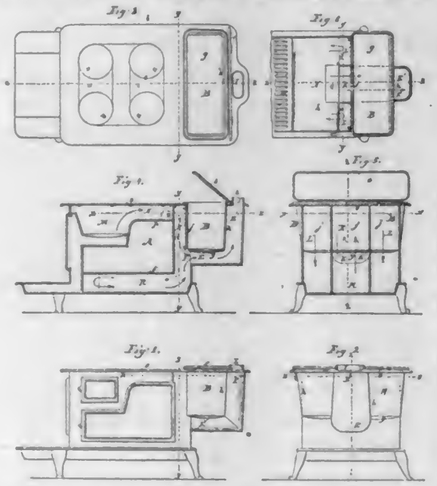
5. SAME—NON-INVENTION—OLD DEVICES.

There was no invention in claim 1 in using, to attach the base-pan, an old mode used in attaching other projecting parts of the stove.

6. SAME—SAME—AGGREGATION.

Claims 2 and 3 are merely for aggregations of parts and not for patentable combinations.

APPEALS from the Circuit Court of the United States for the Eastern District of Missouri.



Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity brought in the Circuit Court of the United States for the Eastern District of Missouri, by Esek Bussey and Charles A. McLeod against the Excelsior Manufacturing Company of St. Louis, a corporation, for the infringement of three several letters patent, being (1) Reissue No. 3,815, granted to the plaintiffs February 1, 1870, for a cooking-stove, the original patent, No. 56,686, having been granted to said Bussey, as inventor, July 24, 1866, and reissued to him, as No. 3,649, September 28, 1869; (2) Letters Patent No. 142,933, granted to David H. Nation and Ezekiel C. Little, as inventors, September 16, 1873, for an improvement in reservoir cooking-stoves; (3) Letters Patent No. 142,934, granted to said Nation and Little, as inventors, September 16, 1873, for an improvement in reservoir cooking-stoves. After an answer and proofs the circuit court made a decree finding no infringement of No. 3,815, and dismissing the bill as to that patent, decreeing that the other two patents were valid and had been infringed as to all their claims, and awarding a perpetual injunction as to those claims and an accounting before a master. The master reported one cent damages. The plaintiffs excepted to the report, claiming $14,972 damages. The court confirmed the report and made a decree accordingly, which also provided that the entire costs to be taxed in the suit should

be divided, and that the plaintiffs should pay five-sevenths of them and the defendant two-sevenths. Both parties appealed to this Court.

The specification of No. 3,815 says:

Figure 1 is a side elevation; Fig. 2, a rear elevation; Fig. 3, a plan; Fig. 4, a vertical section at the line z z; Fig. 5, a front view of a section at the line y y; and Fig. 6, a top view of a partial section at the line x x, all of a cooking-stove embodying my said invention, like parts being marked by the same letters in all the figures, and the arrows therein being indicative of the courses in which the gases of combustion pass through the stove.

One part of my invention consists in arranging a culinary boiler or hot-water reservoir in the rear of the oven of a diving-flue cooking-stove, with an exit-flue extending down the front, under the bottom, and up the rear of the said reservoir, substantially as hereinafter described and specified.

It also consists in arranging a culinary boiler or hot-water reservoir in the rear of the oven of a diving-flue cooking-stove, with an exit-flue leading from some point in the rear of the vertical flue or flues below the top of the said oven, and continuing under the bottom and up the rear side of said reservoir, substantially as hereinafter described and specified.

It also consists in the arrangement of a diving-flue cooking-stove, with an exit-passage constructed in the vertical rear flue or flues thereof, and below the top of the oven, in such a manner that the gases of combustion, after passing through such exit-passage, will impinge upon or come in contact with the bottom or sides of a reservoir placed in the rear of the stove, and just above said exit-passage, substantially as hereinafter described and specified.

It also consists in the employment of a thin plate or sheet of metal between the front plate of the reservoir and the rear end vertical flues of the said stove, substantially as shown and specified.

In illustration of my invention, the aforesaid drawings represent a cooking-stove having an oven, A, a culinary boiler or hot-water reservoir, B, arranged opposite to the rear upright side or end, d, of the oven, and an exit-flue, E E', extended from the central vertical flue, K, of said stove at a point below the top of the oven, under or across the bottom g of the reservoir, and from thence up along the rear upright side of said boiler or reservoir to the draft-pipe I.

For the purpose of allowing the boiler to heat more readily, a portion of the rear end vertical plate of said stove is removed, so as to uncover the upper portion of the rear end vertical flues, and the front of the boiler is attached to the rear of said flues in the manner shown and described in my reissued patent of July 24, 1866. Between the inner side of the boiler B and the rear end vertical flues, K and L L', a plate may be employed, indicated by dotted line w w. The object of this plate is as follows: It has been ascertained by experience that when, during the use of the oven for baking purposes, a large quantity of cold water is suddenly poured into the reservoir, and there is nothing between the front of the boiler and gases of combustion passing through the rear end vertical flues, the heat of the said gases will be so much absorbed by the reservoir as to sensibly cool the oven and interfere with the process of baking. To obviate this I employ the thin plate w w, placed between the front of the reservoir and the said rear end vertical flues, and which, while it allows sufficient heat to pass through it to aid in heating the boiler, protects the front thereof from the direct impact of the gases of combustion and preserves an equable heat in the oven. In case the said plate is dispensed with, the inner side, J, of the said boiler will form a part of the lateral rear casing of the said rear end vertical flues, and will be heated by direct contact with the gases of combustion as they pass down and up the same.

M is the fire-box, and N and R the top and bottom flues of said stove.

The operation of my said invention is as follows: A fire being kindled in the fire-box M, and the damper Q at the top of the oven being open, so as to allow of a direct draft, the gases of combustion from the said fire-box will pass down the middle vertical flue, K, through the exit-passage F and exit-flue E E', to the smoke-pipe I, heating the contents of the reservoir in its passage through the exit-flue, as aforesaid. By this mode of construction I am enabled to obviate what has been heretofore the greatest objection to reservoir-stoves of this class—namely, that the reservoirs would not heat with a direct draft. It will also be observed that, by this device of constructing the exit-passage below the top of the oven, I can at the same time by a direct draft heat the rear side of the oven and the reservoir, instead of wasting the heat by carrying it directly to the chimney. When the damper Q is closed for the purpose of heating the oven, the gases of combustion will pass down the side vertical flues, L L', and under the bottom of the oven, returning through a central horizontal flue to the central vertical flue, K, from which they pass through the exit-flue E E', as aforesaid.

I am aware that cooking-stoves have been in use in which the reservoir has been incased or inclosed on all sides except the top by a kind of expanded flue, through which the gases of combustion are made to pass. The advantages of my plan over this device are twofold: First, it is much more economical, requiring far less material and labor to construct it, and, second, by confining the heat and gases of combustion to a small space at the bottom and rear of the reservoir the contents thereof will be much more effectually heated than where the products of combustion are admitted to an extensive flue-space and permitted to rise and expend their heat at or near the top of the reservoir.

The claims of the patent, the first four only of which are alleged to have been infringed, are as follows:

1. A diving-flue cooking-stove with the exit-flue so constructed as to inclose on the sides and bottom the culinary boiler or hot-water reservoir B.

2. A diving-flue cooking-stove with the exit-flue constructed across the bottom and up the rear upright side of the culinary boiler or hot-water reservoir B.

3. A diving-flue cooking-stove constructed with an exit-passage, F, below the top of the oven, and an exit-flue, E E', in combination with an uncased reservoir, B, attached to the rear of the stove, and placed just above such exit-passage, and so arranged that the gases of combustion, in passing through such exit-flue, will impinge upon or come in direct contact with said reservoir, substantially as and for the purposes hereinbefore specified.

4. An exit-passage, F, constructed in the rear of a diving-flue cooking-stove and below the top of the oven, in combination with an uncased reservoir, B, attached to the rear of the stove, the bottom of which reservoir is also below the top of the oven, and so arranged that the gases of combustion will come in contact with and heat such reservoir by a direct draft from the fire-box to the smoke-pipe.

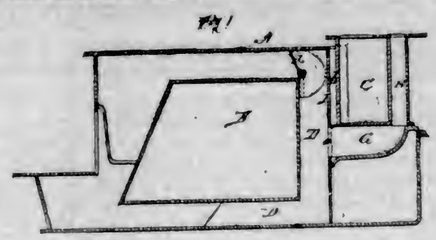
5. In a cooking-stove wherein the rear end vertical plate, or a portion of the same, has been removed for the purpose of heating a reservoir placed in the rear thereof, the shield-plate w w, in combination with the uncased reservoir B and the rear end vertical flues, K, L, and L', substantially as and for the purposes hereinbefore described and specified.

The defendant's stove has three flues and an exit-passage below the top of the oven, and a reservoir, the bottom of which is below the top of the oven; but no part of the rear end vertical plate is removed so as to allow the gases of combustion to come into direct contact with the front of the reservoir, nor is any such plate employed as the plate w w of the patent; but there is a dead-air space between the rear plate of the flue and the front of the reservoir. The exit-flue is not a narrow one, carried across the middle of the bottom of the reservoir, as in the patent, but the products of combustion, on leaving the flue-space, pass into a chamber beneath the reservoir, the area of which is coextensive with the entire surface of the bottom of the reservoir, and the vertical passage out of such chamber is not one outside of the rear of the reservoir, but is one in and through the body of the reservoir and removable with it. In view of the earlier patents put in evidence, we are of opinion that the four claims in question must be limited to a structure in which the front of the reservoir has no air space in front of it, and in which the exit-flue does not expand into a chamber at the bottom of the reservoir, and in which the vertical part of the exit-flue does not pass up through the reservoir. Under this construction there is no infringement of No. 3,815.

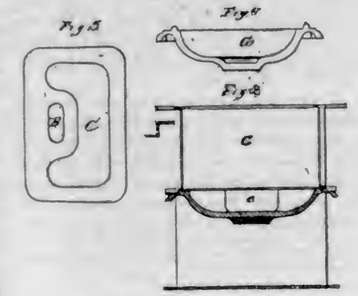
Claim 1, in requiring that the exit-flue shall "inclose on the sides and bottom," the reservoir requires, in the language of the text of the specification, that it shall extend "down the front, under the bottom, and up the rear" of the reservoir; and it does not admit of an air-space in front of the reservoir; nor is it limited to what is called a "low-down boiler or reservoir." The Getz patent of 1840 shows an exit-flue passing under the bottom and up the rear side of a reservoir. The Spaulding or Paris patent of 1858 shows a diving-flue inclosing the bottom and one of the sides of a reservoir.

Claim 2 is not limited to a low-down boiler or reservoir. If a stove with an exit-flue constructed across the bottom and up the rear upright side of a boiler or reservoir existed before, there was nothing patentable in applying such construction to a diving-flue stove. The combination of exit-flue and reservoir with which claim 2 is concerned has no patentable relation to the arrangement of the internal flues of the stove. The Getz patent of 1840 shows an exit-flue extending across the bottom and up the rear upright side of a boiler. In the Stewart patent of 1859 the products of combustion enter a chamber under the reservoir, and thence pass off by a pipe embraced within the walls of the reservoir. The exit-flue of claim 2 must, therefore, be limited to one which passes under the bottom of the reservoir without expanding into a chamber substantially coextensive with the area of the bottom of the reservoir, as in the defendant's stove and in the Stewart patent of 1859, and also to one in which the escape-pipe is outside of the rear wall of the reservoir and not within the reservoir, as in the defendant's stove and in the Stewart patent of 1859.

Claim 3 adds to claim 2 only the feature of having the exit-passage or exit orifice into the exit-flue below the top of the oven. There is no patentable relation between the combination of exit-flue and reservoir and the location of the exit-passage with reference to the oven, in view of the state of the art. In the Stewart patent of 1859 the exit-opening was on a level with the top of the oven and led into a chamber under the reservoir. In the Spaulding or Paris patent of 1858 and in the Bussey patent of 1865 the bottom of the reservoir was below the top of the oven. There was no invention in causing the gases to act on a low-down reservoir in the same way in which they had acted before on an elevated reservoir, and no invention in lowering the exit-opening to correspond with the depression of the reservoir, even though the incidental effect was to heat by a direct draft at the same time the reservoir and the rear side of the oven.



Claim 4 adds to claim 3 only the feature of heating the reservoir by a direct draft from the fire-box to the smoke-pipe. This, however, is only a statement of the effect produced in a structure made according to the first three claims. In the Getz patent of 1840 and in the Stewart patent of 1859 the exit-pipe was in the rear of the reservoir, and the gases were brought into contact with the bottom of the reservoir, and it was heated by a direct draft. There is really nothing in claim 4 beyond what is found in claim 3.



The specification of No. 142,933 is as follows:

Our invention relates to that class of cooking-stoves in which a water-reservoir is situated at the rear end of the stove; and it consists in the arrangement of the reservoir upon an extended support at the rear of the stove, so that an air-chamber, opening at its top into the air of the room, is left between the back-plate of the stove and the front of the reservoir, thereby protecting the front of the same from becoming burned out by being in direct contact with the heat from the fire.

It also consists in a broad sheet-flue arranged under the reservoir, the heated air for which enters through a small passage in the back-plate of the stove, and after circulating in said flue passes out through the small opening in the rear thereof, all as more fully hereinafter set forth.

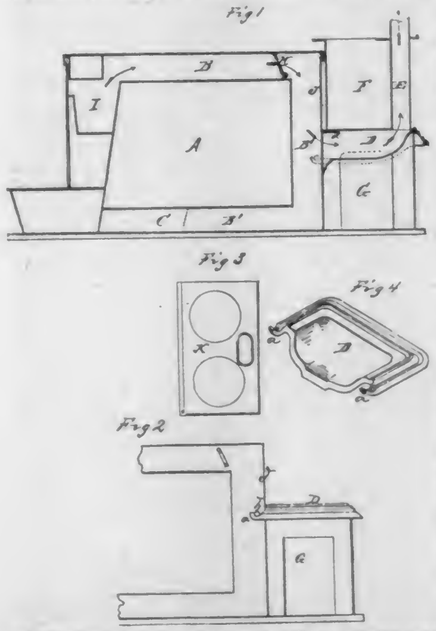
Figure 1 is a longitudinal vertical section of our stove; Fig. 2 is a transverse vertical section of the same through the water-reservoir; Fig. 3 is a plain view of the reservoir; and Fig. 4 is a front view of the sheet-flue under the bottom of the reservoir.

A represents the top plate of the stove. B is the oven; C, the water-reservoir; D, the center one of the three flues of the stove; and E, the exit-flue, located in the rear of the reservoir C. This reservoir is located upon a support therefor, which extends rearward from a point about half-way between the top and bottom plates of the stove, and which may either be attached to or form part of the stove, and a sheet-flue, G, is provided in the same under the bottom of the reservoir C. The heat, entering this flue, passes through the small central passage *a* in the stove-back I. It is there spread and retained under the reservoir until it gradually ascends through the small passage or exit-flue E. By this construction the rapid exit of the heated air from under the reservoir is prevented, and the heat, being retained under the bottom of the reservoir, causes the water in the same to become hot in a short time. The reservoir C is so arranged with respect to the back-plate I of the stove that an air-space, *b*, communicating with the air of the room at the top, is left between the front of the reservoir and the back-plate. By this means the outside air will pass down between the back-plate and front of the reservoir and prevent the front of the reservoir from burning out, which would be the case if the parts were in direct contact, especially when the water in the reservoir becomes low. In the ordinary method the flame is made to strike directly upon the front surface of the reservoir, thereby rendering it liable to crack while replenishing with cold water upon the heated plates. The opening *a* in the back-plate I of the stove is of the same width as the center-flue D, and the products of combustion pass through said opening into the sheet-flue G, which thus has a contracted entrance and a contracted exit. When using the direct draft the damper *d* of the center-flue D is turned downward and rests against the back-oven plate, as shown by the dotted lines in Fig. 1. At such times the heat passes down the center-flue D of the back, through the opening *a* in the back-plate I, into the sheet-flue G, under the bottom of the reservoir, and out of the exit-flue E. When the indirect draft is used, the damper *d* occupies the position shown in Fig. 1, and at such times the heat passes down the usual side flues and under the bottom of the oven to the front of the stove, where it turns into the center-flue D and passes back through the opening *a* to the sheet-flue G under the bottom of the reservoir, and out of the exit-flue. With a stove thus constructed, the reservoir is heated almost entirely from the bottom, and the heat acts upon the entire surface of the bottom of the reservoir, and when the reservoir is but partially filled there is no danger of the heat acting against and burning out the top part of the front side of the reservoir.

We do not claim under this patent a flue-shell and rear central extension that be detachable from the stove-body by means of hooks on the one and catches or pins on the other; nor do we specifically claim a reservoir with a flue in its rear, as these elements of invention are the subject of a separate application for a patent now pending; neither do we wish to be understood as claiming the arrangement of the reservoirs and flues for heating the same in front of the fire-box of the stove, as shown in our patent of May 6, 1873, No. 138,662.

The claims of No. 142,933 are two in number, as follows, and the infringement of both is admitted:

1. The combination, with the back-plate I of the cooking-stove A, of the reservoir C, arranged on a support about midway between the top and bottom plates of the stove, and the air-chamber *b* between the stove-back and reservoir-front, open at the top, and communicating with the air in the room, substantially as and for the purposes set forth.



2. The combination, with the stove A and reservoir C, of the small opening *a*, the sheet-flue G under the entire bottom of the reservoir, and the small exit passage or pipe E, all substantially as and for the purposes herein set forth.

The point of invention in claim 1 is in so arranging the reservoir as to have an air-space between the front plate of the reservoir and the back-plate of the stove, to a sufficient extent to prevent the flame from striking against the upper part of the front plate of the reservoir, which it would do if the upper part of the back-plate of the stove were cut away and there were no such air-space. It is the upper part of the front side of the reservoir which, as the specification states, is liable to be burned out by the direct action of the flame as the water in the reservoir is lowered. In the McDowell patent of 1871 all the upper part of the reservoir is protected by an air-space, open at the top, between the reservoir and the stove.

The point of invention in claim 2 is to take the gases through a small opening into a broad sheet-flue under the bottom of a reservoir and out through another small opening in the rear, so that they will circulate in the broad flue and act on the entire surface of the bottom of the reservoir. The Stewart patent of 1859 shows the same arrangement with an elevated reservoir, but there is no invention in applying it to a low-down reservoir. The Tiffany patent of 1869 shows the same arrangement with a low-down reservoir.

The specification of No. 142,934 says:

The nature of our invention consists in the construction and arrangement of a cooking-stove with a portable base-pan or flue-shell,

and the means for attaching the same, as will be hereinafter more fully set forth.

* * * * * * *

Figure 1 is a longitudinal vertical section of our improved cooking-stove. Fig. 2 is a side view of the rear end of the same. Fig. 3 is a plan view of a loose cover or plate for the base-pan, and Fig. 4 is a perspective view of the portable base-pan or flue-shell.

A represents the main baking-oven of the stove. B is the top flue; B′ B″, the vertical and horizontal side flues. C is the center flue. D is the base-pan or flue-shell; E, the exit-flue passing up the rear side of the reservoir. F is the reservoir; G, the warming-closet; H, the damper; I, the fire-chamber; and J, the division-plate. When using the direct draft, the damper H occupies a line parallel with the back plate of the main oven, hanging down in the center flue of the back part of the stove. At such time the products of combustion pass from the fire-chamber I, along the top flue, B, and down the center flue, between the back oven-plate and the division-plate J, into the base-pan D, and out of the exit-flue E. When using the indirect draft, the damper H occupies the position shown in Fig. 1. At such time the products of combustion pass over the top oven-plate flue, B, and down the vertical end flues, B′, into the corresponding flues at the bottom, making the turn into the center flue of the bottom at C, through said bottom center flue, into and through the rear center flue, through the division-plate J, into the base-pan flue D, and out of exit-flue E, so that, whether using the direct or indirect draft, the reservoir is heated only on its bottom surface. The base-pan D is made separate from the stove, and provided on each side with a hook-projection, *a*, to be fastened on a pin, *b*, projecting from the side of the stove. By this means the base-pan can readily be attached and detached, and when attached it fits in the upper end and forms the top of the warming-oven G.

K represents a plate with two boiler-holes in it, which can be used when the reservoir is removed or should become broken in shipment, thus converting it into a six-hole stove.

It is our purpose to insert a loose center-piece between the boiler-holes in the plate K, so that an ordinary wash-boiler can be used on said plate, if desired.

The novelty of this invention consists in the portability of the reservoir base-pan D and in the warming-closet attachment, whereby we economize space in shipment, and whereby repairs can be made at a very small cost and by unskilled workmen, as all the attachments will be shipped separate from the body of the stove, and mounted after they reach their destination.

Should the reservoir become broken in shipment or otherwise, the plate K can be used, thus converting it into a six-hole stove, upon which an ordinary wash-boiler can be used in case of emergency.

The front bottom corner of the reservoir rests upon a strip, *d*, attached to the division-plate J, which thus entirely shuts off the air-space at the bottom.

By means of the base-pan flue D, extending under the whole bottom of the reservoir F and the space between the reservoir and the division-plate J, the reservoir becomes heated only on its bottom surface, where there will always be water, if any in the reservoir at all. The exit-flue E passes up through and forms part of the reservoir F at the back or rear side, as shown.

We do not claim, under this specification, the combination of the reservoir with the back of the stove when an air-space open at the top is left between the two, as seen in the drawings; nor do we claim the sheet-flue under the reservoir in the shell D, as both of these arrangements are the subject-matter of a separate application for a patent now pending.

The claims of No. 142,934 are three in number, as follows, and the infringement of all of them is admitted:

1. The detachable base-pan or flue-shell D, attached to the body at a point near the center of the back plate of the stove by means of hooks *a a* cast on the base-pan, and pins *b b* on the stove-body, substantially for the purposes herein set forth.

2. The portable reservoir F, with flue E in the rear side, in combination with the portable base-pan or flue-shell D, substantially as and for the purposes herein set forth.

3. The combination, with a three-flue stove having damper H, arranged as described, of the portable base-pan or flue-shell D and warming-closet G, all substantially as and for the purposes herein set forth.

The Tiffany patent of 1869 shows a low-down reservoir at the rear of a three-flue stove, and a warming-closet below the reservoir. The gases pass from the flue-space into a base-pan or chamber which is immediately below the reservoir, and forms the top of the warming-closet. The flue by which the gases escape from the base-pan is in the rear of the reservoir, and is removable with it. The Tiffany stove, having three flues, must have a damper to open and close the middle flue.

The specification of the Tiffany patent states that the reservoir and the warming-closet are capable of being attached to and detached from the stove, so that the stove is complete without them, and they are complete without being attached; and it also states that they may be attached to the stove by lugs or hook either cast in the back of the stove, with a corresponding eye in the side of the case surrounding the reservoir, or in the top and side of the reservoir, or the hook and the eye may be reversed. A detachable base-pan existed before, and hearths and ash-pans existed attached by lugs and hooks in the same way as the defendant's base-pan. A portable reservoir was old, with an escape-pipe or flue forming a part of the reservoir. A damper for the middle flue was old. A warming-closet below a base-pan and that below a reservoir were old.

In view of the state of the art, there was no invention in claim 1 of the patent in using to attach the base-pan an old mode used in attaching other projecting parts of the stove. Claim 2 is merely for an aggregation of parts, and not for a patentable combination, there being no patentable relation between a portable reservoir with a flue in its rear side and the existence or portability of a base-pan beneath it. In claim 3 there is merely an aggregation of parts, there being no patentable relation between a damper for the middle flue of a three-flue stove and the existence or portability of a base-pan or the existence of a warming-closet.

The decree of the circuit court is reversed, with costs in this Court to the Excelsior Manufacturing Company on both appeals, and the case is remanded to the circuit court, with direction to dismiss the bill, with costs.

Supreme Court of the United States.

ZANE *et al.* v. SOFFE.

Decided January 21, 1884.

1. PARTICULAR PATENTS.
Letters patent granted to Nathaniel Jenkins, June 22, 1865, construed.

2. CONSTRUCTION OF PATENTS.
In view of the fact that certain mechanical equivalents of a device claimed were previously used, the patent was construed to cover only the specific device mentioned in the claim.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. Thos. Wm. Clarke for the appellants.
Mr. Henry P. Wells for the appellee.

Mr. Justice BRADLEY delivered the opinion of the Court.

This writ was brought by Zane and Roach, as assignees of one Nathaniel Jenkins, against the defendant Soffe, for infringing (as charged) certain letters patent granted to said Jenkins, June 22, 1865, for an improvement in self-acting cocks or faucets.

The general features of the invention patented so far as material to be considered may be described as follows: The valve is situated in a chamber below the valve-seat, where the water is introduced by the induction-pipe, and is kept in place against the valve-seat by a spiral spring underneath resting on the bottom of the chamber. On its upper side the valve is connected by a swivel with a stem which projects upward through the top of the faucet, where it is provided with a handle, by which it may be turned. A screw is formed on the upper part of the stem, by which, when the stem is turned by the hand, it is forced downward and pushes the valve from its seat, thus permitting the water to flow out of the cock. On letting the handle go the spiral spring below the valve, aided by the pressure of the water, forces the valve back to its seat, and the flow of water is stopped. In the specification the stem is called a "screw-follower." The patent has two claims, only the first of which is claimed to be infringed by the defendant, and this is in the following words, to wit:

What I claim as new, and desire to secure by Letters Patent, is—

1. The screw-follower H, in combination with the valve of a self-closing faucet, substantially as set forth, and for the purpose described.

The defendant answered the bill, denying that Jenkins was the first inventor of the thing patented, denying infringement, and setting up a patent granted to defendant himself on the 10th of May, 1874, under and according to which the faucets manufactured by him were made, and which he alleges are no infringement of the Jenkins patent. The answer specifically refers to only one patent as anticipating the supposed invention of Jenkins—namely, a patent granted to one Frederick H. Bartholomew, in August, 1846—in which (as alleged) all the essential elements of the faucet patented to Jenkins are described and exhibited. The answer, however, contains the following general averment:

This defendant, further answering, denies that the patent granted said Nathaniel Jenkins is valid, and alleges that prior to the invention described in said patent a screw and spring, worked in opposition to each other, had been used to open and close faucets and hydrants, in which faucets and hydrants the screw did all the work of opening the faucets and hydrants, and the spring did all or most of the work of closing the valve of the faucets and hydrants; that faucets and hydrants operated in the above manner had been in public and general use and for sale in the cities of New York and Brooklyn and in various other places long prior to and at least fifteen years before the date of the alleged invention of Nathaniel Jenkins; and defendant is advised and believes that by reason of said prior public use and sale the patent granted to said Jenkins is invalid.

This answer was not excepted to, and evidence was given by the defendant, without objection, showing that a large number of faucets and hydrants were made by Bartholomew and publicly used in the city of New York several years before the issuing of the patent sued on, differing in some respects from the specific device described in Bartholomew's patent referred to in the answer, but relied on as anticipating the alleged invention of Jenkins, or, at least, as containing all the essential elements of the faucets manufactured by the defendant. The court below held that this evidence was competent to show the state of the art at the time Jenkins's patent was granted, and might be used for the purpose of limiting its construction, but not for the purpose of showing such a previous knowledge and use of the invention as would affect the validity of the patent. But since the decision of this case in the circuit court we have held, in Loom Company *v.* Higgins, (105 U. S., 595,) that under a general denial of the patentee's priority of invention, evidence of prior knowledge and use, taken without objection, is competent at the final hearing on the question of the validity of the patent; and since in the present case there was neither an exception to the answer nor any objection to the evidence, except as to a single faucet marked "Defendant's Exhibit No. 2," (which may be laid out of the case,) we think that the remaining evidence of prior knowledge and use might well have been considered by the court on the question of priority as affecting the validity of the patent. Viewing the evidence however with the court below only as demonstrative of the state of the art, and therefore competent to limit the construction of the patent to the precise form of parts and mechanism described and claimed therein, it was amply sufficient to sustain the decree.

Self-closing cocks and faucets were no new thing in June, 1865, when the patent of Jenkins was issued. Bartholomew had manufactured and sold them for a period of ten or fifteen years before that time. As early as 1854 he had made and sold faucets in which the valve was kept on its seat by the pressure of a spiral spring, and when a flow of water was desired the valve was lifted from its seat against the force of the spring by means of a stem operated by a collar or cross-piece moving around on a fixed circular inclined plane or cam, having the same effect as a screw. When the handle or thumb-piece attached to the collar was liberated or let go, the spiral spring would force the valve back to its seat and the flow of water would be stopped.

The improvement of Jenkins, (or what was patented to him as such,) as we have seen, was the employment of a screw on the upper part of the valve-stem, in lieu of the circular cam or inclined plane, to force the valve from its seat. This valve-stem, called by him the "screw-follower," forced the valve not only against the pressure of the spring, but against that of the water, both of which were exerted in carrying the valve back to its seat as soon as the force operating upon the screw was removed. Now, in view of the fact that an inclined plane or cam was previously used by Bartholomew as a means of producing the same result upon the valve-stem as that produced by the screw made upon it by Jenkins, it is clear that the claim of the latter in his patent of "the screw-follower H in combination with the valve of a self-closing faucet, substantially as set forth," must be limited to the precise form of mechanism designated. It must be limited to a screw-follower, and cannot be construed to embrace a cam arrangement for moving the valve. Whether it is also to be limited to a valve which moves to its seat concurrently with and not against the pressure of the water it is not necessary to determine. The limitation to the screw is sufficient to determine this case. In the faucet manufactured by the defendant the screw is not used, but the old cam device is employed for lifting the valve from its seat. It is true that the cam, instead of being placed at the top of the stem, on the outside of the faucet, as was done by Bartholomew, is placed at its lower extremity by the valve inside of the faucet; but this does not change the principle of its construction or operation.

We concur with the court below in holding that, construed as the patent of Jenkins must be in view of the state of the art at the time of its issue, the defendant has not infringed it, and the bill of complaint was properly dismissed. The decree of the circuit court dismissing the bill is therefore affirmed.

Supreme Court of the District of Columbia.

IN RE HATCHMAN.

1. FORMER DECISION AFFIRMED.

Decision of the Commissioner of Patents in *ex parte* Hatchman (reported in 25 O. G., 979) affirmed.

2. ATTORNEY—PARTY BOUND BY ACTS OF HIS ATTORNEY.

In legal effect the action of an applicant or his attorney is the same.

3. REISSUE—INADVERTENCE, ACCIDENT, OR MISTAKE.

Where one of the claims in an original application was rejected upon reference to certain patents, and the applicant, by his attorney, orders the same to be erased, and thus obtains and accepts a patent for the residue of his claims, there has been no inadvertence, accident, or mistake within the meaning of the patent law, and the patentee is not entitled to a reissue covering the claim before erased.

Application of Robert Hatchman for reissue of Letters Patent No. 283,602.

Mr. Justice MCARTHUR delivered the opinion of the court.

This is an appeal from the decision of the Commissioner of Patents. In his application for a patent, Hatchman made several claims, all of which were allowed except one, and that was rejected on the ground that it was too broad and was met by previous inventions for which patents had issued. Upon such examination said claim was erased and withdrawn by order of his attorney, and he obtained and accepted the original patent for the other claims, dated August 21, 1883. The application for reissue was made October 5, 1883, for the same claim which had been examined in granting the original patent and rejected with his acquiescence or that of his attorney, which is the same thing in legal effect. Upon this state of the record the reissue was denied on the ground that the claim had been canceled by the duly authorized attorney of the applicant, and that, having been canceled and the patent issued without it, he is not entitled to a reissue covering that identical claim. The case is here on appeal from that decision.

The sole question presented is whether, under these circumstances, Hatchman is entitled to a reissue to protect the disallowed claim on the ground that the same had been rejected by inadvertence, accident, and mistake, and without any fraudulent or deceptive intention.

We are of opinion that on an application for a patent, when one of the claims presented is covered by previous inventions and the patents therefor are referred to, and the Examiner upon such reference decides against such claim, and the applicant thereupon, by his attorney, orders the same to be erased and withdrawn, and thus obtains and accepts a patent for the residue of his claims, he is not entitled to a reissued patent containing the identical claim which he has so erased and withdrawn. We also hold that under such circumstances no error has arisen by inadvertence, accident, or mistake within the meaning of the patent law which would authorize the Commissioner to entertain the application for a reissue. We therefore think that the decision appealed from ought to be affirmed and the appeal dismissed. Let the proper order be prepared.

Amendment of Rule 209.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, February 20, 1884.

Rule 209 of the Rules of Practice (revised edition November 15, 1883) is amended to read as follows, viz:

209. The following is the schedule of fees and of prices of publications, &c., of the Patent Office:

On filing each original application for a design patent for three years and six months	$10 00
On filing each original application for a design patent for seven years	15 00
On filing each original application for a design patent for fourteen years	30 00
On allowance of an application for a design patent, no further charge.	
On filing each caveat	10 00
On filing each original application for a patent	15 00
On allowance of an original application for a patent, except in design cases	20 00
On filing each disclaimer	10 00
On filing every application for the reissue of a patent	30 00
On filing each application for a division of a reissue	30 00
On allowance of an application for the reissue of a patent no further charge.	
On filing every application for an extension of a patent	50 00
On the granting of every extension of a patent	50 00
On filing an appeal from a primary examiner to the Examiners-in-Chief	10 00
On filing an appeal from the Examiners-in-Chief to the Commissioner	20 00
For manuscript copies of records in the English language, for every one hundred words or fraction thereof	10
If certified, for the certificate additional	25
For copies of drawings not in print, the reasonable cost of making them.	
For uncertified copies of the specifications and accompanying drawings of all patents which are in print:	
Single copies	25
Twenty copies or more, whether of one or several patents, per copy	10
For twenty coupon orders, each coupon good until used for one copy of a printed specification and drawing	2 00
For certified copies of patents, whether in manuscript or in print:	
For the specification, for every one hundred words or fraction thereof	10
For the drawings, if in print	25
For the drawings, if not in print, the reasonable cost of making them, as above.	
For the certificate	25
For the grant	50
For certifying to a duplicate of a model	50
For abstracts of title to patents or inventions:	1 00
For the certificate of search	20
For each brief from the digests of assignments	
For copies of matter in any foreign language, for every one hundred words or fraction thereof	20
For translation, for every one hundred words or fraction thereof	50
For recording every assignment, agreement, power of attorney, or other paper, of three hundred words or under.	1 00
For recording every assignment, agreement, power of attorney, or other paper of over three hundred words and under one thousand words	2 00
For recording every assignment, agreement, power of attorney, or other paper of over one thousand words	3 00
For assistance to attorneys and others in the examination of records, one hour or less	50
Each additional hour or fraction thereof	50
For assistance to attorneys in the examination of patents or other matter in the scientific library, one hour or less.	1 00
Each additional hour or fraction thereof	1 00
For subscription to the OFFICIAL GAZETTE, published every Tuesday, all subscriptions to commence with the beginning of a volume, none being taken for a less period than three months, and there being no club rates or discount to newsdealers, as follows:	
To all subscribers within the United States and Canada, one year	5 00
To foreign subscribers, except in Canada	7 00
Single numbers	10
For bound volumes of the OFFICIAL GAZETTE:	
Semi-annual volumes, from January 1, 1872, to June 30, 1883, full sheep binding, per volume	4 00
Do. Half sheep binding, per volume	3 50
Quarterly volumes subsequent to July 1, 1883, full sheep binding, per volume	2 75
For the Annual Index—Lists of patentees and inventions, alphabetically arranged, with date of patent, number, &c., from January, 1872—one volume each year, full law binding, per volume	2 00
In paper covers, per volume	1 00
For the General Index—a list of inventions patented from 1790 to 1873, with the name of inventor, residence, date of patent, number, &c.—three volumes, full law binding, per set	10 00
For the Index from 1790 to 1836—a list of inventions patented from 1790 to 1836, photolithographed from Patent Office Reports—one volume, full law binding	5 00
For the Monthly Volumes, containing the specifications and photolithographed copies of the drawings of all patents issued during the month, certified, bound full sheep, per volume	12 00
Do. Bound half sheep, per volume	10 00
For the Index to Patents Relating to Electricity, granted by the United States prior to June 30, 1882, one volume, two hundred and fifty pages, bound	5 00
In paper covers	3 00
Appendix from June 30, 1882, to June 30, 1883, paper covers	1 50
For Commissioner's Decisions:	
For 1869–'70–'71, bound in one volume, full law binding	2 00
For 1872–'73–'74, bound in one volume, full law binding	2 00
For 1875–'76, bound in one volume, with decisions of United States courts in patent cases, full law binding	2 00
For 1875–'76, bound in paper covers	1 00
For 1877–'78–'79–'80–'81–'82–'83, one volume *each year*, with decisions of United States Courts, full law binding, per volume	2 00
For 1877–'78–'79–'80–'81–'82–'83, bound in paper covers.	1 00
For pamphlet of the Rules of Practice	Free.
For pamphlet of the patent laws	Free.

There are no annual reports for gratuitous distribution.

BENJ. BUTTERWORTH,
Commissioner.

Approved to take effect March 1, 1884.

H. M. TELLER,
Secretary of the Interior.

Issue of February 26, 1884.

Patents	349—No. 293,996 to No. 294,344, inclusive.	
Designs	28—No. 14,808 to No. 14,835, inclusive.	
Trade-marks	11—No. 10,958 to No. 10,968, inclusive.	
Labels	22—No. 3,924 to No. 3,945, inclusive.	
Reissues of patents	5—No. 10,450 to No. 10,454, inclusive.	
Total issue	415	

TO CITIZENS OF THE UNITED STATES.

Patents and Designs—Alabama, 3; Arkansas, 3; California, 6; Colorado, 1; Connecticut, 19; Dakota Ter., 1; District of Columbia, 4; Georgia, 1; Illinois, 40; Indiana, 10; Iowa, 8; Kentucky, 1; Louisiana, 3; Maine, 3; Maryland, 3; Massachusetts, 28; Michigan, 5; Minnesota, 1; Missouri, 8; Nebraska, 3; Nevada, 1; New Hampshire, 1; New Jersey, 11; New York, 93; Ohio, 24; Pennsylvania, 41; Rhode Island, 5; Tennessee, 2; Texas, 4; Virginia, 2; Washington Ter., 1; West Virginia, 5; Wisconsin, 8; Wyoming Ter., 1.—Total, 353.

Trade-Marks and Labels—California, 1; Connecticut, 1; Florida, 1; Georgia, 1; Illinois, 3; Iowa, 1; Louisiana, 1; Massachusetts, 2; New York, 12; Ohio, 1; Oregon, 1; Pennsylvania, 4; Rhode Island, 1; Utah Ter., 1; Virginia, 1.—Total, 32.

TO CITIZENS OF FOREIGN COUNTRIES.

Patents and Designs—Austria-Hungary, 1; Canada, 3; England, 11; Germany, 7; Scotland, 2.—Total, 24.

Trade-Mark—England, 1.

DESIGNS.

14,808.—DINNER OR TEA SET.—*James Barlow* and *James Moses*, Trenton, N. J., assignor to *The Mercer Pottery Company*, same place. Application filed February 28, 1883. Term of patent 7 years.

14,809.—STATUE.—*Abia Z. Boda*, Washington, D. C., assignor to *Christian Devries*, *Minnie A. Vogeler*, and *Herman D. Umbstaetter*, all of Baltimore, Md. Application filed December 19, 1883. Term of patent 14 years.

14,810 to 14,816, inclusive.—BACK OF A PLATING-CARD.—*Edwin R. Eavenson*, Philadelphia, Pa., assignor to *James H. Caterson* and *Robert Brotz*, both of same place. Applications filed January 23, 1884. Term of patents 3½ years.

14,817.—CIGAR CUTTER CASE.—*Le Roy O. Fairchild*, New York, N. Y. Application filed October 16, 1883. Term of patent 7 years.

14,818.—GEM-SETTING.—*Sylvester K. Merrill*, Auburn, R. I. Application filed January 17, 1884. Term of patent 3½ years.

14,819.—CALENDAR.—*Clarence S. Nathan*, New York, N. Y. Application filed November 28, 1883. Term of patent 3½ years.

14,820.—LADY'S COSTUME.—*Catherine O'Hara*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,821.—LAMP.—*William J. Patterson*, Beaver, Pa. Application filed January 15, 1884. Term of patent 7 years.

14,822.—GIRL'S COSTUME.—*Catherine Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,823.—LADY'S WALKING-SKIRT.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,824.—CHILD'S COSTUME.—*Catherine Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,825.—MISS'S WALKING-SKIRT.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,826.—LADY'S WALKING-SKIRT.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,827.—LADY'S DRESS.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,828 and 14,829.—LADY'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Applications filed January 23, 1884. Term of patents 3½ years.

14,830.—MISS'S COSTUME.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,831.—CHILD'S WRAP.—*Mary Turner*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,832.—MISS'S COSTUME.—*Mary Turner*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,833.—LADY'S COAT.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company*, (*Limited*,) same place. Application filed January 23, 1884. Term of patent 3½ years.

14,834.—BILLIARD-TABLE.—*Albert Wagner*, New York, N. Y., assignor to *H. W. Collender*, same place. Application filed December 31, 1883. Term of patent 3½ years.

14,835.—TOY.—*Edward L. Morris*, Boston, Mass. Application filed August 8, 1883. Term of patent 3½ years.

TRADE-MARKS.

10,958.—GLOVES.—*Elias Apfelbaum*, Gloversville, N. Y. Application filed January 15, 1884.

"The letters and word 'KIRBY.'"

10,959.—CERTAIN KIND OF JEWELRY.—*Orsp. C. Devereux*, Providence, R. I. Application filed December 17, 1883.

"The combination of letters of any kind to form the word 'STONNE.'"

10,960.—WHISKY.—*Elias Block & Sons*, Cincinnati, Ohio, assignors to *M. and K. Gottstein*, Seattle, Wash. Ter. Application filed January 24, 1884.

"The arbitrary symbol-word 'GOLDRAR.'"

10,961.—GOLD-LEAF.—*Stephen Hickson*, New York, N. Y. Application filed February 2, 1884.

"The word-symbol 'EUREMA.'"

10,962.—WATCH-MOVEMENTS.—*Mathey Brothers & Mathez*, New York, N. Y. Application filed January 25, 1884.

"The word 'LEONVILLE.'"

10,963.—ORANGES AND LEMONS.—*Antonio Minaldi*, New York, N. Y. Application filed January 23, 1884.

"The words 'GOOD MORNING.'"

10,964.—CIGARS.—*Celestino Palacio & Co.*, New York, N. Y. Application filed November 21, 1883.

"The word 'EUDORA.'"

10,965.—RAT-TRAPS.—*Elijah P. Peacock*, Chicago, Ill. Application filed December 5, 1883.

"The representation of a rat upon the neck of which is sprung a trap constructed of wire, the end of which is on the neck of the rat in the form of a bow set on end, and the ends thereof connected with a ring at about opposite the hind part of the rat."

10,966.—SPECTACLES, EYEGLASSES, AND OPTICAL GOODS.—*Sussfeld, Lorsch & Co.*, New York, N. Y. Application filed November 14, 1883.

"The representation of a crown with pointed ends finishing in balls."

10,967.—CAPS, CARTRIDGES, PRIMERS, WADS, AND SHELLS FOR SMALL-ARMS.—*Union Metallic Cartridge Company*, Bridgeport, Conn. Application filed January 11, 1884.

"The letters 'U. M. C.'"

10,968.—ANVILS.—*Peter Wright & Sons*, Dudley, County of Worcester, England. Application filed June 23, 1883.

"An arbitrary circular arrangement of the words 'SOLID WROUGHT.'"

LABELS.

3,924.—Title: "R. S. REPELLENT SHIELDS WARRANTED."—*Brooklyn Shield Company*, Brooklyn, N. Y. Application filed January 16, 1884.

3,925.—Title: "BRUCKLINE" (FOR A HAIR RESTORER.)—*Matthew Bruce*, New York, N. Y. Application filed February 1, 1884.

3,926.—Title: "CUPID'S TEARS" (FOR CAPSULES.)—*George Burwell*, Boston, Mass. Application filed February 4, 1884.

3,927.—Title: "CHAMBERLAIN'S EYE AND SKIN OINTMENT."—*Chamberlain & Co.*, Des Moines, Iowa. Application filed February 1, 1884.

3,928.—Title: "LEMON" (FOR AN EXTRACT.)—*Chapman, Smith & Co.*, Chicago, Ill. Application filed February 4, 1884.

3,929.—Title: "VANILLA" (FOR AN EXTRACT.)—*Chapman, Smith & Co.*, Chicago, Ill. Application filed February 4, 1884.

3,930.—Title: "B. FARLEY'S WONDERFUL DISCOVERY" (FOR A MEDICINE.—*Bernard Farley*, San Francisco, Cal. Application filed February 1, 1884.

3,931.—Title: "HICKMAN'S RELIABLE HAIR AND SCALP REMEDY."—*William McO. Hickman*, Jefferson, Pa. Application filed January 31, 1884.

3,932.—Title: "TROPHY" (FOR CIGARS.)—*Hier & Aldrich*, Syracuse, N. Y. Application filed January 24, 1884.

3,933.—Title: "THE SILVER KING" (FOR MANUFACTURED TOBACCO.) *Charles D. Hill & Co.*, Richmond, Va. Application filed February 2, 1884.

3,934.—Title: "HOLBROOK'S ENAMELINE" (FOR A COSMETIC.)—*George H. Holbrook*, Portland, Oreg. Application filed February 1, 1884.

3,935.—Title: "FLORIDA WATER."—*Benjamin L. Hughes*, Jacksonville, Fla. Application filed January 14, 1884.

3,936.—Title: "CARBONATED-IODINE-LITHIA WATER."—*Christian Lewis Keppler*, New Orleans, La. Application filed February 5, 1884.

3,937.—Title: "SUN MACKINAW" (FOR HAT TIPS OR LININGS.)—*Lippincott, Oglevee & Co.*, Philadelphia, Pa. Application filed January 31, 1884.

3,938.—Title: "CHINESE MACKINAW" (FOR HAT TIPS OR LININGS.) *Lippincott, Oglevee & Co.*, Philadelphia, Pa. Application filed January 31, 1884.

3,939.—Title: "ROYAL CURTAIN FIXTURE."—*Louis Page* and *Louis Keber*, Brooklyn, N. Y. Application filed February 4, 1884.

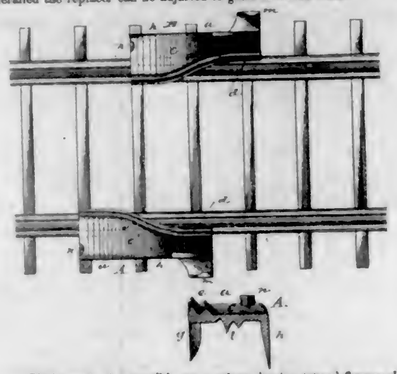
3,940.—Title: "DR. SALTER'S EYE LOTION."—*M. T. Salter*, Atlanta, Ga. Application filed February 4, 1884.

3,941.—Title: "SUNSHINE METAL POLISH."—*Lucius E. Sayre*, Philadelphia, Pa. Application filed February 2, 1884.

3,942.—Title: "WAY UP BAKING POWDER."—*Smith & Case*, Salt Lake City, Utah Ter. Application filed February 4, 1884.

3,943.—Title: "NABOB" (FOR CIGARS.)—*David B. Stewart*, Ithaca, N. Y. Application filed January 24, 1884.

3,944.—Title: "PEARLIOCA" (FOR FOOD PRODUCTS.)—*William J. Stitt & Co.*, New York, N. Y. Application filed January 31, 1884.



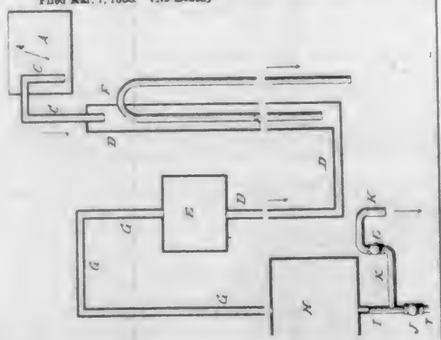
3,945.—Title: "WHITING'S IMPERVIOUS DRAFTING INKS."—*Frederic A. Whiting*, Wellesley Hills, Mass. Application filed February 2, 1884.

PATENTS

GRANTED FEB. 26, 1884.

293,996. CAR-REPLACER. ROBERT E. ALEXANDER, Niagara, Pa. Filed May 12, 1883. (No model.)

Brief.—A pair of reversible right and left car-replacers so arranged with lateral flanges, inclined track-bodies, and curved guide-grooves on their bodies that in whatever position a car may be when derailed the replacer can be adjusted to guide it on the track.

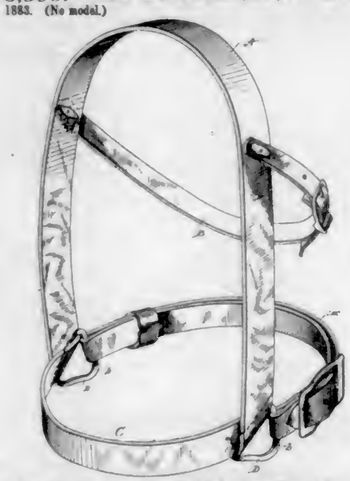


Claim.—1. A reversible car-replacer having lateral flanges *d h*, and holding legs or lugs *g m*, and an inclined track-body, *c*, having on one side a guide-groove, *e*, next the lateral flange, and on the other side a guide-groove, *l*, separated from the flange by an interval, substantially as specified.

2. A pair of reversible right and left car-replacers, A and B, respectively formed with lateral flanges, inclined track-bodies, and curved guide-grooves on said track-bodies, substantially as specified.

3. The combination, with a right-hand car-replacer, A, having lateral flanges *d h*, and holding-lugs *g m*, and an inclined track-body, *c*, formed with curved guide-grooves *e l*, respectively, on opposite sides thereof, of a left-hand replacer, B, of similar formation, but having its guide-grooves reversely curved with reference to those of the right-hand replacer, substantially as specified.

293,997. APPARATUS FOR RAISING WATER. THOMAS ARTHUR, Bangor, Pa., assignor to himself and Robert James Nagle, same place. Filed Mar. 7, 1883. (No model.)



Claim.—1. An apparatus for raising water constructed substantially as herein shown and described, and consisting of three tanks placed at different levels, and connected by two bent tubes and a siphon, one of the said bent tubes being provided with a discharge-siphon, and the lower tank being provided with a pipe leading to the water to be raised, and having an upwardly-opening valve, and a discharge-pipe having an outwardly-opening valve, as set forth.

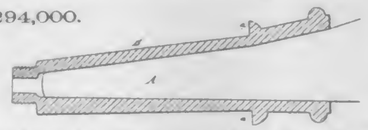
2. In an apparatus for raising water, the combination, with the three tanks A E H, placed at different levels, of the siphon C, the bent tubes D G, the discharge-siphon F in the bent tube D, and the valve-pipes I K, substantially as herein shown and described, whereby water can be raised by atmospheric pressure induced by the flowing of water through the said tanks and siphons, as set forth.

293,998. PASTE FOR CLEANING METALS. HERRMAN BARLET, Nuremberg, Bavaria, Germany. Filed Aug. 31, 1883. (No specimens.)

Claim.—A paste for cleaning metals, obtained by mixing stearine, oil of stearine, trip, and nitrobenzoyle, according to the process described above.

293,999. HALTER. EDWARD BARNARD, Rome, N. Y. Filed Dec. 26, 1883. (No model.)

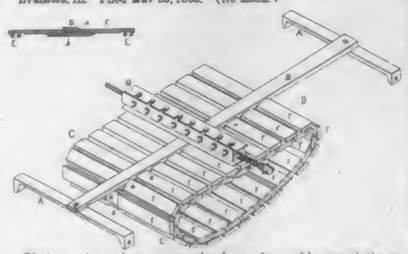
Claim.—1. The herein-described bail or loop D for halters, having the upper portion, *a*, and the lower rounded portion, *b*, substantially as described, and for the purpose set forth.



2. In a halter, the combination, with the head and nose portions, consisting of a single strap, of bails or loops D, made substantially triangular in form, and located at the angle formed at the junction of the head and nose portions of the halter, substantially as set forth.

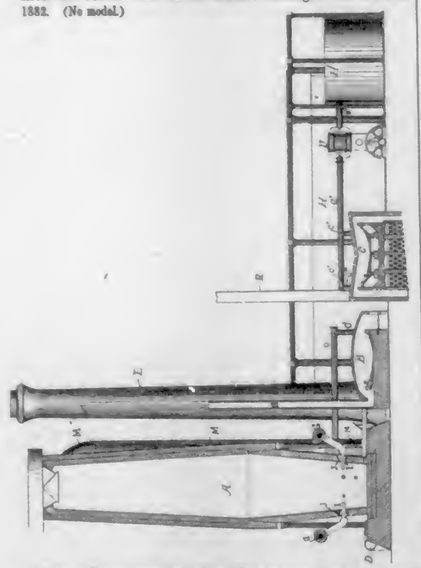
3. The combination, with a bail or loop, D, consisting of the upper portion, *a*, and the lower rounded portion, *b*, of the head-strap secured to said upper portion, *a*, and bent upon itself at an angle to form the nose-strap, and the halter-strap secured to the lower rounded portion, *b*, substantially as set forth.

294,000. THIMBLE-SKEIN FOR WAGONS. ALLEN J. BEACH, Linden, Mich. Filed Dec. 1, 1881. (No model.)



Claim.—In combination with an axle having its lower edge horizontal, an axle-skein having the lower portion of its interior in a hori-

294,000.

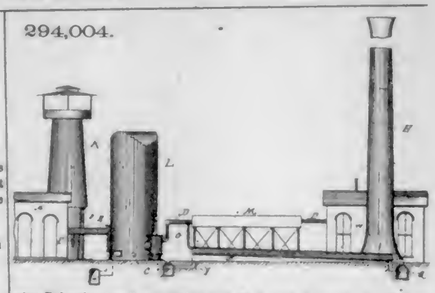


zontal line on a level with the bottom of the axle-tree, and having its point or outer end extending below the horizontal plane of the skein at the base or rear end of its bearing-surface, substantially as and for the purpose specified.

294,001. WOOD-PLANING MACHINE. EDWIN BENJAMIN, South Evanston, Ill. Filed May 23, 1883. (No model.)

Claim.—As an improvement in planers for working wood, the tapered guide B, gained into the bed at *a*, and placed with its wider end to the delivery end of the machine, to shorten the cutting-length of the knives to the cutter-head gradually from the narrow to the wide end of the guide B, and thus forming a draft for the uniform delivery of stuff from the machine, as specified.

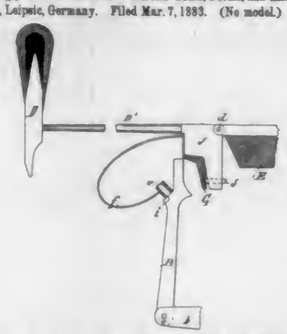
294,002. APPARATUS FOR THE MANUFACTURE OF INGOT IRON AND STEEL. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Dec. 1, 1882. (No model.)



Claim.—The combination, with a blast-furnace, A, of a reverberatory furnace, B, a regenerative furnace, C, connected and constructed as described, of a gas-holder, H, suitable blowers, F F, and connections, as and for the purposes herein fully set forth.

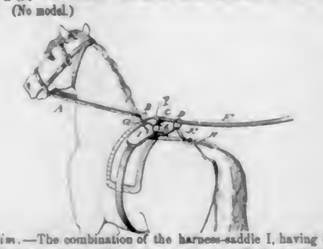
294,003. HOT-BLAST APPARATUS FOR BLAST-FURNACES. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Feb. 7, 1883. (No model.)

Claim.—1. The combination, with a blast-furnace, of two hot-blast stoves, a steam-boiler, a preheating-reservoir, and connecting-pipes and valves, substantially as and for the purpose specified.



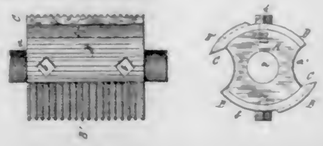
2. The combination, with a blast-furnace, K, of a downcomer, T, drop-

294,004.



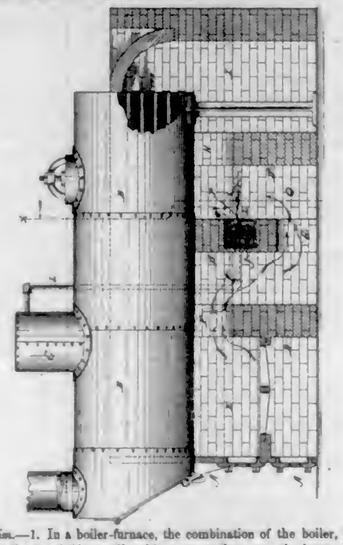
pipe P, bustle-pipe J, connecting-pipe E', heated-air-supply pipe E, hot-air-supply pipe U, connecting-pipes V X X', valves S S', stoves L L', valves R R', hot-air pipe F, air-pipe D, steam-pipe O, flues Y Z G, chimney H, blower I, and tank M, substantially as and for the purpose specified.

294,004. PIANO-ACTION. ALFRED BIESE, Berlin, and KARL GUSTAV ZIEROLD, Leipsic, Germany. Filed Mar. 7, 1883. (No model.)



Claim.—In a piano-action, the combination of the hammer-butt, hammer-fly, and interposed spring with the cushion G, attached to said hammer-butt, and receiving the pressure of said spring, and the adjusting-screw, which works through said hammer-butt against the back of said cushion, to regulate the stress of said spring, substantially as set forth.

294,005. HARNESS. SAMUEL L. BUSH, Custard's, Pa. Filed July 7 1883. (No model.)



Claim.—The combination of the harness-saddle I, having check-hook G, the crupper-strap H, having elastic strap E, the guide-ring D, placed loosely upon the said strap, the plate P, having hook B, adapted to receive the check-rein, and provided on its under side with a staple having a ring, C, adapted to engage the check-hook, and the operating-strap F, attached to the rear end of the plate P and passing through the guide-ring D, substantially as and for the purpose herein set forth.

294,006. CUTTER-HEAD. HORACE S. BOYNTON, Oshkosh, Wis. Filed Nov. 2, 1883. (No model.)

Claim.—The curved plates having elevations on the outside, bevsled to serrated cutting-edges from the inside, and curved to conform to cutter-head having convexed knife-seats, in combination with the latter, all constructed substantially as specified.

294,007. SMOKE AND GAS CONSUMING FURNACE. HENRY M. BRADY, Dalton, Ill. Filed Nov. 5 1883. (No model.)

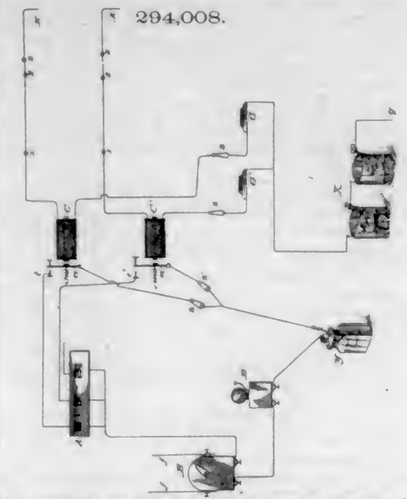
Claim.—1. In a boiler-furnace, the combination of the boiler, the fire-grate, the two bridge-walls with passages thereover, the intermediate bridge-wall having a passage thereunder, the transverse air-chamber located in the intermediate wall, means for controlling the admission of air into said chamber, and steam-ejector nozzles located in said chamber, and arranged, as described, to deliver the air in a backward direction.

2. In a boiler-furnace, a bridge-wall provided with a transverse air-chamber divided longitudinally, as described, into two compartments, in combination with means for controlling the admission of air to said compartments independently, a steam-pipe provided with nozzles, and located in the rear compartment, and nozzles O, also located in said compartment and arranged to deliver the air in a backward direction, as described.

3. In a boiler-furnace, a bridge-wall provided with a transverse air-passage divided longitudinally into two communicating compartments, the rear compartment being provided with a steam-pipe and with nozzles, as described, for delivering the air in a backward direction.

4. The combination, in a furnace, of the bridge-wall D, having over it the space or passage F, and the wall D', having under it the space or passage G, and a steam-injector arranged in an air-supplying chamber, the said injector and air-supplying chamber communicating with the chamber behind the wall D', substantially as and for the purposes set forth.

5. The combination, in a furnace, of the bridge-wall D, having over it the space or passage F, the bridge-wall D', having under it the space or passage G, the bridge-wall D'', having over it the space or passage H, and the box J, located in the wall D', and containing the chambers N and M, with their slides or doors K K, the said chambers being separated by means of a perforated partition, and the chamber M containing the injector L P and the funnels O O, substantially as and for the purposes specified.



294,008. ELECTRIC FIRE-ALARM AND FIRE-EXTINGUISHER SYSTEM. CHARLES E. BUELL, New Haven, Conn. Filed Dec. 22, 1883. (No model.)

Claim.—1. The combination, with two or more alarm-circuits that are adapted to open by heat, of alarm apparatus adapted to be made operative when either of said circuits opens, and an independent circuit and means common to the several alarm-circuits adapted to transmit a definite alarm-signal thereon to a remote station when either of said alarm-circuits opens.

2. The combination, with two or more alarm-circuits that are adapted to open by heat, of alarm apparatus adapted to be made operative when either of said circuits opens, and a galvanometer in each circuit for determining the cause of accidental alarms and for showing the condition of the circuits.

3. The combination, with two or more normally-closed alarm-cir-

294,008.

cuits adapted to open by heat, of an alarm apparatus common to the several circuits and adapted to sound an alarm by the opening of either, and an annunciator controlled by said circuits to indicate the opening of the several circuits, or either of them, and means common to the several circuits for transmitting a definite alarm-signal to a remote station.

4. The combination, with two or more alarm-circuits adapted to open by heat, of an alarm apparatus adapted to sound an alarm when either circuit opens, an annunciator controlled by said circuits to indicate the opening of said circuits, or either of them, and a galvanometer in each circuit to indicate the condition of said circuits, substantially as described.

5. The combination, with two or more alarm-circuits adapted to open by heat, of alarm apparatus adapted to sound an alarm when either of said circuits opens, an annunciator adapted to indicate the opening of said circuits, or either of them, and an independent circuit, and means common to the several circuits adapted to transmit a definite number-signal thereon to a remote station when either of said circuits open.

6. The combination, with two or more alarm-circuits adapted to open by heat, of an alarm apparatus adapted to be made operative by the opening of either of said circuits, and an annunciator adapted to indicate the opening of either of said circuits, a galvanometer in each of said circuits for denoting the condition of said circuits, and a normally-closed independent circuit, and mechanism common to the several circuits adapted to transmit a definite number-signal over said independent circuit when either of said alarm-circuits opens.

7. The combination, with a series of alarm-circuits adapted to open by heat, of the alarm apparatus D, the annunciator A, the circuit *f f*, signaling mechanism B, the galvanometers G G, and switches *s s'*, the whole arranged and operating substantially as set forth.

8. The combination, with the sprinkler H, of a spring insulated thereon and held to close an electric circuit by the parts T and L of said sprinkler when those parts are in the position of normally closed, and in a manner to allow said spring to retract and make operative said circuit when the said parts T and L, or either, become displaced from the position of closed.

9. The combination, with the distributing part of a sprinkler, of a circuit-closing key insulated thereon and held to close an electric circuit by the interlocking parts T and L, or either of them, in a manner to allow said spring to retract when said parts, or either, become displaced from their normally-closed position, to make operative said electric circuit.

10. A series of sprinklers, each provided with a circuit-closing spring that is insulated therefrom and adapted to close a circuit common to the series when the moving parts of the sprinkler are in their normal position, for excluding water, and the said spring in such relation to the fusible devices of the sprinkler as to accelerate their movement when released by heat.

11. The combination, with a sprinkler that is adapted to be made operative by the action of heat upon a fusible substance, of electrical circuit-connections insulated thereon and portable therewith, and adapted to make operative an electric circuit when said sprinkler becomes open by heat or its moving parts displaced by accident.

12. The combination, with a sprinkler that is adapted to be made operative by the action of heat upon a fusible substance, of circuit-con-

nections insulated thereon and held to close an electric circuit when the said sprinkler is closed to exclude water, and said circuit-connections adapted to become operative when said sprinkler is in a position the reverse from pendent and its moving parts become released.

13. The combination, with an alarm-circuit composed in part of a water-conducting pipe, of means for short-circuiting the battery charging said circuit by the opening or partial opening of a sprinkler.

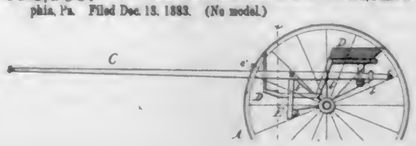
14. The combination, with battery X, of the pipe P, sprinklers H H H, with W W, resistance, and means for shunting said resistance by the partial opening or opening of the sprinklers, or either of them, to produce an alarm.

15. The combination, with a series of alarm-circuits that are normally charged, and composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, of an alarm apparatus common to the series of circuits, adapted to sound an alarm when either of said circuits opens, and means to indicate which of the several circuits has opened.

16. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, and provided with alarm apparatus common to the several circuits, adapted to sound an alarm when either of said circuits opens, of a normally-closed independent circuit and a call mechanism adapted to transmit a definite call-signal to a remote station when either of said alarm-circuits opens, substantially as described.

17. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, and provided with alarm apparatus adapted to sound an alarm when either of said circuits opens, and to indicate which of the several circuits has opened, of a normally-closed independent circuit and mechanism common to the series of circuits adapted to transmit a definite call-signal to a remote station when either of said alarm-circuits becomes open.

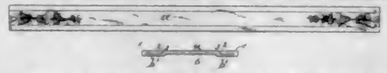
18. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, and provided with alarm apparatus common to the several circuits, adapted to give an alarm when either of said circuits opens, of a normally-closed independent circuit and devices adapted to produce an alarm at a remote station when either of said alarm-circuits becomes open.



19. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, and provided with alarm apparatus common to the several circuits, adapted to give an alarm when either of said circuits opens, of independent devices in each of said circuits adapted to indicate the condition of said circuits, substantially as described.

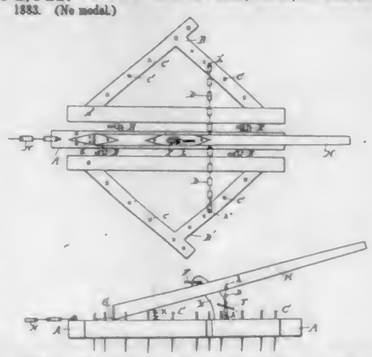
20. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, of alarm apparatus in a local or sub circuit adapted to be made operative to give an alarm when either of the said normally-closed alarm-circuits becomes open, whereby said normally-closed circuits may be short-circuited or the force charging said circuits be augmented without making operative said alarm.

21. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, and provided with alarm apparatus adapted to give an alarm when either of said circuits becomes open, of a local circuit that is normally open, and a call mechanism, and means controlled by said local circuit and adapted to transmit a signal to a remote station when the said local circuit is closed by the opening of either of said alarm-circuits, and devices in the said alarm-circuits for closing the said local circuit when either of said alarm-circuits opens.



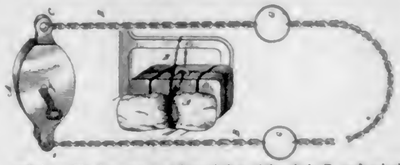
22. The combination, with a series of alarm-circuits that are normally charged, and are composed of lengths of wire not easily fused, held in electrical continuity by easily-fused joints, of an alarm apparatus adapted to sound an alarm when either of said circuits opens, and an annunciator adapted to be made operative by the closing of a local circuit when either of said alarm-circuits opens, to indicate which of said alarm-circuits has opened, with devices for each alarm-circuit adapted to close said open circuit through its respective drop of said annunciator when it becomes opened, the whole arranged and operating substantially as set forth.

294,009. TWO-WHEELED VEHICLE. LEWIS F. CASTOR, Philadelphia, Pa. Filed Dec. 13, 1883. (No model.)



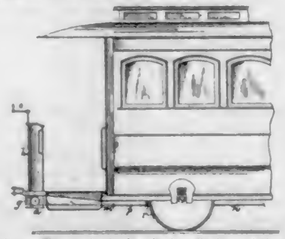
Claim.—In a two-wheeled vehicle, the combination of the shafts C C, having cross-bars *c c'*, axle B, bent or elliptic cross-bar E, spring F, dropped or curved front body D, and the spring G, the whole arranged as described, and for the purpose specified.

294,010. PLATED-EDGE BAND-BRACELET. JAS. A. CHARNLEY and CHAS. F. CHARNLEY, Providence, R. I. Filed Nov. 2, 1883. (No model.)



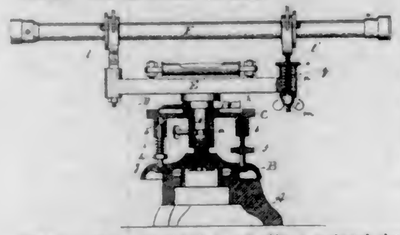
Claim.—A bracelet formed of a gold plate or other malleable metal, having its edges 1 1 turned over on its face *a*, and said face forced up from the back *b* until even with the upper side of edges 1 1, forming a level face, *a*, and ribs *b' b'*, on the back *b*, which plate is engraved and bent into proper shape, substantially as shown and described.

294,011. HARROW. JOHN H. CHENEY, Cowden, Ill. Filed July 24, 1883. (No model.)



Claim.—The hinged and slotted handle H, arc L, having check-rings F, and spring K, in combination with the central draft-beam of a harrow, having vibrating frames affixed to the sides thereof, substantially as specified.

294,012. CHAIN-LOCK OR BAGGAGE-GUARD. MYRON J. CLARK, Washington, D. C. Filed Nov. 3, 1883. (No model.)

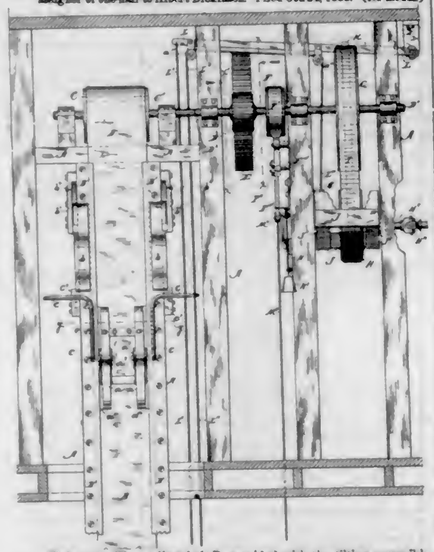


Claim.—The baggage-guard consisting of the chain B, spring-lock A, hasp C, and the rings or loops G G near the respective ends of the chain, all constructed and combined as herein shown and described.

294,013. CAR-BRAKE. GEORGE W. COFFIN, Pittsburg, Pa. Filed Dec. 10, 1883. (No model.)

Claim.—The car-brake herein described, consisting of the boxing *b c*, secured together and to the platform of the car by rods *d e*, the worm *g*, having the cylinder *f* seated in bearings in the boxing, the shaft *j*, carrying the toothed wheel *k*, meshing with said worm, the drum *l* on said shaft, having one end of the chain *m* attached thereto, the other end thereof connected to the rod *n* and lever *p* of the brake, and the removable crank-shaft A, for winding and unwinding the chain on the drum to operate the brake, as shown and described.

294,014. LEVELING-INSTRUMENT. WILLIAM T. COMSTOCK, New York, N. Y. Filed Jan. 14, 1884. (No model.)



Claim.—1. The combination, in a level, of lower graduated plate C, with base-plate B, and with thumb-screws *f f* and pins *g g*, having shoulders A and springs *i*, substantially as and for the purpose specified.

2. The combination, in a level, of a base-plate, B, with the telescope-carrying frame E, and with two graduated plates, C D, the lower plate, C, made in one piece with the central sleeve, *a*, open on top, and with the sleeves *b b' d d'* open at the bottom, substantially as specified.

3. The combination of frame E, having hollow arm *s*, with the screw-shank *m*, nuts *o p*, spring *q*, and with the supports *l l'*, and telescope F, substantially as specified.

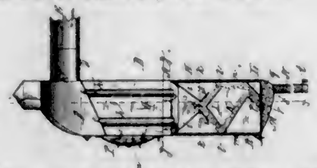
294,015. ELEVATOR FOR BAGS, &c. ADAM CONRAD, Chicago, Ill., assignor of one-half to Albert Dickinson. Filed Oct. 24, 1883. (No model.)

Claim.—1. The endless belt B, provided with the tilting reversible carrier composed of the frame *a* and the two arms *a'*, rigidly connected together and pivoted or hinged to the frame, substantially as and for the purpose described.

2. The described dumping device, composed of the bar *b* and of the bar *v*, rigidly attached thereto, and pivoted at *b''*, adapted to throw off packages in their upward passage, substantially as described.

3. The described dumping device, consisting of bar *b* and bar *v*, rigidly fastened thereto and pivoted at *b''*, and provided with a hinge, as shown in Fig. 6, adapting it to be folded back out of the way when packages are to be elevated above it, substantially as described.

4. The skids *c*, bent laterally, as shown, so as to form loops *c'* in each one, and leave space for a bag to pass up between them, and made detachable and interchangeable for use on any floor in the building, the lower ends resting on or in the floor, and their upper ends loosely in sockets or brackets, adapted to allow packages to pass up between them and then catch them when thrown off the carriers and guide them to the floor, substantially as described.



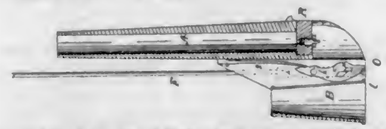
5. The rods *c'''* in pairs, having bearings for their upper ends in the uprights A, and for their lower ends in or upon the floor, and detachable, adapted to receive bags or packages in their downward passage and guide them out of the way and upon the floor, substantially as described.

6. The combination of the lever L, having one end pivoted to the main frame, and having pivoted to it the fulcrum-bar *k*, and the pivoted weighted frame J, bearing its pinion H and shaft H', substantially as described.

7. The brake for the pulley F, composed of the two shoes F', pivoted at their lower ends to the main frame, and the vertical lever F'', working on pivot F', and operating the brake-shoes by the two links, as shown in Fig. 5, substantially as described.

8. The combination of the pawl O, pivoted on the main frame, and the rack-bar O' on the inner end of pivoted frame J, adapted to hold that end down against the weight J' on the other end of the same, substantially as described.

294,016. CAR-VENTILATOR. WILLIAM E. COWEN, Defiance, Ohio. Filed Oct. 9, 1882. Renewed Aug. 15, 1883. (No model.)

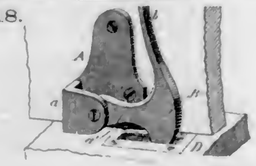


Claim.—1. As an improvement in car-ventilators, a deflector, H, in combination with and interposed between a receptacle, M, for collecting cinders, dust, &c., located thereunder, and one or more vertical pipes, A A', extending through a compartment, G, located thereover, and an inlet and outlet for the air, as and for the purpose described.

2. An inlet-pipe, E, a chamber, D, the compartment G, provided with a series of vertical pipes, A A', extending through the same, a deflector, H, a cinder and dust receptacle, M, and an outlet, *u*, opening into the car, and controlled by a register, P, slide, damper, or other suitable valve, combined and arranged as shown and described, for the purpose set forth.

3. The deflector H, with its inclined partitions *i' i* I K L and passages *g e r*, in combination with and interposed between a compartment, G, located thereover, and provided with a series of vertical pipes, A A', extending down through the same, and a cinder and dust receptacle, M, located thereunder and provided with a discharge-pipe, N, having a suitable valve, as and for the purpose specified.

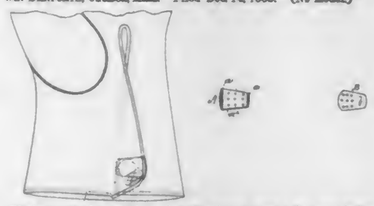
294,017. BOMB-GUN. PATRICK CUNNINGHAM, New Bedford, Mass. Filed Nov. 30, 1883. (No model.)



Claim.—1. In a breech-loading bomb-gun, the combination of a gun-barrel having a lock-case containing firing devices arranged along its side, and having a suitable breech-block adapted to turn on a hinge, with a suitable pole-socket arranged alongside of said barrel, as and for the purpose shown and described.

2. In a breech-loading bomb-gun, the combination of a gun-barrel having a lock-case containing firing devices arranged along its side, and having a suitable breech-block adapted to turn on a hinge, with a pole-socket having suitable lugs on its side for the support of a harpoon, arranged alongside of said gun-barrel, as and for the purpose shown and described.

3. In a breech-loading bomb-gun, the combination of a gun-barrel having a suitable breech-block adapted to turn on a hinge, a lock-case containing firing devices arranged alongside of said barrel, and having a socket in which a rod is adapted to slide and actuate the firing devices, and a suitable pole-socket having on its side suitable lugs for the support of a harpoon, arranged alongside of the lock-case or gun-barrel, all as shown and described.



294,018.

294,018. DOOR-CHECK. WILLIAM B. DAGER, Canton, Ohio. Filed June 25, 1883. (No model.)

Claim.—The door-check herein described, consisting of the plate A, adapted to be secured to a door, and provided with an arm, *a*, and the pivotal lever B, rounded upon its bearing-surface, and provided with a projection, C, in combination with a plate, D, adapted to be secured to the door-sill, said plate and sill being mortised, substantially as and for the purpose set forth.

294,019. CLASP OR FASTENING FOR GLOVES, &c. GEORGE EDWIN DANFORTH, Chelsea, Mass. Filed Dec. 14, 1883. (No model.)

Claim.—A clasp or fastening for gloves, shoes, &c., consisting of the two parts A and B, the part A having a grooved flange at each end, as described, and the part B adapted to be inserted under the end flanges to close the clasp, the parts each having suitable means for attachment to the glove or shoe, all substantially as set forth.

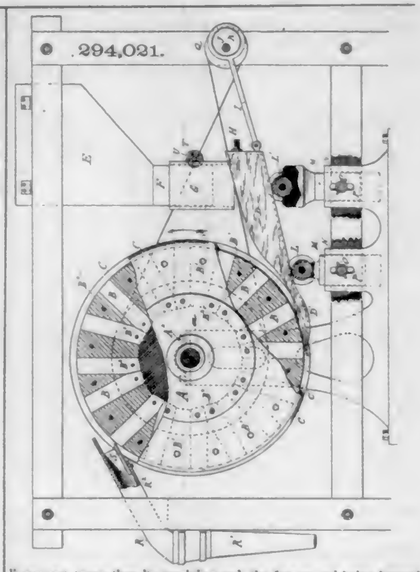
294,020. LUMBERMAN'S SOCK. WILLIAM N. EISENDRATH, Chicago, Ill., assignor to himself and Benjamin D. Eisendrath, same place. Filed Oct. 1, 1883. (No model.)

Claim.—1. In a wool-skin sock, the combination of wool-skin sock A, composed of two pieces, *a* and *a'*, united together by a seam, a^2, at their edges, with felt lining B, likewise composed of two pieces, *b* and *b'*, united together at their edges by a seam, b^2, said lining being secured to said wool-skin only at the top of the sock by a seam, b^3, and smooth facing C, secured on the inside of the leg of the sock to said piece *a* by seams c^2 and central seam, c^3, thus forming pockets *c* and *c'*, substantially as specified.

2. The combination, with wool-skin sock A, of felt lining B, secured to said wool-skin only at the top of the sock, so as to be removable therefrom, substantially as specified.

294,021. MAGNETIC-IRON-ORE SEPARATOR. CHARLES FABER, Brooklyn, N. Y. Filed Nov. 20, 1883. (No model.)

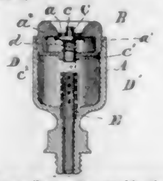
Claim.—1. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A and the scraper S, held by a suitable support, with its operative edge in proximity to the convex surface of the cylinder, whereby collected ore may be removed therefrom and a covering or armature of said ore left for the ends of the magnets, substantially as set forth.



2. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A, having end flanges, C, projecting radially beyond the periphery thereof, and a scraper, S, held above the cylinder by a suitable support, the operative edge of said scraper projecting inwardly toward the cylinder between the flanges C, whereby the material collected by the scraper is confined and its escape over the edges of the cylinder prevented, substantially as set forth.

3. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A, ore-feeding trough or spout D, vertically-adjustable rollers L L', situated at or near each end of said trough and supporting the same, and mechanism, substantially as described, for reciprocating said trough, as set forth.

4. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A, ore-feeding trough or spout D, situated with one end in proximity to said cylinder, to deliver ore to the same, ore-hopper E, having a spout, F, the casing G, situated above the trough D and forming a conduit between the latter and said spout F, and means, substantially as described, for adjusting said casing G toward or from the bottom of the trough D, as set forth.



5. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A, trough D, situated with its delivery end in proximity to said cylinder, to feed ore thereto, and a water-connection, whereby a stream may be directed through said trough, substantially as set forth.

6. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A, the ore-feeding trough D, situated with its delivery end lower than its receiving end, the former end being beneath the cylinder and in proximity thereto, and having the depression D' in its bottom, and a water-connection, whereby a stream may be directed through the trough and out at its delivery end, by which devices an interruption to the descending stream of ore and water is caused at the point D', and said stream diverted upward toward the magnetic surface, to facilitate the separation of the attracted particles, substantially as set forth.

7. In a magnetic-iron-ore separator, the combination of the magnet-carrying cylinder A and scraper S, arranged to remove the attracted particles from said cylinder, the scraper being composed of non-magnetic material incapable of being magnetized, and rendered attractive by the magnet-carrying cylinder, substantially as set forth.

294,022. OIL-CUP. JOHN J. FAWCETT, Springfield, Ohio. Filed Dec. 17, 1883. (No model.)

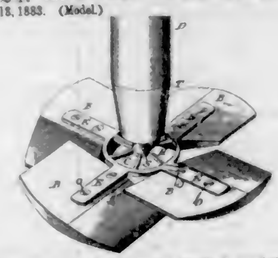
Claim.—1. In an oil-cup, the combination, with a cap having a conical cavity and an inlet-opening therein, as described, of a bridge-tree extending diametrically across the lower end of said cap, a collar central in said bridge-tree, a valve having its lower stem extending through the collar of said bridge-tree, and a spiral spring supported upon the latter and adapted to operate said valve in automatically closing the same, as set forth.

2. In an oil-cup, a cap having an opening therein, and a valve and means for operating the same inclosed therein, said valve being provided with a central upright stem projecting from the top as means for operating the same in addition to the pressure of the can-nozzle, substantially as set forth.

3. The combination, with an oil-cup, A, having a discharge-outlet, E, of the screw-threaded cap B, having a rounded top to prevent the lodgment of dust, a conical cavity, and an opening, *a*, therein, a bridge-tree, D, extending diametrically across the lower end of said cap, provided with a central collar, *c'*, and a valve, C, with its lower stem extending through said collar and its upper stem projecting centrally through said opening *a*, said valve being operated in closing the latter by a spiral spring, *d*, surrounding the valve-stem c^2, within said cap and supported upon the bridge-tree D of the same, substantially as set forth.

294,023. RACK FOR CIDER-PRESSES. WILLIAM H. FERGUSON, Voorheesville, N. Y. Filed June 4, 1883. (No model.)

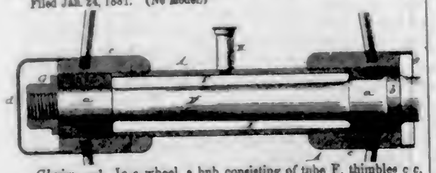
294,023.



Claim.—1. A rack for cider-presses, composed of slats or bars arranged in a square series, and provided with two oppositely-located hinged rails, which are adapted to be turned alternately to vertical and horizontal positions in relation to the rack, and be temporarily secured in vertical positions by means of other side rails which are transversely arranged with the rack, for temporarily supporting the outer portions of the straining-cloths of a layer of cheese, and for the retention of the pomace on the rack, substantially as set forth.

2. The combination, with a cider-press rack which is provided at two of its oppositely-located edges thereof with rails so hinged thereto as to be adapted to be turned from horizontal positions to vertical ones and the reverse, of two rails which are separate from and independent of said hinged rails, and adapted to be secured transversely to the hinged side rails, so that the hinged rails and these transversely-arranged rails will be made to temporarily support each other in a vertical position, as and for the purposes set forth

3. The combination, with rack A, made with a square form and composed of slats, of rails A' A', hinged to two oppositely-located edges of the rack, transversely-arranged rails B B, or their described equivalents, which are removable from connection with rails A' A', and mechanism by which the ends of said hinged rails and transversely-arranged rails will be securely connected at will, for the purposes set forth.

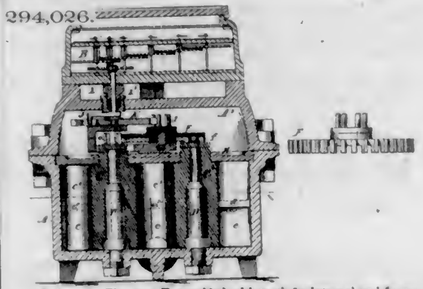


4. The means for holding straining-cloths and pomace in forming the several layers of a cheese in a cider-press, consisting of the combination and arrangement of two or more slat-racks, A, made with uniformly the same dimensions and squared form, and each provided at two oppositely-located edges with hinged rails A' A' and the removable rails B B, adapted to be used interchangeably with each rack and its hinged rails, and having secure temporary connection with said hinged rails, substantially as and for the purposes set forth.

294,024. CHURN-DASHER. JOHN E. FINLEY, Memphis, Tenn. Filed Aug. 18, 1883. (Model.)

Claim.—The churn-dasher herein described, consisting of the casting C, having central perforated hub, and provided with arms E E, having slanting ends, the segmental wedge-shaped sections of wood B B, attached to said ends, hub H, screw S, and staff D, as specified.

294,025. VEHICLE-WHEEL. FRANK L. F. FISH, East Saginaw, Mich. Filed Jan. 24, 1881. (No model.)



Claim.—1. In a wheel, a hub consisting of tube F, thimbles *c c*, and internal wearing sleeves or thimbles, E, all substantially as shown.

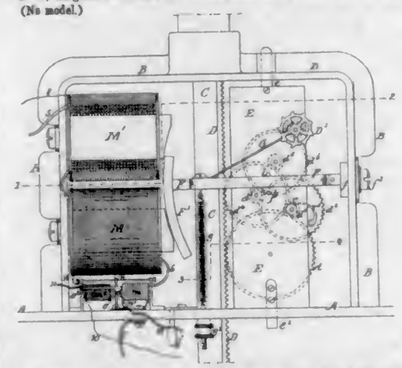
2. The herein-described hub, consisting of tube F, end sleeves, *c*, inner sleeves or wearing-thimbles, E, sand-band *g*, and dust-cap *d*, all substantially as described.

3. A vehicle-wheel consisting of a hub, A, composed of tube E, thimbles *c c*, and internal bearing sleeves or thimbles E, spokes B, formed with a series of connecting short curves in a plane at right angles to the circumference of the wheel, and a rim or felly connected with the outer ends of the spokes, all substantially as shown and described.

294,026. ROTARY METER. BENAIAH FITTS, Worcester, Mass. Filed Oct. 11, 1883. (No model.)

294,026.

Claim.—1. The gear F, provided with teeth for internal and for external action on the same pitch-circle, in combination with rotating pistons having pinions which severally intermesh with said gear for simultaneously operating it, substantially as set forth.



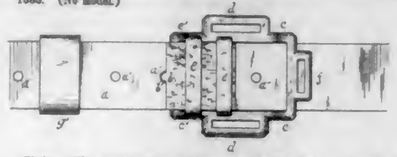
2. The combination, with two rotating pistons provided with pinions or pin-teeth, of a gear adapted to be simultaneously actuated from both pistons, and means for transmitting motion therefrom to a mechanical train or registering mechanism, as set forth.

3. The combination, with two rotating pistons having a series of intermeshing blades which are adapted to make contact on their adjacent surfaces, of a single end gear intermeshing with pinions or studs on the piston-axes, and adapted for retaining said pistons and their interacting blades in uniform relation with each other as the pistons revolve, substantially as set forth.

4. The pistons C C', having series of thin blades *c*, with faces *c'*, curved as described, and provided with narrow transverse back ribs, *d*, the edges of which, in connection with the face-curve *c'*, give the contour of gear-teeth for close intermeshing action as said pistons are revolved in contact with each other, as set forth.

5. A water-meter having the shell or case A, provided with a divided inlet with ports a' a^2, directed to the right and left, the rotating pistons provided with series of blades *c*, intermeshing with each other and making contact on adjacent curved faces *c'*, a train of spur-gears within the cap A, for receiving motion from said pistons, and a crank with shaft passing through a stuffing-box in said cap, for transmitting motion to the registering mechanism, as shown and described.

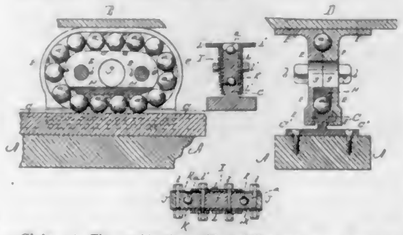
294,027. ELECTRIC-ARC LAMP. WARREN P. FREEMAN, Brooklyn, N. Y., assignor to William F. Jobbins, same place. Filed Mar. 9, 1883. (No model.)



Claim.—1. The combination of the movable carbon-holder of an electric-arc lamp having a rack, with a movable frame carrying a train of gears, electro-magnets in the main and shunt circuits, an armature-lever adapted to raise the movable frame, and a catch or arm carried wholly by the said armature-lever, to lock and release the gears, substantially as set forth.

2. The combination of the movable carbon-holder of an electric-arc lamp having a rack, with a movable frame having lifting-pins and carrying a train of gears, and ratchet or break wheel, and with electro-magnets in the main and shunt circuits, and an armature-lever carrying a catch for said ratchet or break wheel and adapted to act on the said lifting-pins, all substantially as described.

3. The combination of the movable carbon-holder having a rack, and the frame slotted for the passage of said holder, with a train of wheels gearing with the rack, and a retaining-lever, J, as and for the purpose specified.

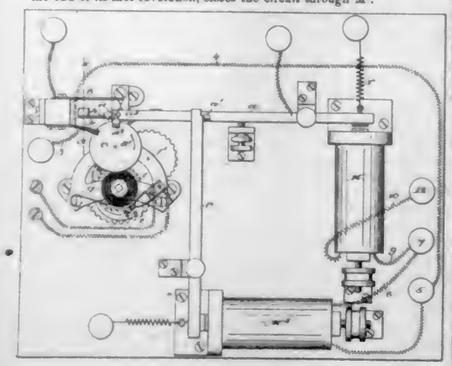


4. The combination of electro-magnets *m m'* in the main and shunt circuits, and armature *n*, carrying a catch-pin, with a contact, *n'*, and pivoted catch adapted to come in contact with the latter on its release by the catch-pin and conductors 11 12, substantially as set forth.

294,028. TUG-BUCKLE. SAMUEL FUNK, Decatur, Ill. Filed Dec. 7, 1883. (No model.)

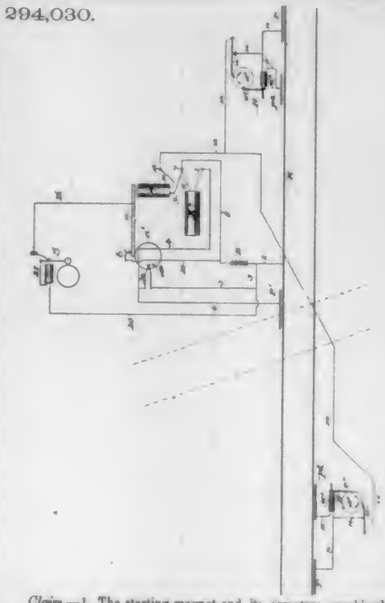
Claim.—The combination of frame *c c'*, having loops *e e*, wedge *b*, provided with projection *b'*, and hame-tug *g*, provided with elongated perforation *h*, as and for the purpose set forth.

294,029. SLIDING SEAT FOR BOATS. JOHN C. GARROOD, Boston, Mass. Filed Dec. 24, 1883. (No model.)



Claim.—1. The combination, with a sliding seat and a track in a boat, of a box or carriage secured to said seat, provided with the internal passage, *e e'*, the parts *e* thereof being substantially straight and parallel, and the parts *e'* being curved and connecting the parts *e* at opposite ends, said passage being provided with balls *a*, adapted to run on said track, substantially as and for the purpose set forth.

2. The ball-bearing for a sliding boat-seat, of substantially the shape shown—*i. e.*, flattened at its upper and under sides—and having the passage *e e'*, provided with the hard-metal lining H, placed next the upper side of the under of the portions *e* of said passage, substantially as and for the purpose described.



3. The herein-described improved box or carriage E, made in two parts by dividing it vertically and longitudinally, provided with the seat-flanges E'', the passage *e e'*, balls *a*, and the guides E', all constructed and arranged substantially as and for the purpose hereinbefore set forth.

294,030. RAILWAY-SIGNAL. OSCAR GARRETT, Boston, Mass., assignor to the Union Switch and Signal Company, Pittsburg, Pa. Filed June 6, 1883. (No model.)

Brief.—Train approaching crossing energizes magnet M, withdrawing armature, closing signal-circuit, and allowing disk to revolve under impulse of clock-work. The armature of M is locked by armature of a magnet, M^3, in normally-open circuit. At crossing train closes circuit through M^3, withdrawing its locking-armature and stopping the signal; but if train does not proceed to crossing, a pin on the revolving disk, near the end of its first revolution, closes the circuit through M^3.

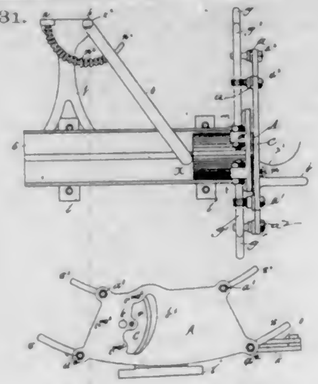
294,030.

Claim.—1. The starting-magnet and its armature, combined with the stopping-magnet and its armature controlling the said starting-magnet armature, and the mechanical motor controlled by the starting-magnet, and adapted to operate a circuit-controlling instrument in the circuit of the stopping-magnet, substantially as described.

2. The starting electro-magnet and armature and the stopping electro-magnet and its armature controlling the armature of the starting-magnet, combined with a mechanical motor controlled by the starting-magnet, and circuit-controlling instruments for the starting-magnet operated by passing trains, and circuit-controlling instruments for the stopping-magnet operated by the trains and by the said motor, substantially as described.

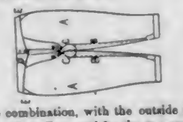
3. The signal and its co-operating starting and stopping electro-magnets operated by a momentary change in the condition of the circuit, combined with circuit-controlling instruments for the said magnets and an independent intermediate circuit-controlling device for the starting-magnet, all controlled by passing trains, substantially as and for the purpose described.

4. The starting electro-magnet and armature and signal controlled thereby, combined with the mechanical motor having a regulated time-movement when in operation, controlled by the said magnet, and adapted to cause the signal to cease operating at the end of a definite interval of time after it is started by the said magnet, substantially as described



5. The signal and its starting electro-magnet and circuit thereof, containing a circuit-controlling track-instrument, and a circuit-controlling instrument and mechanical motor for actuating it, combined with an electro-magnet and its armature controlling the said motor, and provided with a circuit-controlling track-instrument near that of the starting-magnet, whereby trains moving in one direction will cause the release of the said motor, which will remove the starting-magnet and signal from the control of its track-instrument while the motor remains in operation, substantially as described.

294,031. BEEF-CUTTER. JOSEPH GLOVER, Paterson, N. J. Filed Aug. 23, 1883. (No model.)



Claim.—1. The combination, with the stationary head provided with curved guide-rods, of the cutter-head having an eye-stud in each corner, and provided with a curved opening and an operating-handle, the cutting-tool C, carried by said cutter-head, the devices for securing and adjusting said cutting-tool, and the means for securing the curved guide-rods, substantially as described.

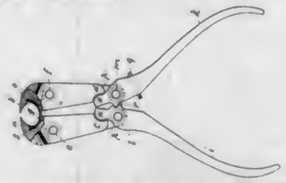
2. The combination, with the stationary head provided with curved guide-rods, V-shaped bed, and projecting arm having a lug, of the feed-rod pivoted on said arm, curved rod secured in said lug and passing through the feed-rod, spring arranged on said curved rod for actuating the feed-rod, and securing means for the stationary head, substantially as described.

294,031.

294,032. PANTS OR DRAWERS. PHILIPP GOTTHEIMER, Omaha, Nebr. Filed June 7, 1882. (No model.)

Claim.—1. The combination, with the outside leg portion, A, of the curved inside leg portion, B, as and for the purposes set forth.

2. In a pair of drawers, the curved inside leg portions, terminating at the crotch in two inside seams for each leg, as and for the purposes set forth.

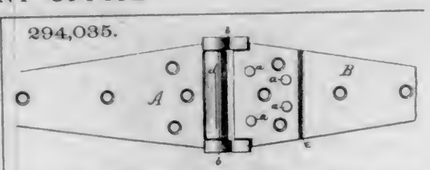


294,033. MACHINE FOR ATTACHING AND SETTING METALLIC HANGERS TO COATS OR OTHER GARMENTS. EDWARD P. HART and JOHN H. WALKERDEN, Brooklyn, N.Y. Filed Dec. 19, 1883. (No model.)

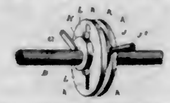
Claim.—1. In a machine for attaching metallic hangers, the combination of the movable bar B, having the semicircular projection E, with the crimping-blocks G G, having the recess F between them, said blocks being supported upon the base-plate A, substantially as described.

2. The combination of the base-plate A, the crimping-blocks G, containing the channel or groove *g'*, and having between them a recess, F and the bar B, carrying the projection E, and having a slot, D, containing the striking-bar C, substantially as described.

294,034. CUTTING-PLIERS. THOS. G. HALL, Brooklyn, N.Y. Filed July 25, 1883. (No model.)



Claim.—A cutting pliers or nippers consisting of a pair of jaw-levers, *a b c d*, handle-levers *i k n o*, connected by gearing *r*, the independent fulcra *e f l m*, C-spring *g*, seated in notches cut in the under side of the jaws, side plates, *p p*, and a stop, *q*, substantially as described.

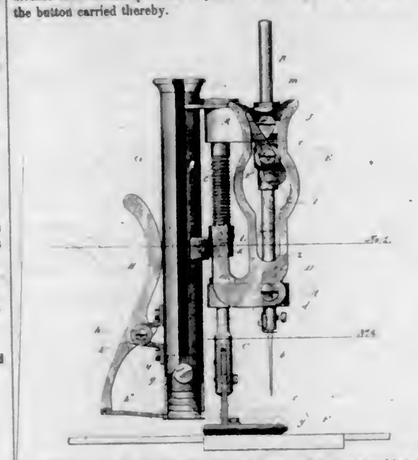


294,035. HINGE. CHARLES E. HART, New Britain, Conn., assignor to the Stanley Works, same place. Filed June 7, 1881. (Model.)

Claim.—The improved strap-hinge consisting of the flanged plate C, bearing the pintle, the coilless strap-leaf B, secured to the body of said plate, said two parts forming one half of the hinge, and the strap-leaf A, coiled around the pintle and forming the other half of the hinge, substantially as described, and for the purpose specified.

294,035.

294,036. CUT-OFF-VALVE GEAR. GEORGE T. HATCH and FRANK W. RIEMENSNS, Peoria, Ill. Filed July 11, 1883. (No model.)



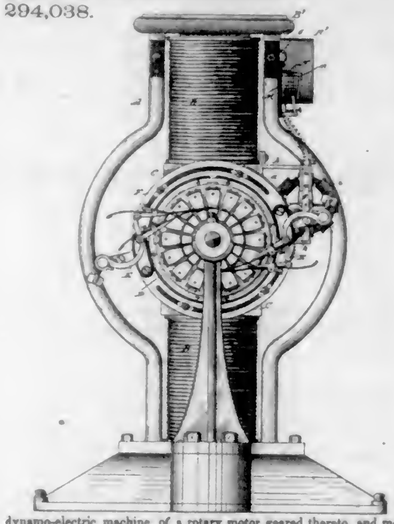
Claim.—1. The eccentric J, having non-central slot J' and pins L L, the disks K K, having slots K' K', and the eccentric H, having arm G, in combination with the rod D, weighted lever C, rod E and spring F, the fly-wheel A, and shaft B, substantially as and for the purpose specified.

2. The eccentric J, having non-central slot J' and pins L L, the disks K K, having slots K' K', and the eccentric H, having arm G, in combination with the shaft B and means whereby the variations in the speed of revolution of said shaft shall oscillate said arm G, substantially as and for the purpose specified.

294,037. SEWING-MACHINE ATTACHMENT FOR SEWING BUTTONS ON FABRICS. JOHN HEDEMAN and BENJAMIN THACKRAH, Amsterdam, N.Y. Filed May 5, 1883. (No model.)

Brief.—A switch-cam oscillates a bell-crank lever, which, by means of an arm connected therewith by a ball-and-socket joint, rocks the presser-foot bar, and thereby causes the button-holding presser-foot to assume the alternate positions required for stitching through the eyes of the button carried thereby.

Claim.—1. In combination with an organized sewing-machine, the cam-link D, so constructed as to be operated by the pivoted switch E, secured to the needle-bar B, and the stationary switch-wedge J, the presser-bar C, provided with a button-holder presser-foot, c, the spiral spring *c'*, and the ball-and-socket joint L *l*, all constructed and operated as and for the purposes set forth.



2. In combination with a sewing-machine, the barrel or reservoir G, provided with a slot upon one side, an internal weight provided with a thumb-piece working in the slot, and a lever and plunger to force out the buttons, and the button-holder presser-foot, all operating together substantially as set forth.

3. The button-holder presser-foot c, constructed as described, combined with the presser-bar C, spring *c'*, cloth-plate F, cam-link D, stationary switch-wedge J, pivoted switch E, spring *m*, ball-and-socket joint L *l*, and needle-bar B, all substantially as set forth.

294,038. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSEN, New York, N.Y. Filed Mar. 16, 1883. (No model.)

Claim.—1. The combination, with the adjustable commutator on a

294,038.

dynamo-electric machine, of a rotary motor geared thereto, and means for reversing said motor, controlled by an armature that is supported by the field-magnet and arranged to be actuated by the magnetic attraction thereof.

2. The combination, with the adjustable commutator, of the rotary motor placed in a bridge between two branches, each containing a resistance, and means for admitting the current to one or the other terminal of the motor, or to both simultaneously, as and for the purpose described.

3. The combination of the adjustable commutator, the rotary motor geared thereto, the bibranched circuit, each branch containing an artificial resistance, the motor-terminals connected to the two branches, and a circuit-closer for admitting the current to one or the other of the branches, as described.

4. The combination, with the electric motor, of the rocking lever carrying two insulated contacts, one connected to one and the other to the other terminal of the motor, and a rocking circuit-closer working upon said lever in the manner described, so as to close one or the other circuit, or both simultaneously.

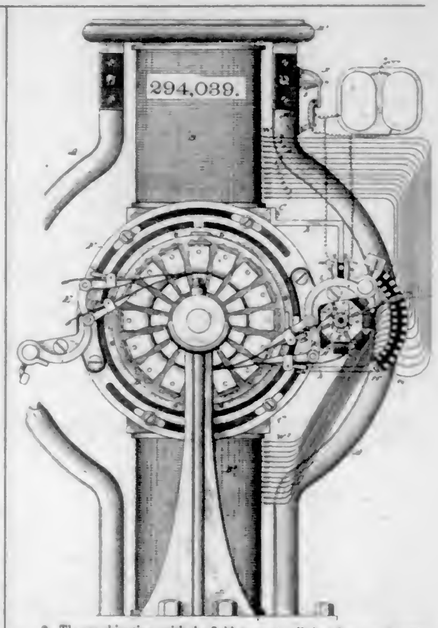
5. The combination of the circuit-closing lever *r*, the double contact-lever $q\ q^2$, whose contacts are insulated from one another and arranged one above the other, and the electric motor and artificial resistance, connected as described.

6. The combination, with the commutator-brush support F, of the rack *a*, the electric motor, and the gear *b d c*.

7. The combination, with the rotary motor and the adjustable commutator, of reversing devices for said motor, and an armature for actuating said circuit-reversing devices, supported on the field-magnet frame and arranged to be actuated by the magnetic attraction of said frame.

8. The combination, with the adjustable commutator, of the rotary actuating electromotor, the pole-pieces G G for said motor, connected to the pole-pieces of the machine, and the non-magnetic connecting-pieces $g\ g^2$, in which the motor-shaft is pivoted.

9. The combination of armature M, circuit-closer *r*, double insulated contacts $t\ t^2$, each connected with the continuation of the circuit through a separate branch containing an artificial resistance, and an electric motor in a bridge between said branches at a point between the resistances and the circuit-closer.



10. The combination of circuit-closer *r*, armature N, compound contact-lever $q\ q^2$, contacts $t\ t^2$, resistances R R^2, and electric motor, connected as described.

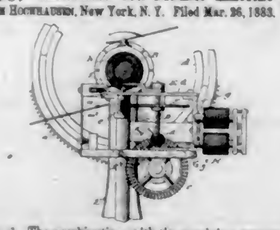
11. The combination, with the adjustable commutator on a dynamo-machine, of an actuating electric motor whose pole-pieces are magnetized from the field-magnets of said machine.

294,039. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Mar. 22, 1883. (No model.)

Claim.—1. The combination, with a series of loop-connections from the field-coils in a dynamo-electric machine, of a circuit closer and breaker, a motor operating the same, and automatic reversing devices for causing said motor to move in one direction or the other, so as to vary the number of field-coils through which the exciting-current shall flow.

294,039.

2. The combination, with the field-magnet coils in a dynamo-electric machine, of a circuit-closer and loop-connections from the coils, whereby an exciting-current may be caused to flow through a greater or less number of said coils, an electric motor for operating said circuit-closer, and means for automatically reversing said motor in accordance with a rise or fall of the current generated by the machine.



3. The combination, with the field-magnet coils, of a circuit-closer and connections, whereby a greater or less number of said coils may be included in circuit, a rotary electric motor for operating said circuit-closer, and devices whereby the direction of the current through said motor may be automatically reversed in accordance with variations in the working-resistance.

4. The combination, with the field-magnet coils, of a circuit-closer and connections, whereby a greater or less number of coils may be included in the circuit, an actuating electric motor for said circuit-closer in a bridge-wire between two branches, each including a resistance, and a circuit-closer for admitting the current to one or the other branch singly, or to both together.

5. The combination, with the rotary electric motor, of the contact-arm secured to the armature-shaft thereof, and means for automatically reversing said motor as the main-current strength rises or falls above or below normal.

6. The combination, with the two field-magnets, of the two intermediate series of insulated contacts forming the terminals of loops from the magnet-coils, and a circuit-closer for connecting said insulated contacts in succession, as described.

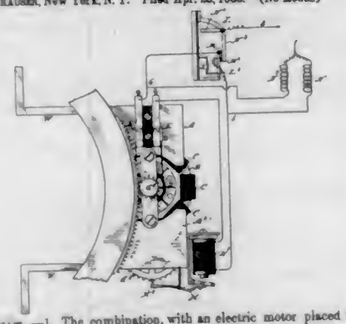
294,040. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Mar. 26, 1883. (No model.)

Claim.—1. The combination, with the revolving armature or armature-shaft on a dynamo-electric machine, of an adjustable commutator for said armature, two revolving wheels actuated by said armature-shaft, an intermediate wheel gearing positively with the adjustable commutator, and an electro-magnet for bringing said intermediate wheel into connection with one or the other of the revolving wheels, said electro-magnet being energized by and varying in power with the current collected by said commutator.

2. The combination, with the armature-shaft, of adjustable commutator-brushes connected therewith by intermediate reversing mechanism, two electro-magnets acting in opposite directions on said reversing mechanism, so that when one actuates said reversing mechanism the commutator-brushes may be moved in one direction, and vice versa, and means for energizing one or the other of said magnets simultaneously with the rise or fall of the normal current strength.

3. The combination, with the armature-shaft, of two disks or wheels, A A^2, on the armature-shaft, a wheel, *f*, through which movement may be communicated to the regulating devices for changing the electro-motive force of the machine, and means for bringing said wheel into contact with one or the other of said disks or wheels A A^2, according as the current strength rises or falls above or below normal.

4. The combination of the armature-shaft having the two disk wheels or surfaces A A^2, the adjustable commutator-brushes or other device for regulating the electro-motive force of the machine, the intermediate actuating mechanism, wheel *f*, forming a portion of the same, and mounted on a swinging lever, and two electro-magnets acting on said lever in opposite directions, as and for the purpose described.



5. The combination, with the armature-shaft, of the adjustable commutator or other device by the adjustment of which the electro-motive force of the machine may be regulated, the intermediate actuating mechanism, the frame or support G, carrying wheel *f*, or other device whereby the mechanism may be run in either direction from the shaft, and two electro-magnets, H H^2, arranged to actuate the frame G in opposite directions, substantially as and for the purpose described.

6. The combination of the armature-shaft having driving-surfaces A A^2, the adjustable commutator or its equivalent, the intermediate actuating mechanism provided with the movable driving-wheel *f*, the two electro-magnets controlling the position of said wheel, and suitable means whereby a current may be admitted to both or one of said magnets, according as the current strength is at normal or above or below normal.

7. The combination, with the armature-shaft having driving-surfaces A A^2, of the wheel *f*, mounted on swinging frame G, magnets H H^2, brush-support A, having rack *a*, and the intermediate driving mechanism between said rack and wheel *f*.

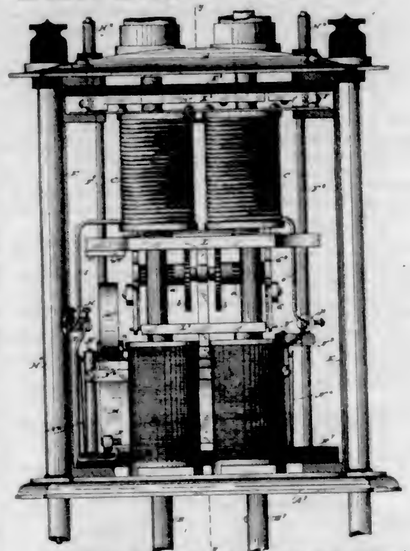
8. The combination of support G, wheel *f*, gear F *d c*, horizontal shaft C, pinion *b*, and rack *a*.

294,041. AUTOMATIC BRAKE FOR ELECTRIC MOTORS. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination, with an electric motor placed in a bridge between two branches of a supply-conductor, of an automatic electro-magnetically-controlled brake the electro-magnet for which is placed in the bridge-wire.

2. The combination, with an electric motor placed in a bridge between two branches of a main circuit, of means for admitting current to either or both of said branches, and an electro-magnet in the bridge-wire controlling an automatic brake for the motor.

3. The combination, with an electric motor placed in a bridge-wire between two branches, of the main conductor, a resistance in each branch, a switch for admitting the electric current to either branch, and a brake for the motor controlled by an electro-magnet in the bridge-wire.



4. The combination, with an electric motor placed in a bridge-wire, of an electro-magnet in said bridge-wire, a brake for stopping the motor actuated by a spring or other power, and an electro-magnet in the bridge-wire for holding the brake out of action so long as there is an excess of current in either branch over that in the other.

5. The combination, with an electric motor, of the bibranched conductor containing artificial resistances, a bridge-wire containing an electric motor, a brake for said motor supported by an armature-lever, and an electro-magnet acting on said armature and included in the bridge-wire.

6. The combination, with an electric motor placed in a bridge-wire, of a switch for producing an inequality of flow in the two branches between which the bridge-wire is placed, and a brake for said motor controlled by an electro-magnet which is arranged to hold the brake out of action when the current in either branch prevails over that in the other.

7. The combination of the lever N^2, the double contact-lever L^2, electric motor in the bridge-wire between the branches from the double contact-lever, and a brake electro-magnet, H^2, substantially as and for the purpose set forth.

294,042. DOUBLE ELECTRIC-ARC LAMP. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination, with two carbon-carriers, of two independent sets of feed-regulating mechanisms—one for each carrier—constantly in normal or feed-regulating connection with said carrier, so that when the magnet system acts it will act alike and in the ordinary manner upon both mechanisms and their carriers, a catch for engaging with and preventing the movement of one carrier when the feed-regulating mechanism is released by the movement of the lever, while the other is left free to move, and means for automatically releasing the first-named carrier when the latter has fed to a predetermined point.

2. The combination, in a double-carbon lamp, of a single pivoted frame, a single magnet system actuating said frame, two independent trains of wheels mounted on said frame, independent retarding devices for each train, detents arranged to release both trains when the frame is moved, carbon-carriers—one for each train—and means for holding one train from movement when both are released, while the other is left free to rotate.

3. The combination, with two carriers supported from a common armature lever or support, of an intermediate locking-lever carried by said support and engaging positively with one carrier, and a releasing projection upon the other carrier, for actuating and disengaging said locking-lever when the latter carrier has moved downward to a predetermined extent.

4. The combination, with the two carbon-carriers, of the intermediate elbow-lever pivoted on the armature-lever of the lamp, and locking and releasing projections on the carriers, as described, whereby the one carrier may be held while the other is feeding, and when the latter has fed to a predetermined point it may itself be held by the lever, and at the same time may release the first carrier.

5. The combination, with two carbon-carriers, of a locking mechanism for holding one of said carriers from movement while the other is feeding, said mechanism being mounted on the support that carries and actuates the feed-regulating devices for said carriers, and a suitable projection upon the first-acting of the two carriers, suitably arranged to bring said carrier to rest, so that its weight will bear upon the common support after said carrier has fed to a predetermined extent.

6. The combination of the lever, the two independent feed-regulating mechanisms, with their independent escapements and detents, the two carbon-carriers, the overbalancing-weight resting on the lever when

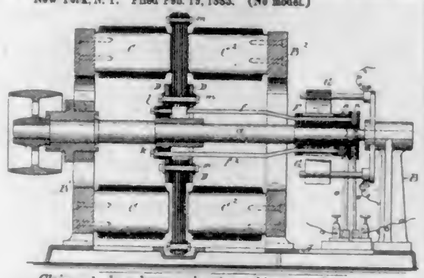
there is no current passing, the main-circuit magnet for holding said weight out of action, and the derived-circuit magnet connected to the lever.

7. The combination of the derived-circuit regulating-magnet, the armature presented to the side thereof, a stop for said armature, through which the main-circuit magnet is short-circuited, and a spring connected to the armature and arranged to be forced against the frame of the lamp by the weight released by the main-circuit magnet.

8. The combination of the pivoted armature, the contact-stop for the lower end thereof, and the spring connected to the other end and arranged in the path of the weight normally supported by the main-circuit magnet.

9. The combination of the insulated plate to which the positive conductor is connected, the two carbon-carriers, and the contact-springs supported by said plate.

10. The combination of the insulating-plate E^3, plates E^3 and F, conducting-rods F^2 F^3, and suitable binding posts or clamps, whereby the derived-circuit magnet may be connected in circuit between said rods.



11. The combination, in a double-carbon lamp, with the second-acting of the two carbon-carriers, of a lug or projection, T^2, arranged in the manner described, to engage with the automatic cut-out mechanism of the lamp when the carrier has completed its speed.

12. The combination of plate M, conducting-strip M^2, bent around the lower edge of plate M, stop R, and means for forcing the upper end of the strip into contact with the rod F^3, or other portion of the lamp-frame, upon an abnormal increase in the length of arc.

13. The combination of the lever G, supporting the two feed-regulating trains and the two carbon-carriers, the counterbalance-weight G^2, or its equivalent, the derived-circuit magnet D, connected to said lever, and the main-circuit magnet C, whose cores are supported by said lever when the lamp is out of action, but may be raised out of connection therewith when the magnet is energized.

14. The combination, in a double-carbon lamp, of the feed-regulating lever G, the derived-circuit magnet D D, whose cores are hung from cross-bar L^2, and the main-circuit magnets C C, whose cores are connected by cross-bar L, arranged to rest loosely on the end of the lever G.

294,043. DYNAMO-ELECTRIC MACHINE. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Feb. 19, 1883. (No model.)

Claim.—1. In a dynamo-electric machine, a conducting armature-plate having radial portions *c*, and alternate interior and exterior connecting portions *e d*, as and for the purpose described.

2. The combination, with the armature-shaft *a*, of a conducting sheet-metal plate stamped or formed in the shape described, with radial portions *c* and connecting portions *e d*.

3. The combination, with the armature-shaft *a*, of a conducting sheet-metal plate, *c e d*, and a series of fixed magnets, as and for the purpose described.

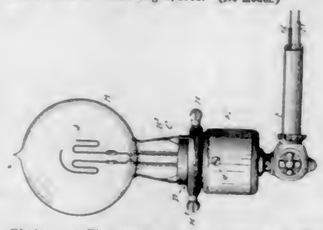
4. The combination, with a series of parallel conducting-plates connected in series, and each formed with the radial and connecting portions, as described, of a series of field-magnets between whose poles said plates are made to rotate.

5. In a dynamo-electric machine, an armature-plate composed of radial portions and alternate interior and exterior connecting portions, said plate being provided with a projecting portion, *g*, as and for the purpose described.

6. The combination, with the series of conducting armature-plates having parallel radial portions *c*, of the bolts *m*.

7. The combination of the series of plates *c e d*, the bolts *m*, and clamp rings or plate D, as and for the purpose described.

8. The combination, with the radial conductors capable of rotation, of, the conductors *f f'*, arranged on opposite sides of the shaft, and the conducting-ring between one of said conductors and a terminal of the radial conductors, whereby the armature is balanced.



9. The combination, with the parallel conducting-plates *c e d*, electrically connected in series, of the bolts *m*, insulated from said plates, and two circular ranges of magnets, between which the radial portions of said plates are made to pass.

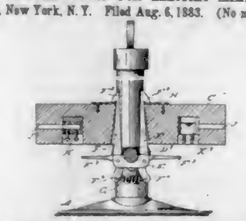
10. The armature-plate, as described, made with connecting portions *d e*, larger in cross-section than the radial portions *c*, which they unite.

11. The armature-plate *c e d*, having portions *e* and *d* wider than the radial portion *c*.

12. The combination, with the two circular ranges of magnets C C^2, of a series of conducting-plates formed as described, and having their radial portions in the same lines parallel with the armature-shaft, said plates being bolted together, and adapted to rotate in the interpolar space between the two ranges of magnets.

294,044. INCANDESCENT ELECTRIC LAMP. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, substantially as described, of the holder D, adapted to revolve, the split conductors, the entering conductors for the lamp, and the set-screws bearing upon said conductors, as and for the purpose described.



2. The combination of the revolving holder D, carrying the lamp and the switch-plates, the socket E for said holder, and the set-screws entering the horizontal groove on the exterior of the holder.

3. The combination, with the fixed contact-springs, of the contact-plates secured to a revolving support, and terminating in conductors having split or divided ends, and the set-screws for compressing said split ends, so as to grasp and form connection with the entering conductors for the lamp.

4. The combination, with the revolving switch-block and holder D, of the plates J J^2, secured to the lower face of said block, the conductors projecting up through the block and split or divided at their upper ends, and the screws H H^2, as and for the purpose described.

5. The combination, with the revolving switch-block and holder, of the clamping-screws, of non-conducting material, forming knobs or handles, by which the block may be turned in its socket for the purpose of turning the light on or off.

294,045. HANGER-BOARD FOR ELECTRIC LAMPS. WILLIAM HOCHHAUSEN, New York, N. Y. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, with the carrier-tube for an electric-arc lamp, of a collar clamped upon the same, and a spring-catch supported by said collar and adapted to engage with the hanger board or support from which the lamp is to be suspended.

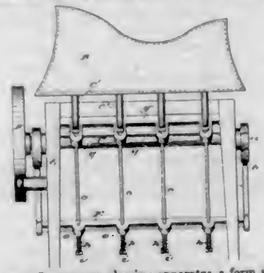
2. The combination of the hanger-board perforated for the carrier-tube, a catch or catches supported from said tube, for engaging with said board, and spring-switches upon the board adapted to receive the terminals of conductors leading into the lamp.

3. In a double electric lamp, the combination, with the collars D D, clamped to the carrier-tubes, and having eyes or rings that receive and support the lamp-conductors I I^2, of an intermediate connecting-piece, and an automatic catch pivoted from the latter, as and for the purpose described.

4. In a hanger-board for an electric lamp, the combination, with a block, C, perforated at its center, and provided with a circular groove upon its bottom, of the horizontally-movable connecting-springs lying in said groove.

5. The combination, with the insulating-block C, having annular groove on its bottom, of the binding-posts seated in said groove, and a connecting spring and plate extending from each of said posts, and adapted to receive the terminals of conductors rising from the lamp.

6. The combination, with each of the two binding posts or blocks seated in the bottom of the hanger-board, of a horizontally-projecting spring and two horizontally-projecting plates, one of which on each of said posts forms, in connection with the spring, a connecting-clip for grasping the terminal of a conductor of the lamp, while the other plate forms an anvil or stop for the free end of the spring connected with the other post when the lamp is lowered.



7. In a hanger-board for an electric lamp, the combination of two binding posts or blocks, K' K^2, curved plates and springs extending from said blocks and lying in a circular groove in the bottom of the block, and conductors I I^2, rising from the lamp-casing.

8. The combination, with the hanger-board C, perforated at its center, of a binding-post, K, on the bottom of said board, horizontally-curved plates M R, curved around a central boss or projection, and spring I, between which and plate R the end of a conductor on the lamp may be forced, and a second post provided with a similar spring and plates, one of which latter forms a contact-stop for the free end of the spring connected with the first-named binding-post when the lamp is lowered.

9. The combination, with the block C of insulating material, perforated at its center, of the binding posts or blocks seated in a circular groove on the bottom of the board, and the longitudinal openings J, for the insulated line-wires.

10. The combination, with the hanger-board C, perforated at its center, and provided with means for completing the circuit to the lamp when the latter is raised to a sufficient distance, of the two catch-levers F F, carried by the lamp, the connecting-spring, and the releasing horizontal arms F^2 F^3, as and for the purpose described.

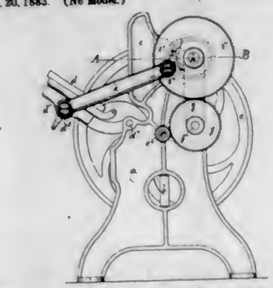
294,046. APPARATUS FOR FORMING AND SHAPING CORSETS. JAMES ALFORD HOUSE, Bridgeport, Conn. Filed July 16, 1883. (No model.)

Claim.—1. In a corset-shaping apparatus, a form and a series of independent clamps at each side thereof to grasp the corset, and a series of movable clamp-carriers, combined with means to actuate the said clamp-carriers, and with springs to enable the clamps and carriers to stretch the corset by a strain measured by the said springs, substantially as described.

2. The shaft C, cross-head E, or equivalent, clamp-carriers, clamps, and springs, combined with the form, to operate substantially as described

294,047. INHALER FOR ANÆSTHETICS. GEORGE H. HURD, Cleveland, Ohio. Filed Mar. 15, 1881. (No model.)

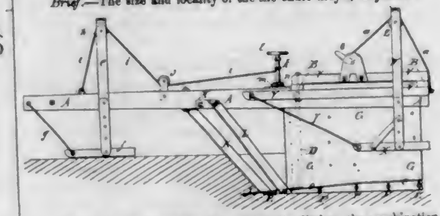
Brief.—A stop-cock having an opening to carry a definite quantity of the anæsthetic fluid is located between the source of supply and a pipe situated at a lower level. Beneath the stop-cock is a sponge-chamber, to which the definite quantities of fluid are conveyed upon turning the stop-cock.



Claim.—1. The combination, with a reservoir for ether, chloroform, or other similar substances, and a pipe arranged upon a lower level, and connected with said reservoir by an intermediate pipe, of a stop-cock arranged in said intermediate pipe, and having a cavity in its side, whereby definite quantities of the contents of the reservoir may be transferred therefrom to a position to fall toward the pipe below, substantially as described.

2. The combination, with a reservoir and a pipe arranged adjacent thereto on a lower level, of an intermediate connecting-pipe, and means arranged in said connecting-pipe for transmitting definite quanties of liquid from the reservoir through said connecting-pipe to the lower pipe, substantially as described.

3. The combination, with the upper reservoir and lower pipe, of the intermediate connecting-pipe provided with a stop-cock, the plug of which has a cavity formed in one side, and the sponge-chamber arranged below said stop-cock, substantially as described, and for the purpose set forth.



294,048. PRINTING-PRESS. ALBE P. HYDE, Boston, Mass. Filed Aug. 20, 1883. (No model.)

Claim.—In a printing-press, the oscillating link *g*, shaft *h*, cam *l*, pin and roll *m m'*, cranks *i i'*, connecting-rods *k k*, and hinged platen-yoke *d'*, combined and arranged as and for the purpose set forth.

294,049. TILE-DITCHER. KERWIN JAMES, Adair, Iowa. Filed Apr. 30, 1883. (No model.)

Brief.—The size and locality of the tile-chute may be adjusted.

Claim.—1. In a machine for making tile-ditches, the combination, with the beams A, adjustably secured together at their rear ends, of the side plates, G, and the base-plate E, the said side and base plates being adjustably connected together, substantially as herein shown and described.

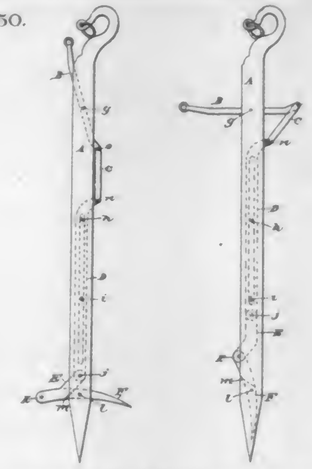
2. In a machine for making tile-ditches, the combination, with the beams A and the slotted bars B, connecting the rear ends of the beams together, of the side plates, G, the base-plate E, and the rod D, the said side and base plates being adjustably connected together, substantially as herein shown and described.

3. In a machine for making tile-ditches, the combination, with the shear J, the base-bar E, the angle-irons H, and the side plates, G, of the adjustable flanged plates O, substantially as herein shown and described, to assist in opening a channel to receive the tiles, as set forth.

4. In a machine for making tile-ditches, the combination, with the adjustable beams A, the side plates, G, and the base-plate adjustably connected to the side plates, of the shear J, provided with flanges M, and the central and side cutter, K L, secured to the shear and beams, substantially as herein shown and described.

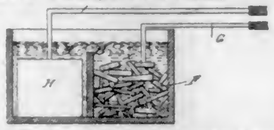
5. In a machine for making tile-ditches, the combination, with the adjustable beams A and the curved guide-plates Q R, of the slotted angle-plates S, substantially as herein shown and described, whereby the said guide-plates can be adjusted midway between the beams, and will be securely held in place, as set forth.

6. In a machine for making tile-ditches, the combination, with the cross-bars B, of the bar V, the slotted standard W, the foot X, the hinged draw-rods Y, and the rope, pulley, and windlass *a* Z *b*, substantially as herein shown and described, whereby the machine is kept in an erect position, as set forth.



7. In a machine for making tile-ditches, the combination, with the adjustable beams A and the side plates, G, adjustably connected to the base-plate, of the guide-plates Q R and the angle-irons S T, for adjusting the said guide-plates midway between the beams and side plates, substantially as herein shown and described.

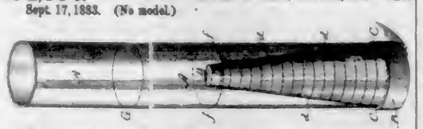
8. In a machine for making tile-ditches, the combination, with the beams A and the bars B V, of the platform U, the standard W, the foot X, the brace-rod Y, the cord *a*, and windlass *b*, substantially as herein shown and described.



294,050. HAY-FORK. JOHN GEORGE KAWOHNE and RICHARD MILLER, Appleton, Wis. Filed Mar. 15, 1883. (No model.)

Claim.—In combination with the slotted vertical shaft A, provided with the pins *h* and *i*, the lever B, pivoted to said shaft, the link C, the slotted sliding bar D, the angle-bar E, and the curved bar F, pivoted to said shaft A, substantially as and for the purpose set forth.

294,050.



294,051. PROCESS OF MAKING COPPER SALTS BY THE AID OF ELECTRICITY. JOHANN KARL KESSLER, Milwaukee, Wis., assignor to the Wisconsin Chemical Company, of Wisconsin, and George Sylvester, Milwaukee, Wis. Filed Aug. 3, 1882. (No model.)

Claim.—1. The process of making basic acetate of copper, which consists, first, in passing an electric current through a solution of chloride of sodium or chloride of potassium, using copper as an anode and any suitable substance as a cathode, keeping the products forming at the opposite poles separate from each other, and then mixing them together, whereby hydrated suboxide of copper is precipitated; and, secondly, in mixing the precipitated hydrated suboxide of copper, properly washed and dried, with neutral acetate of copper, moistening the mixture with water, and exposing it to the air, substantially as described.

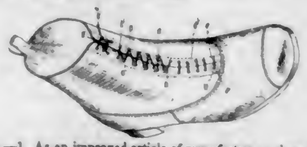
2. The process of producing basic acetate of copper from hydrated suboxide of copper, which consists in mixing the hydrated suboxide of copper with neutral acetate of copper, in the proportion of seventy-nine parts, in weight, of the former to one hundred and ninety-eight parts, in weight, of the latter, moistening the mixture with water, and exposing it to the air, as set forth.

294,052. LACTOMETER. ALBERT R. LEEDS, Hoboken, N. J. Filed Sept. 17, 1883. (No model.)

Claim.—An instrument for testing milk, consisting of the glass vessel A, in combination with the conical stopper B, made of any non-transparent material, on which are drawn lines at regular intervals parallel to the circumference of its base forming a graduated scale, substantially as described.

294,053. METHOD OF AND DIE FOR FORMING RAIL-JOINTS. FRANCIS LIGHTFOOT, Media, Pa. Filed May 12, 1883. (No model.)

Claim.—1. The method of making rail-joints which consists in laterally flattening each end of the rail, but on opposite sides, at opposite ends, down to the longitudinal vertical plane of the middle of the rail, thickening the web on the outer side thereof, and elongating the reduced end by means of dies, substantially as set forth.



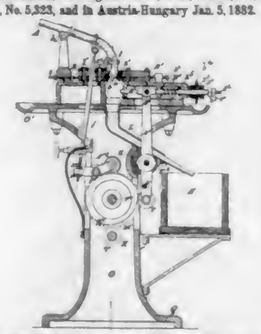
2. A die-box, B B', for clamping a rail and supporting its projecting end beyond or outside the clamping-point, in combination with a series of dies, D D' D^2, more or less in number, for progressively elongating and flattening the rail end down to the vertical longitudinal middle plane of the rail, substantially as set forth.

3. In combination with the die-box B B', the dies D D' D^2, three or more in number, having working-faces d d' d^2, substantially as and for the purposes set forth.

4. The series of dies D D' D^2, having each a recess, d', for the formation of a tongue, c, substantially as set forth.

5. The die D^2, having recesses d' and projection e, substantially as and for the purposes set forth.

294,054. SHOE-LACE FASTENER. HOSE H. V. LILLEY, Milford, Mass. Filed July 9, 1883. (No model.)



Claim.—1. As an improved article of manufacture, a shoe string or lacing fastener composed of a tubular part adapted to surround the shoe string or lacing, and provided with a spring-finger, between which and the string or lacing in the said fastener a part of the said string or lacing may be drawn to effectually secure said string or lacing in position, substantially as described.

2. The combination, with a shoe string or lacing, of a fastener, a, applied thereto, composed of a tubular part, a spring-finger, and a prong, to operate substantially as described.

3. A shoe string or lacing provided at one end with a holder, b, applied thereto, combined with the fastener a, provided with the spring-finger, and applied directly to the said string or lacing where the same is to be fastened, substantially as described.

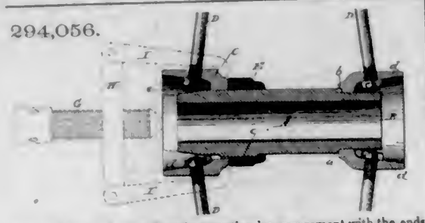
294,055. MACHINE FOR TREATING CARTRIDGE-SHELLS. WILHELM LORENZ, Carlsruhe, Baden, Germany. Filed June 10, 1882. (No model.) Patented in Germany June 29, 1881, No. 17,333; in France Aug. 26, 1881, No. 144,574; in Belgium Oct. 3, 1881, No. 55,879; in England Dec. 6, 1881, No. 5,323, and in Austria-Hungary Jan. 5, 1882.

Claim.—1. The feed mechanism for the cartridge-cases, consisting of the pivoted chute A, having a spring-jaw, a, and gage-plate d^2, in combination with the rod i, lever N^2 and cam M', as set forth.

2. The combination of the cheeks b b', slides B B', and adjusting means therefor with the spring f, levers N N', and cam M, as set forth.

3. In a cartridge-finishing machine, the combination of the slide B' and rod b^2 with the washer b^3, sleeve b^4, having collar b^5, and springs Z Z' and lever N N', as herein set forth.

4. The combination of the spindle C and spring-pin e with the cheeks b b', substantially as herein set forth.



294,056. CARRIAGE-WHEEL. EDWARD P. LYNCH, Davenport, Iowa. Filed Nov. 10, 1883. (No model.)

Claim.—1. In a suspension-wheel, the tubular box having one end threaded externally and the opposite end reduced in diameter and provided with a lip, the non-rotating collar applied over one end of the box, the sliding non-rotating collar applied over the other end of the box, and the nut E, applied to the box and acting to urge the collar C outward, whereby the parts are adapted to apply a tensile strain to the spokes.

2. The tubular box A, provided with the shoulder a and mutilated screw-thread, combined with the spokes, the stationary collar B, the movable non-rotating collar C, and the nut acting against said collar.

3. In a carriage-wheel, the combination of a tubular box with mutilated threads thereon, a sliding spoke-receiving collar mounted to slide

294,056.

upon said box, and secured against rotation by engagement with the ends of the threads, and a nut mounted upon said threads and acting against said collar, substantially as described.

4. In a suspension-wheel, the tubular box, the two non-rotating collars applied to the ends of the box, and constructed, as described, to afford an open space between their inner surfaces and the outer surface of the box, the nut applied to urge the collar C outward, and the spokes inserted through the collars from the exterior, and provided with retaining nuts or heads upon their inner ends, as described, whereby the entire series of spokes may be adjusted simultaneously, or the individual spokes removed and replaced or varied in tension without removing or adjusting the other parts.

5. In a suspension-wheel, the combination of the following elements: a rim or felly, a central box, two spoke-receiving collars, one of which is fixed and the other movable upon the box, and means, substantially as described, for effecting the adjustment of the movable collar lengthwise of the box.

294,057. DETACHABLE BARREL-COVER. HENRY MANN, Milwaukee, Wis. Filed June 13, 1883. (No model.)

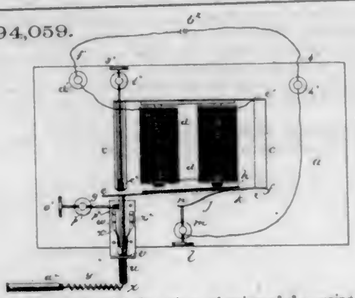
Claim.—1. The combination of a detachable barrel-cover provided with outward-projecting barbs adapted to engage against the inner surface of a barrel-chine, chine-hook E, the shank of which is provided with a series of cog-teeth, rack-pinion G, and stud H, said chine-hook being adapted to be moved horizontally and inserted and withdrawn from the chine by turning said stud, substantially as set forth.

2. The combination, with the stationary leaf of a detachable cover, of the chine-hook E, provided with a series of teeth, F, retaining-block J, provided with projecting barbs D, and rack-pinion G, adapted to engage in the teeth of said chine-hook E, said pinion G being provided with angular projection H' for the reception of a wrench, said chine-hook E and barbs D being adapted to be inserted in the respective sides of the chine by turning said stud in one direction, and withdrawn therefrom by turning said stud in the opposite direction, substantially as and for the purpose specified.

294,058. PADLOCK. AUGUST FRIEDRICH MARTENS, Hamburg, Germany. Filed Sept. 27, 1883. (No model.)

Claim.—1. In a safety-lock for securing overcoats and other articles of wearing-apparel, the combination of a shell provided with a perforation to receive a button, and a hook, g, with a sliding plate, e, having perforation b and slit b', and a locking mechanism, substantially as and for the purpose set forth.

2. In a safety-lock for securing overcoats and other articles of wearing-apparel, the combination, with a shell having a perforation to receive a button, of a sliding plate, e, provided with hole and slit, as shown, spring f, and a locking mechanism, substantially as and for the purpose set forth.



3. In a safety-lock for securing overcoats and other articles of wearing-apparel, the combination, with a shell having hook g and perforation to receive a button, of a sliding plate, e, provided with hole and slit, as shown, a toothed rod, d, and locking mechanism engaging with it, and spring f, substantially as and for the purpose set forth.

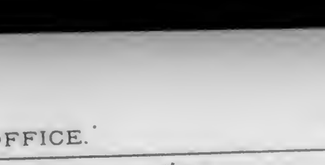
294,059. PHOTOGRAPHER'S RETOUCHING-POINT. HASKELL HARRIS MCELHINEY, Nebraska City, Nebr. Filed Dec. 5, 1883. (No model.)

Claim.—1. The combination, in a photographer's retouching device having frame c, magnets d d, and spring e, having armature h, and hollow tube u, of hollow column c', with threaded post f^2, set-screw c^3, and rubber bumper c^2, substantially as shown and described, and for the purposes set forth.

2. The combination, in a photographer's retouching device having frame c, hollow column c', rubber cap c^2, set-screw c^3, brass spring e,

294,059.

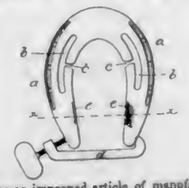
having armature h, and hollow tube u, of springs x^2 x^3, grasping hollow tube u, and set-screw o', passing through threaded post p', and having soft-rubber cap p^3, adapted to press gently against the side of hollow tube u, substantially as shown and described.



3. In combination with electric batteries b^2, wires f b', magnets d d, spring-plate a, having on its under face armature h, insulated tube u, spiral spring y, and pencil-holder a^2, substantially as shown and described, and for the purposes set forth.

294,060. LINK-WELDING DIE. ALEXANDER MCINNES, St. Louis, Mo., assignor to the Helmbacher Forge and Rolling Mills Company, same place. Filed June 28, 1882. (No model.)

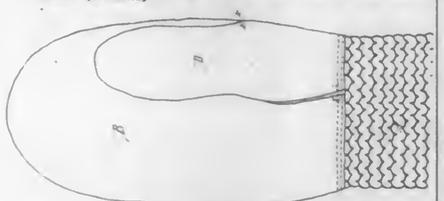
Claim.—The die herein described for welding links and cutting off the fins, consisting of the part B, having a recess, b, of a greater depth than the diameter of the finished link, the projection or guide b^3, and the recess b^4, forming a raised fin-cutter, in combination with the part C, having a recess, c, of less diameter than the finished link, the chamber for receiving the projection b^3, and the recess c^3, forming the upper fin-cutter, all constructed and adapted to operate substantially as described.



294,061. NEEDLE-THREADER FOR SEWING-MACHINES. EDWIN N. MCPHERRON, Greenfield, Ill. Filed June 21, 1883. (Model.)

Claim.—1. In a needle-threader, the combination of the arm C, supporting-axis d, spiral spring c, stop p, and guide-blocks r and o, all of said parts being adapted for united operation, substantially as and for the purpose herein set forth.

2. In a needle-threader, the arm C, provided with a longitudinal slit, f, near its inner edge, so as to form a spring, to the lower extremity of which is attached one half, m, of the split funnel-shaped thread-guide, the other or fixed half, n, being secured to the rigid part a of the arm C, said rigid part being provided with a guide, o, and the free or spring part q with a guide and stop, r, all these parts combined substantially in the manner and for the purpose herein set forth.

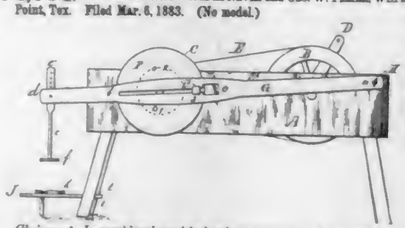


294,062. HORSESHOE. OLIVER H. MERRILL, North Manchester, Conn., assignor to H. Lydall & Foulds, same place. Filed June 2, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the horseshoe a, of spring-steel, having in each side, between the toe and heels, the T-shaped mortise b, piercing the shoe depthwise, whereby the prongs are made capable of lateral adjustment under pressure, and of recoil when the pressure is removed, all substantially as described.

2. As an improved article of manufacture, the horseshoe *a*, of spring-steel, having in each side, between the toe and heels, the T-shaped mortise *b*, piercing the shoe depthwise, whereby the prongs are made capable of lateral adjustment under pressure, and of recoil when the pressure is removed, and bearing integral with the shoe on the inner edge of the heels the upturned flanges *c*, all substantially as described.

294,063. MITTEN. THOUR MUNTER, Rockford, Ill. Filed Sept. 8, 1883. (No model.)



Claim.—1. The combination, with the palm-facings of the hand and thumb in one piece, of a thumb outer facing and upper-edge-overlap facing in one piece, substantially as and for the purpose set forth.

2. The combination, with the hand and thumb palm-facing in one piece, an outer thumb-facing, and an upper-edge-overlap facing in one piece, of a tip and under-edge facing, substantially as and for the purpose set forth.

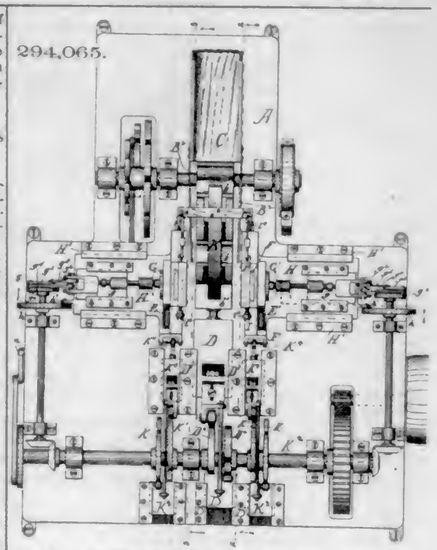
3. The herein-described four-part facings, consisting of a palm-facing of the hand and thumb in one piece, an outer facing of the thumb and upper-edge facing in one piece, a tip, and an under-edge facing, said several facings united to each other by a single continuous seam, to produce a complete facing, substantially as and for the purpose set forth.

4. The combination, with a textile mitten, of the herein-described four-part facing, the meeting edges of the palm and outer portions of which are joined to each other by a continuous seam, and the outer edges of which are joined to the textile mitten by a continuous seam, substantially as and for the purpose set forth.

294,064. CHURN-MOTOR. WM. A. NEVEL and GEO. W. FISHER, Will's Point, Tex. Filed Mar. 6, 1883. (No model.)

Claim.—1. In combination with the churn-motor, as above described, removable apron J, fitting into grooves on the inside of the front legs of the frame A, and chine-brace K, consisting of parts M, *k*, k^2, and k^3, substantially as shown, and for the purposes set forth.

2. In a churn constructed substantially as above described, the removable apron J, and chine-brace K, consisting of the parts M *k* k^2 k^3, substantially as shown and described, and for the purposes set forth.



294,065. CAN ENDING AND SEAMING MACHINE. EDWIN NORTON and JOHN G. HODGSON, Chicago, Ill., assignors to said Norton and Oliver W. Norton, same place. Filed June 8, 1883. (No model.)

Brief.—Can-bodies are fed to an intermittingly-revolving carrier containing half-molds. A reciprocating half-mold clamps each body successively to a half-mold in the revolving carrier. While thus clamped, a head is forced upon each end of the can-body, and then seamed to the can-body.

Claim.—1. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with part-molds on its periphery for clamping the can-body, of mechanism for bending and compressing into a seam the flanges uniting the head to the body, substantially as specified.

2. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with part-molds on its periphery for clamping the can-body, of mechanism for applying the can-head to the can-body and mechanism for bending and compressing into a seam the flanges uniting the head to the body, substantially as specified.

3. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with part-molds on its periphery for clamping the can-body, of a chute or device for delivering the can-bodies to the machine automatically, chutes or devices for automatically delivering the can-heads at the mouth of the mold, pistons or devices for forcing the can-heads on the can-body, and mechanism for bending and compressing into a seam the flanges uniting the head to the body, substantially as specified.

4. The combination, with the reciprocating part-mold and intermittently-revolving wheel provided with part-molds on its periphery for clamping the can-body, of a reciprocating piston-head for forcing the can-head upon the can-body, and crimping-jaws projecting over the seam at the end of the can-body, and operating, in conjunction with the faces or periphery of the piston-head, to squeeze the parts of the seam together, substantially as specified.

5. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with half-molds on its periphery for clamping the can-body, of a reciprocating piston-head for applying the can-heads to the can-body, and squeezing or crimping jaws mounted on a reciprocating frame or block, and operating, in conjunction with the piston-head which forms the interior mandrel or support for the seam, to squeeze the parts of the seam together, substantially as specified.

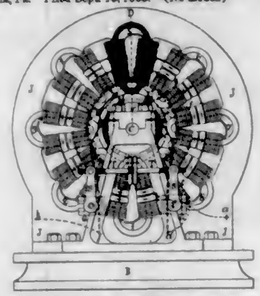
6. The combination, with a device for clamping the can-body at its middle portion, of mechanism for simultaneously applying or forcing both the heads upon the can-body, and mechanism for simultaneously bending and compressing into a seam the flanges uniting both the heads to the can-body, substantially as specified.

7. The combination, with a mold or device for clamping the can-body, of reciprocating piston-heads for applying the heads thereto, and crimping-jaws mounted on a reciprocating block, mechanism for operating the jaws, and mechanism for reciprocating the block on which said jaws are mounted, and mechanism for reciprocating the piston-heads, substantially as specified.

8. The combination, with reciprocating part-mold *b'*, wheel B, provided with part-molds *b* on its periphery, can-body delivery-chute C, curved guard B', mechanism for revolving wheel B intermittently, mechanism for reciprocating the part-mold *b'*, can-head delivery-chutes E E', piston-heads G G', provided with peripheries or faces to fit the countersunk can-head, mechanism for reciprocating said piston-heads, reciprocating frame or block H and mechanism for operating the same, crimping-jaws F F' F^2 F^3, mounted on said reciprocating block or frame, and mechanism for operating said crimping-jaws, and a chute for delivering the headed and seamed cans from the machine, substantially as specified.

9. The combination, with a can-body-clamping mold or device, of a reciprocating block, seaming mechanism mounted on said reciprocating block, and a reciprocating piston-head forming the interior mandrel or support against which the seam is formed, substantially as specified.

10. The combination, with a can-body-clamping mold, of a reciprocating block, can-head delivery-chute mounted on said reciprocating block, mechanism for applying the can-head to the can-body, and mechanism for seaming the same, substantially as specified.



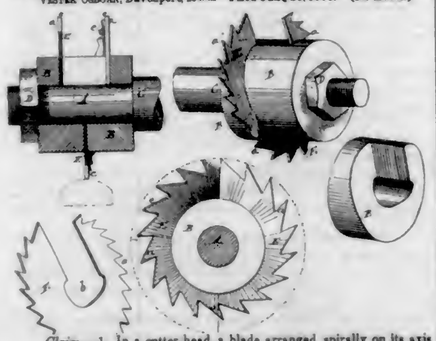
11. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with part-mold on its periphery for clamping the can-body, of a reciprocating block provided with mechanism for seaming the can-head to the can-body, substantially as specified.

12. The combination, with a reciprocating part-mold and an intermittently-revolving wheel provided with part-molds on its periphery for clamping the can-body, of a reciprocating block, a can-head delivery-chute, mechanism for applying the can-head to the can-body, and mechanism for seaming the same, substantially as specified.

13. The combination, with a mold or device for clamping the can-body at its middle portion, of reciprocating mechanism at each end of said mold for simultaneously seaming both heads to the can-body, and reciprocating piston-heads at each end, forming the interior mandrels or supports against which said seams are formed, substantially as specified.

14. The combination, with a can-body-clamping mold, of a chute or device for delivering the can-bodies thereto, a chute or device for delivering the can-heads at the mouth of said mold, mechanism for applying the can-head to the can-body, and mechanism for bending and compressing into a seam the flanges uniting the can head and body, substantially as specified.

294,066. ELECTRO-MAGNETIC MACHINE. JOHN W. NYSTROM, Philadelphia, Pa. Filed Sept. 10, 1883. (No model.)



Claim.—1. In an electro-magnetic or magneto-electric machine, the elongated and curved magnets having polar extensions solidly formed in one piece with each leg of both the field and armature magnets, arranged so that both the poles of each magnet are in the magnetic field, substantially as and for the purpose described.

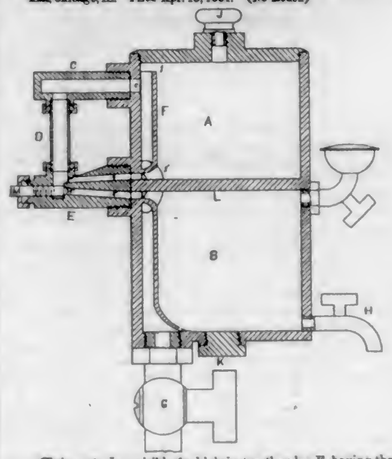
2. In an electro-magnetic or magneto-electric machine, the curved magnets, cast solid in one piece with their supporting frames or ribs, so that both the poles of each magnet are in the magnetic field, and that the neutral magnetic line is in the horseshoe bend, substantially as and for the purpose described.

3. The combination of the shafts O P with the brush-clamps Q at the inner ends, the levers S at the outer ends, and the screw T, the levers being connected with the screw for the purpose of regulating the pressure of the brushes upon the commutator.

294,067. CUTTER-HEAD FOR WOOD-WORKING MACHINES. SYLVESTER OSBORN, Davenport, Iowa. Filed June 20, 1883. (No model.)

Claim.—1. In a cutter-head, a blade arranged spirally on its axis, and provided with peripheral teeth arranged, respectively, at different distances from the axis.

2. In a cutter-head, the combination with clamping devices, substantially as shown, of a cutter consisting of a single spiral blade provided with peripheral teeth, the points of which are respectively at different distances from the axis of rotation.



3. A rotary cutter-head encircled by an eccentrically-disposed series of teeth arranged to revolve in parallel planes at right angles to the axis of rotation.

4. A cutter-head, substantially as described, provided with a spiral series of teeth terminating at different distances from the axis, and revolving in parallel planes, said teeth having their edges inclined or beveled transversely, substantially as described and shown, whereby they are caused to co-operate in producing a smooth curved surface.

5. The improved blade for a cutter-head, consisting of a single plate of metal, having a spiral curvature, an opening for the arbor, and a series of teeth the points of which are at different distances from the center of said opening.

6. In combination with the spiral blade E, having eccentrically-disposed teeth, the hubs E, and clamping devices, substantially as shown.

294,068. STEAM-CYLINDER LUBRICATOR. WASHINGTON L. PARKER, Chicago, Ill. Filed Apr. 13, 1881. (No model.)

Claim.—1. In a visible-feed lubricator, the plug E, having the tubes *e* and *e'*, so arranged as to form a water-trap, as and for the purpose set forth.

2. In a visible-feed lubricator, the plug E, having the tubes *e* and *e'*, so arranged that when it is attached to the cylinder at the line of intersection of the diaphragm a connection of the chambers A and B will be effected, as and for the purpose set forth.

3. In a visible-feed lubricator, the combination of the plug E, having the tubes *e* and *e'*, arranged as described, and the valve M, with the transparent tube or chamber D, plug C, and the pipe F, as and for the purpose set forth.

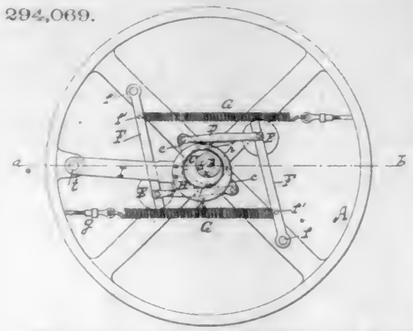
4. In a visible-feed lubricator, the pipe G, connected with the feed-pipe F, and issuing from the base of the cylinder and attaching directly to the parts to be lubricated, as described above, as and for the purpose set forth.

5. In a visible-feed lubricator, the combination of condensing-chamber A and oil-chamber B, connected by a single passage through the plug E by the tubes *e* and *e''*, with the plug E and transparent tube or chamber D, as and for the purpose set forth.

6. In a visible-feed lubricator, the combination of chambers A and B, separated by diaphragm L, with plug E, having tubes *e* and *e'*, arranged as described, and valve M, with transparent tube D, plug C, pipes F and G, as and for the purpose described.

7. The method of feeding oil in a lubricator, which consists in carrying it drop by drop from the oil-chamber in and by a current of moving water to the parts to be lubricated.

8. In a visible-feed lubricator, the transparent tube or chamber D, connected at its base by a double connection with the base of the condensing-chamber and the top of the oil-reservoir, as described.



9. The combination of the transparent tube or chamber D with the condensing-chamber A, being connected therewith, as described, and for the purpose set forth.

10. In a lubricator, the method of feeding oil to the parts to be lubricated, which consists in discharging it in drops from the oil-chamber by means of hydrostatic pressure and then carrying it by and in a current of water to the parts to be lubricated.

11. In a lubricator, the method of feeding oil to the parts to be lubricated, which consists in discharging it in drops from the oil-chamber by means of hydrostatic pressure, and then carrying it to the parts to be lubricated by means of its inferior specific gravity and the action of a moving current of water.

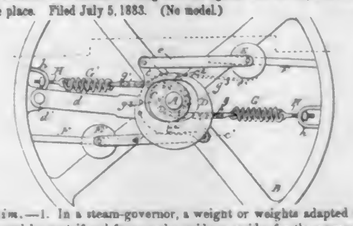
294,069. STEAM-GOVERNOR OR SHIFTING ECCENTRIC. DAVID W. PAYNE and CHARLES R. WILLIAMS, Corning, N. Y., assignors to B. W. Payne & Sons, same place. Filed Feb. 24, 1883. (No model.)

294,069.

Claim.—1. An eccentric provided with interiorly-projecting bearing-surfaces, as *h h*, substantially as specified.

2. The combination of an outer eccentric having interiorly-projecting bearings *h h* with an inner eccentric mounted loosely upon a shaft and having a continuous bearing upon said interiorly-projecting bearings, substantially as specified.

3. The combination of an outer eccentric adapted to be suspended to a wheel or disk, and provided with interiorly-projecting bearing-surfaces arranged opposite each other and on opposite sides of the line of suspension, with an inner eccentric mounted loosely upon the shaft and adapted to bear continuously upon said oppositely-located bearings, and to be automatically rotated upon said shaft, substantially as specified.



4. The combination of a shaft, and an inner eccentric mounted loosely thereon and connected to centrifugal weights, with an outer eccentric mounted upon said inner eccentric, suspended upon a wheel or disk and connected with the valve, substantially as specified.

5. The combination of the wheel A, shaft B, eccentric C, and eccentric H, having interiorly-projecting bearings *h h*, substantially as specified.

6. The combination of the wheel A, shaft B, and eccentric C, having lugs *c c*, connected to centrifugal weights, with eccentric H, having interiorly-projecting bearings *h h*, and arm I, substantially as specified.

7. The combination of wheel A, shaft B, centrifugal weights E, links D, and springs G, with eccentrics C and H, the latter having internal projections, *h h*, and an arm I, pivotally secured to the wheel, substantially as shown and described.

294,070. GOVERNOR OR SHIFTING ECCENTRIC. DAVID W. PAYNE and CHARLES R. WILLIAMS, Corning, N. Y., assignors to R. W. Payne & Sons, same place. Filed July 5, 1883. (No model.)

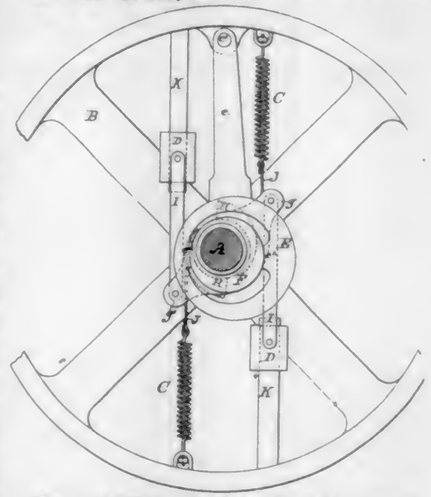
Claim.—1. In a steam-governor, a weight or weights adapted to be influenced by centrifugal force, and a guide or guides for the same arranged squarely within the area of the governor or its described equivalent area, substantially as specified.

2. In a steam-governor, a shifting eccentric connected with and operated by a weight or weights mounted upon straight guides arranged squarely within the area of the wheel or disk, substantially as specified.

3. The combination of a suspended shifting eccentric, a weight or weights arranged to slide upon a straight guide or guides arranged in or on other than radial lines, connecting links, bands, or chains, and a counterbalancing spring or springs, substantially as specified.

4. The combination of a shifting outer eccentric, an inner eccentric, and links secured to the latter and to weights adapted to slide upon straight guides arranged on other than radial lines, substantially as specified.

5. In a steam-governor, the combination of an eccentric, a counterbalancing-spring, and a flexible connecting band or strap, substantially as specified.



6. In a steam-governor, the combination of an inner eccentric, and an outer eccentric operated thereby by means of centrifugal weights, with counterbalancing-springs connected to said inner eccentric by flexible means, substantially as specified.

7. The combination of the eccentric D, links *e e'*, weights E E', and straight guides F, arranged as described, with means for counterbalancing the weights, substantially as specified.

8. The combination of the eccentrics C D, springs G G', links *e e'*, weights E E', straight guides F, wheel B, and shaft A, substantially as shown and described.

9. The combination of the suspended outer eccentric, D, inner eccentric, C, having hub C' and lugs *c c'*, the bands, straps, or chains *g g'*, springs G G', bolts H, brackets A, links *e e'*, weights E E', guides F, wheel B, and shaft A, substantially as shown and described.

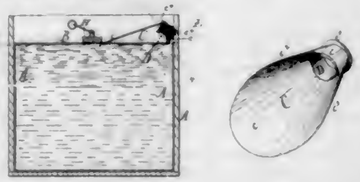
294,071. SHIFTING ECCENTRIC. DAVID W. PAYNE and CHARLES R. WILLIAMS, Elmira, assignors to R. W. Payne & Sons, Corning, N. Y. Filed Nov. 21, 1883. (No model.)

Claim.—1. A shifting eccentric the hub of which is provided with peripheral cams, substantially as and for the purpose set forth.

2. In a shifting eccentric, a hub provided with peripheral cams, in combination with counterbalancing-springs and connecting straps, bands, or chains, substantially as specified.

3. In a shifting eccentric, a hub provided with peripheral cams, in combination with counterbalancing-springs, centrifugal weights, connecting links and straps, bands, or chains, substantially as specified.

4. In a steam-governor of the class specified, the combination of centrifugal weights and counterbalancing-springs with an eccentric formed with or connected to a hub having peripheral cams, and with devices for connecting the said eccentric with said springs and weights, substantially as specified.



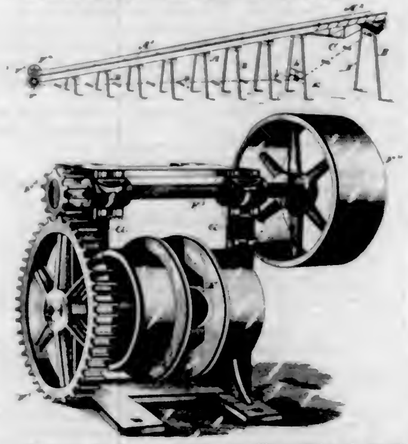
5. The combination of an outer eccentric with an inner eccentric, having as adjuncts peripheral or circumferential cams, and with centrifugal weights and counterbalancing-springs, constructed and arranged substantially as and for the purpose described.

6. The combination of an eccentric, a link-plate, and oppositely-arranged peripheral cams with connecting straps, bands, or chain, substantially as specified.

7. The combination of the eccentric F, link-plate G, and cams H H, with the shaft A, wheel B, springs C, and centrifugal weights, and with links I and straps, bands, or chains J, substantially as shown and described.

8. The combination of shaft A, wheel B, guides K, weights D, links I, straps, bands, or chains J, and springs C, with an outer eccentric suspended by an arm to said wheel, and with the inner eccentric, having a link-plate and peripheral cams, substantially as shown and described.

294,072. OIL-CAN. CHARLES R. PEASLEE, Louisville, Ky. Filed Dec. 29, 1883. (No model.)

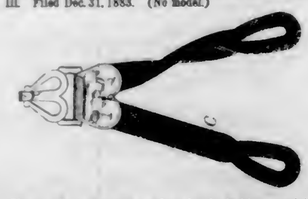


Claim.—1. The combination, with a can and its top, of an elliptical flaring inclined spout having a circular mouth or end, and a conical cork nozzle inclined to said spout, projecting inside the same, and secured thereto at its circular end, substantially as specified.

2. The combination, with a can and its top, of an inclined flaring spout and a cork nozzle inside the same, said cork nozzle and spout being inclined toward each other and united together at their circular ends, substantially as specified.

3. The combination, in a can, of an inclined flaring spout and conical cork nozzle inside the spout, and inclined thereto, whereby the liquid may be drawn from its surface and the cork nozzle protected from injury, substantially as specified.

294,073. REFUSE-CONVEYER FOR SAW-MILLS. WILLIS J. PERKINS, Grand Rapids, Mich. Filed Dec. 21, 1883. (No model.)



Claim.—1. A refuse-conveyer for saw-mills, consisting of a trough made up of two sections, the upper section being made of metal suitably trussed, and the lower of wood, and an endless chain provided with buckets or sweeps, which latter move in said trough, substantially as set forth.

2. A refuse-conveyer for saw-mills, consisting, essentially, of an inclined trough, an endless chain provided with buckets or sweeps, driving mechanism secured to the lower end of the trough, and a chain-wheel journaled to the upper end of a trussed metallic portion of the trough, substantially as set forth.

3. A refuse-conveyer for saw-mills, consisting of a trough made up of two sections, the lower section being made of wood and the upper section of metal, the outer end of the metallic portion of the trough being provided with metallic boxes and wooden bearing-blocks, and the lower end of the wooden trough being provided with the driving mechanism, and a suitable chain having buckets or sweeps secured thereto, substantially as set forth.

294,074. SUSPENDERS. SOLOMON PRICE and HERMAN ANDES, Chicago, Ill. Filed Dec. 31, 1883. (No model.)

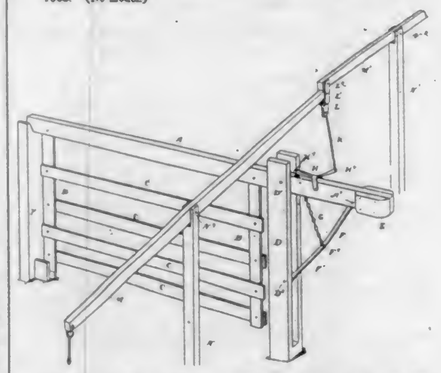
Claim.—In a suspender-end made of suitable material, doubled edgewise upon itself to form a reach, a securing device consisting of a continuous wire or cord passed lengthwise through the interior of each of the strands of braid, and from one strand to the other, so as to fasten the two together to form a button-hole, substantially as described.

294,075. BROOCH-PIN. JOHN H. PURDY, Chicago, Ill. Filed Aug. 30, 1883. (No model.)

Claim.—1. A brooch-pin consisting of a steel wire, over which a sheath or envelope of gold, silver, or metallic composition is drawn, substantially as and for the purposes set forth.

2. As a new article of manufacture, a brooch-pin consisting of a

294,075.



pointed steel wire provided with a sheath or envelope of gold, silver, or other ductile metal or metallic composition drawn thereover and attached thereto, in the manner and for the purposes described.

294,076. MECHANICAL TOY. WILLIAM S. REED, Leominster, Mass. Filed May 12, 1883. (No model.)

Claim.—As an improvement in mechanical toys, an object, person, or thing provided with a means for projecting a ball or other weapon or thing, in combination with another object, person, or thing, also provided with a means for projecting a ball or other weapon or thing, the action of one toy upon the other producing the response or reply of the action of the former, substantially as described.

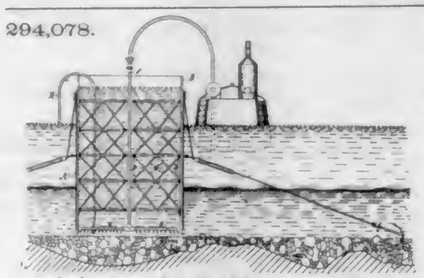
294,077. GATE. DULANEY E. ROBINSON, Roanoke, Ill. Filed Sept. 5, 1883. (No model.)

Claim.—1. The combination, with a counterweighted vertically-swinging bar having a folding gate depending therefrom, of a toggle-joint pivoted at its ends to the weighted end of said bar, and to the post supporting the same, and means whereby to flex said joint, substantially as described, and for the purpose specified.

2. In combination with the weighted bar A, pivotally supported by the post D, the gate B C, the toggle-joint F F', chain G, rocking lever H, and means for depressing the end H^2 of the same, substantially as and for the purpose set forth.

3. The bars B B, counterweighted bar A, having pivotally-supporting post D, toggle-joint F F', chain G, and rocking lever H, in combination with means whereby the end H^2 of said rocking lever is acted upon by the movement of the levers M, substantially as and for the purpose described.

294,078. CONSTRUCTION AND OPERATION OF CAISSONS. JOHN E. ROBINSON, Baltimore, Md. Filed July 21, 1883. (No model.)



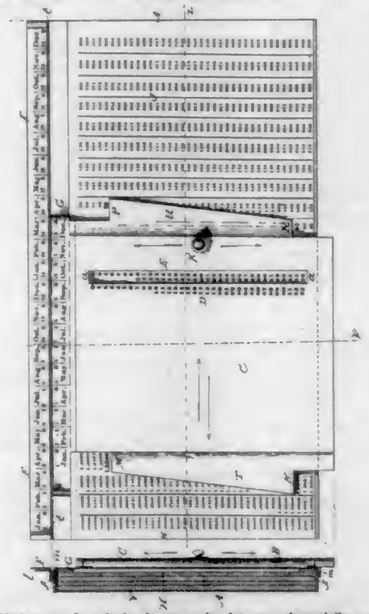
Brief.—An iron cylinder lined with wooden staves, adjustable and jointed, as described, is provided with a rotative valved perforated pipe in the interior, for supplying water in jets to wear away the bottom, and for maintaining the water at a higher head within than without, for the purpose of producing an outgoing current underneath the sides for washing away the ground, and thus sinking the structure. A siphon or pump is provided for removing the mud and for emptying the cylinder after it has reached bed.

Claim.—1. A caisson which consists of an iron shell supported internally by staves arranged to form a complete cylinder, substantially as specified.

2. A caisson which consists of an iron shell supported by staves arranged to form a complete cylinder, and bracing, substantially as specified.

3. A caisson which consists of an iron cylinder supported by staves and tightening-logs, substantially as specified.

294,078.



4. A caisson composed of an iron shell and supporting logs or staves arranged to form a complete internal cylinder, the said staves having pointed lower ends, substantially as and for the purpose specified.

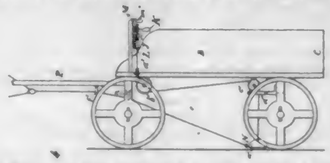
5. In a caisson constructed as described, the staves separated by T-iron bars, substantially as specified.

6. The process of removing mud from a caisson, which consists in supplying the caisson with water to a height above the natural level, stirring up the mud at the bottom, and holding it in suspension in said supplied water and siphoning out the mixture, substantially as specified.

7. In combination with the vertical pipe F and the perforated cross-pipe G, the ball-valve *f*, and means for adjusting it within the said cross-pipe, substantially as specified.

294,079. MACHINE FOR COMPUTING INTEREST. J. WATTS ROBINSON, Boston, Mass. Filed Dec. 15, 1883. (No model.)

Claim.—1. In a device for computing interest, substantially such as described, the body A, provided with the tables H J and scale F, the carriage B, provided with the scales E G, and the slide C, provided with the slot *a*, scale D, and flanges T U, combined and arranged to operate substantially as set forth.

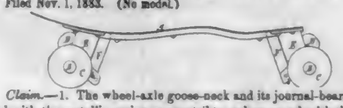


2. In a device for computing interest, substantially such as described, the body A, provided with the bracket *l* for the scale F, and with the groove *t* for receiving the flange *m* of the carriage B, and thereby preventing the carriage from moving longitudinally, substantially as specified.

3. In a device for computing interest, substantially such as described, the flange U, having the wide shoulder P and narrow end R, and the flange T, having the wide shoulder N and narrow end M, said flanges being arranged substantially as shown and described.

294,080. MANUFACTURE OF CEMENT. LUDWIG ROTH, Wetzlar, Prussia, Germany. Filed Oct. 1, 1883. (No specimens.)

Claim.—The method of making cement by burning and pulverizing a mixture of blast-furnace cinder, carbonate of lime, and an alkaline chloride, substantially as herein specified.

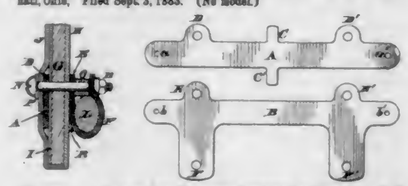


294,081. HALTER-WEIGHT. JOSEPH ROY, Montreal, Quebec, and EMILE WALLOT, Toronto, Ontario, Canada. Filed Dec. 17, 1883. (No model.)

Claim.—1. A halter drag-weight for one or more horses, constructed with anchors in the bottom thereof, in combination with a grooved pulley, J, with handle K and pivot *k'*, a ratchet, L, with pawl M and handle *m'*, a flexible cord or strap, O, with guide-pulleys *a' b' c'*, and stopping-ring *d'*, all as shown and described, and operating as set forth.

2. In combination with the drag-weight N, a cord or strap, O', connecting the horses with the drag-weight, and the guide-rings *e' f'*, as specified and described, and for the purpose set forth.

294,082. ROLLER-SKATE. LUCIUS LORENZO RYERSON, Boston, Mass. Filed Nov. 1, 1883. (No model.)



Claim.—1. The wheel-axle goose-neck and its journal-bearing, provided with the metallic spring connected to and arranged with them substantially as set forth.

2. The wheel-axle goose-neck journal-bearing provided with the lips or lateral stops, in combination with the said goose-neck, and with the spring connecting it with the said bearing and arranged therewith as represented.

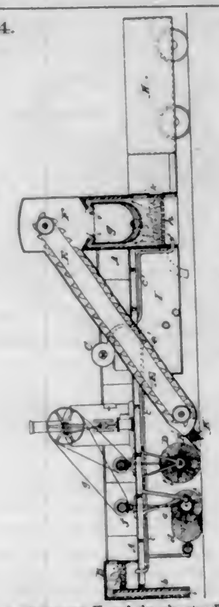
3. The goose-neck bearing having the duplex conical bore, as and arranged in it as set forth, in combination with the goose-neck connected to such bearing by a metallic spring arranged as represented, and provided with a cylindrical journal to work in the bearing, as specified.

294,083. BACK-STAY FASTENER. CHARLES M. SCHAEFER, Cincinnati, Ohio. Filed Sept. 3, 1883. (No model.)

Claim.—1. A back-stay fastening consisting of the plates A B, pierced at *a a' b b'*, to receive the shanks of knobs K K', and furnished with perforated ears D D' E E' and perforated clips F F', to admit the bolts N N', wherewith said stay is clamped to the shifting-rail L, as herein described.

2. A back-stay fastening consisting of the plates A B, pierced at *a a' b b'*, to receive the shanks of knobs K K', and furnished with perforated ears D D' E E' and perforated clips F F', to admit the bolts N N', for the purpose specified, said clips F F' being integral with the plate B, as herein described.

3. A back-stay fastening consisting of the plate A, having holes *a a'*, perforated ears D D', and integral tongues C C', and the plate B, having holes *b b'*, perforated ears E E', and integral clips F F', for the purpose specified.



4. The combination, in a back-stay fastening, of plates A *a a'* B *b b'*, tongues C C', perforated ears D D' E E', perforated clips F F', knobs K *k* K' *k'*, and bolts N *n* N' *n'*, as herein described.

294,084. SNOW-CLEARER FOR TRACKS, &c. LOUIS SCHULER, Philadelphia, Pa., assignor of one-half to William Briscoe, same place. Filed Mar. 20, 1883. (No model.)

Brief.—A snow-remover consisting of a front furnace with downward fire, rotating brushes, an endless elevator which discharges into a receiver which is supplied with heat at top and bottom, and tanks to receive the melted snow, from whence it is discharged into the street gutters or sewers.

Claim.—1. The combination of the inclined sweepers *d d'*, the large

294,084.

sweeper D, the small sweeper K, and the elevator E, and melter F, all arranged substantially as shown and described.

2. The combination of the furnace F, having receiver *g* and grate *h*, with the blast-pipe *c'* and blower C, all substantially as and for the purpose herein set forth.

3. In a snow-clearer, the receiver *g* in the furnace F, arranged to have heat applied from above as well as from below, in combination with the swiveled pipes G, arranged for the purpose described.

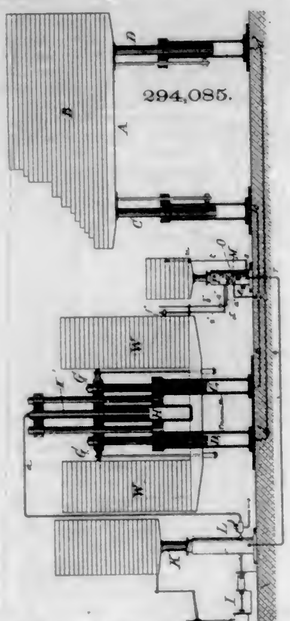
4. In a snow-clearer, the combination of a furnace, F, and melter *g*, having heat applied from above and below, with a tank, I, conveying the water from the melter to any distances, substantially as and for the purpose specified.

5. In combination with a furnace, B, having flat pipe *b*, the revolving brushes and elevator, arranged as shown, the furnace F, and melter *g*, arranged to have heat applied above and below, substantially as specified.

6. The snow-clearer herein described, consisting of a frame, A, a furnace, B, having flat pipe *b*, the blower C, the inclined brushes *d d'*, brushes D and K, elevator E, furnace F, provided with melter *g*, the tank I, and truck H, with suitable engine and driving machinery, substantially as specified.

7. The method herein described of clearing snow from streets, &c., consisting in first loosening the snow by a hot-blast, then sweeping it toward the center, then sweeping it on a catcher, E', then elevating it and dumping it into a furnace with melter, and finally conveying the water into a tank or into the gutters, substantially as specified.

294,085. HYDRAULIC RAMS ARRANGED IN SERIES. LOUIS SCHUTTE, Philadelphia, Pa. Filed Jan. 24, 1883. (No model.)



Claim.—1. In combination with two or more hydraulic lifting-rams, a transmitter embracing a corresponding number of rams connected separately with the respective lifting-rams, accumulators or sources of fluid-supply, and means whereby communication may be established between said accumulators and the lifting-rams at or near the end of their movement, substantially as described.

2. In combination with a series of hydraulic lifting-rams, a corresponding number of transmitting-rams arranged to move in unison and connected separately with the respective lifting-rams, the accumulators or equivalent sources of fluid-pressure supply, substantially as described, and stop-valves located between the accumulators and lifting-rams and operated by the transmitter, substantially as described and shown.

3. The combination of a series of lifting-rams, a corresponding number of transmitter-rams moving in unison, and connected separately with the respective lifting-rams, accumulators, or equivalent sources of supply, O P, automatic valves connecting the same alternately with a common chamber, and check-valves, whereby communication may be established with the respective rams independently of each other.

4. In combination with the series of lifting-rams, the corresponding series of simultaneously-moving transmitter-rams, each connected separately with the corresponding lifter-rams, the accumulators O P, chamber N, automatic valves *o* and *p*, and check-valves *c d e f*.

294,085.

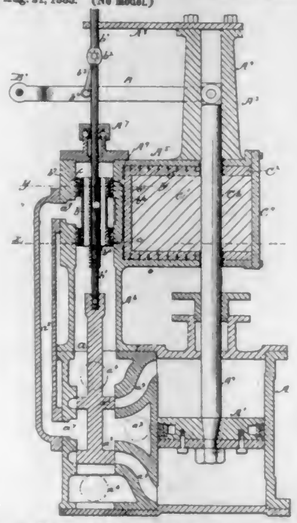
5. In combination with the valves *o* and *p* and the series of check-valves, arranged to operate as described, the bar Q, whereby the opening of the check-valves is effected.

6. In a system of hydraulic rams, the combination of a series of lifting-rams, a corresponding series of transmitter-rams, each connected independently with the corresponding lifter-rams, and intermediate means, substantially as described, for automatically supplying to the rams fluid to replace that which may escape by leakage.

7. In combination with the series of lifter-rams, the series of simultaneously-operating transmitter-rams in individual connection therewith, the operating piston and cylinder H, the check-valves between the transmitter and lifting rams, and the automatic valves *o p*, connecting with sources of pressure-fluid supply, substantially as described.

8. The combination, with the lifting-rams, of the corresponding series of transmitter-rams, the individual fluid-conductors connecting the rams, substantially as described, the counterbalancing-weight W, applied to the transmitter, check-valves applied to the respective fluid-conductors, and automatic valves *o* and *p*, communicating, respectively, with sources of high and low pressure fluid-supply, substantially as described and shown.

9. In combination with a series of elevator-rams, each having an independent fluid-supply by which it is actuated, an independent fluid-supply at a pressure greater than that required to actuate the lifter-rams, and automatic means, substantially as described, whereby said independent supply is placed in communication with the rams as the latter complete their outward or lifting movement, whereby automatic compensation for the leakage of fluid is effected.



10. In combination with the lifting-rams, the simultaneously-operating transmitter-rams, conductors connecting the respective transmitting and lifting rams, the intermediate check-valves, accumulators and automatic valves, and the accumulator K in advance of the transmitter, and a pump or equivalent source of supply to said accumulator K.

11. In combination with the lifting-rams, the transmitter-rams connected therewith, substantially as described, the cylinder and piston H H', for operating the transmitter, the high-pressure accumulator K, connected with said cylinder, and a reversible valve, L, located between the accumulator and transmitter, substantially as and for the purpose described.

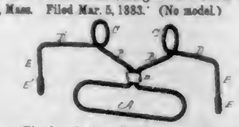
12. In a hydraulic ram, the combination of a lifting or working ram, a transmitter-ram, a fluid-conducting pipe connecting the two, a branch pipe provided with a check-valve opening outward, and a high-pressure fluid-supply communicating with said check-valve on the opposite side, substantially as described, whereby the outward flow of fluid from the conductor-pipe is prevented, but the inward flow from the high-pressure supply permitted to replace loss from leakage.

13. In combination with a hydraulic ram, a conductor for supplying fluid thereto, a source of high-pressure supply to said conductor, a source of low-pressure supply to said conductor, and automatically-operating valves, substantially as described, connecting said sources of supply alternately with the conductor, whereby the admission of fluid to supply loss from leakage is permitted through the one valve or the escape of surplus fluid permitted through the other.

294,086. STEAM-ENGINE. FREDERICK E. SICKELS, New York, N. Y. Filed Aug. 31, 1883. (No model.)

Claim.—1. In a steam-engine, a valve mechanism constructed substantially as described, and so combined with a brake-valve as to act automatically to apply the brake, substantially as set forth.

2. In a steam-engine, a brake-valve connected with the main valve and automatically operated by the valve mechanism of the main valve to apply the brake, substantially as described.



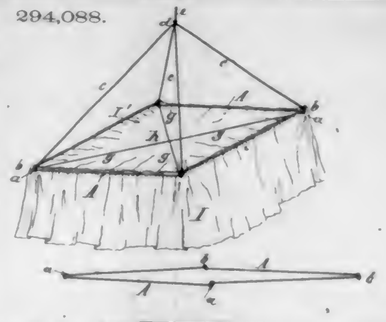
3. In a steam-engine, a brake-cylinder and brake-valve connected with and automatically operated by the valve mechanism of the engine to apply the brake, substantially as described.

4. In a steam-engine, the combination of a brake-lever and its connection, as described, a brake-valve, and operating mechanism to automatically admit the steam upon the brake-piston to apply the brake, substantially as described.

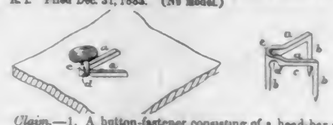
5. In a steam-engine, the combination of the main steam and exhaust passages, a steam-brake cylinder, and steam-passages leading thereto, with a brake valve and lever to automatically apply the brake controlling the steam to the main and brake cylinders, substantially as described.

6. In a steam-engine, the combination of a brake with a valve mechanism, constructed substantially as described, which valve mechanism is adapted to be moved by the operator to start the engine and release the brake, and is automatically moved to stop said engine, substantially as set forth.

294,087. DEVICE FOR HOLDING OPEN THE LEAVES OF BOOKS. GEORGE D. B. SMALL, Chelsea, assignor of one-half to William G. Emery Boston, Mass. Filed Mar. 5, 1883. (No model.)



Claim.—The herein-described improved device for holding open the leaves of books, consisting of a wire bent as shown at A, B, C, D, and E, and provided with a ring, *a*, substantially as and for the purpose set forth.



294,088. MOSQUITO BAR AND CANOPY HOLDER. DEWITT C. SMITH, Cincinnati, Ohio. Filed July 23, 1883. (Model.)

Claim.—In combination with a mosquito-bar, the mosquito-bar holder herein described, consisting of a series of rods, A, provided with eyelets *a*, and connected as set forth, and the suspending-cords *c* and cords *g*, as and for the purpose described.

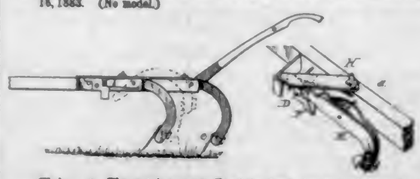
294,088.

294,089. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Dec. 31, 1883. (No model.)

Claim.—1. A button-fastener consisting of a head-bar and three or more prongs integral therewith, and projecting in substantially the same direction from one side or edge thereof, the said head-bar being bent at an angle to and at each side of the middle or button prong, for the purpose specified.

2. A metal fastener consisting of a V-shaped head-bar having prongs integral therewith located at its ends and at the angle or bend, and projecting in substantially the same direction from one side or edge of the head-bar, substantially as set forth.

3. A button-fastener consisting of an angular head-bar and three or more prongs integral therewith, and projecting from the head-bar in substantially the same direction from the edge and in the line of said head-bar, all of said prongs being adapted to enter the material while they are in the line of the head-bar, and the cut edge of said head-bar adapted to engage or rest upon the material to which the fastener may be secured, substantially as set forth.

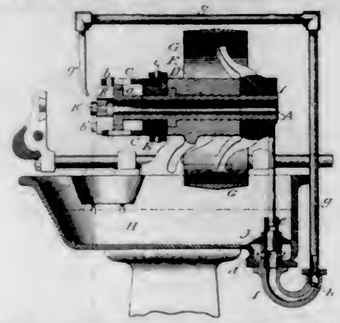


4. The improved sheet-metal button-fastener, consisting, essentially, of the V-shaped head-bar *a*, provided with the recesses *d* and strengthening portion *e*, and having the prongs *b* integral therewith, disposed at the ends and middle of the head-bar and projecting in substantially the same direction from the cut edge *c* of said head-bar, the head-bar and prongs being in alignment when adapted to be secured to leather or other material, all substantially as described, and for the purpose set forth.

294,090. CAR-WHEEL. FREDERICK H. SMITH, Baltimore, Md. Filed Aug. 3, 1883. (No model.)

Claim.—A car-wheel in which there is interposed between a peripheral tire and a central hub a separate annular web constructed of wrought-iron or steel annular plates strengthened, braced, and stiffened by wrought-iron or steel spokes placed in between and in contact with the annular plates, and attached thereto and combined therewith by bolts or rivets passing through the annular plates and spokes, as shown.

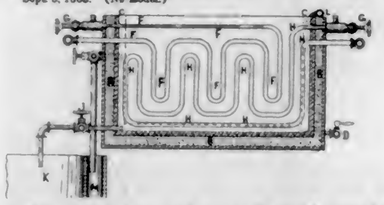
294,091. CULTIVATOR. ISAAC A. SMITH, Dexter City, Mo. Filed Aug. 16, 1883. (No model.)



Claim.—1. The catch or cam F, of the form shown and described, centrally pivoted, and having the shoulder *f* and beveled or knife edge C.

2. The combination, with a cultivator-beam and a pivoted standard, of the rotating catch F, of the form shown and described, and the spring H.

3. The combination, with a cultivator-beam and pivoted standard, of the catch F, of the form shown and described, spring H, and side spring, *d*, substantially as described.

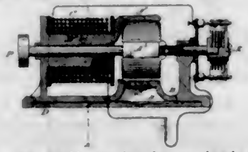


294,092. MACHINE FOR CUTTING SCREW-THREADS. ELMER A. SPERRY, Cortland, N. Y., assignor to Jesse Van Duzburgh, same place. Filed Sept. 30, 1882. (No model.)

Claim.—1. Jointly with the rotating spindle A, eccentrics *f f*, carriers B B, and cam-plates C, the base H, serving as a reservoir, and means for automatically forcing a lubricant from this base to the dies, as set forth.

2. In combination with the die-carriers B, pivoted to the spindle A, and longitudinally-sliding cam-plates C C, the eccentrics *f* and pulley G, the whole being adapted to throw the dies in and out of action without disconnecting the power, as and for the purposes set forth.

294,093. ICE-MACHINE. GEORGE TAYLOR, Everett, Mass. Filed Sept. 8, 1883. (No model.)



Claim.—1. In a congealer, the evaporating-pipe F, arranged so as to extend horizontally through the upper portion thereof, and thence downward below the center thereof, and upward and backward and downward with two or more of such angular turns or vertical zigzag curves, and thence outward below the point of entrance, as shown and described, as and for the purposes set forth.

2. In a congealer, the two evaporating-pipes F and H, provided with valves, and each arranged so as to extend through the same in two or more vertical zigzag curves passing upward and downward above and below the central horizontal plane thereof, and nearly equidistant at all points, and thence outward therefrom near the point of entrance, as shown and described, as and for the purposes set forth.

3. In combination with the ice-box, the perforated bottom plate, E, and vertical end plates, C, as and for the purposes set forth.

294,094. DYNAMO-ELECTRIC MACHINE. ELIHU THOMSON, New Britain, Conn. Filed May 23, 1883. (No model.)

Claim.—1. The combination, in a dynamo-electric machine or motor, of a field-magnet core, through which and parallel with whose axis the armature-axis passes, and two or more pole-pieces, between which the armature rotates, said pole-pieces being magnetically connected with the opposite ends of the core, so as to be of opposite polarity.

2. The combination, in a dynamo-electric machine or motor, of a field-magnet having a longitudinally-perforated core, an armature whose axis passes through the core, and pole-extensions projected from opposite ends of the core, and respectively of north and south polarity, said pole-extensions forming the magnetic pole-pieces between which the armature rotates.

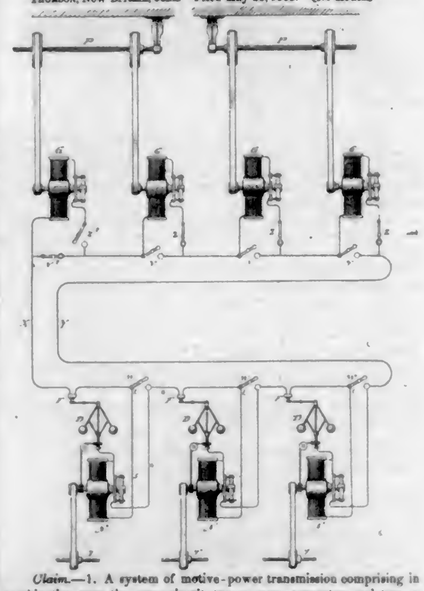
3. A field-magnet for a dynamo-machine, the axis of whose core coincides with the armature-axis, and provided with field-of-force poles formed the one by a direct extension from said core and the other by the base-plate to which or with which said core is in magnetic connection.

4. The combination of the frame D B of iron, core D′, formed with or secured thereto, pole-pieces N S, coils C, and an armature, A, mounted on a shaft passing through the core D′.

5. In a dynamo-electric machine or motor, an armature wound with two coils or conducting wires in different planes or positions, two of the four terminals of said coils being united together and to a commutator-segment, while the other terminals are singly connected to two other commutator-segments, substantially as set forth.

6. In a dynamo or magneto electric machine or motor, a system of two revolving coils wound in different planes or positions, as described, united by a joint formed of two of the terminals at a commutator-segment, and having their other or remaining terminals connected to the two other segments of a three-segment commutator.

7. The combination, substantially as described, of two armature-coils and a three-segment commutator, one segment of which is united to a terminal from each coil, while the remaining segments are separately connected to the remaining terminals of said coils.



8. The combination, with a set of two armature-coils or armature-helices, of a three-segment commutator, the overlap of whose segments is made unequal, as described.

9. The combination, with a set of two armature-helices, of a three-segment commutator, connected, as described, to said helices, and having an overlap between its successive segments approximately twice as long at one of its points between the segments connected to single ends of the armature-helices as is the overlap at the two other points.

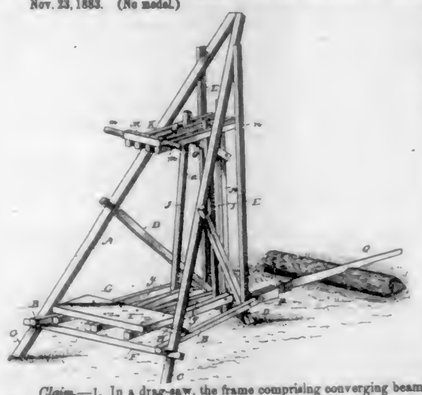
10. In a magneto or dynamo electric machine or motor, a commutator-cylinder made in two sections adjustable with respect to one another, as described, so as to permit the overlap between successive commutator segments or sections to be adjusted.

11. A commutator for a dynamo-electric machine or motor consisting of two commutator-rings, L M, each divided into the proper number of segments, and means for setting the divisions of said ring at any desired circumferential angle with relation to one another.

294,095. ELECTRIC-POWER-DISTRIBUTION SYSTEM. ELIHU THOMSON, New Britain, Conn. Filed May 25, 1883. (No model.)

Claim.—1. A system of motive-power transmission comprising in combination upon the same circuit two or more generators and two or more motors, all in series with one another, switch devices for open-circuiting each generator, and means for shunting each generator and each motor.

2. A system of motive-power transmission comprising in combination two or more driven electric generators and two or more motors or translators coupled in series, as described, an automatic regulator for each generator, and an automatic governor for each motor, that cuts down the strength of the motor field-magnet upon an increase of the motor's speed beyond a determinate point.



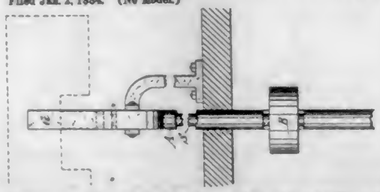
3. The combination upon one and the same electric circuit, and in series with one another, of two or more electric generators, each provided with a suitable current-governor, and two or more electric motors, each provided with means for closing a shunt around its field upon an abnormal increase of speed.

4. The combination upon one and the same circuit of two or more electric generators, two or more electric motors, means for varying the electro-motive force of the current generated in accordance with variations in the current strength upon the main circuit, and motor-governors for cutting down the effective magnetism of such motor when their speed increases to an abnormal extent.

5. The combination upon one and the same electric circuit of two or more electric generators, an automatic regulator for each generator that simultaneously shifts the commutator-brushes and decreases the field-magnetism upon an increase in the current upon the general circuit supplied by the generators, and two or more motors arranged in series with one another and with said generators, each provided with a suitable automatic speed-governor that shunts the field-magnet of the motor upon an abnormal increase in the speed.

6. The combination of the motor N, governor D, lever S^2, contacts F, and derived or shunt circuit 9.

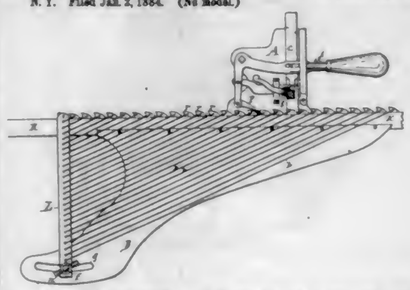
294,096. DRAG-SAW. GEORGE VALENTINE, Monticello, Ill. Filed Nov. 23, 1883. (No model.)



Claim.—1. In a drag-saw, the frame comprising converging beams B, converging legs C, legs D, attached to said legs C and converging downward, uprights E, connecting the legs C D to the beams B, in combination with the treadle G, oscillating frame K, saw-handle P, and connecting-rod N, as set forth.

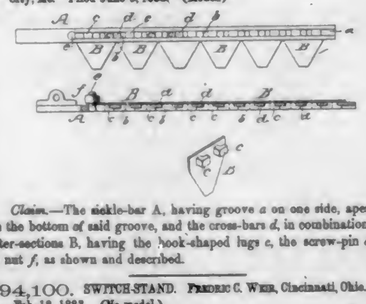
2. In a drag-saw, the treadle, formed in two parts, *g*, in combination with an oscillating frame, K, above the treadle, a connecting-rod attached to one end of said frame and provided with a detachable saw-handle, and a handle, M, at the other end of the frame, and pitmen connecting the oscillating frame and treadle, as and for the purpose set forth.

3. In a drag-saw, the combination, with saw and saw-handle, a connecting-rod, N, oscillating frame K, comprising a series of bars connected together, a handle, M, at rear of said frame, brace-bars O, connecting the frame with the rod N, a treadle formed in two parts, *g*, between which the saw-handle works, and pitmen connecting the frame and treadle, arranged and operating for the purpose set forth.



294,097. MORTISE-CLEANER. SIDNEY VAN AUKEN, Oswego, N. Y. Filed Jan. 2, 1884. (No model.)

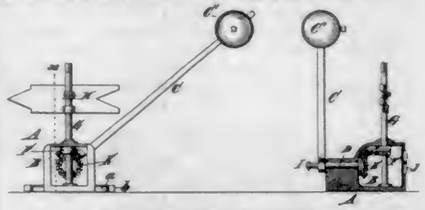
Claim.—1. The combination of a vertical rotary spindle, a tool mounted upright on the upper end of said spindle, and having the face of its uppermost end provided with scraping or cutting edges, and guides at opposite sides of said tool adapted to receive between them the article containing the mortise to be cleaned, substantially as set forth and shown.



2. In combination with the cutter C, arranged vertically with its cutting end uppermost, the guides G G, arranged at opposite sides of the cutter adjustably in relation to the distance between them, substantially as described and shown, for the purpose specified.

294,098. WIRING BLIND-STILES. SIDNEY VAN AUKEN, Oswego, N. Y. Filed Jan. 2, 1884. (No model.)

Claim.—In combination with the staple-driver A, provided with a pawl, P, the within-described gage, consisting of the rail R, provided with the way *a* for the reception of the blind-rod, a series of separate rack-teeth, *r r*, mounted movably on said rail, the pivoted lever L, connected with the respective rack-teeth by a series of rods, *b b*, and a clamping device for confining the lever in its requisite position, substantially as described and shown.

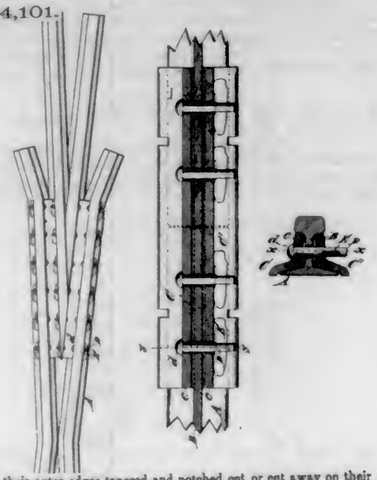


294,099. SICKLE BAR AND KNIFE. LORENZO WALLACE, Kansas City, Mo. Filed June 5, 1883. (Model.)

Claim.—The sickle-bar A, having groove *a* on one side, apertures *b* in the bottom of said groove, and the cross-bars *d*, in combination with cutter-sections B, having the hook-shaped lugs *c*, the screw-pin *e*, and the nut *f*, as shown and described.

294,100. SWITCH-STAND. FREDERIC C. WEIR, Cincinnati, Ohio. Filed Feb. 12, 1883. (No model.)

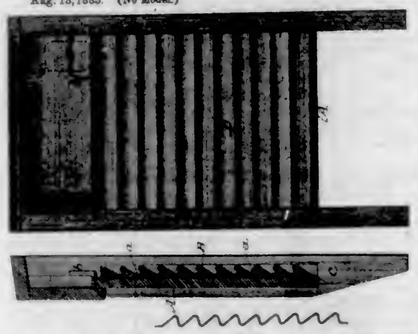
Brief.—The vertical target-shaft and the horizontal shaft of the switch-actuating lever—said lever being adjustably weighted or slotted to receive a locking-staple, and having a crank-pin adapted to a switch-connecting rod—have their bearings in a casting which constitutes the body of the stand, and is chambered to receive the bevel-gears which connect the two shafts. The chambered casting has a sliding door.



Claim.—The combination of the chambered casting having the horizontal and vertical bearings of the shaft D, target-shaft G, gears E and F, inclosed within the casting, and the weighted lever C, rigidly attached to shaft D, and carrying the crank-pin I, to which the pitman or connecting-rod is adapted to be connected, the whole arranged and operating substantially as described.

294,101. RAILWAY-RAIL JOINT. FREDERIC C. WEIR, Cincinnati, Ohio. Filed Feb. 12, 1883. (No model.)

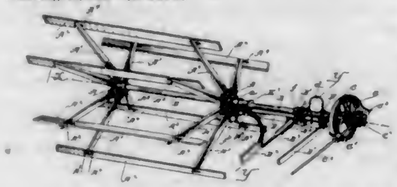
Brief.—The elastic keys have their inner portions straight and their outer edges tapered, and are cut away on their inner edges, so as to form bearings on either side of each bolt.



Claim.—The combination, with the rail and the fish-plates, of the headed and slotted bolts passing through the web of the rail, and the fish-plates and the elastic keys having their inner bearing portions straight

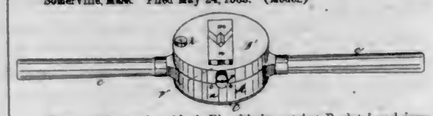
294,101.

and their outer edges tapered and notched out or cut away on their inner edges opposite to the bolts, so as form bearings on either side of each bolt, substantially as described.



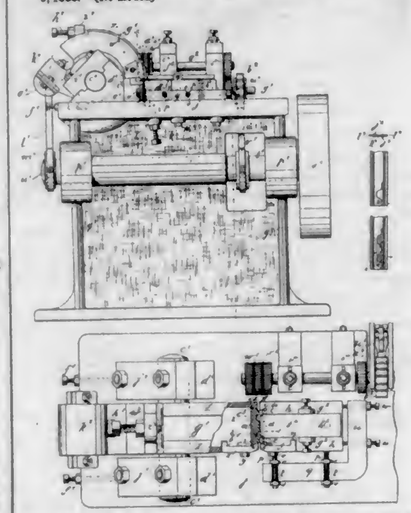
294,102. WASH-BOARD. ANGELINE WHITE, London, Ohio. Filed Aug. 18, 1883. (No model.)

Claim.—1. In combination with the back board, A, and side pieces, C, of a wash-board, the sheet of zinc B, having grooves extending from one side to the other, formed with a deeply re-entering angle, whereby transverse pockets capable of retaining water upon a vertically-held wash-board are formed, substantially as and for the purpose described.



2. The combination of the back board, A, and side pieces, C, of a wash-board with the bent wire *b*, having one end inserted into one of the side pieces and the other into the back board, substantially as and for the purpose described.

294,103. HARVESTER-REEL. WALTER A. WOOD, Hoosick Falls, N. Y. Filed Aug. 25, 1883. (No model.)



Claim.—The combination of the reel-support D, the tubular reel-shaft B, and internal shaft, F, the lever-supporting plate B^3, secured to the reel-support, and provided with perforations b^2 b^2 b^2, the pivot-bolt b^2, and spring b^2, with the bifurcated lever B^3, having a pin, b^4, on the under side thereof, substantially as and for the purpose described.

294,104. TAP AND REAMER WRENCH. HARRY E. WOODS, West Somerville, Mass. Filed May 24, 1883. (Model.)

Claim.—The ratchet-block B', with its ratchet B, slot *l*, and jaws *m n*, the stock or holder A, having handles *c c*, an opening, *b*, for the reception of the ratchet, and one or more pawls to engage therewith, in combination with a plate, C, for keeping the ratchet within the holder, constructed to operate substantially as and for the purpose described.

294,105. MACHINE FOR BARBING METALLIC FENCING. HORACE L. ARNOLD, Middletown, Conn., assignor to Thomas W. Hall. Filed Feb. 9, 1883. (No model.)

Claim.—1. The combination, in a barbing-machine, of a bed-die, *a*, having two projecting ribs in its side, a movable die, *a'*, having two grooves in its side corresponding to the ribs of die *a*, mechanism for working the movable die, and mechanism for feeding the blank strips, said ribs and grooves having bevel sides to produce the required taper of the barbs, and being located the same distance apart the barbs are to be, also being as much wider than the barbs to be formed as the width of the waste material to be cut away between the barbs, and said feed mechanism being adapted to feed the blanks intermittingly half the length of the dies from outside to outside of the ribs and grooves at each operation, substantially as described.

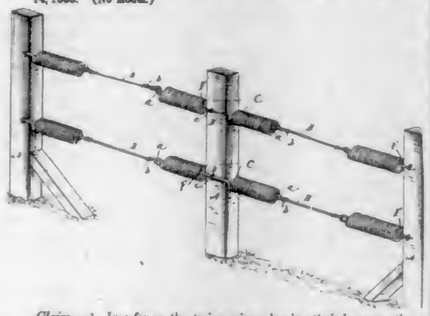
2. In a barbing-machine, the combination of mechanism consisting of bed-die *a*, working-die *a'*, rocker die-stock w^3, feed-rolls w', and a driving-shaft w', said driving-shaft being arranged with relation to said die-stock and feed-rolls and connected directly to said die-stock by eccentric m' and rod l', and to the feed-rolls by the eccentric t', rod v', and ratchet u' a^2, substantially as described.

3. The rocker die-stock w^3, having a turned and grooved face for the die *a'* and follower g', the cheek-piece *x*, for clamping the die, and the adjusting-screw h', substantially as described.

4. The rocker die-stock w^3, having pivot-trunnions c', mounted in inclined boxes d' j', by which the taking up of the slack of the journals also takes up the slack of the dies, substantially as described.

5. The rocker die-stock w^3, having pivot-trunnions c', mounted in inclined boxes d' j', by which the taking up of the slack of the journals also takes up the slack of the dies, in combination with the pillow-block e', adjustable toward the stationary die, substantially as described.

6. The combination of the die-block A, bed-die *a*, cheek-piece *f*, follower *i*, and adjusting-screw *k*, substantially as described.



7. The combination, with the dies *a* and *a'*, in which the blank strip is supported in part of its breadth only by the bed-die, of a guard, f^3, attached to the die-block h^3, and projecting over the strip to or near the limit of the working-die, substantially as described.

8. The combination, with the dies *a* and *a'*, in which the blank strip is supported in part of its breadth only by the bed-die, of a guard, f^3, attached to the die-block h^3, and projecting over the strip to or near

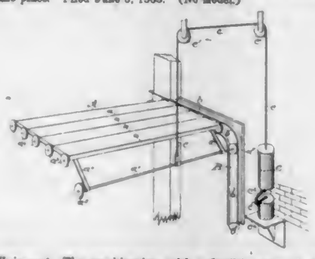
the limit of the working-die, said guard having a groove in the lower face of its projecting part for the rib j^3 on the strip to be cut, substantially as described.

9. The combination, with the die-block h^2 and dies a a', of the presser-guard f^3 and spring k^3, said presser being pivoted to the die-block, substantially as described.

294,106. FENCE. LEROY AMBURY BAKER, Elmira, N. Y. Filed Aug. 14, 1883. (No model.)

Claim.—1. In a fence, the twin springs, having their inner portions bearing against the sides of the posts, and formed with a bridge-piece connecting the springs and secured to the front face of said posts, as set forth.

2. In a fence, the combination, with the posts and wires, of the twin springs, secured to the wires at one end and bearing at their other ends against the sides of the posts, and a bridge-piece formed with and connecting the twin springs, said bridge-piece being secured to the face of the posts, as set forth.

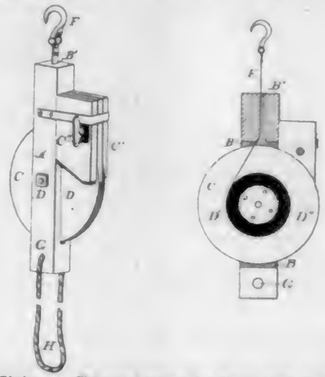


3. The herein-described fence, comprising the posts A, wires B, and twin springs C, the latter being connected to the wires at their outer ends, and formed with a connecting bridge-piece at their inner ends, said bridge-piece being bent at right angles to the springs and secured to the face of the posts, substantially as and for the purpose set forth.

294,107. THILL-COUPLING. NELSON R. BAKER, Greene, N. Y. Filed Jan. 7, 1884. (No model.)

Claim.—The combination of the iron A, attached to the thill or pole, with hinge B, forming the fastening, including bolt, spring, or clutch D, as shown in Fig. 1 and as set forth in the description.

294,108. SELF-CLOSING HATCH-COVER. ANDREW J. BALLARD, Cohoes, N. Y., assignor to the Cohoes Iron Foundry and Machine Company, same place. Filed June 8, 1883. (No model.)

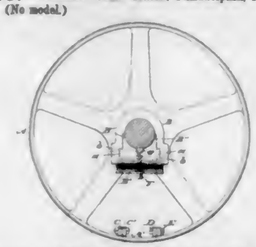


Claim.—1. The combination, with a flexible cover, A, for a hatchway, the said cover being connected together by means of hinge-joints a', and provided with a series of friction-wheels, a^2, as herein described, of the tracks B, each being composed of a horizontal portion, b, curved portion b', and vertical portion b^2, the said tracks being adapted to receive the friction-wheels a^2 in such manner as to govern the direction of the travel of the cover A, as herein specified.

2. The combination, with a flexible cover, A, for a hatchway, the said cover being jointed together and provided with friction-wheels a^2, as herein described, of the tracks B, composed of horizontal portion b, curved portion b', and vertical portion b^2, as herein set forth, and the weights C, all being constructed and arranged to operate substantially as herein specified.

3. The combination, with a flexible cover, A, for a hatchway, the cross-bar a^3, flexibly connected to said cover by means of the links a', and the weights C, connected to said cross-bar, of the tracks B, composed of horizontal portions b, curved portions b', and vertical portions b^2, all being constructed and arranged to operate substantially as herein specified.

294,109. FIRE-ESCAPE. FRANK A. BOSS, Lebanon, Ohio. Filed May 3, 1883. (No model.)



Brief.—To the main frame are secured three wings, one between and one on each side of the rope-spool flanges. A thumb-screw is passed through these wings for clamping them upon the flanges of the spool to check its rotation.

Claim.—1. The combination of the sheave-block A, having the longitudinal slot B, opening B', with the pulley D'', composed of the disks, as shown, and the wings C', provided with the thumb-screw C'', substantially as herein set forth.

2. The combination of the sheave-block A, having the longitudinal slot B and vertical slot B', and the rope, strap, or chain H, with the pulley D'', disks C, wings C', clamping-screw C'', and the tape E, substantially as herein set forth.

294,110. PULLEY. JOHN BRAUN, Philadelphia, Pa. Filed Nov. 8, 1883. (No model.)

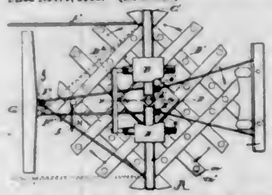
Claim.—1. A pulley having a divided rim, and a divided hub in the portions between two adjacent arms, said rim and hub being provided each with sections independent of the other, closing the divisions of the rim and hub, substantially as and for the purpose set forth.

2. A pulley having its rim divided, and provided with a removable section occupying the space of the division, preserving the continuity of the rim, both ends of the section and of divided rim being formed with ears, in which fastening-bolts are fitted, substantially as and for the purpose set forth.

3. A pulley having its hub divided, and a section occupying the space of the division removably connected with the hub, in combination with a bolt passed through the section and tightening against the shaft, substantially as and for the purpose set forth.

4. A pulley formed of a rim having a removable section with ears and fastening-bolts, and a hub portion with a removable section tongued and grooved, and fastening devices, substantially as and for the purpose set forth.

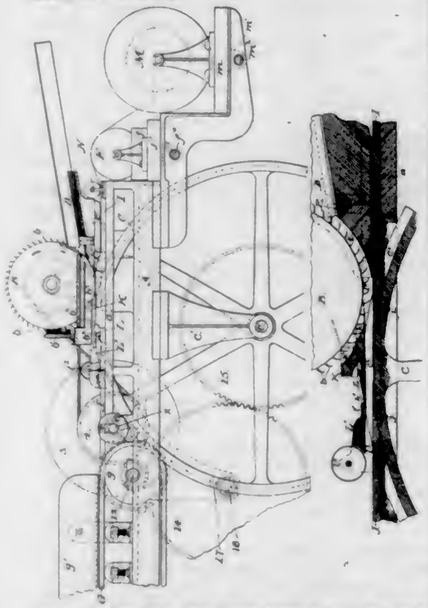
294,111. NAIL-STRIP. WM. H. BROCK, Corona, N. Y. Filed Sept. 4, 1883. (No model.)



Claim.—A nail-strip for box-nailing having such structure that its head-piece is partly severed by the indentations a and b, made in its sides, and that the single nail mechanically cut therefrom has its head, shank,

294,111.

and entering end identical with the corresponding parts of the regular nail in common use for the nailing of boxes, all substantially as and for the purposes herein shown and described.



294,112. ROTARY HARROW. DAVID W. BROWN, Buckhannon, W. Va. Filed Nov. 9, 1883. (No model.)

Claim.—1. In a rotary harrow, the combination, substantially as described and shown, of the harrow, the draft-beam pivoted centrally thereon, the draft-bars secured to the said beam, and one on each side of and near the center thereof, and the guy-rods secured to the draft-beam near the opposite outer ends thereof, as and for the purposes specified.

2. The improved rotary harrow herein described, composed of the harrow proper, the draft-beam pivoted centrally on and supported thereby, the draft-bars F F', secured to forward side of the draft-beam and near to and on opposite sides of the pivot thereof, and the guy-rods, secured one near each end of the draft-beam, the bar E', provided with shovels E, and the rods s s, connecting said bar E' and the beam C, all substantially as and for the purposes specified.

294,113. CIGARETTE-MACHINE. JAMES BURNS, Brooklyn, and ALEXANDER BUCKMAN, Schodack Depot, N. Y., assignors of twenty-two fortieths to Abram L. Schermerhorn and John S. Baker, both of Stuyvesant, and James R. Downer and Frank P. Harder, both of Castleton, N. Y. Filed Jan. 22, 1883. (No model.)

Claim.—1. In a cigarette-machine, a tobacco-feeding wheel whose periphery is provided with circumferential rows of pins, which are curved or bent backward in respect to the direction of the rotation of said wheel, as herein described, and a stationary channel-piece, which forms part of the tobacco-feeding table, and contains a concave groove whose bottom is parallel, or nearly so, to the periphery of the tobacco-feeding wheel, the fixed peripheral pins of said wheel being adapted to pass through the entire length of said groove, in combination with a device for stripping the tobacco from the pins and compressing it into a trough of wrapper, the said device being constructed and arranged in relation to the tobacco-feeding wheel to operate as herein specified.

2. In a cigarette-machine, a peripherally-grooved wheel, in combination with tobacco feeding and filling mechanisms, as herein described, the said grooved wheel being adapted to contain the trough of wrapper during the operation of filling, and to feed forward the cigarette-stock, as herein specified.

3. In a cigarette-machine, the combination, with a tongue-piece, of the peripherally-grooved wheel, the said tongue-piece being provided with a tongue that is tangentially fitted to the bottom of the groove of said wheel and with cheeks, as herein described, whereby a stationary groove of a width and depth that is uniform with the peripheral groove of the grooved wheel is formed beneath the tobacco-feeding mechanism, as and for the purpose herein specified.

4. In a cigarette-machine, the combination, with a tobacco-feeding wheel provided with peripheral rows of immovable pins, as herein described, of a stationary channel-piece adapted to convey the tobacco directly into an open trough form of wrapper lying directly under the center of said feeding-wheel, the said channel-piece being adjunctive to the feeding-table, and provided with a channel or groove whose bottom has a curvature that is parallel or nearly parallel to the periphery of the tobacco-feeding wheel, the peripheral pins of the latter being adapted to pass through the entire length of said groove in such manner that the ends of the pins will not reach to the bottom of said groove, as and for the purpose specified.

5. In a cigarette-machine, the combination, with a rotative wheel containing a peripheral groove, as herein shown and described, of one or more tongue-pieces provided with tongues which are arranged tangentially to the bottom of said groove, one of said tongue-pieces being provided with a straight groove that conforms to the size and produces an unbroken continuation of the groove in the rotative wheel, as and for the purpose herein specified.

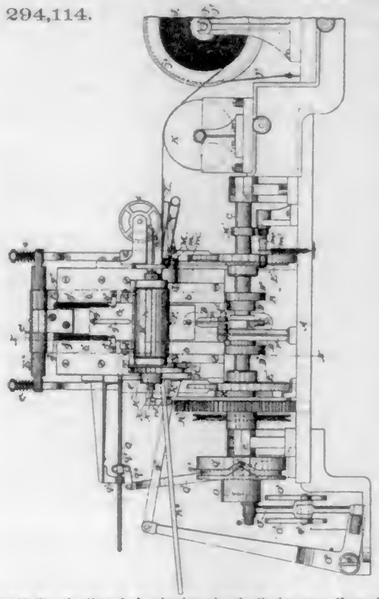
6. In a cigarette-machine, the combination, with a tobacco-feeding wheel, of a dust-guard adapted to bear against the side of said feeding-wheel, so as to protect the pasted edge of the wrapper, as herein specified.

7. In a cigarette-machine, the folder L, having a spring terminal, l, and being provided on its under face with diagonal corrugations or grooves, as and for the purpose herein specified.

8. In a cigarette-machine, the combination, with a tobacco-feeding wheel, B, provided with retrorsely-arranged pins b, a stationary channel-piece, E, provided with concave channel e, and tongue e', and a tongue-piece, I, provided with cheeks i', having upwardly-inclined edges i^3, and expanding throat i^5, of the grooved wheel C, and stripping and compressing device K, all substantially as set forth.

9. The folder L', provided with curved blade l', groove l^2, and the pressing-wheel P, arranged in relation to the groove l^2, and to operate as herein specified.

10. In a cigarette-machine, the combination of the horizontally-reciprocating head H, vertically-reciprocating knife A, and the horizontal spring h', arranged in relation to the cutting-edge of said knife, the said spring being adapted to receive the severed cigarettes and elevate them to the plane of the outcoming cigarette-stock, as and for the purpose herein specified.



11. In a cigarette-machine, the combination of a tobacco-feeding mechanism, a stationary feeding channel-piece, a combined wrapper-trough holding and cigarette-stock feeding device, composed of a stationary grooved tongue-piece, and a peripherally-grooved rotative wheel arranged to form an unbroken straight groove, as herein described, a combined stripping and compressing device, and a wrapper-folding mechanism, all substantially as herein set forth.

294,114. MACHINE FOR MAKING CIGARETTES. JAMES BURNS, Brooklyn, and ALEXANDER BUCKMAN, Schodack Depot, N. Y., assignors of twenty-two fortieths to Abram L. Schermerhorn and John S. Baker, both of Stuyvesant, and James R. Downer and Frank P. Harder, both of Castleton, N. Y. Filed June 20, 1883. (No model.)

Claim.—1. In a cigarette-machine, the combination of a reciprocating bed-die, D, and sliding plate d, having a longitudinal groove, d^2, whose transverse form consists of a segment of more than a semicircle, as herein set forth, and a reciprocating upper die, E, having in its lower end a longitudinal concave groove, e, that will combine with the groove d^2 to form a complete circle, as herein described, with the means, substantially as specified, for reciprocating the said dies D and E toward and from each other, as and for the purpose herein set forth.

2. In a cigarette-machine, the combination, with a vertically-reciprocating bed-die, D, having a vertically-sliding plate, d—which forms part

294,114.

of said die—the die and plate having a longitudinal groove, d^2, consisting of more than a semicircle, as herein described, the cams D′ and D^2, and springs d^4, for actuating said bed-die, of the folders P and mechanism, substantially as described, whereby the said folders are caused to turn over in consecutive order, first the pasted edge and then the unpasted edge of the wrapper, whereby the adhesion of the wrapper around the molded form of tobacco is effected, substantially as herein specified.

3. In a cigarette-machine, the combination, with a reciprocating bed-die, D, provided with a reciprocating sliding plate, d, and a tobacco-feeding mechanism, substantially as described, for feeding the tobacco into the machine, of a vertically-reciprocating upper die, E, arranged in relation to said bed-die, and having on its lower end a cutting-edge, as herein set forth, the cross-bar F′, and mechanism, substantially as described, for reciprocating the dies D and E, in the manner and for the purpose herein specified.

4. In a cigarette-machine, the combination, with the box F and bed-die D, the latter containing a sliding plate, d—the said die and plate having a longitudinal groove, d^2, formed therein, as herein described—and the said die being provided with a strip, d^3, of yielding material, for clamping one edge of a wrapper between said box and die, as herein set forth, and mechanism, substantially as described, for feeding the tobacco into the machine, of the upper die, E, having a reciprocating movement, and adapted to sever a charge of tobacco from the incoming supply, and to force the said charge and its inclosing-wrapper into the groove d^2 of the bed-die D and sliding plate d, as herein specified.

5. In a cigarette-machine, a reciprocating bed-die adapted to retain a molded charge of tobacco and its inclosing-wrapper, folders for turning over and causing the edges of said wrapper to adhere, a reciprocating upper die adapted to cut off the required charge of tobacco and force it—with its inclosing-wrapper—down into the groove of the bed-die, and a sliding plate adapted to reciprocate in the bed-die, for the purpose of dislodging the finished cigarette from the groove in said bed-die, in combination with the mechanisms, substantially as shown and described, for reciprocating said bed-die, sliding plate, and upper die, and for actuating the said folders in the manner and order herein specified.

6. In a cigarette-machine, the combination, with the reciprocating bed-die D, reciprocating upper die, E, and folders P, as herein shown and described, of the mechanisms, substantially as described, for feeding in the wrapper and pasting the edge thereof, in the manner herein specified.

7. In a cigarette-machine, the combination, with a pasting-wheel, K, and wrapper-bed L, of the spring l', arranged on the front edge of said wrapper-bed, for the purpose of raising the pasted edge of the wrapper, as herein specified.

8. In a cigarette-machine, the wrapper-feeding device, consisting of a sliding bar, N, frictionally retarded, substantially as set forth, and a bifurcated lever, N′, pivoted to one end of the sliding bar N, and provided with a pendent arm, n^3, the said pendent arm being connected to mechanism for actuating the said wrapper-feeding mechanism in such manner that a combined vibratory and sliding movement will be imparted to the said bifurcated lever, as and for the purpose specified.

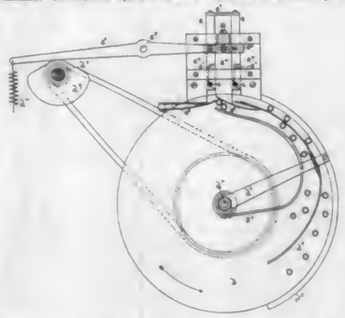
9. In a cigarette-machine, the combination, with a wrapper-feeding device consisting of the sliding bar N and a bifurcated lever, N′, pivoted to said sliding bar, and adapted to operate as herein set forth, the wrapper-bed L, and vibrating knife M, of the bed-die D, upper die, E, folders P, and the several mechanisms, substantially as described, for actuating the said parts, in the manner specified.

10. In a cigarette-machine, the wrapper-feeding mechanism herein described, consisting of a sliding bar, N, and a bifurcated lever, N′, pivoted to one end of said sliding bar, and provided with a pendent arm, n^3, for the purpose of giving to said bifurcated lever a combined vibratory and sliding movement, as herein set forth, in combination with an ejector, n^7, attached to the bifurcated lever N′, and adapted to effect the discharge of the cigarettes, as herein specified.

11. In a cigarette-machine, the ejector n^7, provided with a facing, n^8, as herein described, the said ejector being adapted to reciprocate and to effect the cleaning of the groove d^2 of the bed-die D, in the manner herein specified.

12. In a cigarette-machine, the combination, with a tobacco-feeding mechanism, a reciprocating upper die, E, having the presser-plate G attached directly thereto, and a cut-off, I, and box F, all arranged to operate as herein described, of the several mechanisms, substantially as described, for actuating the said upper die and cut-off, in the manner herein specified.

13. In a cigarette-machine, the combination, with a reciprocating upper die, E, bed-die D, having the groove d^2, and folders P, adapted to move consecutively, as herein set forth, of the sliding plate d, adapted to dislodge the finished cigarette from the groove d^2, and the ejector n^7, as and for the purpose herein specified.



14. In a cigarette-machine, the reciprocating bed-die D, having a groove, d^2, that consists of a segment greater than a semicircle, whereby inturned edges are formed at the opposite sides of said groove, for the purpose of retaining the molded cigarette in place, and a sliding plate, d, adapted to dislodge the finished cigarette from the groove d^2, in the manner herein specified.

15. In a cigarette-machine, the wrapper-feeding mechanism, substantially as described, and consisting of a sliding bar, N, and a bifurcated lever, N′, having the free end of its limbs n^{20} faced on the under side with rubber or other elastic material, for producing a more perfect adhesion to the wrapper, the said bifurcated lever being pivoted to one end of the sliding bar N, and having at its pivoted end a pendent arm, n^3, as herein described, in combination with mechanism, substantially as described, whereby a combined sliding and vibratory movement is imparted to the bifurcated lever N′, as and for the purpose herein specified.

16. In a cigarette-machine, the combination, with the lower die, D, and sliding plate d, having a longitudinal groove, d^2, as herein set forth, of the folders P and the mechanism, substantially as described, for actuating the said folders in such manner that they will first fold over one edge of the wrapper and hold it in place until the second edge is folded over and adhered to the first, in the manner herein specified.

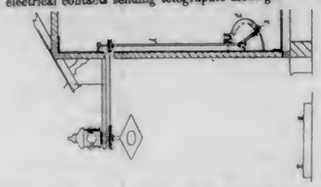
17. In a cigarette-machine, the combination, with an upper die, E, having a groove, e, in its lower end, as herein described, of the reciprocating wiper Q, adapted to clean the groove e, in the manner herein specified.

294,115. MACHINE FOR DRAWING METALLIC CARTRIDGE-SHELLS. PAUL BUTLER, Lowell, Mass. Filed Oct. 13, 1883. (No model.)

Claim.—1. In combination with the feed-table D, three or more shell-guides, d^5 d^7 d^8, substantially as described.

2. In combination with the revolving table D, the two sets of punches and dies c c′ and two reciprocating feeding-slides, e e, substantially as described.

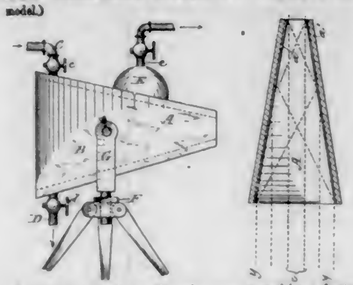
3. In combination with the rigid outer and inner shell-guides, d^5 d^8 the intermediate shell-guide, d^7, having an elastic delivery end, substantially as described.



4. In combination with the revolving feed-table D, three shell-guides, d^5 d^7 d^8, two reciprocating carrier-slides, e e, and two sets of dies and punches, c′ c, substantially as described.

5. In combination with the feed-table D, the shell-guides d^5 d^7 d^8, the springs d^9 d^{7}, and the two reciprocating carriers e e, substantially as described.

6. The combination of the feed-table D, three shell-guides, d^5 d^7 d^8, and two punches, c c, substantially as described.



294,116. RAILWAY-SIGNAL. BERT BUYS, Reese, Mich., assignor of one-third to Frank Wilcox, same place. Filed Nov. 3, 1883. (No model.)

Brief.—The arm by which the signal-shaft is rotated makes a series of electrical contacts sending telegraphic message.

Claim.—The combination of the vertical shaft A for operating a visual signal, the horizontal plate C, forming a step for the shaft, and carrying a series of fixed electrical contacts connected with a telegraph-line, and an arm carrying a contact-point and attached to said shaft, and constructed to both operate said shaft and signal and move said contact-point over the fixed contacts as the visual signal is moved, substantially as described.

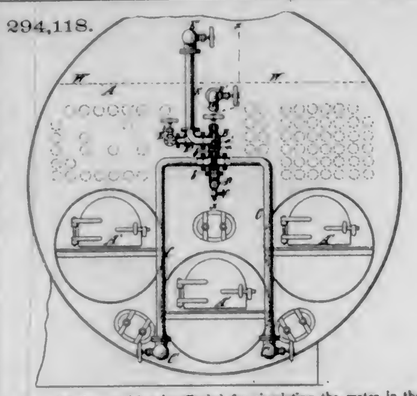
294,117. METHOD OF AND MEANS FOR CONDENSING SOLAR RAYS. WILLIAM CALVER, Washington, D. C. Filed Apr. 25, 1883. (No model.)

Claim.—1. A condenser for solar rays, comprising a frustum of a pyramid, or its described equivalent, the length of the same and the inclination of its walls with its axis being relatively determined to advance the rays entering at its base, and to deliver them from its apex in a smaller column or beam, the whole constructed so as to withstand high degrees of heat, substantially as specified.

2. A solar condenser comprising a hollow frustum and a surrounding water-space provided with an inlet, an outlet, and a steam-outlet, each provided with controlling-valves, substantially as specified.

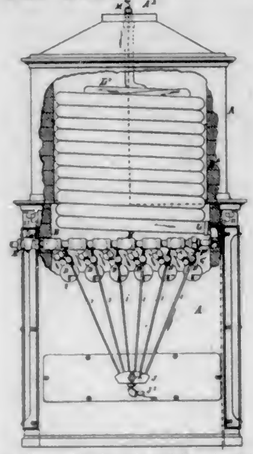
3. A solar condenser comprising a frustum of a pyramid, or its described equivalent, having inner reflecting walls or surfaces, a, and an outer re-enforcing and protecting backing a', substantially as shown.

4. The combination of the condenser A, swivel-bracket G, and tripod F, substantially as shown and described.



5. The combination of the condenser A, jacket B, steam-dome E, inlet C, and outlets D e, substantially as shown and described.

294,118. MEANS FOR PRODUCING CIRCULATION IN STEAM-BOILERS. WM. CRAIG, Brooklyn, N. Y. Filed Dec. 14, 1883. (No model.)

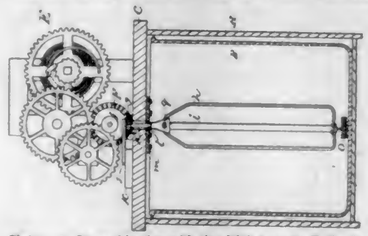


Claim.—1. The combination, with a steam-boiler, of an injector, a suction or supply pipe leading from the lower part of the boiler to the water-inlet of the injector, and a discharge-pipe leading from the injector to the upper part of the boiler, whereby water taken by the injector from the lower part of the boiler will be delivered into the upper part thereof, and an outside circulation of the water in the boiler will be produced, substantially as described, and for the purpose set forth.

2. The combination, with a steam-boiler, of an injector, two suction or supply pipes provided with valves and leading from the lower part of the boiler at opposite sides thereof to the water-inlet of the injector, and a discharge-pipe leading from the injector to the upper part of the boiler, whereby provision is afforded for circulating the water in the boiler and for varying the quantity of water supplied to the injector from different parts of the boiler, substantially as herein described.

294,118.

294,119. STEAM-GENERATING APPARATUS. JOHN H. DALE, Philadelphia, Pa., assignor of two-thirds to Abraham S. Jenks, same place. Filed Mar. 16, 1882. (No model.)



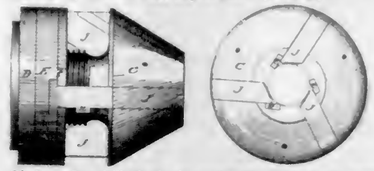
Claim.—1. The combination, substantially as hereinbefore set forth, of the furnace, the water-distributing manifold, the series of feed-pipes connected therewith, the generators extending transversely through the furnace, each connected with its respective feed-pipe and interposed between it and the furnace, the steam-outlets at the opposite end of each generator from its feed-inlet, and the steam-collecting manifold, with which all the generators are connected.

2. The combination, substantially as hereinbefore set forth, of the furnace, the water-distributing manifold, the feed-pipes connected therewith, extending transversely through the furnace, the generators, each connected with its respective feed-pipe and interposed between it and the furnace, the steam-outlets at the opposite end of each generator from its feed-inlet, the steam-collecting manifold, with which all the generators are connected, and the continuous superheating-coil, through which the products of combustion pass from around the generators interposed between the furnace and the superheating-coil.

3. The combination, substantially as hereinbefore set forth, of the furnace, the water-distributing manifold, the feed-pipes, the generators connected therewith, the steam-collecting manifold, the superheating-coil, and the deflector interposed between the central opening of the coil and the generators to diffuse the heat among the coils.

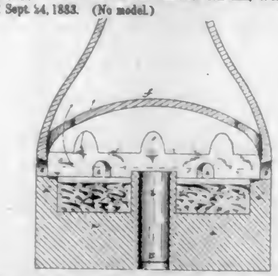
4. The combination, substantially as hereinbefore set forth, of the furnace, the water-distributing manifold, the feed-pipes, the generators, the lower steam-collecting manifold, E, the series of independent concentric or multiple superheating-coils connected therewith, and the upper collecting manifold, E′, with which all the superheating-coils are connected.

294,120. CHURN-MOTOR. WILLIAM FLETCHER EVANS and JAMES BENNETTE FIELDING, Prescott, Ark. Filed Dec. 22, 1883. (No model.)



Claim.—1. In combination with the driving-power E, the double-gear wheel F, rigidly secured on shaft *f*, with pinions *g*, rigidly secured on the upper ends of shafts *i*, shafts *i*, dashers or agitators A, and brace O, substantially as shown and described, and for the purposes set forth.

2. The combination, with the lid C, of block K, rod *j*, plates m' m^2, and brace O, all adapted as bearings for shaft *i*, substantially as shown and described.



3. The combination of grasps *a* with slots *c'* in lid C, fitting over grasps *a*, and latches *c*, pivoted on the upper face of said cover, and fitting into mouths *a'*, all adapted to hold said cover in place and down on the top of churn-holder A, substantially as shown and described.

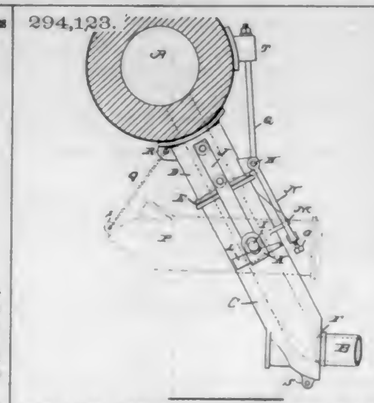
294,121. DRILL-CHUCK. CHAS. GAGE, Somerville, assignor to Lewis B. Russell, Lynn, Mass. Filed Aug. 15, 1883. (No model.)

Claim.—In a drill-chuck, the combination of the body-piece C, having the jawways P and the supplemental guideways *s*, with the jaws J, having ribs X, and the rings E and F, substantially as set forth.

294,122. GLASS-FURNACE. HENRY GASKILL, Wellsburg, W. Va. Filed Sept. 24, 1883. (No model.)

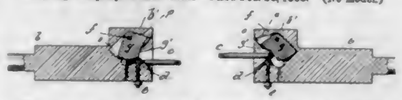
Claim.—1. In a glass-furnace, an open melting-pot built around the eye of the furnace, the walls of the furnace forming the sides and bottom of the melting-pot, substantially as and for the purposes specified.

2. In a glass-furnace, an open melting-pot built around the eye of the furnace, the walls of the furnace forming the sides and bottom of the melting-pot, the melting-pot having a lining of clay or other suitable material, substantially as and for the purposes specified.



294,123. TUYERE-PIPE. FRED. W. GORDON, Pittsburg, Pa. Filed Sept. 21, 1883. (No model.)

Claim.—1. A tuyere-pipe for blast-furnaces, provided with and supported on trunnions, and adapted to be turned into a horizontal position above the plane of the tuyeres, substantially as and for the purpose set forth.

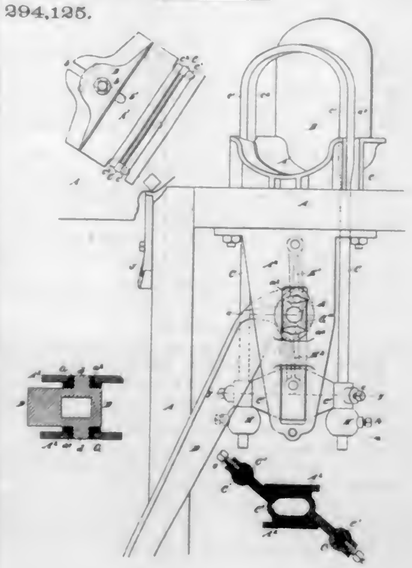


2. The tuyere-pipe provided with trunnions, combined with the trunnion-bearings rigidly connected with the circle-pipe of the furnace, and provided with keys or their equivalent engaging the trunnions, substantially as and for the purpose set forth.

3. The combination of the tuyere-pipe provided with trunnions, the neck-piece, the side bars rigidly secured to the neck-piece and carrying loose bearings for the trunnions, and the bearing-keys or their equivalent, substantially as and for the purpose set forth.

294,123.

294,124. CAR-COUPLING. EDWARD I. GRANGER, South Manchester, Conn., assignor, by mesne assignments, to the Granger Automatic Car Coupling Company, of New York. Filed Feb. 26, 1883. (No model.)



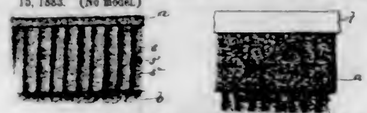
Claim.—1. In a car-coupler, the combination of the draw-bar with the head bearing the swinging cam *g*, covered within it and fast to the rotary shaft *f*, the counterpoise f^3, also fast to the shaft, the chain *h*, and the rod *j*, pivoted to the car-front, and bearing the pawl *k*, held in contact with the fixed ratchet *l* by means of the spring *m*, all substantially as described.

2. In combination, the draw-bar *b*, having a head with a flaring mouth and hook *d* therein, the shaft *f*, and the locking-cam *g*, covered and arranged within the draw-head, and the counterpoise f^3 and the link *c*, with cam-operating mechanism, all substantially as described.

3. In a car-coupler, the combination of the draw-bar *b*, having a head with a flaring mouth, and within the head the hook *d*, and the swinging cam *g* on the shaft *f*, the cam being seated in a mortise within the head, and arranged to hold the link in place by its foot or bottom, and to then bear with its head upon the under side of the roof of said mortise, and not on the shaft or pivot, and the link *c* and cam-lifting mechanism, all substantially as described.

294,125.

294,125. WOOD-BUNDLING MACHINE. DARWIN A. GREENE, New York, N. Y. Filed June 25, 1883. (No model.)



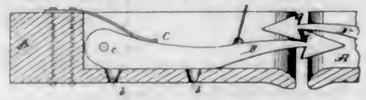
Claim.—1. In a wood-bundling machine, the cradle A', cross-head C', and one or more straps, c' c^2, arranged askew relatively to the shaft *d*, and lever D, in combination therewith, and with the toggle-links E' E^2, as herein set forth.

2. In a wood-bundler, the cradle A', having the slot *b'*, in combination with the fastening-bolt *b*, and with a gage, B, having its lower outline curved to match the cradle and allow it to be adjusted forward and backward thereon, as herein specified.

3. The strap C, single at each end and double at and near the middle, bent as shown, and combined with the cross-head or yoke C', and suitable mechanism for operating it up and down, and with the cradle A' and gage B, as herein specified.

4. In a wood-bundler operating with the aid of a strap, C, and treadle-lever D, the cross-head C', and adjusting means *c*, in combination therewith, and with the re-enforcing clamps H and their adjusting means *h*, as herein specified.

294,126. TRACK OR ROAD-BED. SETH GRIFFIN, New York, N. Y., assignor of one-half to William Halkyard, Providence, R. I. Filed Oct. 15, 1883. (No model.)



Claim.—1. In the track or road-bed herein described, having a suitably-prepared foundation, the combination therewith of grass sods, turf, or peat adapted to rest upon said foundation, and further adapted to be covered with loam or other suitable top-dressing, substantially as and for the purpose set forth.

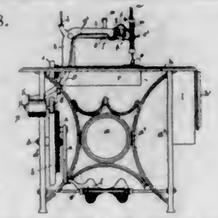
2. An elastic track or road-bed composed of layers or courses of sods, peat, or other analogous substance, when arranged and adapted for use substantially as herein set forth.

3. The improved process in constructing tracks herein described, wherein grass sods, turf, or peat are adapted to rest upon a suitably-prepared foundation or base, the upper edges or courses of said sods, &c., being covered with loam or other equivalent material, substantially as shown and specified.

4. The track or road-bed A herein described, consisting of the prepared foundation *b*, sods or turfs *s*, and top covering, *a*, the whole combined and arranged to produce an elastic or springy track, substantially as shown and specified.

294,127. CAR-COUPLING. DANIEL AMBROSE GROUNDS and JAMES RAMBO GIBSON, Hope, Ark. Filed Dec. 13, 1883. (No model.)

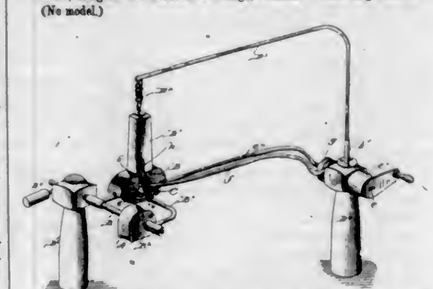
Claim.—1. In a car-coupling device, bumper-head A, made of a whole unbroken body of metal, having trench *a*, opening into a wide mouth at its open end a^2, having in the bottom of said trench funnel-shaped openings *b*, and adapted to carry a coupler, B, and spring C, substantially as shown and described.



2. In a car-coupling device, couplers B, pivoted at their rear ends, at point *c*, into the slot *a*, and having one-half of their length lying on the bottom of slot *a*, and their spear ends standing up from said bottom about two inches, and having their barbs slightly rounded on their faces *e*, substantially as shown and described.

3. In a car-coupling device, in combination with a car-coach, the combination of bumper A, having slot *a*, cone-shaped openings *b*, with couplers B, pivoted in said slot at point *c*, spring C, secured to bumper A, and its front end holding said couplers down, rod *l*, its lower end hinged to said couplers, and its upper end hinged to the end of arm *h*, rod *k*, its lower end hinged to the end of arm *h*, its upper end hinged to the front end of lever *i*, and lever *i*, hung on the end of the car-coach, substantially as shown and described, and for the purposes set forth.

4. In a car-coupling device, in combination with a car-coach, the combination of bumper A, having slot *a*, cone-shaped openings *b*, with couplers B, pivoted in said slot at point *c*, spring C, secured to bumper A, and its front end holding said couplers down, rod *l*, its lower end hinged to said couplers, and its upper end hinged to the end of arm *h*, and rod *f*, pivoted to the end of the coach, having rigidly secured on either end hand-wheels *g g*, and extending from its center arm, *h*, substantially as shown and described, and for the purposes set forth.



294,128. LIGHTING SEWING-MACHINES. OLIVE HEALY, Paterson, N. J., assignor of one-half to John Inglis, same place. Filed Mar. 30, 1883. (No model.)

294,128.

Claim.—The combination of the holder and stationary arm, the holder provided with recess to accommodate the tube, and thumb-screw for holding the tube adjustably therein, the holder secured to the stationary arm by a clip, and clip for securing said holder to the arm, and hollow tube for holding the lamp, and lamp suitably secured to said tube, the lamp having a shade, and insulated wires suitably secured to said lamp, the wires passing through said tube and connected with the dynamo, and dynamo, the dynamo arranged in frictional contact with the driving mechanism of said machine, and frame to which the dynamo is secured by a knuckle-joint, and driving mechanism for operating said dynamo and needle, substantially as set forth.

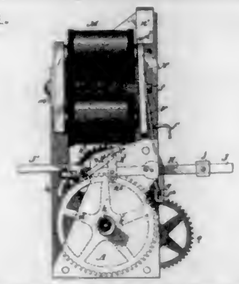
294,129. BURNISHING-MACHINE. WILLIAM J. HEFFERNAN, Lynn, Mass., assignor to Theodore A. Dodge, Trustee. Filed Aug. 13, 1883. (No model.)

Claim.—1. In a burnishing-machine, a burnishing-tool, and means to reciprocate it in the head or hand-piece, the said head or hand-piece being connected loosely with the support or arm D^3, combined with a rod or arm, *f*, to engage a slotted ear on the said head or hand-piece, to permit the lateral movement of the said head, substantially as described.

2. The loosely held or supported head or hand-piece, and the rod or arm *f*, connected loosely with the said head, to permit the same to rock, as described, combined with the reciprocating tool mounted on the said head, and with rod e^3, having a swivel or universal joint, and with means to reciprocate the said rod, substantially as described.

3. The loosely-supported head or hand-piece provided with the slotted ear 5, and the arm *f*, connected with said slotted ear, to permit the lateral movement of the head or hand-piece, combined with the burnishing-tool supported in said head or hand-piece, the link or arm e^3, connected thereto by a swivel or universal joint, and means to reciprocate said link, substantially as described.

294,130. HARDENING AND STRAIGHTENING IRON AND STEEL RODS. J. HENRY HELM, Allegheny, Pa. Filed May 28, 1883. (No model.)



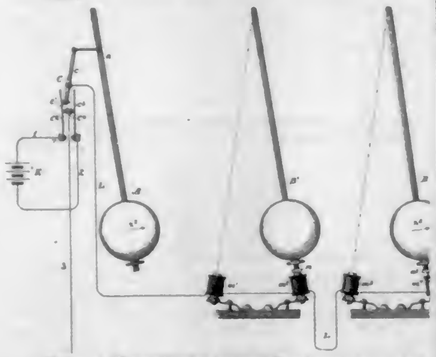
Claim.—The herein-described process of hardening, stiffening, and straightening iron or steel bars or shafts, which consists in drawing them through two or more solid tapering dies, the centers of which are fixed in a line one with the other, substantially as and for the purpose specified.

294,131. SECONDARY ELECTRIC CLOCK. VITALIS HERMER, New York, N. Y., assignor, by mesne assignments, to Joseph Koenigsberg, St. Louis, Mo. Filed Apr. 5, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the toothed wheel, the pawl and lever for actuating the same through the influence of gravity, the electro-magnet, its armature and armature-

294,131.

lever, for actuating said pawl and lever in the direction opposite to that in which they are actuated by gravity, and one or more pins, and the set-screw for adjusting the position of said electro-magnet with reference to said armature.



2. The combination, substantially as hereinbefore set forth, of the electro-magnet, the adjustably-supported armature, the flexible armature-lever, the train of wheels, the lever and pawl for actuating said train of wheels, the arbor for supporting said lever, and a mechanical connection between said arbor and armature-lever, comprising a yoke or plate secured to said arbor and an extension of said armature-lever embracing both sides of said yoke or plate.

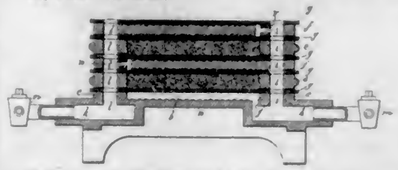
3. The combination, substantially as hereinbefore set forth, of an armature and armature-lever, an electro-magnet for actuating said armature and armature-lever, a lever supported independently of said armature-lever and actuated in one direction by the movements of said armature-lever and in the opposite direction by the force of gravity, an arm and an adjustable weight supported thereon for modifying the active influence of gravity upon said lever, a pawl carried upon said lever, and a train of wheels actuated by said pawl and lever when the latter responds to the action of gravity.

4. The combination, substantially as hereinbefore set forth, of the train of wheels, the pawl and lever acting, when actuated in a given direction by force of gravity, to advance said train of wheels, means, substantially such as described, for actuating said lever in the opposite direction, an adjustable weight for modifying the active influence exerted by gravity upon said lever, and two arms or extensions, respectively extending upon opposite sides of the supporting-arbor of said lever, each of which arms is adapted to receive said adjustable weight.

5. The combination, substantially as hereinbefore set forth, with a toothed wheel, of a propelling-lever constructed from a single piece of metal and provided with a bracket for supporting a pawl, a stop or detent for engaging the teeth of said wheel, and an arm for receiving an adjustable weight, said bracket, stop, and arm being each integral with said lever.

294,132. ELECTRIC DEVICE FOR SYNCHRONIZING CLOCK-PENDULUMS. VITALIS HEMMER, New York, N. Y., assignor, by mesne assignments, to Joseph Koenigsberg, St. Louis, Mo. Filed Apr. 17, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a regulating-pendulum, a series of automatically-actuated pendulums, a battery and a main line, and means, substantially such as described, for transmitting electric impulses from said battery upon said main line, each of said automatically-actuated pendulums vibrating over a pair of electro-magnets included in said main line and located near the respective limits of vibration.



2. The combination, substantially as hereinbefore set forth, of a battery, means, substantially such as described, for periodically transmitting electric impulses of opposite polarity from said battery upon said main line, a series of automatically-actuated pendulums, and an armature applied to each of said pendulums, each of said armatures vibrating over a pair of electro-magnets included in said main line and located at the opposite extremities of vibration.

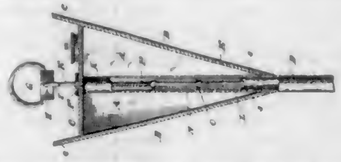
3. The combination, substantially as hereinbefore set forth, of a vibrating pendulum, an armature applied to said pendulum, two electro-magnets having their fields of force at or near the respective limits of the arc of vibration of said pendulum, and means, substantially such as described, for simultaneously vitalizing said electro-magnets, and for reversing the polarity of said electro-magnets at each vitalization.

4. The combination, substantially as hereinbefore set forth, of an automatically-actuated pendulum, an armature carried upon said pendulum, two electro-magnets, and means, substantially such as described, for simultaneously inducing in said electro-magnets magnetism of like polarity, and for reversing that polarity at each semi-vibration of said pendulum.

5. The combination, substantially as hereinbefore set forth, of a vibrating pendulum and armature carried at the extremity thereof, and means, substantially such as described, for inducing in said armature magnetism of opposite polarity at each semi-vibration of said pendulum.

294,133. WATER-FILTER. JOHN JOHNSON, Brooklyn, N. Y. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, in a filter, of a series of plates, *f*, and filtering-disks *g*, said plates having inlets *i* and outlets *l*, with which the filtering-chambers connect, respectively, by the alternate passages *v* and *u* in the plates, substantially as described.



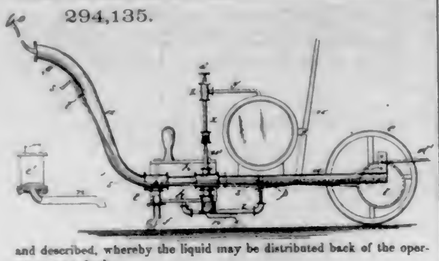
2. The combination, in a filter, of a series of plates, *f*, rings *e*, filtering-disks *g*, and layers of filtering material *b'*, said plates having inlets *i* and outlets *l*, with which the filtering-chambers connect, respectively, by alternate passages *v* and *u* in the plates, substantially as described.

3. The combination, in a filter, of a series of plates, *f*, and filtering-disks *g*, said plates and disks having passages *i* and *l*, and said disks having passages *v* and *u* alternately, as described, and means for reversing the flow of water through said plates and filtering-disks, as specified.

4. The combination, in a filter, of a series of plates, *f*, filtering-disks *g*, supply-pipe *o*, discharge-pipe *p*, and the three-way cocks *m n*, said plates having inlets *i* and outlets *l*, with which the filtering-chambers connect, respectively, by alternate passages *v* and *u* in the plates, substantially as described.

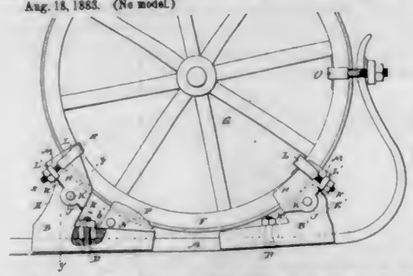
5. The combination, with plates *f*, of filtering-disks *g*, of paper, felt, or other material, having water-proof margins to be clamped between said plates, substantially as described.

294,134. OIL-CUP. HENRY L. JOHNSTON, Palmetto, Ga. Filed Jan. 16, 1884. (No model.)



Claim.—The wedge-shaped oil-cup A, having vent K, and provided with the central tube, D, having inlet-holes *x x*, and the piston-rod E, provided with piston L, spring P, handle G, and stopper-arm H I, substantially as and for the purpose set forth.

294,135. COTTON-WORM DESTROYER, SPRINKLER, &c. JOHN D. LAWBERT, Sr., and JOHN GILLMORE WIGGINS, Mooreville, Ala. Filed Aug. 30, 1883. (No model.)

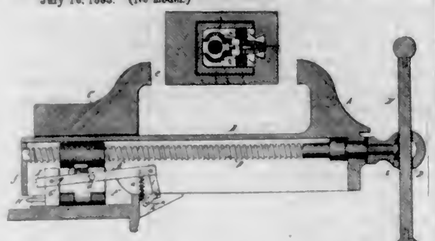


Claim.—1. The combination, with a pump, tank, and sprinkling devices, of a three-wheeled vehicle having side bars, *a a*, turned up to form handles *g g* at the requisite height for a man to hold and guide the machine or propel without lift.

2. In a sprinkler, the combination, with a liquid-tank and a pump for raising the liquid in said tank, of the turned-up tubular bars *a*, provided with the sprinklers *e* at their upper rear ends, substantially as shown and described, whereby the liquid may be distributed back of the operator, as set forth.

294,135.

294,136. SLEIGH-RUNNER. FRANK J. LARKIN, Kenosha, Wis. Filed Aug. 18, 1883. (No model.)



Claim.—1. The combination, with suitable bolts and clips, of the runners A A, the wedges B B', having longitudinal runner-grooves C and top projection, E, and the jaws H H, rabbeted at *a*, as shown and described.

2. The combination, with a runner, of the grooved pieces B B', having upwardly-projecting parts E E', fitting against the rim or felly of the wheel, the jaws H, fitting partly in recesses in the parts E E', the bolts K, and the clips L, substantially as herein shown and described.

3. The combination, with a runner, of grooved pieces B B', the jaws H, the bolts K, the clips L, and the jaws P, held on the piece B, substantially as herein shown and described.

4. The combination, with the runner A and wheel G, of the grooved pieces B B', the jaws H, provided with lugs J and notches M, the bolts K, and the clips L, substantially as herein shown and described.

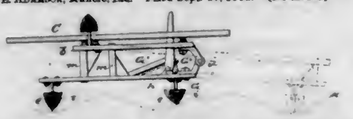
294,137. BENCH VISE. MORTIMER G. LEWIS, Lowville, N. Y. Filed July 16, 1883. (No model.)

Claim.—1. In a vise of the character herein set forth, a sectional or divided nut the two parts whereof are hinged at the bottom and provided with a surrounding yoke, said nut being combined with the screw and arranged to clamp and release the same, substantially as and for the purposes set forth.

2. In a vise of the character herein set forth, the combination, with the screw, of a nut made in two parts hinged together and mounted in the bench-head, substantially as shown, and for the purposes explained.

3. In combination with the two parts of the nut arranged to clamp the vise-screw, an intervening spring, substantially as and for the purposes set forth.

4. In combination with the two parts of the nut arranged to clamp the vise-screw, a movable yoke for forcing the said two parts into operative position, substantially as shown and described.

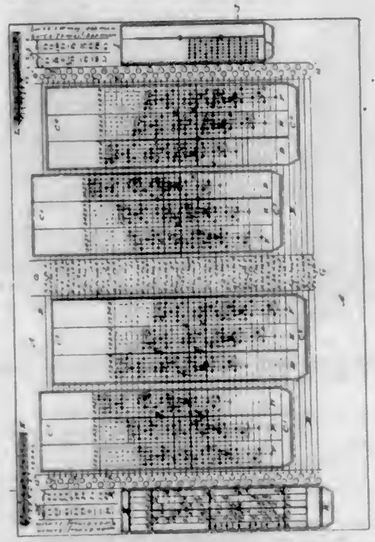


5. In a vise of the character herein set forth, the two parts of the clamping-nut hinged together, the surrounding yoke or frame for operating the nut, and the projecting crank or handle, combined substantially as shown, and for the purposes explained.

6. In a vise, the combination of the clamping-nut made in two parts and hinged at the bottom, and the operating-yoke arranged for operation in connection with the vise-screw and the forward abutting-block, against which said nut is made to bear, substantially as shown and described.

7. In a vise, the combination, with the two parts of the clamping-nut, hinged together as explained, of the front and rear abutting-blocks mounted in the head, substantially as shown and described.

8. In combination with the yoke or frame arranged to move the two hinged sections of the clamping-nut, the spring applied in connection with said frame, and arranged to operate substantially as shown, and for the purposes set forth.



294,138. LAND-MARKER. JNO. W. MADDOX, Wheeling, and CHAS. E. ADAMSON, Muncie, Ind. Filed Sept. 17, 1881. (No model.)

Claim.—1. In a land-marker, the combination, with the section *a*, provided with a central rest or support, *m'*, marking-shoes *e e*, and a mortise, 1, and a section, *b*, hinged to the section *a*, and having a support, *m*, and marking-shoe *e'*, of a seat-board, *c*, one end of which rests upon the support *m'*, while the opposite end is supported by the rest *m*, which latter, when the seat is removed, is designed to enter the mortise 1, substantially as set forth.

2. In a land-marker, the combination, with hinged sections, one of which is provided with a central support, while the other is provided with an end support, of a seat-board adapted to be removably held by said supports, whereby the weight of the driver will be distributed equally upon the shoes, substantially as set forth.

294,139. APPARATUS FOR USE IN STUDYING HARMONY. BLIGH SIDENHAM MAITLAND, London, England. Filed Oct. 22, 1883. (No model.) Patented in England Apr. 16, 1883, No. 1,918.

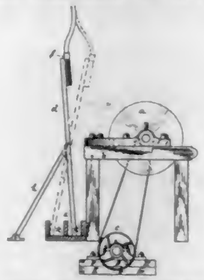
Claim.—1. An apparatus to be employed in the study of the science of harmony, comprising a frame or board bearing a chromatic scale, and four or other number of chord-slides to move on the said frame or board, these slides being each divided vertically into three parts, and each of these parts having vertical chord-lines, and each slide bearing arbitrary signs, (to correspond with a guide or reference table,) and having also devices to represent, respectively, the tonic root, the relative minor key to a major tonic key, and the relative major key to the minor tonic key, all substantially as and for the purposes herein set forth.

2. An apparatus to be employed in the study of the science of harmony, comprising the frame or board A, bearing a chromatic scale, B,

and the chord-slides C' C² C³ C⁴, having the holes *f f* in line with the note-lines of the chromatic scale, in combination with pegs or pins *g g*, to fit in said holes, and wires A, to connect said pins *g g*, as and for the purpose set forth.

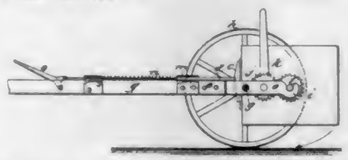
3. An apparatus to be employed in the study of the science of harmony, comprising a frame or board, A, bearing a chromatic scale, B, the chord-slides C' C² C³ C⁴, and a wind-box containing a number of toned reeds, the valves connected with these reeds being operated by buttons or knobs on or in line with the note-lines of the chromatic scale, said parts being arranged and constructed substantially as and for the purpose set forth.

4. The combination, with the frame or board A, bearing the chromatic scale B, of the chord-slides C' C² C³ C⁴ and interval-slide H, as and for the purpose set forth.



5. The combination, with the frame or board A, bearing the chromatic scale, of the chord-slides C' C² C³ C⁴, interval-slide H, and scale-slide I, as and for the purpose set forth.

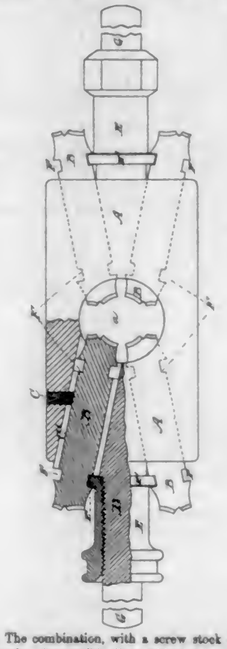
294,140. CAR-TRUCK. JAMES E. MASON, Blanchard, Pa. Filed Dec. 26, 1883. (No model.)



Claim.—In a car-truck, the combination, with divided axles having collars or flanges c and oval bearing portions *d*, of axle-boxes D, consisting of two sections, each having grooves *a*, for the reception of the flanges *c*, said sections being also provided with oval recesses E, for the reception of the oval bearing portions *d* of the axles, and beams E', connecting the said axle-boxes, whereby the boxes are held stationary, substantially as set forth.

294,141. DEVICE FOR SAVING THE WASTE FROM EMERY-WHEELS. PHILIP MATHER, Idlewood, Pa. Filed Aug. 10, 1883. (No model.)

Claim.—The devices herein described, consisting of an adjustable screen having a perforated pipe attached to the upper portion of the face thereof, and a series of boxes or separate receptacles, substantially as and for the purpose specified.

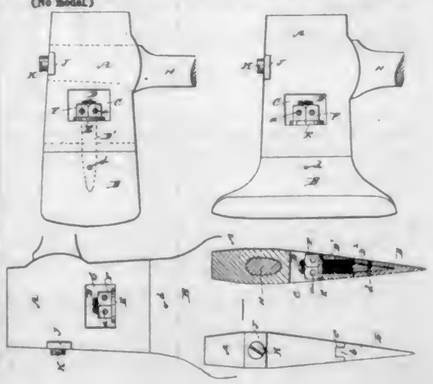


294,142. TRUCK. WARWICK C. MAYOR, Puritan Hope, La. Filed July 7, 1883. (No model.)

Claim.—1. The combination of a box, *a*, having trunnions *b*, and a toothed wheel, *l*, on one of said trunnions, with the truck having hooked bearing rear extensions, *i*, of the frame, and the toothed wheel *j* and lever *k*, said frames being open at the rear end to receive the box between the sides, substantially as described.

2. The combination of a box, *a*, having trunnions *b* and the notched cleat *c*, with the truck having hooked bearing-extensions *i* of the frame, and the sliding latch-bolt *d*, the said frame being open at the rear end to receive the box between the sides, and the latch-bolt having a spring and a lever for actuating it, substantially as described.

294,143. SCREW STOCK AND DIE. WILLIAM J. MCCORMACK, Paignton, County of Devon, England. Filed July 16, 1883. (No model.) Patented in France May 28, 1883, No. 156,707; in England May 29, 1883, No. 2,665; in Germany May 30, 1883, and in Belgium May 30, 1883, No. 61,540.

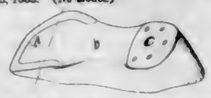


Claim.—1. The combination, with a screw stock or die plate and with a screw-ferrule, of reversible dies or bits having at each end two kinds of threads or teeth, the dies being adapted to be turned axially to bring into position for operative action either kind of such teeth at a given end of the bit, and means for securing the bits in place.

2. In combination with a die-stock, the dies or bits having each a groove or grooves near each end, a screw-ferrule provided with a flange arranged to work in such grooves, and serving to force the dies up to their work or to withdraw them, and a threaded support for such ferrule, substantially as shown and described.

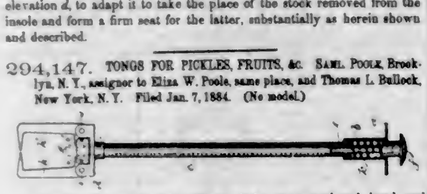
3. In combination, the screw stock or die plate A, reversible dies or bits B, provided with grooves, as described, and having two sets of threads or teeth at each end of the bit, stops C, the threaded piece for supporting the ferrule, and the ferrule E, provided with a flange working in a groove in the dies or bits, all substantially as and for the purposes set forth.

294,144. AX. RICHARD R. PACE, Lineville, Ala. Filed Oct. 2, 1883. (No model.)



Claim.—The combination, with the ax-body A, having a groove, *c*, extending entirely across its lower end, and provided with an opening, C, and an aperture, D', extending from said opening to the lower end of the ax-body, of the blade B, having the aperture D², adapted to register with the aperture D', and provided with the tongue *b*, extending entirely across the upper end of the blade, and adapted to fit into the groove *c*, screw-spindle D, removably secured in the aperture D² of the blade and adapted to fit in the aperture D', and the pin *d* and nut F, substantially as described, and for the purpose set forth.

294,145. HARNESS-SNAP. JAMES A. PARK, Lansing, Mich., assignor of one-half to Ptolla E. Park, same place. Filed Apr. 24, 1882. Renewed July 6, 1883. (No model.)



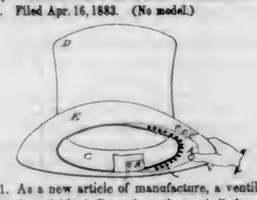
Claim.—In a harness-snap, the combination, with the frame provided with a hook, and a slot, F, of a spring adapted to extend through said slot and be guided by the adjacent sides of the frame, and secured to the under side of the rear end of the frame, which latter is perforated to receive a fastening-bolt, a strap upon which said spring bears, a washer, and retaining-nut, substantially as set forth.

294,146. BOOT AND SHOE LAST. WILLIAM POND, Kansas City, Mo. Filed June 13, 1883. (No model.)

Claim.—A boot or shoe last provided on the extreme outer edge of its bottom, around the toe portion, with the inwardly inclined or beveled elevation *d*, to adapt it to take the place of the stock removed from the insole and form a firm seat for the latter, substantially as herein shown and described.

294,147. TONGS FOR PICKLES, FRUITS, &c. SAML. POOLE, Brooklyn, N. Y., assignor to Eliza W. Poole, same place, and Thomas L. Bullock, New York, N. Y. Filed Jan. 7, 1884. (No model.)

Claim.—In combination with a tubular stem, push-rod, head, and spring, the claws pivoted at 3 4 upon the head *d*, and provided with short slotted arms extending toward each other, a block upon the push-rod, and pins passing through the slotted arms, substantially as set forth.



294,148. ELECTRICAL CONDUCTOR. FRANK L. POPE, Elizabeth, N. J., assignor to the Postal Telegraph and Cable Company, of New York. Filed June 2, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a central core formed of metal having a high coefficient of tensile strength, a continuous metallic coating of greater specific electrical conductivity than the central core closely enveloping the same, and one or more conductors formed of a metal having approximately the same electro-motive properties and conductivity as the coating laid about said coating and its inclosed central core.

2. The combination, substantially as hereinbefore set forth, of a central conductor of steel closely enveloped in a continuous coating of copper, and one or more conductors of copper laid upon or around the steel conductor and its exterior envelope.

294,149. VENTILATOR FOR HATS. WILLIAM M. PROTHEROE, New York, N. Y. Filed Apr. 16, 1883. (No model.)

Claim.—1. As a new article of manufacture, a ventilator for hats composed of the ring of felt A B, perforated at *a a' a''*, &c., prepared and shaped substantially as described.

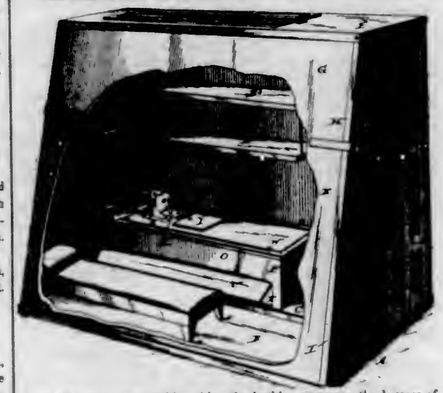
2. As a new article of manufacture, a ventilator for hats composed of the annular section of felt A' B', perforated at *a a' a''*, &c., prepared and shaped substantially as described.

3. As a new article of manufacture, a ventilator for hats composed of the ring of stiffened cloth A B, perforated at *a a' a''*, &c., prepared and shaped substantially as described.

4. As a new article of manufacture, a ventilator for hats composed of the annular section of stiffened cloth A' B', perforated at *a a' a''*, &c., prepared and shaped substantially as described.

5. The combination, in a ventilator-hat, of the ring of felt A B, with the perforations *a a' a''*, &c., the sweat-band C, and the row of stitches *z z' z''*, &c., substantially as and for the purposes described.

6. The combination, in a ventilator-hat, of the ring of felt A B, with the perforations *a a' a''*, &c., the sweat-band C, and the clamps or fastenings *x*, with chock-blocks *y*, substantially as and for the purposes described.



7. The combination, in a ventilator-hat, of the ring of felt A B, with perforations *a a' a''*, &c., sweat-band C, row of stitches *z z' z''*, &c., and clamps or fastenings *x*, with chock-blocks *y*, substantially as and for the purposes described.

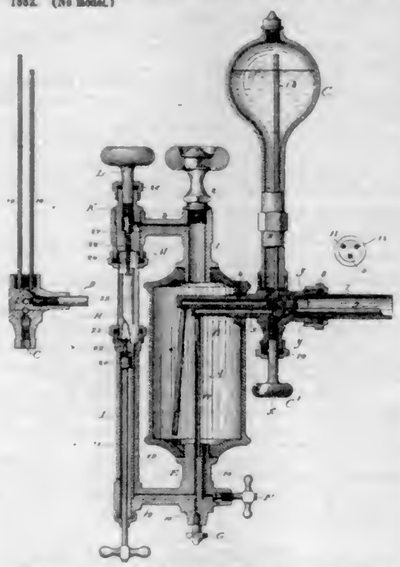
8. In a ventilator-hat, the construction of the flange A of the ring A B sufficiently broad in that part which is adapted to the front of the hat to enable the wearer to grasp it between the thumb and fingers and support it up against the under side of the hat-brim in the operation of putting on or removing the hat, substantially as described.

9. The combination, in a hat the crown of which is enlarged as it approaches the brim for the purpose of ventilation, of the ring of felt A B, perforations *a a' a''*, &c., and the sweat-band C, substantially as and for the purposes described.

10. The combination, in a hat the crown of which is enlarged as it approaches the brim for the purpose of ventilation, of the ring of felt A B, perforations *a a' a''*, &c., sweat-band C, row of stitches *z z' z''*, &c., and supporting-stripe *r*, secured at *s* and *s'*, substantially as and for the purposes described.

294,150. BATHING APPARATUS. JOHN RAMSON, Williamsport, Pa. Filed June 15, 1883. (No model.)

Claim.—1. A portable cabinet for bathing purposes, the bottom of which is composed of one or more shallow pans adapted to retain water that may be splashed over from the bath tub or tubs, substantially as set forth.



2. A portable cabinet for bathing purposes, the bottom of which is composed of shallow pans adapted to be set or fitted within each other, or nested together, substantially as and for the purpose herein set forth.

3. A portable cabinet for bathing purposes, the bottom of which is composed of shallow pans adapted to be nested together, each pan being provided with end walls adapted to be fitted between the end walls of the pan next behind, substantially as set forth.

4. A portable cabinet for bathing purposes, consisting, essentially, of bottom pans adapted to be nested together, a rear wall secured vertically to the rear edge of the rear pan, end walls secured vertically to the ends of the rear pan, a top secured to said rear and end walls, a hood depending from the front edge of said top and having triangular end pieces, end walls, and a front wall secured to the ends and front edge of the front pan, and connected detachably to the end walls of the rear pan and to the hood, and suitable means for ingress and egress and for ventilation, substantially as set forth.

5. The combination, with a portable cabinet for bathing purposes, having its bottom constructed of two or more shallow pans adapted to be nested together, of a bath-tub arranged to fit in or between the sides of the rear pan, substantially as set forth.

294,151. LUBRICATOR. SAMUEL REED, Chicago, Ill. Filed June 15, 1882. (No model.)

Claim.—1. A sight-feed the glass of which contains an excess of air under pressure, substantially as described.

2. A sight-feed lubricator containing an excess of air under pressure, in combination with devices, substantially as described, for supplying air to and compressing the same in the sight-feed, substantially as described.

3. The combination, with a lubricator, of a sight-feed tube arranged at a point between the oil-reservoir and an oil-passage to a steam-pipe, said feed containing air under pressure, substantially as described.

4. In a lubricator, the combination, with a sight-feed and with the outlet oil-passage to the steam-pipe, of an intermediate oil-passage adapted to contain an opposing column of oil for preventing the steam from entering the sight-feed, substantially as described.

5. The combination, with a sight-feed and with the direct outlet of the oil to the steam-pipe, of a horizontal passage, 18, and a vertical passage, 17, connecting said outlet and sight-feed, substantially as described.

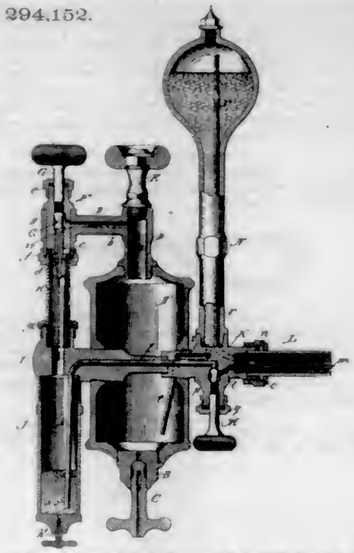
6. A combined valve and nozzle, the nozzle of which is provided with perforations intersecting and extending at a right angle to each other, substantially as described.

7. In a lubricator, the combination, with the oil-reservoir, the passage 1 3, the plug K, and its bushing, of the combined and removable valve and nozzle and a sight-feed, substantially as described.

8. The combination, with the sight-feed and with the projecting oil-nozzle, of an air-supply tube extending up into the sight-feed and above the opening of the nozzle, substantially as described.

9. In lubricators, the herein-described method of feeding oil, which consists in passing oil through a glass tube filled with an excess of air under pressure.

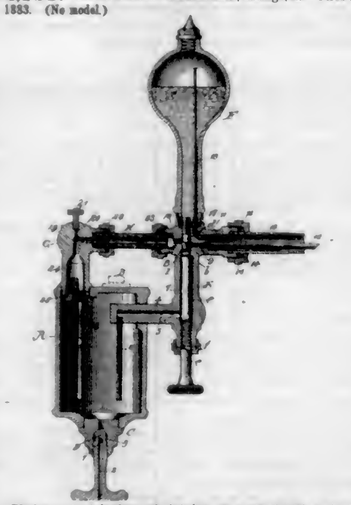
10. In a lubricator, the means for determining the amount or quantity of oil or other liquid being injected or fed, consisting of a sight-feed arranged in a supply-pipe, and a valve for limiting or regulating the passage of the liquid therethrough, substantially as described.



294,152. LUBRICATOR. SAMUEL REED, Chicago, Ill. Filed June 11, 1883. (No model.)

Claim.—1. The herein-described method of compressing and maintaining compressed air in the sight-tube of a lubricator, the same consisting in subjecting the air to a direct pressure of water, afterward displaced by oil under pressure, and in its passage to the device to be lubricated, substantially as described.

2. The combination, in a hydrostatic lubricator, of a sight-feed tube filled with air compressed by and in direct contact with water, substantially as described.



3. The combination, with the lubricator and the sight-feed tube thereof filled with air, of a water-chamber connected with said tube, and in turn having a direct communication with a steam-pipe or other steam-containing device to which the lubricator is attached, whereby condensed steam may be employed for forcing the air from said chamber and compressing it in the sight-feed tube, substantially as described.

294,152.

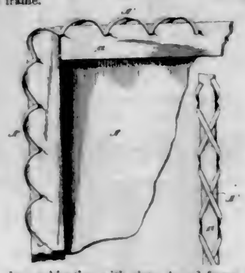
4. The combination, in a lubricator, of the sight-feed tube H, the chamber J, the tube *k*, and devices connecting said parts with the oil-reservoir, the condenser, and the device to be lubricated, substantially as described.

294,153. LUBRICATOR. SAMUEL REED, Chicago, Ill. Filed July 11, 1883. (No model.)

Claim.—1. A hydrostatic lubricator provided with a single valve adapted to control both the flow of the oil and water, substantially as described.

2. A hydrostatic lubricator in which feed-passages bisect each other, and which is provided with a valve working in and controlling both of said passages, substantially as described.

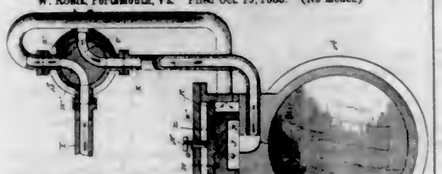
3. A hydrostatic lubricator in which feed-passages bisect each other, and which is provided with a tubular valve working in and adapted to control both of said passages, substantially as described.



4. The combination, with the oil-reservoir and condenser, of a valve, I, provided with passages *a b*, annular groove *d*, and shoulder *e*, substantially as described.

5. A sight-feed lubricator provided with a water-supply chamber arranged in the path of the oil being fed to and through the sight-feed, substantially as described.

6. A hydrostatic lubricator provided with a water-supply chamber communicating with the oil-reservoir and hydrostatic column, substantially as described.



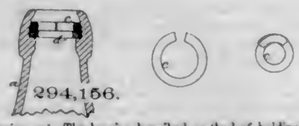
294,154. MUFFLER FOR SCHOOL-SLATES. JOS. RIDGE, Chicago, Ill., assignor to John H. Beers, same place. Filed Nov. 5, 1883. (No model.)

Brief.—A strip of rattan, chair-cane, wood, or metal laced over the edge of the frame.

Claim.—In combination with slate A and frame a, the flexibly-elastic spring-muffler, substantially as described, and for the purpose specified.

294,155. REVERSING-VALVE FOR STEAM-ENGINES. HENRY W. ROBIE, Portsmouth, Va. Filed Oct. 19, 1883. (No model.)

Claim.—1. The combination, with the steam-chest of an engine having an exhaust-port and a feed-port, of an intermediate rotary valve having two independent and direct passages into which the exhaust and feed ports of the steam-chest directly connect on opposite sides of the said valve, the main feed and exhaust being in direct connection with the other ends of said passages and on opposite sides of the valve, whereby the direct feed of the steam is reversed by simply turning the rotary valve, substantially as and for the purpose set forth.



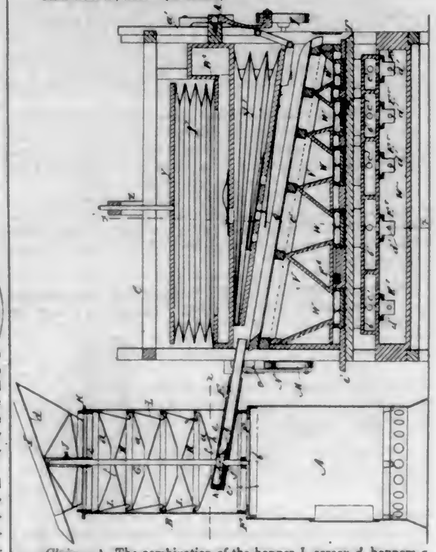
2. An engine embodying the cylinder having the steam-ports and exhaust-ports, the steam-chest arranged over these ports and having the feed-port, a slide-valve working in the steam-chest and having the passage or port in its under side, the four-way stop-valve from which extends the main steam-pipe and the main exhaust-pipe, and the independent pipes leading from opposite sides of the four-way valve into the exhaust-port of the cylinder and the feed-port of the steam-chest, substantially as and for the purpose set forth.

3. The combination of the cylinder having the exhaust-port, the steam-chest having the feed-port, the slide-valve arranged over said exhaust-port, the plate or partition adjusted against the back of the valve to retain it in its seat, mechanism for adjusting this plate, and the four-way valve receiving the main exhaust and feed pipes and having connection with the exhaust-port under the slide-valve and with the feed-port in the steam-chest, substantially as set forth.

4. An engine embodying the cylinder having the steam-ports and the exhaust-port, the steam-chest having the feed-port at one end, and provided with a top plate or partition having a longitudinal guide-rib on its under side, and the slide-valve of less width than the steam-chest and having the smooth back formed with the groove to receive the rib, substantially as set forth.

5. In an engine adapted to take its feed under the slide-valve, the herein-described steam-chest having a series of screw-threaded perforations in its top plate, the slide-valve having a top partition disposed between the top plate and the back of the valve and fitted neatly between the walls of the steam-chest, and a series of set-screws disposed in a series along the said partition and working from the outside through the top plate and against the partition, substantially as set forth.

294,156. STOPPERING BOTTLES FOR CONTAINING AERATED OR GASEOUS LIQUIDS. RICHARD J. SAWKEY, South Hill, near Ashford, County of Kent, England. Filed June 26, 1883. (No model.) Patented in Germany May 26, 1883, No. 24,740, and June 19, 1883, No. 25,679; in England June 9, 1883, No. 2,883; in Victoria Aug. 7, 1883, No. 3,516; in South Australia Aug. 13, 1883, No. 380, and in New South Wales Oct. 11, 1883, No. 12,341.

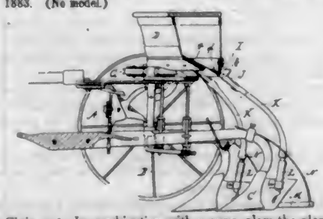


294,156.

Claim.—1. The herein-described method of holding to place an elastic seating, located in the neck of a bottle, consisting in introducing into such neck and against such seating a severed or a non-severed ring and effecting the expansion of such ring within the neck while the ring is in its cold or unheated state.

2. A bottle for internal stoppers having a seating fixed against a shoulder in the neck thereof by means of a severed or cut ring of suitable flexible material, substantially in the manner hereinbefore described, and illustrated in the accompanying drawings.

294,157. ORE DRIER AND SEPARATOR. ALBERT SENEFF, Laramie City, Wyo., assignor to himself and Francis Mulhern, same place. Filed June 30, 1883. (No model.)



Claim.—1. The combination of the hopper I, screen *d*, hoppers *a*, conical disks H, shaft G, heat-flue B, and vibrating spout E, as and for the purpose described.

2. The combination of the spout E, jacket *e*, sliding bar O, shaft G, the hopper, and the disks, as and for the purpose set forth.

3 The combination, in an ore-separator, of the sloping graded and shaking screen Q, series of hoppers W, shakers X, blow-pipes c^3, and receptacles D^4, substantially as described.

4. The bellows Y', regulator Y, conductors B^3, and the air-trunk *w*, in combination with the blow-pipes c^3, shaking-spouts X, and the receptacles D^4, substantially as described.

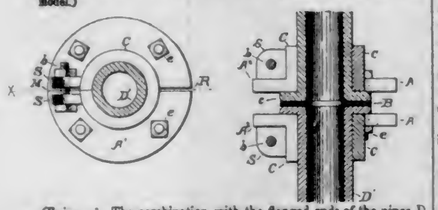
294,158. SEEDING-MACHINE. ABRAHAM SHAFFER, Canopolis, Mich., assignor of one-fourth to Carlton E. Sage, Elkhart, Ind. Filed Aug. 27, 1883. (No model.)

Claim.—1. In combination with a gang-plow the plows of which are adapted to cut furrows of uniform depth, a seeding attachment for conducting the seed to the furrows, and means, as M, in the rear of each plow for covering the seed as it is dropped, substantially as set forth.

2. A seeding attachment provided with an endless carrier running continuously in the same direction, and operated by one of the traction-wheels for continuously delivering the seed to the spout, substantially as and for the purposes described.

3. A seed-box provided with an inclined bottom, *a*, openings *c*, trough *b*, and a regulating-slide, E, in combination with an endless carrier, I, adapted to be operated from one of the traction-wheels of the device to which it is attached, substantially as and for the purposes specified.

4. In combination with a series of gang-plows, C, mounted upon a suitable frame and traction-wheel, with a seed-box D, slide E, groove-pulleys G and H, endless carrier I, spouts J K, spreader-spouts L, and spring spreader-bar M, when constructed, arranged, and operating substantially in the manner and for the purposes described.



294,159. **PROCESS OF EXTRACTING SUGAR FROM MOLASSES, SIRUPS, AND THE JUICES OF PLANTS.** CARL STETTEN, Vienna, Austria-Hungary. Filed June 6, 1883. (No specimens.) Patented in Germany Mar. 26, 1883, and in Austria May 3, 1883.

Claim.—1. The herein-described improvement in the art of forming insoluble calcareous saccharate, which consists in mixing with an aqueous saccharine solution enough lime at one dose to form, first, a lime-saturated saccharine solution, and, second, a precipitate of calcareous saccharate, the temperature of the mixture being maintained during the operation below 95° Fahrenheit, and as nearly uniform as possible, substantially as set forth.

2. The herein-described process of forming calcareous saccharate, which constitutes a continuous step in my process, and which consists in mixing previously-precipitated saccharate with an aqueous saccharine solution, and then precipitating the saccharate by the addition of lime or a further quantity of the saccharate, substantially as set forth.

3. The herein-described process of reducing the percentage of lime in the finished and purified saccharate before its conversion into sugar, which consists in mixing the hard purified saccharate with a saccharine liquid, and then separating the precipitated hydrate of lime by filtering, substantially as set forth.

294,160. **METALLIC STEAM-PIPE CONNECTION.** JOHN M. SWEENEY, Wheeling, W. Va. Filed Nov. 21, 1882. Renewed Oct. 5, 1883. (No model.)

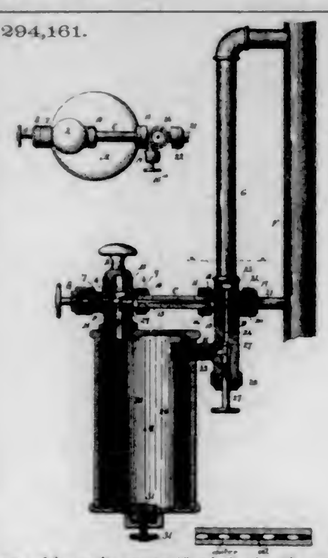
Claim.—1. The combination, with the flanged ends of the pipes D D', of the laterally-split collars A, adapted to be sprung one upon the end of each pipe, and to be connected by longitudinal bolts *c c*, substantially as described.

2. An improved flange-coupling for connecting pipe ends together, consisting of a ring, A^2, and collar C, the flange cut through to the collar at R, and cut through the flange and collar at *m*, and having lugs S S and compression-bolt *b*, substantially as and for the purpose set forth.

3. In combination with the pipes, a coupling consisting of an annular collar, C, and a base-ring, A^2, split upon one side entirely through said collar and base-ring, and upon the opposite side through the said base-ring alone, and having means, substantially as described, for clamping it upon the end of the pipe, substantially as described.

294,161. **LUBRICATOR.** JOHN C. THAYER, Chicago, Ill. Filed June 20, 1882. (No model.)

Claim.—1. The combination, in a lubricator, of a sight-feed tube filled with alternately-arranged portions of oil and water during the operation of the lubricator, and means for supplying said oil and water to the sight-feed, substantially as described.



2. The combination of the sight-feed of a lubricator, with oil-passages leading from the reservoir, and a water-eduction passage intersecting with said oil-passages, substantially as and for the purpose described.

3. The combination of the sight-feed of a lubricator, with intersecting oil and water eduction passages, and a valve controlling one of said passages, substantially as described.

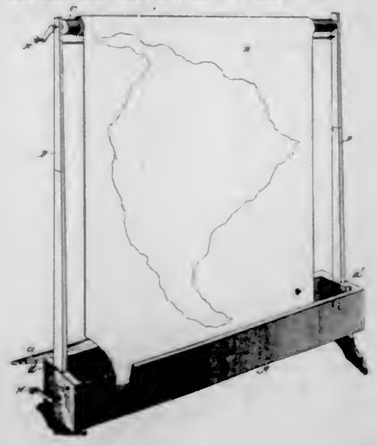
4. The plug B, provided with passages 3 4, and a water-cut-off passage, in combination with an oil-reservoir and means for conducting the oil and water to said passage and the device to be lubricated, substantially as described.

5. The combination, with the sight-feed and the oil-passage leading

294,161.

thereto, of the angular passages 15 and 18 and a valve working in said passages at their intersection, substantially as described.

6. The reservoir, the casting D, provided with passages 24 and 25, valve 27, induction-pipe 26, and eduction-pipe 30, in combination with plug B, cut-off passage 29, passage 4, valve 6, and sight-feed tube C, substantially as described.



7. The casting D, provided with the passages 24 25 and 15 18, induction-pipe 26, valve 27, and the reservoir, in combination with the plug B, provided with passages 3 and 4, cut-off 29, eduction-pipe 30, and a sight-feed tube, substantially as described.

8. The reservoir, the casting D, and plug B, constructed as described, induction-pipe 26, eduction-pipe 30, and valves 6 and 27, in combination with the sight-feed C, condensing-pipe G, steam-pipe H, and nipple 21, substantially as described.

9. The herein-described method of lubricating, the same consisting in continuously feeding a stream composed of alternate portions of oil and water through a passage or passages leading to the device to be lubricated.

10. The herein-described method of lubricating, the same consisting in continuously feeding a regulated stream composed of alternate portions of oil and water, in desired variable proportions, through a passage or passages leading to the device to be lubricated.

294,162. **COMBINED MAP CASE AND HOLDER.** JEROME TRAVIS, North Adams, Mich. Filed Oct. 8, 1883. (No model.)

Claim.—1. A portable map-holder consisting of a case provided with map-rollers, and with a pair of detachable standards adapted, when set upon the case, to support in an elevated position a roller for holding the map in a spread-out condition, substantially as described.

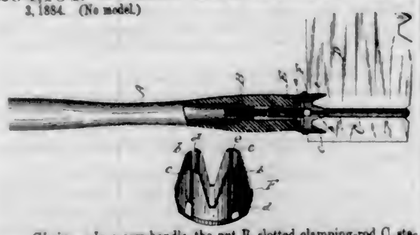
2. The combination, with the map-case provided with a pair of map-rollers, of the removable sectional standards adapted to support a roller above the case, one of said rollers being removably journaled within the case, whereby it can be removed and mounted between the standards, substantially as described.

3. The herein-described portable map-holder, comprising map-rollers and removable sectional standards, all capable of being contained within the case, said standards and one of the rollers being also capable of adjustment above the case, substantially in the manner and for the purpose specified.

4. The combination, with the case A, of the sectional standards removably supported thereon, the upper map-roller mounted between the upper ends of the standards, the lower map-roller mounted in the box, the map disposed substantially as described, and the crank-handles for operating the map-rollers, substantially as and for the purpose set forth.

5. The map-case A, containing a pair of map-rollers, and having sockets for receiving a pair of standards for supporting a roller for the maps thereon, said case being provided with a hinged lid, substantially as described.

294,163. **AUTOMATIC LUBRICATOR.** JOHN C. THAYER, Chicago, Ill., assignor of one-half to Charles H. Morse, same place. Filed Oct. 17, 1883. (No model.)

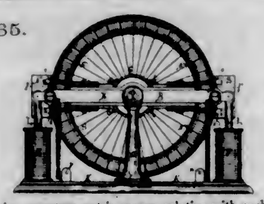


Claim.—1. In a lubricator, the valve provided with a stem having an elongated opening, in combination with the right-angled lever having a fixed pivot bearing in its angle, its perpendicular arm weighted at the upper end, and its other arm working loose in the elongated opening in the valve-stem, substantially as described.

2. The reservoir and the valve provided with a stem having a bearing at each extremity of the reservoir, in combination with an angular lever connected with said stem, and having a fixed pivot bearing in its angle, and its perpendicular arm weighted, substantially as described.

3. The reservoir, the valve seated in the bottom thereof, the valve-stem extending the length of the reservoir, and an angular lever pivoted in its angle for automatically actuating said valve, in combination with a filling-plug provided with an axial bore receiving said stem, and an adjusting-screw working in said plug, substantially as and for the purpose described.

294,164. **SAW-HANDLE.** MOSES E. TRUE, Batavia, N. Y. Filed Jan. 3, 1884. (No model.)



Claim.—In a saw-handle, the nut B, slotted clamping-rod C, stationary ferrule E, having the lugs *a*, in combination with the loose ferrule F, having the braces *b* and *c*, and provided with sets of slots of different sizes, so arranged that the slots diametrically opposite each other are of the same size, substantially as and for the purpose shown and described.

294,165. **MOTOR FOR ELECTRIC REGULATORS.** CHARLES J. VAN DEPOELE, Chicago, Ill. Filed June 14, 1883. (Model.)

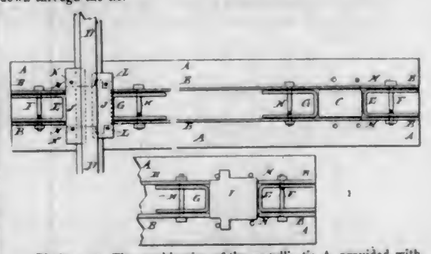
Claim.—1. A motor for electric regulators, consisting of a stationary electro-magnet and a revolving armature disposed between the opposite poles of said electro-magnet, in combination with a commutator and four brushes constantly in contact with said commutator, and means for allowing the current to pass through all four of the brushes, as shown, so as to prevent the armature from revolving or moving either way, as above described and set forth.

2. In a motor for electric regulators, a stationary electro-magnet,

294,165.

and a revolving armature put in proper relation with each other's poles, in combination with a commutator to said revolving armature, upon which four brushes are constantly pressing, and proper means to put a diametrically-opposite pair of said brushes out of circuit, in order to make the armature in the device to rotate either to the right or to the left, according to the position of the pair of brushes remaining in circuit, with regard to the stationary poles of the electro-magnet, substantially as described.

3. In a motor for electric regulators, a revolving armature placed between the poles of a stationary electro-magnet, the commutator to said armature provided with four contact-brushes constantly pressing upon said commutator, in combination with two insulated contacts borne by an oscillating beam, which will keep all four of the brushes in circuit when the apparatus is to be kept stationary, but which on the oscillating of said beam will cut out of circuit one pair of diametrically-opposite brushes, while the other pair remain in circuit, so as to produce the motion in said armature from its highest point of attraction toward the stationary poles of its field-magnet, as above shown and described.



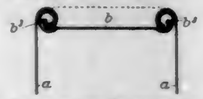
4. A motor for electric regulators, consisting of an electro-magnet, M M, having its poles N and S, between which a circular armature, A, is placed capable of revolving on its center, either to the right or the left, by the action of an electric current directed by brushes *a a'* and *b b'*, all bearing upon a commutator, C, and an oscillating beam, B B, carrying insulated contacts I and I' in connection with the brushes, and so disposed as to allow the current to circulate through four brushes at the same time, and by locating the centers of attraction in the revolving armature at points opposite the centers of attraction in its field-magnet to keep the said armature stationary, but when it is desired to revolve A either to the right or the left, I and I', to break contact with either pair of diametrically-opposite brushes, and thereby displacing the polarity in the revolving armature with regard to the stationary poles N and S, and producing motion in A corresponding to the two brushes left in circuit, as set forth.

5. In a motor for electric regulators, a revolving armature and its commutator, in combination with four brushes constantly in contact with said commutator and on opposite sides of the latter, and a means for cutting either out or in circuit a pair of diametrically-opposite brushes, in order to alter the position of polarity in the revolving armature with regard to two stationary magnetic points, and so to produce motion in said armature in such direction as determined by the action of the current through the brushes left in circuit.

6. In a motor for electric regulators having a stationary field-magnet and rotating armature, the commutator whereof is provided with two pairs of opposing or oppositely-placed contact-brushes, an oscillating contact-breaking device capable of making contact with all the brushes at once, and means, substantially as described, whereby the same is adapted to break contact with either pair of opposing brushes without breaking the main circuit, as set forth.

294,166. **METALLIC RAILROAD-TIE.** CHARLES H. VAN ORDEN, Catskill, N. Y. Filed Aug. 23, 1883. (No model.)

Brief.—Between the vertical flanges of the metallic tie and at the ends a rail-supporting block is held by U-shaped bars bolted to the flanges. A wear-plate is secured to the top of the block by bolts passed down through the tie.

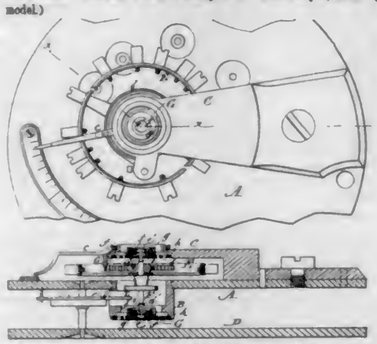


Claim.—1. The combination of the metallic tie A, provided with the flanges B, with the block C, held in place by the U-shaped bars E G, placed upon either side of said block, the arms of said U-shaped bars being attached to the flange B by bolts, keys, or other suitable means passing through said arms and flanges, substantially as set forth.

2. The combination of the tie A B, having the rail-supporting block C, provided with the wear-plate I, resting against the shoulder M of bolts, for securing said wear-plate and the rail in place on the tie, substantially as set forth.

3. The combination of the flanged and shouldered tie A B M with the rail-chairs J J, the outer ones of which are secured by bolts passing vertically through them and the tie, and the inner ones of which are secured by bolts passing through them and the tie in an inwardly-inclined direction, whereby a firm support against lateral strain is afforded the rails, substantially as described.

294,167. SEAM FOR SHEET-METAL VESSELS. FRANCIS A. WALSH, Chicago, Ill. Filed July 2, 1883. (No model.)

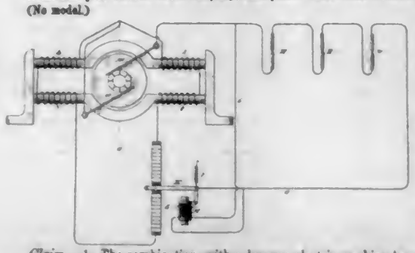


Claim.—1. A seam or joint for uniting the bodies and ends of sheet-metal vessels, wherein the body and flange of the end are rolled inward upon the end of the can, substantially as specified.

2. In combination with a straight can body and end united by an involute seam, a packing applied substantially as specified.

3. A sheet-metal vessel formed of the straight-sided body *a* and head or end *b*, provided with a groove, *b'*, the body and end being united by an involute seam, substantially as specified.

294,168. JEWEL-SUPPORT FOR THE BALANCE-STAFFS OF WATCHES. WALTER WARK, Waverly, N. Y. Filed July 5, 1883. (No model.)



Claim.—1. In a jewel-bearing for the balance-staffs of watches and other time-pieces, the combination, with the box *g*, in which the settings are secured, of the single spring G, to the center of which the box *g* is secured, substantially as herein shown and described.

2. In a jewel-bearing for the balance-staff of a watch, the combination, with the internally-threaded box *g*, of the exteriorly-threaded settings *f f*, substantially as herein shown and described.

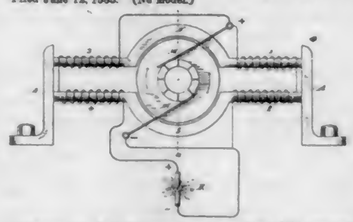
3. An improved spring for supporting the jewel-bearings of the balance-staff of a time-piece, constructed of a plate of elastic material having a series of interrupted and connected concentric slots, and branch slot extending to and through the outer edge of the plate, substantially as herein shown and described.

294,169. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. ADDISON G. WATERHOUSE, New York, N. Y., assignor, by mesne assignments, to the Schuyler Electric Light Company, same place. Filed June 12, 1883. (No model.)

Claim.—1. The combination, with a dynamo-electric machine having two field-magnetizing current-coils or sets of coils working in harmony to produce the field magnetism in which the armature moves, of means for increasing one magnetizing-current and simultaneously decreasing the other magnetizing-current to the same extent, so as to keep the total magnetizing influence of the currents or coils the same, whatever the adjustment, but at the same time to shift the poles of the field-magnet.

2. The combination, with a dynamo-electric machine having two paths or circuits in its field-magnet carrying currents that act in conjunction in producing the field magnetism, of means for increasing the flow of the current in one circuit and simultaneously decreasing the flow in the other to the same extent, without varying the total magnetizing-current, substantially as and for the purpose described.

3. The combination, with a dynamo-electric machine having two field-magnet circuits, of a reciprocating adjustable resistance device interposed in said circuits, and arranged and constructed in the manner described, to increase the resistance in one circuit simultaneously with producing a decrease in the other, without, however, disturbing the total amount of current-circulation in the two circuits.



4. The combination, in a dynamo-electric machine, of two field-magnet circuits and an automatic current-distributer, whereby the magnetizing effects of one circuit may be increased simultaneously with a corresponding decrease in the other circuit, as and for the purpose described.

5. The combination, with a dynamo-electric machine, of two sets of field-magnet circuits carrying currents that act in conjunction to produce the field magnetism in which the armature moves, and a current-regulator for increasing the magnetizing action in one circuit and simultaneously and to the same extent decreasing the magnetizing effects in the other, and vice versa.

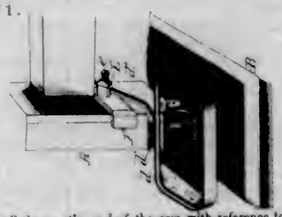
6. The combination, with two sets of field-magnet coils acting in conjunction to produce consequent polarity in the field-of-force pole-pieces, of two adjustable resistances, one for each set, and means for increasing one resistance and simultaneously and to a corresponding extent decreasing the other.

7. The combination, with two sets of field-magnet coils, of the two carbon resistances and the intermediate pressure-bar, E, as and for the purpose described.

294,170. AUTOMATIC REGULATOR FOR DYNAMO-ELECTRIC MACHINES. ADDISON G. WATERHOUSE, New York, N. Y., assignor, by mesne assignments, to the Schuyler Electric Light Company, same place. Filed June 12, 1883. (No model.)

Claim.—1. In a dynamo-electric machine, field-magnet coils divided into sets, as described, such that a diminution or a variation of current in one set will cause a shifting of the consequent points of the field-magnet, one of said sets being arranged in a derived circuit around the working-resistance.

2. The combination, in a dynamo-electric machine, of two field-magnet coils or bobbins conspiring to produce consequent polarity in an intermediate field-pole, one of said coils or bobbins being arranged in a direct circuit with the working-resistances, and the other, of higher resistance, being arranged in a derived circuit around the working-resistances.



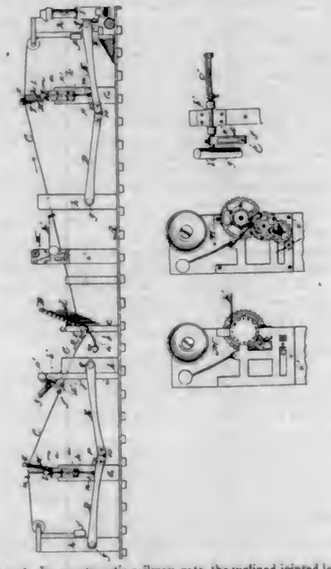
3. The combination, substantially as described, of four field-magnet coils wound in the manner described, to produce consequent polarity in the field-of-force pole-pieces, one set of coils being arranged in a direct circuit with the working-resistance and the other in a derived circuit, so that a variation of the distribution of currents in said coils consequent upon change of working-resistance will shift or distort the consequent points of the pole-pieces.

4. The combination, substantially as described, with a field-of-force magnet, of four magnetizing-coils acting to produce consequent poles, said coils being divided into two sets, each including two diagonally-opposite coils, one of which sets is in a derived circuit around the working-resistances, while the other set is in direct circuit therewith.

294,171. OPTICAL ATTACHMENT FOR SEWING-MACHINES. JEREMIAH WATTS, Racine, Wis. Filed Apr. 14, 1883. (No model.)

Claim.—1. In a sewing-machine, the combination of the needle, needle-bar, the head, a clamp upon the head, an adjustable arm held by the clamp, and a magnifying-glass and frame therefor, the said frame being jointed to the adjustable arm, whereby the position of the glass

294,171.



may be controlled upon the end of the arm with reference to the work under the needle, substantially as set forth.

2. In combination with the head of a sewing-machine, a magnifying-glass held by an adjustable arm secured thereto, and provided with a hinge, whereby it may be turned up against the said part when not in use, as set forth.

294,172. RAILWAY GATE AND SIGNAL. HENRY F. WIGHT, Boston, and HOSEA P. ALDRICH, Somerville, assignors of one-half to Samuel N. Aldrich, Marboro, Mass. Filed Dec. 8, 1883. (No model.)

Brief.—A pivoted gate is operated by a wire rope connected to a crank-arm mounted on a support at the side of the track, and which is operated to open and close the gate by means of two inclined jointed and pivoted levers actuated by a projecting arm on the locomotive or car. A signal and an alarm are operated by the same mechanism.

Claim.—1. In an automatic railway-gate, the inclined jointed levers D E, pivoted above the level of the track to supports A, and arranged alongside of and parallel with the said track, and adapted to be vibrated together by an arm, K, projecting out laterally from a locomotive or car, in combination with the pivoted gate B, connected by a wire rope, C, with a bell-crank lever, H, actuated by the jointed levers D E, all constructed to operate substantially in the manner and for the purpose described.

2. The combination, with the pivoted gate B, of two pairs of inclined levers, D E, each pair jointed together at 10 and located one pair on each side of the gate, mechanism, substantially as described, adapted to be operated by said jointed levers, and the wire rope C, for connecting the lever mechanism with the gate B, whereby the gate is first closed on the approach of the train by the contact of the arm K with one pair of levers, and then opened after the passage of the train by the contact of the arm K with the other pair of levers, substantially as set forth.

3. In an automatic railway-gate, the combination, with the inclined jointed levers D E, pivoted above the level of the track and arranged alongside of the same, of the adjustable suspension-rod *k*, sliding vertically in guides *a* on the post G, and provided with a collar or stop, *l*, substantially as and for the purpose set forth.

4. In an automatic railway-gate, the combination, with the inclined jointed levers D E, pivoted above the level of the track, of the crank-arm H, adapted to slip over the wire rope C, passing through its upper end, and operate the same by contact with a collar thereon, substantially as described.

5. The combination, with the inclined jointed levers D E, crank-arm H, and wire rope C, operated as described, of the rock-shaft *b'*, with its arm *d'* and signal *c'*, operating substantially as set forth.

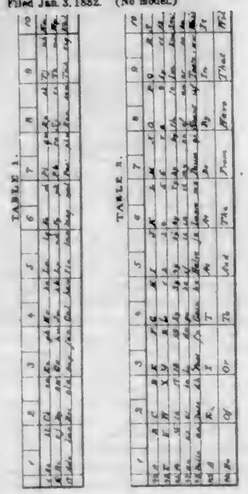
6. The combination, with the signal *c'*, mounted upon a rock-shaft, *b'*, having a slotted arm *d'*, vibrated by collars *f'* upon the wire rope C, of the tubular guide *g'* and rolling counter-weight or ball *h'*, all constructed to operate substantially in the manner and for the purpose set forth.

7. The combination, with the inclined jointed levers D E, crank-arm H, and wire rope C, operated as described, of the bell-alarm M, adapted to be set in operation by the movement of the rope C, substantially as set forth.

294,173. RUBBER BOOT OR SHOE. ISAAC F. WILLIAMS, Bristol, R. I. Filed June 24, 1882. (No model.)

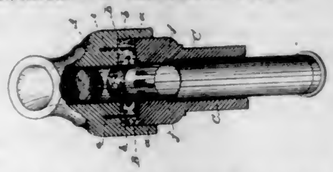
Claim.—1. A rubber boot or shoe lined with a fabric having on its inner face fibrous surfaces, and intervening rubber-coated surfaces, substantially as described.

2. In a rubber boot or shoe, a fibrous lining having upon its inner face parallel raised ribs, and intermediate surfaces of rubber, substantially as described.



294,174. RUBBER BOOT OR SHOE. ISAAC F. WILLIAMS, Bristol, R. I. Filed Aug. 28, 1883. (No model.)

Claim.—1. Rubber boots and shoes having a tap or tread sole and a heel, or either of them, united to the main sole by the ordinary method, supplemented by rubber studs or tenons and mortises, substantially as described.



2. The combination, substantially as hereinbefore described, of the rubber main sole, the rubber heel, and the interlocking rubber studs or tenons, whereby, with the usual vulcanizing operations, the heel and sole are firmly united, as set forth.

294,175. CRYPTOGRAPHEAL TABLE. JOHN L. WINNEA, San Francisco, Cal. Filed Jan. 3, 1882. (No model.)

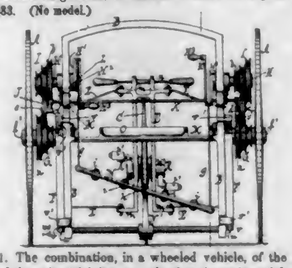
Claim.—A table or tables from which cryptograms with keys therefor may be constructed, consisting of columns of letters, figures, words, or symbols, and corresponding lines or columns of numerals or figures above or at one side, together with blank spaces, in which other independent numerals or figures may be inserted, substantially as herein described.

294,176. CARTRIDGE IMPLEMENT. MARCELLUS SHERRARD ALEXANDER, Moorefield, W. Va. Filed Jan. 3, 1884. (No model.)

Claim.—1. In an implement for dampening and seating gummed wads in cartridges, the combination, with the cylindrical portion adapted to receive the wad and guide it into the shell, substantially as described, of the sponge having a central opening for the passage of the wad placed within said cylindrical portion.

2. In an implement for seating wads in cartridges, the cylindrical body composed of the portion A, provided with the projections *e* and the depending flange *a*, and the portion C, having the shoulder *f*, in combination with the sponge B, substantially as described.

3. In an implement for seating wads in cartridges, the cylindrical body composed of the portion A, provided with the projections *e* and the depending flange *a*, and the portion C, having the notched shoulder, as described, in combination with the sponge B, substantially as described.



294,177. GUN-WAD. MARCELLUS SHERRARD ALEXANDER, Moorefield, W. Va. Filed Jan. 3, 1884. (No model.)

Claim.—1. The combination, with a gun-wad, of a disk of suitable material attached thereto, and extending a short distance beyond the periphery of said wad, said projecting portion being provided with adhesive material for securing the wad in place, substantially as described.

2. The combination, with a gun-wad, of a disk of suitable material attached thereto, and having the notched projecting portion provided with a coating of adhesive material, substantially as and for the purpose set forth.

294,178. VELOCIPEDE. ARTHUR M. ALLEN, New York, N. Y., assignor, by mesne assignments, to Leonora I. Allen, same place. Filed Apr. 12, 1883. (No model.)

Claim.—1. The combination, in a wheeled vehicle, of the pair of wheel-cones and the pair of driving-cones having circumferential grooves corresponding to each other, the pair of gear-wheels adapted to enter said grooves for connecting the wheel-cones with the driving-cones, a means for throwing the gear-wheels into and out of action, either independently from or in unison with each other, and a means, substantially such as herein described, for operating the driving-cones.

2. The combination, substantially as hereinbefore set forth, of the pair of wheel-cones and the pair of driving-cones having circumferential grooves corresponding to each other, the pair of gear-wheels adapted to enter said grooves for connecting the wheel-cones with the driving-cones, a support common to both gear-wheels for throwing them into and out of action, and a means, substantially such as herein described, for operating the driving-cones.

3. The combination, in a wheeled vehicle, of the pair of wheel-cones and the pair of driving-cones having circumferential grooves corresponding to each other, the pair of gear-wheels adapted to enter said grooves for connecting the wheel-cones with the driving-cones, a means for throwing the gear-wheels into and out of action independently from or in unison with each other and adjusting them to different grooves of the cones, and a means, substantially such as herein described, for operating the driving-cones.

4. The combination, in a wheeled vehicle, of the pair of wheel-cones and the pair of driving-cones having circumferential grooves corresponding to each other, the pair of gear-wheels adapted to enter said grooves for connecting the wheel-cones with the driving-cones, a support common to both gear-wheels for throwing them into and out of action and adjusting them to different grooves of the cones, and a means, substantially such as herein described, for operating the driving-cones.

5. The combination, substantially as hereinbefore described, of the pair of road-wheels having central cones, the pair of driving-cones, the pair of gear-wheels for connecting the wheel-cones with the driving-cones, and the longitudinally and laterally movable hand-rod supporting both gear-wheels.

6. The combination, substantially as hereinbefore described, of the pair of road-wheels having central cones, the pair of driving-cones, the pair of gear-wheels for connecting the wheel-cones with the driving-cones, the hand-rod supporting both gear-wheels, and the levers supporting the hand-rod.

7. The combination, substantially as hereinbefore described, of the pair of road-wheels, the operating-cranks, the foot-bar, the rods connecting the foot-bar to said cranks, and a means for throwing each crank into and out of gear with its road-wheel independently of the other.

8. In a wheeled vehicle, the combination, with a road-wheel, a driving medium having a fixed relation to the road-wheel, and with foot-gear for operating the driving medium, of a gear-wheel for connecting the road-wheel with the driving medium, and a support for the gear-wheel adapted to be adjusted for throwing said wheel into and out of action, whereby the power may be taken off from the road-wheel without affecting the driving medium or foot-gear.

9. In a wheeled vehicle, the combination, with a road-wheel and a driving medium having a fixed relation to the road-wheel, of a gear-wheel for connecting the road-wheel with the driving medium, a support for the gear-wheel adapted to be adjusted for throwing said wheel into and out of action, and a brake connected to said wheel-support to act on the road-wheel when the gear-wheel is thrown out of action.

10. The combination, substantially as hereinbefore described, of the pair of road-wheels having central cones, the driving-cones, the gear-wheels for connecting the wheel-cones with the driving-cones, the hand-rod supporting the gear-wheels, and the brake-straps connected to the hand-rod, to be applied thereby to the wheel-cones when the gear-wheels are thrown out of action.

11. In a wheeled vehicle, the combination, with a road-wheel, of a movable frame connected to the axle of said wheel, and a driving medium arranged in the frame to act on the road-wheel by the friction maintained between it and the wheel by the weight of the load.

12. In a wheeled vehicle, the combination of a road-wheel having a central cone or pulley, a movable frame connected to the axle of said wheel, a driving cone or pulley arranged in the frame above the wheel cone or pulley to maintain friction, and a gear-wheel connecting the wheel-cone with the driving-cone.

13. The combination, substantially as hereinbefore described, of the pair of road-wheels having central cones, the movable frame, the pendants connecting the frame to the axles of the wheels, the driving-cones arranged in the frame, and the gear-wheels connecting the wheel-cones with the driving-cones.

14. The combination, substantially as hereinbefore described, of the pendants having knuckles *v*, the frame having knuckles *v'*, the pivots passing through said knuckles, the pair of road-wheels having central cones, the driving-cones arranged in the frame, and the gear-wheels connecting the wheel-cones with the driving-cones.

15. The combination, substantially as hereinbefore described, with the pair of road-wheels, of the pendants having knuckles *v*, the frame having knuckles *v'*, and the pivots passing through said knuckles, and having different lengths on the respective edges of the frame.

16. The combination, substantially as hereinbefore described, with the pair of road-wheels and driving-gear, of the foot-bar oscillating on a central pivot and connecting with the driving-gear, and a series of pedals arranged on each side of said pivot, at equal distances therefrom, upon the foot-bar, whereby a positive hold is afforded to the feet of the rider at different portions of the bar.

17. The combination, substantially as hereinbefore described, with the pair of road-wheels and their driving-gear, of the crank-shafts concomitant to the driving-gear, the cranks, each having its pin provided with a supplemental arm carrying a handle diametrically opposite to the crank-pin, the oscillating foot-bar, and the rods connecting said bar to the crank-pins, whereby an alternating action of the hands and feet is produced.

18. The combination, substantially as hereinbefore described, of the reversible seat O with the frame B, the pair of road-wheels, and the road-wheel driving-gear.

19. The combination, substantially as hereinbefore described, of the reversible seat O and the reversible hand-rod K with the frame B, the pair of road-wheels, and the road-wheel driving-gear.

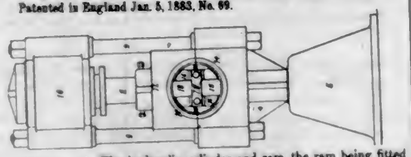
20. The combination, substantially as hereinbefore described, of the reversible seat O and the reversible oscillating foot-bar N with the frame B, the pair of road-wheels, and the road-wheel driving-gear.

21. The combination, substantially as hereinbefore described, of the reversible seat O, the reversible hand-rod K, and the reversible oscillating foot-bar N with the frame B, the pair of road-wheels, and the road-wheel driving-gear.

22. The combination, substantially as hereinbefore described, of the frame B, the frame D and its seat, the pair of road-wheels, and the single road-wheel supporting said frames, respectively, and the connecting-rods united to the opposite sides of said frames above and below the wheel-axles by coincident pivots.

23. The combination, substantially as hereinbefore described, of the frame D, having the reversible seat P, and the single road-wheel supporting said frame, and having a cranked axle.

24. The combination, substantially as hereinbefore described, of the frame D, the single road-wheel, the wheel-axle having its bearings in the sides of said frame, and having the collar and screw-nut on opposite sides of the wheel-hub, and the washers interposed between said collar and nut and the sides of the frame.



25. The combination, substantially as hereinbefore described, of the frame B, the single road-wheel, the wheel-axle having its bearings in the sides of said frame, and having the collar and screw-nut on opposite sides of the wheel-hub, the bushes fitted to said bearings of the axle, and the washers interposed between said collar and nut and the sides of the frame.

26. The combination, substantially as hereinbefore described, of the frame D, the single road-wheel, the wheel-axle, the split cranks arranged thereon, and provided with pedals, and bolts for clamping the jaws of said cranks on the axle.

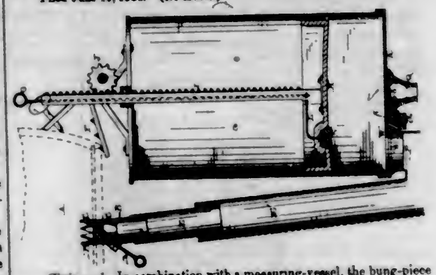
27. The combination, substantially as hereinbefore described, of the frame D, the single road-wheel, the wheel-axle, the split cranks arranged thereon, the bent pins fitted between the jaws of said cranks, and bolts for clamping said jaws of the cranks on the axle and on the crank-pins.

28. The combination, substantially as hereinbefore described, of the frame D, the single road-wheel, the wheel-axle, the split cranks arranged thereon, the bent pins fitted between the jaws of said cranks, bolts for clamping said jaws, and pedals mounted on the bent pins.

294,179. DEVICE FOR WELDING BOILERS, &c. STEPHEN ALLEY, Glasgow, County of Lanark, Scotland. Filed Oct. 2, 1883. (No model.) Patented in England Jan. 5, 1883, No. 99.

Claim.—1. The hydraulic cylinder and ram, the ram being fitted with two rollers, one to roll along and operate with welding-pressure on the joint, and the other to roll along the opposite part of the shell, in combination with external blocks or parts, which confine the shell and prevent its enlargement, substantially as herein set forth.

2. A hydraulic cylinder, ram, and welding-rollers, and devices applied to the outside of a shell to keep it in place, the whole mounted on a turn-table, in combination with a series of furnaces arranged radially in relation to the center of the turn-table, substantially as described.

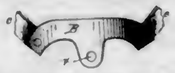


294,180. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. CHARLES E. BALL, Philadelphia, Pa. Filed Nov. 19, 1883. (No model.)

Claim.—1. An automatic regulator for a dynamo-electric machine, comprising an electro-magnet or solenoid in the external circuit of the machine, and having its armature or core connected to both the commutator brushes or collectors, said brushes or collectors being movable toward and from each other, substantially as shown and described.

2. In a dynamo-electric machine in which the armature is adapted and designed to rotate in the inductive field of only one magnetic pole, the combination, with two movable commutator brushes or collectors, of an electro-magnet or solenoid in the external circuit of the machine, and having its armature or core connected with both said brushes or collectors, whereby variations in said circuit will affect said magnet and produce the movement of both said brushes or collectors, substantially as shown and described.

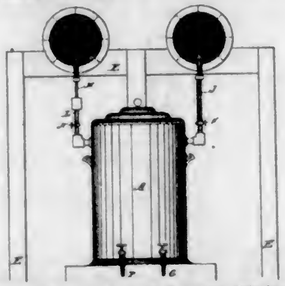
294,181. MEASURING-TANK. WILLARD E. BARGUR, Vineland, N. J. Filed June 19, 1883. (No model.)



Claim.—1. In combination with a measuring-vessel, the bung-piece B, having its inner end shaped as shown, the plug C, and the rod D, passing through an opening in the side of the bung-piece, whereby the plug can be moved in and out of the mouth of the bung-piece, substantially as shown.

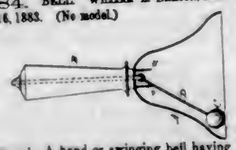
2. In a measuring-vessel, the combination of the rotary valve, having but a single opening through it, and adapted to be turned one-half way round, with the cap-piece provided with two openings, and the head of the cylinder having suitable recesses to receive the two parts, and provided with suitable inlet and outlet openings for the passage of the fluid, substantially as set forth.

3. In a measuring-vessel, the combination of the valve, provided with the suitable packing material upon its under side, and having a curved flange upon its top, with the cap-plate, provided with two openings, and having a groove in its under side to receive the curved flange, substantially as specified.



4. The combination, with a measuring-vessel, of the pivoted arms and a slide or other device for closing the arms, substantially as shown.

294,182. SKATE-FASTENING. EVERETT H. BARNEY, Springfield, Mass. Filed Dec. 31, 1883. (No model.)

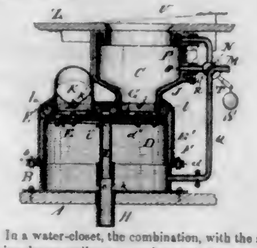


Claim.—The within-described portable skate-fastening, consisting of a metallic strap-yoke having a perforated leg, and having straps attached to its arms, substantially as and for the purpose set forth.

294,183. BEER-COOLER. CHAS. A. BARTLETT, Bartlett, Tenn. Filed July 2, 1883. (No model.)

Claim.—The combination, with the cooler, of the ice-basket formed of pipe F, having two inlets for stale and fresh beer, respectively, and an outlet for drawing off the beer after it is mixed and cooled, substantially as shown and described.

294,184. BELL. WILLIAM E. BARTON, East Hampton, Conn. Filed July 16, 1883. (No model.)



Claim.—1. A hand or swinging bell having the hammer centrally suspended therein by an elastic arm, a concentric circular stop within the bell between the point where the hammer is suspended and the hammer,

to arrest the swing of the arm just before the hammer reaches the bell, substantially as described.

2. The combination of the hand or swinging bell A, internal concentric circular flange, *a*, the bell-hammer having an elastic arm hung within said flange, the said flange serving as a stop to arrest the swing of the arm just before the hammer reaches the bell, substantially as described.

294,185. WATER-CLOSET. EMIL BAUDE, Cincinnati, Ohio. Filed July 18, 1883. (No model.)

Claim.—1. In a water-closet, the combination, with the soil-hopper and soil-pipe having downwardly-presented ports in the same horizontal plane, of the duplex valve, to seat upwardly and simultaneously against said ports by the pressure of water-supply.

2. In a water-closet, the combination, with hopper and soil-pipe having downwardly-presented ports in the same horizontal plane, of duplex valve, hat-formed diaphragm, and temporary receiver.

3. In a water-closet, the combination, with temporary receiver B B' and diaphragm D, of the double-seating valve G, whose tubular and perforate stem I occupies a tubular perforate guide, H, in the reservoir-floor, as and for the purpose set forth.

4. In a water-closet, the described organism, to wit: a soil hopper or bowl and a soil-pipe, both ported downward and at the same level, a valve whose gravity during use of the closet opens both ports simultaneously, and which on vacation of the closet closes both ports simultaneously by pressure of the water-supply, a four-way cock, N, and an operating instrumentality, substantially as set forth.

294,186. BUTTON-HOOK. JAMES CLARENCE BEETLE, New Bedford, Mass. Filed Dec. 27, 1883. (No model.)

Claim.—1. The combination, with a handle, of a button-hook pivoted on the end of the same, and of a spring for holding the hook at right angles to the handle, substantially as herein shown and described.

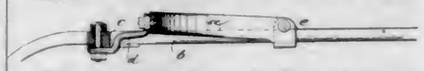
2. The combination, with a handle, of a tube held on the end of the same, a button-hook pivoted in the outer end of the tube, and a spring held in the tube and acting on the hook in such a manner as to hold it at right angles to the tube, substantially as herein shown and described.

3. The combination, with the handle B, of the tube A, having jaws *a*, and notches *b*, formed on its outer end, the hook C, pivoted in the outer end of the tube A, the spring D, and the chain F, substantially as herein shown and described.

294,187. DEVICE FOR CHECKING HORSES. W. STUART BENTZ and HARRY BENTZ, York, Pa. Filed Nov. 9, 1883. (No model.)

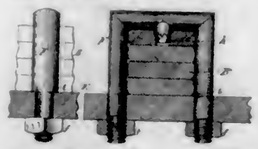
Claim.—1. The axle B', provided with the anti-friction roller *d*, and the shaft C', provided with the drum C and rubber roller D, in combination with the hub D', check-rein *a*, and strap E, all constructed to operate substantially as and for the purpose set forth.

2. The axle B' and shaft C', provided with the drum C and roller



D, in combination with the check-rein *a* and strap E, and spring-pin F, all constructed to operate substantially as and for the purpose set forth.

294,188. REVOLVER. WILLIAM H. BLISS, Norwich, Conn. Filed Dec 17, 1883. (No model.)



Claim.—In a revolving fire-arm, a cylinder whose rear end is so concaved or cupped that the flanges of the cartridge-shells find a bearing only on the outer edge of said cylinder, forming an anvil immediately opposite that part of the cartridge-head which is to be struck and indented by the falling hammer, as described.

294,189. BREECHING ATTACHMENT FOR CARRIAGE-SHAFTS. SAMUEL WALKER BOOKER, Baton Rouge, La. Filed Oct. 27, 1883. (No model.)

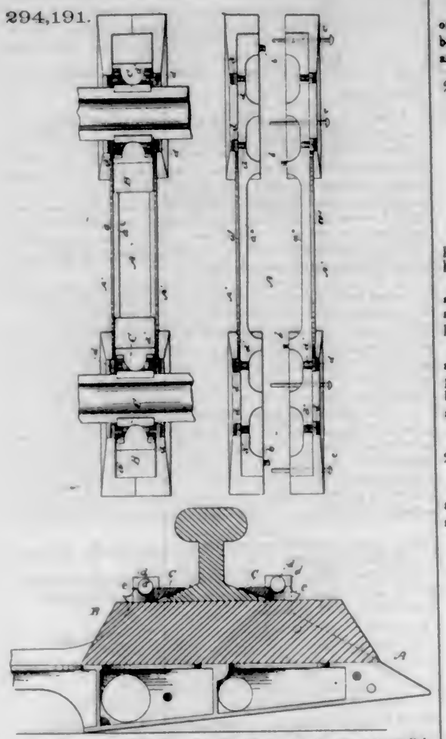
Claim.—In a breeching attachment for carriage-shafts, the combination, with the shafts or thills of a vehicle, of the bow *a*, with its ends clipped to the thills, and its curved rear portion somewhat elevated above a horizontal plane touching the upper surfaces of the shafts, said curved rear portion being connected to the cross-bar of the thills or shafts by an upwardly and downwardly bent or curved rod bolted to said curved rear portion of breeching-bar and thill cross-bar, essentially as shown and described, and for the purpose set forth.

294,190. VEHICLE-SPRING. CHRISTOPHER COLUMBUS BRADLEY, Syracuse, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination, with a carriage-body and carriage-spring, of a clip rigidly secured to the carriage-body and constructed with a projection or stud fitted loosely in a recess in the spring, whereby the spring is held in place, while being permitted to rock in the clip in adjusting itself to the movements of the carriage-body, substantially as described.

2. The combination, with the carriage-body, of end springs, C C, side springs, B B, connected with the end springs by couplings D, and clips F, secured to the carriage-body and having projections *g*, loosely fitted in openings or depressions *h* in the side springs, whereby the springs are held in place, and at the same time permitted to move in the clips, substantially as described.

294,191. RAILROAD-TIE. THOS. BREEN, Knowlton, Pa. Filed May 25, 1883. (No model.)

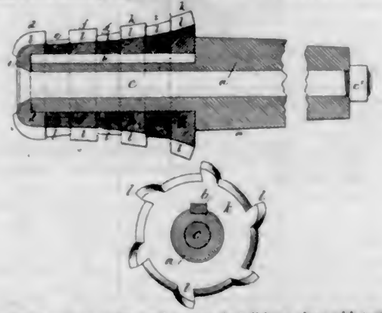


Brief.—A railway-tie having wedge-shaped end portions. The tie is made in readily-separable sections. It has also upwardly-inclined lower surfaces.

Claim.—1. In a railroad-tie, sections A', having wedge-shaped end portions, in combination with blocks B and key-plates C, substantially as shown and described.

2. In a railroad-tie, the end portions and their connections formed in readily-separable sections, said sections having studs and sockets for the latter, to prevent individual endwise displacement, substantially as and for the purpose set forth.

3. In a railroad-tie, the end portions having studs, in combination with the key-plates having concavities in their upper surfaces, and upwardly-inclined lower surfaces, substantially as and for the purpose set forth.



294,191.

4. In a railroad-tie, the end portions having studs arranged parallel with the rail, in combination with the key-plates having concaved upper surfaces, upwardly-inclined under surfaces, and concaved lower outer surfaces, the ends of the latter projecting below the inner ends thereof, and the whole made of elastic metal, substantially as and for the purpose set forth.

294,192. MILLING-CUTTER. SIDNEY BROADBENT, Scranton, Pa. Filed Aug. 20, 1883. (No model.)

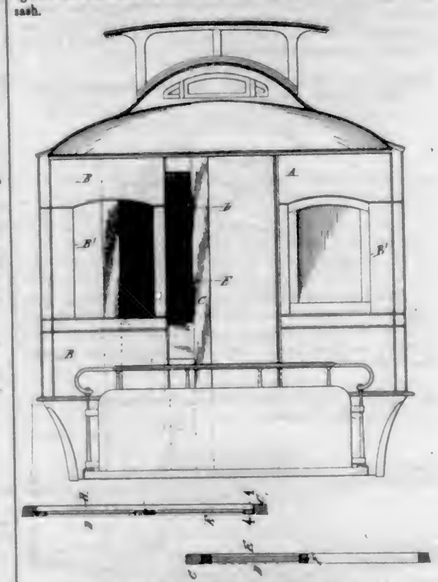
Brief.—The inclination of the cutting-edges of the teeth gives a shear cut, and the alternation of the teeth, in connection with the greater breadth of their cutting-edges, prevents the formation of burrs or ribs.

Claim.—1. A milling-tool composed of disks or rings with teeth upon their edges, each tooth being longer on its edge than the thickness of the disk, and said disks secured together upon a spindle, with the teeth on one disk between the teeth upon the next disk, substantially as set forth.

2. The combination, in a milling-tool, of the spindle *a*, key *b*, and tie-bolt *c*, with movable rings, each of which is provided with teeth that are wider than the thickness of the ring, and at an inclination, as specified.

3. The milling-tool having peripheral teeth in rows, the teeth in one row alternating with those in the next, and the edge of each tooth being at an inclination and longer than the distance between one tooth and the next, substantially as set forth.

294,193. LEAD-AND-WIRE SEAL. EDWD. J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Dec. 29, 1883. (No model.)



Claim.—1. An improved lead-and-wire seal having a tubular leaden part cast fast within an eye at one extremity of its wire, substantially as herein specified, for the purposes set forth.

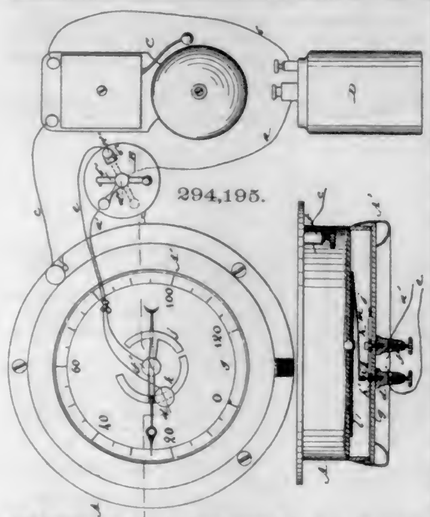
2. The combination, in a lead-and-wire seal, of a tubular leaden part and a wire having an eye at one extremity to embrace said leaden part, and provided at its other end with anchoring devices, substantially as herein described, for the purposes set forth.

3. The combination, in a lead-and-wire seal, of a tubular leaden part and a wire having at one extremity an eye, *e*, within which said leaden part is cast fast, and at its other end anchoring devices, with detector-indentations *d* in that end of the wire which forms said eye, substantially as herein specified, for the purposes set forth.

294,194. CAR-DOOR. FREDERICK B. BROWNELL, St. Louis, Mo. Filed June 19, 1882. (No model.)

Brief.—A sash hinged to a fixed sash in a sliding car-door folds up against the fixed sash into a recess equal in depth to the thickness of said sash.

Claim.—1. A sliding car-door having a window-opening provided with a fixed sash and a movable sash to fold against the fixed sash, the window-opening being of sufficient depth to receive both sashes when folded together and permit the door to pass in and out of its casing.

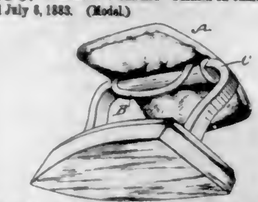


2. A sliding car-door having a hinged sash folding, when opened, against a fixed sash and into a recess in the door on one side of the fixed sash.

3. The combination, with the window-opening of a sliding car-door, of the two sashes D and E, hinged one to the other, and adapted, when folded together, to be flush on both sides of the door, as set forth.

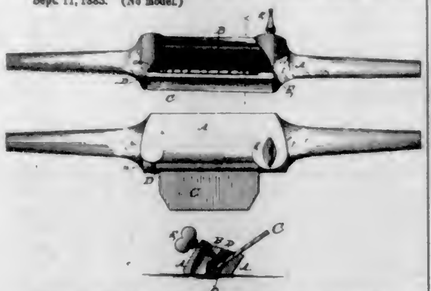
294,195. ELECTRIC ALARM FOR STEAM-GAGES. HARVEY CARLEY and THOMAS MCKENNA, Long Branch, N. J.; said Carley assignor to said McKenna. Filed May 11, 1883. (No model.)

Brief.—Adjustable contact-plates determine a neutral limit for fluctuation of needle. When pressure exceeds maximum limit, alarm sounds. When pressure falls too low, alarm may be sounded by closing a circuit.



Claim.—The combination, with the steam-gage A, having the ne-

294,195.



tallic binding-posts *d f f'*, the electric switch B, having binding-post *d'*, the electric-alarm bell C, and the galvanic battery D, of the circuit-plates *j k*, struck from the same center, the screws *h h'*, the pointer *l*, and the flat spring *m*, as shown and described.

294,196. SAD-IRON HOLDER. SERENA M. CARNES, New York, N. Y. Filed July 8, 1883. (Model.)

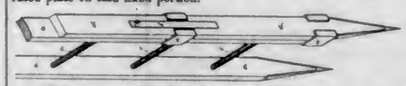
Claim.—In a sad-iron holder, the combination, with the pad, of the clasp-spring connected to the under side of and externally to the pad, and curved to immediately clasp the sad-iron handle, whereby the holder or pad is enabled to open out from the handle and remain connected thereto, substantially as and for the purpose set forth.

294,197. SPOKESHAVE. ADDISON E. CHAPMAN, Olean, N. Y. Filed Sept. 11, 1883. (No model.)

Claim.—The stock of a spokeshave, having an aperture to receive the blade and a bed for the same to rest on throughout its length, and a wedging-ledge at one end of said aperture, in combination with a tapering pointed screw in the stock at the opposite end of said aperture, and a wedge inclined at both ends, as shown and described, whereby a blade may be held, as specified.

294,198. SOFA-BED. WILLIAM A. CLARK, San Francisco, Cal. Filed Aug. 22, 1883. (No model.)

294,198.



Claim.—1. The plate D, having a perpendicular, a horizontal, and one or more intervening arms, *b*, and an extension, *d*, having a lower wall notched or shouldered at *e*, as shown, and in line with the lower wall of the horizontal groove, said arms having grooves, the walls of which leave a space, *c*, open on top, and a point, *m*, formed by the outer wall of the perpendicular groove and the lower wall of the extension *d*, said point being in line with the lower walls of the horizontal and inclined intervening grooves, in combination with the bar or pin C, which fits and slides within any of said grooves, changing from one to the other by fulcruming on point *m*, substantially as herein described.

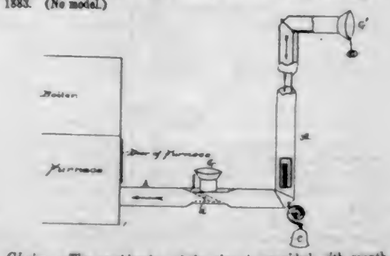
2. The body or seat frame A, having end guides, *a*, and the plates D, secured to the inner surfaces of said guides, and having a perpendicular, horizontal, and one or more intervening arms, *b*, grooved as shown, to form space *c*, open on top, and fulcrum-point *m*, and having an extension, *d*, with a notched or shouldered lower wall, in combination with the head-frame B and the bars or pins C, secured to the sides or ends of said head-frame, constructed as set forth, and to fit and slide within said grooved arms, substantially as and for the purpose herein described.

3. The plate D, having a perpendicular, a horizontal, and one or more intervening arms, *b*, said arms having grooves, as shown, the walls of which are so arranged as to leave a space, *c*, open on top, and a projection, *m*, in a line with the outer and lower walls of the perpendicular and horizontal grooves, respectively, and the lower walls of the inclined intervening grooves, in combination with the bar or pin C, adapted to fit and slide within said grooves, substantially as herein shown and described.

294,199. LADDER. GRANVILLE H. CLOVES, Portland, Me. Filed Apr. 27, 1883. (No model.)

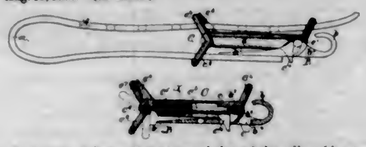
Brief.—The adjustable leg of the ladder slides in clasps on the fixed portion, and is adjusted thereon by a spring-held pin entering a perforated plate on said fixed portion.

Claim.—The combination of the side *a*, rungs *c c*, short side *b*, having the holes K, leg *d*, clasps *e e*, spring *f*, and pin *h*, substantially as described.



294,200. POOL TRIANGLE AND BOX. HUGH W. COLLENDER, New York, N. Y. Filed Jan. 25, 1884. (No model.)

Claim.—1. A combined triangle and ball-case, substantially as set forth.

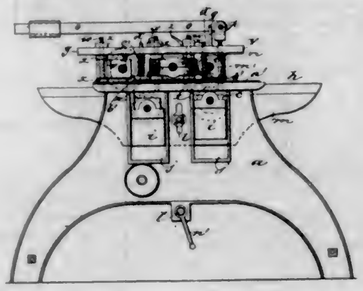


2. In a triangle and tray, a sliding bottom having two parallel edges and means for supporting said edges during the movements of the bottom, as set forth.

294,201. APPARATUS FOR INDICATING TEMPERATURES OF DISTANT ROOMS. WILLIAM R. COMINGS, Norwalk, Ohio. Filed Aug. 27, 1883. (No model.)

Claim.—The combination of the pipe A, provided with mouthpieces G G', a thermometer located in the pipe, a valve which can be used either to check the flow of air through the pipe or to close the lower mouth-piece, and a mechanism for exhausting the air through the pipe, substantially as shown and described.

294,202. HAME-FASTENER. ALONZO B. CONDE, Albany, N. Y. Filed Aug. 13, 1883. (No model.)



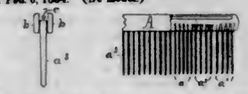
Claim.—1. A hame-fastener consisting of the adjustable strap A, having the plate B, with retaining-bar b^3, permanently attached to one end of said strap, in combination with the detachable catch C, the latter adapted to engage with the retaining-bar, substantially as set forth.

2. In a hame-fastener, the combination, with a strap, A, provided with a hook-piece, B, having a hook, *b*, and transverse bar b^3, as herein set forth, of a detachable catch, C, provided with a hook, *c'*, a spring-actuated sliding bolt, c^2, having a head, c^4, adapted to abut against the point of the hook *c'*, a stationary tongue, c^5, formed on the body-piece *c*, and a double buckle-frame composed of the loops c^6 and c^6 and center bar, c^6, pivoted, as described, to the body-piece *c*, all constructed and arranged to operate substantially as herein specified.

3. The catch C, composed of the body-piece *c*, provided with a hook, *c'*, adapted to engage with the bar b^3, as herein described, and a spring-actuated sliding bolt, c^2, having a pendent head, c^4, which abuts against the point of the hook *c'*, but projects laterally beyond the point of said hook, in combination with means, substantially as described, for engaging the latter with the hame, as and for the purpose set forth.

294,203. WOODEN-STIRRUP MACHINE. WILBER F. COWLES, St. Mary's, and JAMES WOOLWORTH, Sandusky, Ohio. Filed Dec. 27, 1883. (No model.)

Claim.—1. The combination, in a stirrup-slat-planing machine, of the forward upper planer, *e*, fitted with notched or spaced knives adapted to plane the inside portions of the stirrup-slat, except the platform, narrow upper rear planer, *g*, adapted to plane the platform portion of the slat, and the lower middle planer, *f*, having cutters adapted to surface the outside portion of the stirrup-slat, said machine having suitable feed-rolls, substantially as described.

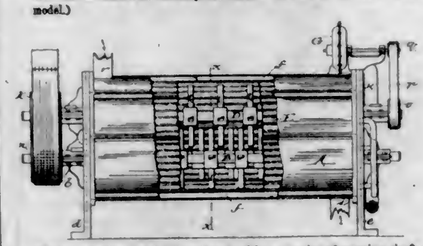


2. The combination, in a stirrup-slat-planing machine, of the upper forward planer, *e*, fitted with notched or spaced knives adapted to plane the inside portions of the stirrup-slat, except the platform, narrow upper rear planer, *g*, adapted to plane the platform portion of the slat, saws *z* on the shaft *z'*, on both sides of the planer *g*, for trimming the ends of the slat, and the lower middle planer, *f*, adapted to surface the outside portion of the stirrup-slat, said machine being provided with suitable feed-rolls, substantially as described.

3. The combination, in a stirrup-slat-planing machine, of the upper forward planer, *e*, fitted with notched or spaced knives adapted to plane the inside portions of the stirrup-slat, except the platform, narrow upper rear planer, *g*, adapted to plane the platform portion of the slat, lower planer, *f*, adapted to surface the outside portion of the stirrup-slat, and the pressers *f'*, mounted on vertical guide-rods above the table and on both sides of it, to hold the stirrup-slats against the pressure of the planer *f*, substantially as described.

4. The combination, in a stirrup-slat-planing machine, of the upper table-planers, *e g*, and upper feed-roll, *b*, mounted in suitable boxes sliding on vertical bars on the side frames or housings, *a*, and the lower planer, *f*, and lower feed-roll, *c*, journaled below the table A, said table being provided at its sides with blocks *i* and binding-screws *l*, working in slots in the sides of said housings *a*, and provided with means for adjusting the said planer *f* and feed-roll *c* to and from the upper planer and feed-roll, mounted on said housings, substantially as described.

5. The guides *a'*, presser-bars *b'*, presser-springs *c'*, and rods *d'*, mounted on each of the housings above and on each side of the table A, combined with the feed-rolls *b c*, planers *e f g*, and the table A, substantially as described.

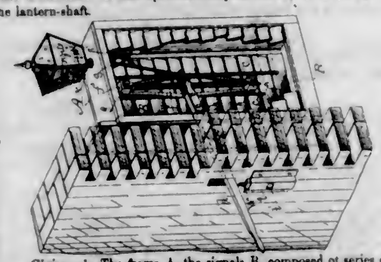


294,204. COMB. WM. CRABB, Newark, N. J. Filed June 16, 1882. Renewed Feb. 6, 1884. (No model.)

Claim.—1. The method herein described for forming a comb-back of celluloid or analogous material upon a series of separate teeth, consisting in supporting the series of teeth in one half of a divided mold with a strip or strips of material adapted to yield under pressure below a temperature of 300° Fahrenheit, and then applying the other half of the mold and causing the material to flow in a plastic state around and between the roots of the teeth, substantially as shown and described.

2. In combination with a comb-back of the nature herein described, the teeth *a*, provided with crimped ends, substantially as shown and described.

294,205. GRAIN-CLEANING MACHINE. FRANK E. CURTIS and WILLIAM H. HELFRICH, Minneapolis, Minn. Filed Nov. 17, 1883. (No model.)

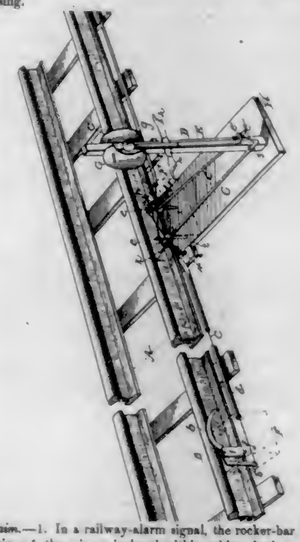


Claim.—1. In a grain-cleaning machine, a series of rotating shafts carrying beaters, in combination with an inclosing investment having a series of curvilinear plane surfaces, the curves of which are substantially struck from the axes of the rotating shafts, for the purpose set forth.

2. The casing A, provided with the suction-fan G and discharge-pipe H, and proper gearing to drive said fan, in combination with the curvilinear shell E, of less cross-sectional dimension than casing A, and a series of shafts, B C D, geared to revolve in opposite directions, and carrying interlapping beaters *l*, all constructed, arranged, and operated as set forth.

294,206. RAILWAY-SIGNALING APPARATUS. WM. N. DAWSON, Adel, Iowa. Filed June 14, 1883. (No model.)

Brief.—A lever extending through the wall of the building operates by spring-connections the operating-bars of the rolling slats in the sides of the case. It also operates a loop embracing spiral prongs upon the lantern-shaft.

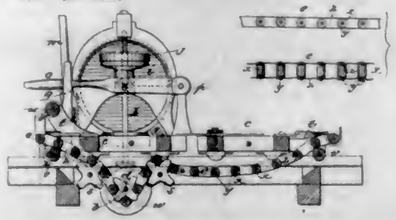


Claim.—1. The frame A, the signals B, composed of series of pivoted slats connected by rods *c*, the rod *f f'*, the blocks *g*, the springs *h*, and a lever, *d*, arranged and combined substantially as shown and described, to operate in the manner set forth, for the purposes specified.

2. The shaft *k*, carrying a signal-lantern, J, and having a cross-head, *m*, and spiral prongs *n*, and the rod *r*, having a cross-head, *s*, in combination with the lever *d*, for the purposes set forth.

3. The railway-signaling apparatus composed of a frame, A, two reversible signals, B, and their operating mechanism *d f g h*, a signal-lantern, J, and its operative mechanism *k m n r s*, and an indicator, *t t' w*, substantially as shown and described, and adapted to be applied and operated in the manner set forth, for the purposes specified.

294,207. ALARM-SIGNAL FOR RAILROAD-CROSSINGS. JOHN B. DEEDS and JOSEPH H. BLAKE, Terre Haute, Ind.; said Deeds assignor to said Blake. Filed Apr. 7, 1883. (No model.)



Brief.—The device embraces a bell and vertically-pivoted hammer mounted on a post near a railroad-crossing, a slot in an arm on the lower end of which hammer being provided to receive the actuating-arm of a rock-shaft having a crank-arm on its opposite end, the crank-arm being connected by means of a wire with a lever situated by the track at a suitable distance from the crossing, and constructed and arranged, as described, to be depressed by the wheels of a passing train, the crank-arm being also provided with a retracting-spring, by means of which lever and spring the shaft is rocked and the bell rung while the train is passing. Another rock-shaft of like construction and operation is connected with like actuating mechanism situated on the opposite side of the crossing.

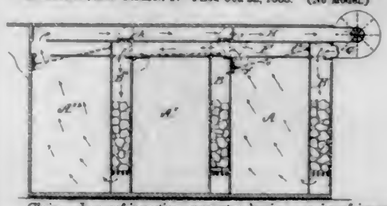
Claim.—1. In a railway-alarm signal, the rocker-bar fulcrumed in the bearings 1, the wire *c*, inclosed within tubing, both as described, in combination with the spring, and rod C, turning in bearings, one end of which rod extends up through the slotted portion of rod E, and said rod E adapted to be oscillated by the alternate depression of the curved rocker-bar and its restoration to position by the spring, as set forth.

2. In a railway-alarm signal, a sonorous body secured to both sides of a post at or near its upper end, in combination with the vertical oscillating rod E, pivoted to said post, its upper end having a clapper and its lower end bent and slotted, the rod C, turning in bearings and its outer end entering the slot in rod E, spring *k*, wire *c*, and the rocker-bar, the whole connected and designed to be operated substantially as set forth.

294,208. SAW-MILL-FEED MECHANISM. SILAS DICKSON, Marcy, Ohio, assignor of one-third to Samuel Myers, same place. Filed Nov. 19, 1883. (No model.)

Claim.—1. In a saw-mill-feed apparatus, the combination, with the log-carriage, of a chain having a series of frictional rolls at the pivotal connection points of its links, and connected to end extensions of said carriage by slack-taking-up rolls, the driving sprocket-wheel, and additional sprocket-wheels arranged one in a plane on each side and slightly above the driving sprocket-wheel, substantially as and for the purpose set forth.

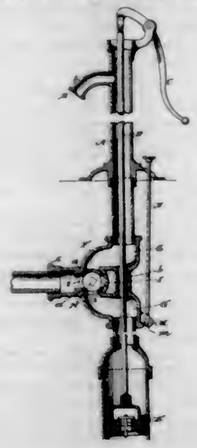
2. In a saw-mill-feed apparatus, the combination, with the log-carriage-operating chain and the chain-operating gearing, of the drive-wheel adapted to be shifted from one to the other of two wheels arranged upon a common shaft, gearing with the shaft of the driving sprocket-wheel of the log-carriage, substantially as and for the purpose set forth.



3. In a saw-mill-feed apparatus, the combination, with the log-carriage-operating chain and the chain-operating gearing, of the drive-wheel and additional wheels arranged upon a common shaft, gearing with the driving-sprocket-wheel shaft of the carriage, one of said latter wheels adapted to be shifted vertically, substantially as and for the purpose set forth.

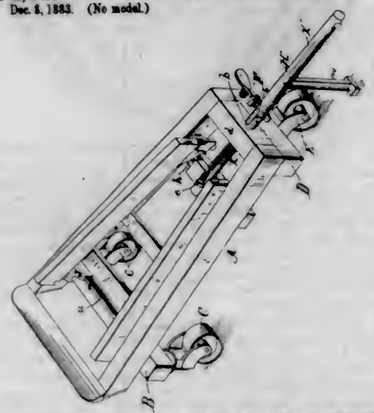
4. In a saw-mill-feed apparatus, the combination, with the log-carriage-operating chain and the chain-operating gearing, of the drive-wheel and additional wheels arranged upon a common shaft, gearing with the shaft of the driving sprocket-wheel of the log-carriage, one of said latter wheels adapted to be shifted vertically, and the drive-wheel arranged to be shifted from one to the other of the latter wheels, substantially as and for the purpose set forth.

5. In a saw-mill-feed apparatus, the combination, with the log-carriage-operating chain and the chain-operating gearing, of the drive-wheel adapted to be shifted from one to the other of two wheels arranged upon a common shaft, gearing with the shaft of the driving sprocket-wheel of the log-carriage, and the lever, with one end connected to an adjustable bearing of the drive-wheel shaft, and having its other end fulcrumed a suitable distance from said adjustable bearing, and provided with an operating arm or handle, substantially as and for the purpose set forth.



6. In a saw-mill-feed apparatus, the combination, with the log-carriage-operating chain and the chain-operating gearing, of the drive-wheel, additional wheels arranged upon a common shaft, gearing with the driving-sprocket-wheel shaft of the log-carriage, one of said latter wheels adapted to be vertically adjustable, and the hand-lever connected about centrally to the hub of said vertically-adjustable wheel, and suitably fulcrumed and retained in position, substantially as and for the purpose set forth.

294,209. REFRIGERATING APPARATUS FOR CARS, &c. WM. H. DOUGHTY, New York, N. Y. Filed Oct. 22, 1883. (No model.)



Claim.—In a refrigerating apparatus having a series of ice-receptacles and provision-chambers, and provided with means for forcing a current of air through said receptacles and chambers, the combination, with flues and passages arranged substantially as described, of valves connected together in pairs, whereby the opening of one passage closes another, and a circulation can be conveniently obtained in either or all of the compartments, as set forth.

294,210. PUMP. JOSEPH W. DOUGLAS, Middletown, Conn., assignor to himself and W. & B. Douglas, same place. Filed Apr. 6, 1883. (No model.)

Claim.—The combination, with a pump-tube, of a three-way valve or cock having a lateral branch pipe, and provided with two water-ways arranged in alignment and introduced into the pump-tube to form straight continuations thereof, and a plunger-rod passing directly through the pump-tube from its top portion, and also through both the aligned water-ways of the three-way valve or cock, substantially as described.

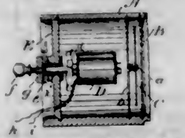
294,211. HAND-TRUCK. JAMES L. DOWNING, Richmond, Ill. Filed Dec. 8, 1883. (No model.)

Claim.—1. A truck-frame mounted on three wheels, substantially as described, the single wheel at one end of the frame being detachable, so that this end of the said truck-frame can be lowered and adjusted under the object to be raised.

2. In a hand-truck, the combination of a truck-frame mounted on three caster-wheels, one of which is readily detachable, and a handle with leverage means, substantially as and for the purposes set forth.

3. A hand-truck having at its rear end a detachable caster-wheel, a locking device, and handle with leverage means, substantially as and for the purpose set forth.

4. The combination, with a truck-frame mounted on wheels, one of which is detachable, of an adjustable handle or lever with a pivoted support to rest on the floor, substantially as and for the purpose set forth.



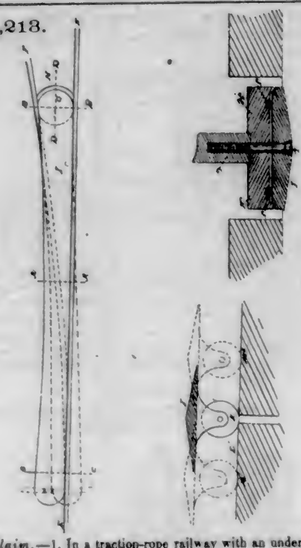
5. The combination, with a truck-frame mounted on wheels, one of which is detachable, of an auxiliary frame adjustably connected to the truck-frame, and a handle with leverage means, substantially as and for the purposes set forth.

6. In a hand-truck, an adjustable frame composed, essentially, of the connected side pieces and inclined lifts, as described.

7. In a hand-truck, the adjustable handle composed of the hinged sections *k k'* and pivoted support *n*, substantially as and for the purpose set forth.

8. The improved hand-truck consisting, essentially, of a bed-frame mounted on three castor-wheels, one of which is readily detachable, an auxiliary adjustable frame, and an adjustable handle with leverage means, substantially as described.

294,212. ELECTRIC ANNUNCIATOR. ISAIAH H. FARNHAM, Portland, Me., assignor to the American Bell Telephone Company, of Massachusetts. Filed Dec. 26, 1883. (No model.)



Claim.—An annunciator consisting of an electro-magnet capable of horizontal and rotary adjustment, and provided with a magnetic and polarized needle pivoted in front of or between the poles of the electro-magnet, substantially as described.

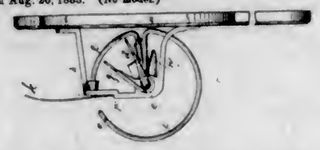
294,213. TRACTION-ROPE RAILWAY. CHARLES F. FINDLAY, Liverpool, England. Filed Nov. 18, 1882. (No model.)

Brief.—The wide slot where cable-tubes meet is covered by a swinging plate turning upon a pivot in a pillar-block, the pivot end of said plate resting upon a supporting-piece on the pillar-block. The forward end of the plate has a supporting-roller moving over a notched or depressed track, whereby the plate is retained in position.

294,213.

Claim.—1. In a traction-rope railway with an underground tube, the combination of the piece H, the pillar G, and the cover I, substantially as set forth.

2. In a traction-rope railway with an underground tube, the combination, with the piece H and the pillar G, of the slotted screw L and a cover for the aperture between E and F, substantially as set forth.



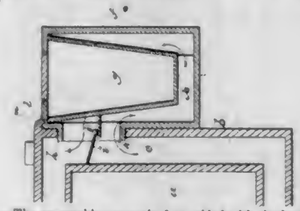
3. The combination, for use in a traction-rope railway, of an underground tube or tunnel for the traction-rope, the cover I, and piece H, secured to a pillar, G, and upheld at the other end by a roller, K, which runs on a track, L', as set forth.

4. For use in connection with a traction-rope railway, the track L', having depressions M' and M², in combination with roller K and cover I, held in place by screw L, as set forth.

5. The combination, with a tube for a traction-rope railway, of the piece H and pillar G, ring J, cover I, screw L, roller K, and track L', provided with depressions M' and M², substantially as and for the purposes set forth.

6. In combination with the cover I, turning on a pivot, the roller K, and track L', substantially as and for the purposes set forth.

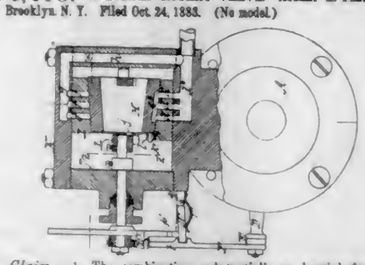
294,214. BILL AND LETTER FILE. SAMUEL H. FISH, Hinsdale, Ill. Filed Aug. 20, 1883. (No model.)



Claim.—1. The rings attached to the shaft, as described, in combination with the sleeve provided with the arm, the springs, and the cranks, whereby said rings may be opened by hand and closed automatically, substantially as and for the purpose specified.

2. The combination, in a bill and letter file, of the hooks or rings, each composed of two portions, one portion of each hook or ring being fixed to the shaft, and the other portion of each movable thereon a determinate distance, with the sleeve, provided with the arm extending across the frame within the rings or hooks, and means, substantially as described, for opening the hooks and piercing the paper, substantially as and for the purpose specified.

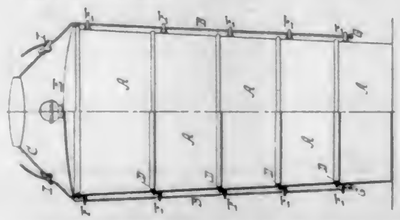
3. The frame provided with the gage, in combination with the hooks, and the shaft provided with the sleeve, mounted between the thumb-piece and the frame, and the arm extending across the frame parallel with the shaft, whereby the hooks may be opened and the bills placed thereon, substantially as and for the purpose specified.



4. The combination, with the hooks or rings, each consisting of two parts, the pointed portion of one of the parts of each ring being provided with an eyelet, *o*, of the shaft provided with the crank, and the sleeve provided with the arm and crank, substantially as specified.

294,215. PORTABLE RESERVOIR FOR STOVES. HARVEY L. FISHER and ANGELL J. HASSELL, Toledo, Iowa. Filed Jan. 19, 1883. (No model.)

Claim.—The removable reservoir *f*, provided with the basin *g* and flange *h*, extending laterally from the same, furnishing bearings for the damper *i*, which is journaled in the vertical portions thereof, the said damper adapted, when in operation, to engage the outer surface of the inner wall of the stove, the top plate of the reservoir having notches *l* to engage the flange *m* of the stove-top, the whole adapted to be applied to a cook-stove having a rectangular opening in its rear wall, substantially as specified.



294,216. BALANCED ROTARY VALVE. ROBERT H. FLETCHER, Brooklyn, N. Y. Filed Oct. 24, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the hollow plug-valve H, seated in the shell I, which is secured to the bottom of the steam-chest, the cover K, fitting the top of the shell I, the opening or openings *d* in the bottom of the shell and communicating with the exhaust-port *d*², and the opening or openings *f* in the top of said shell and communicating through channels *g h* with the exhaust-port *d*².

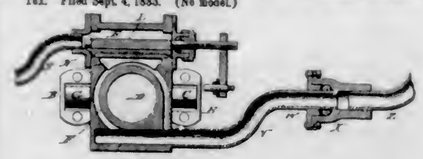
2. A rotary valve having ports and cavities for balancing it in relation to the live steam, and also ports and cavities for balancing it in relation to the exhaust-steam, substantially as set forth.

294,217. DINNER-PAIL. ALBERT A. FOOS, Brooklyn, N. Y. Filed Aug. 3, 1883. (No model.)

Claim.—1. A dinner-pail consisting of a series of superposed detachable pans tapering continuously from the top to the bottom member, to adapt them to be nested or placed one within the other, each pan having a bottom which forms a cover to the upper end of the pan beneath it, substantially as described.

2. The combination, substantially as hereinbefore set forth, of the series of superposed pans tapering continuously from the top to the bottom member of the series, and each having side loops diametrically opposite each other, and the supporting-straps having their lower ends provided with stops to abut against such loops.

3. The combination, substantially as hereinbefore set forth, of the series of superposed pans tapering continuously from the top to the bottom member of the series, and each having side loops diametrically opposite each other, the supporting-straps having their lower ends provided with stops to abut against such loops, and the handle-strap having the upper ends of the supporting-straps connected to it.



294,218. HORSE-COLLAR. MARION S. FORT, Greenfield, Iowa. Filed Dec. 26, 1883. (No model.)

Claim.—1. The combination of a protecting-plate for horse-collars, bent and curved to conform to the shape of the inner side of the lower portion of a collar, having thin flexible edges, a longitudinal corrugation, and countersunk perforations in the said corrugation, a protecting-plate bent and curved to conform to the shape of the outer side of the lower portion of a collar, having thin flexible edges, a longitudinal corrugation corresponding to the crease in the collar, and threaded perforations in the said corrugation, and threaded bolts resting with their heads in the countersunk perforations in the inner plate, and fitting and turning with their threaded ends in the perforations in the outer plate, as and for the purpose shown and set forth.

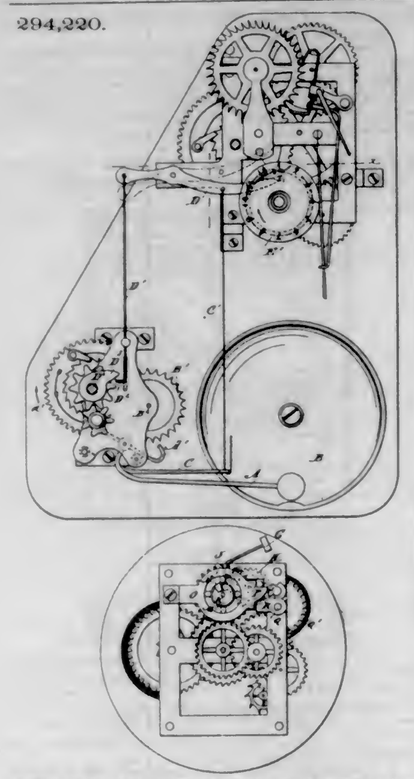
2. The combination of a horse-collar with an inner plate having thin and flexible edges, bent and curved to conform to the shape of the inner side of the lower portion of the collar, having a longitudinal corrugation and countersunk perforations in the said corrugation, an outer plate having thin and flexible edges, bent and curved to conform to the shape of the outer side of the lower portion of the collar, having a longitudinal corrugation, and headed screw-bolts resting with their heads in the countersunk perforations in the inner plate, passing through the creased portion of the collar, and fitting and turning in the threaded perforations in the outer plate, as and for the purpose shown and set forth.

294,219. OSCILLATING ENGINE. JOHN OAKLEY GILBERT, Houston, Tex. Filed Sept. 4, 1883. (No model.)

Claim.—1. An oscillating steam-engine having its trunnions solid, and having a curved live-steam pipe and exhaust-pipe opening at opposite sides of the cylinder at one end, and opening at their other ends into stuffing-boxes upon the ends of the feed and exhaust pipes rocking in the same, the said boxes being opposite to and concentric with the trunnions, as and for the purpose shown and set forth.

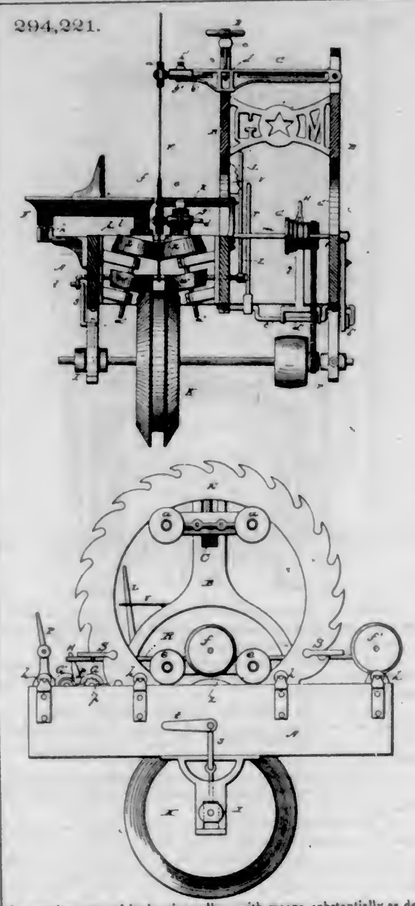
2. An oscillating engine having a curved live-steam pipe opening into the valve-chest upon the side of the cylinder, and having the other end of the said pipe turning in a stuffing-box opposite to and concentric with one of the trunnions of the cylinder and fastened upon the end of the feed-pipe, as and for the purpose shown and set forth.

3. An oscillating engine having a curved portion of its exhaust-pipe opening into the exhaust-channel upon the side of the cylinder, and having its other end fitting and rocking into a stuffing-box upon the end of the exhaust-pipe opposite to and concentric with a trunnion of the cylinder as and for the purpose shown and set forth.



294,220. ALARM-CLOCK. ISAAC ST. CLAIR GOLDMAN, Pasadena, Cal. Filed Nov. 23, 1883. (Model.)

Claim.—1. The combination, with an alarm-clock mechanism, of a latch-plate for covering the notch in the wheel for releasing the alarm-clock mechanism, substantially as herein shown and described.



2. The combination, with an alarm-clock mechanism, of a latch-plate for covering the notch in the wheel for releasing the alarm-clock mechanism, and of a cam on the arbor for winding the alarm-spring, which cam is adapted to adjust the alarm-releasing device in such a manner that it will rest upon the latch-plate, and thus cannot pass into the notch in the releasing disk or wheel, substantially as herein shown and described.

3. The combination, with an alarm-clock mechanism having a notched wheel, of a latch-plate for covering the said notch, a spring for pressing the said latch-plate over the notch, and of a cam adapted to act on the lever for releasing the alarm mechanism, for adjusting the said lever

294,220.

294,221.

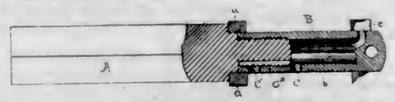
in such a position that it will rest on the latch-plate, substantially as herein shown and described.

4. The combination, with an alarm-clock mechanism having a notched wheel or disk, of a latch-plate covering the said notch, a spring for pressing the latch-plate over the said notch, a cam on the spring-winding shaft of the alarm mechanism, and of a lever or a spring-bridge adapted to be acted on by the said cam, substantially as herein shown and described.

5. The combination, with an alarm-clock mechanism having a notched disk or wheel, of a spring-latch adapted to cover a notch, a cog-wheel mounted to slide on the arbor carrying the notched disk, which cog-wheel is provided with a stud, and of a spring for pressing the stud against the notched disk, which spring extends inward, and is adapted to engage with an arm or projection on the hammer-vibrating shaft, substantially as herein shown and described.

6. The combination, with an alarm-clock mechanism, of the notched disk or wheel K, mounted on the end of the shaft I', the spring-band M, terminating in a beveled flange, N, and secured to the edge of the disk K, the cog-wheel J, adapted to slide on the shaft I', the stud L, projecting from the cog-wheel J', adapted to engage with the arm I of the hammer-vibrating shaft G', and of the spring-bridge O, substantially as herein shown and described.

7. The combination, with an alarm-clock mechanism, of the notched disk K, mounted on the end of the shaft I', the spring-band M, terminating in a beveled flange, N, and secured to the edge of the disk K, the cog-wheel J, adapted to slide on the shaft I', the stud L, projecting from the cog-wheel J, the spring J', adapted to engage with the arm I of the hammer-vibrating shaft G', the spring-bridge O, provided with a beveled tongue, P, and of the cam R, mounted on the spindle for winding the alarm-spring, substantially as herein shown and described.



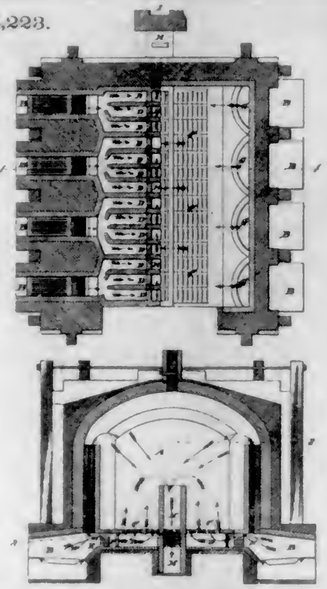
8. The combination, with an alarm-clock mechanism having a notched disk, of means for automatically covering the notch when the clock is wound immediately after the alarm has been sounded, substantially as herein shown and described.

294,221. CIRCULAR SAW MILL. JOHN B. GORRELL and JOHN MILLER, La Otte, Ind. Filed May 19, 1883. (No model.)

Claim.—1. In a circular sawing machine, the combination, with the annular saw and its bearing-rollers, with means, substantially as described, for adjusting the same, of the kerf-dividing disks and saw-actuating mechanism, as specified.

2. In a circular sawing machine, the combination, with the double-bevel friction-wheel K, of the bevel friction-pinions *w*, engaging the same, and the bevel friction-wheels *z*, engaging the sides of the annular blade, with mechanism for adjusting the same, substantially as specified.

294,222. CARRIAGE-AXLE. JOHN GOWLAND, Philipsburg, Pa. Filed June 30, 1883. (No model.)



Claim.—1. The collar D, provided with notches *f f'*, raised portion *f*², and notch *f*³, substantially as described and shown.

2. The combination, with the axle A, having groove *c*², of the hollow sleeve B, provided with the perforations *c*, *c'*, and *c*, and secured to said spindle, substantially as described and shown.

3. In the device as described, the combination, with the hollow perforated sleeve B, of the movable collar D, provided with notches *f f'*, raised portion *f*², and notch *f*³, substantially as and for the purpose set forth.

294,223. BRICK-KILN. WILLIS N. GRAVES, St. Louis, Mo., assignor of one-half to the Hydraulic Press Brick Company, same place. Filed Feb 12, 1883. (No model.)

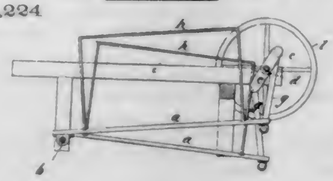
294,223.

Claim.—1. The process of burning bricks in a kiln-chamber, which consists in drawing the products of combustion from the top and bottom to the center of the chamber, as set forth.

2. A brick-kiln having means to draw the products of combustion simultaneously from the top and bottom to the central portion of the chamber, as set forth.

3. A brick-kiln in which the products of combustion attack the contents of the chamber from the top and bottom of chamber simultaneously, and pass out through the central portion of the contents, as set forth.

4. A brick-kiln having an exit-flue whose mouth is located at the central portion of the main chamber between the top and bottom and sides, as set forth.

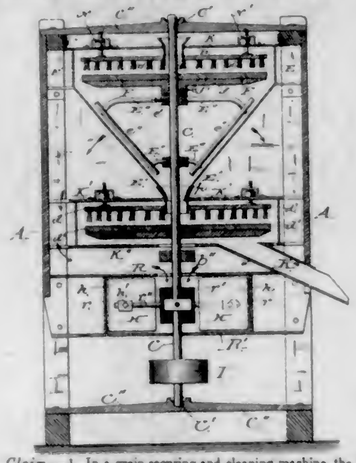


5. In a brick-kiln, the combination of a main chamber having vertical side flues extending to near the top thereof, and a perforated floor to admit the products of combustion, and a central flue having its mouth located between the top and bottom and sides of the chamber, as set forth.

6. In a brick-kiln, the combination of a main chamber having a perforated floor, fire-chambers on each side of the main chamber, vertical flues on each side of the main chamber, forming a communication between the fire-chambers and the top of the main chamber, horizontal flues beneath the perforated floor, communicating with the fire-chambers, and a central flue extending up into the body of the main chamber and in communication with the chimney, as set forth.

7. In a brick-kiln, the combination, with the main chamber having a perforated floor, of the fire-chambers located on each side, a central flue extending into the body of the chamber to form the exit for the products of combustion, vertical and horizontal flues carrying the products of combustion to the top and floor of the chamber, and walls built up in the horizontal flues to regulate the amount of draft therethrough, as set forth.

8. In a brick-kiln, the combination of main chamber A, vertical side flues, G, extending to near the top thereof, fire-chambers B on each side, perforated floor C to the main chamber, horizontal flues D beneath the floor, having openings E, formed by walls F, central flue, H, extending up into the body of the main chamber, and the chimney I, as set forth.

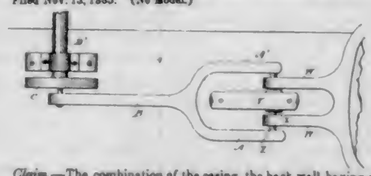


294,224

294,224. TREADLE-POWER. GEO. A. GREENE, Taylor, Tex. Filed July 11, 1883. (No model.)

Claim.—In a treadle-power, the combination, with the shaft *d*, carrying the cranks *c*, of the treadles *a*, connected at one end to the arms *g*, connected to oppositely-projecting cranks *e*, the opposite ends of said treadles *a* being pivoted upon a shaft, *b*, and the bail-shaped rails *h*, with both their lower ends fastened to the treadles, substantially as and for the purpose set forth.

294,225. GRAIN SCOURER AND CLEANER. RICHARD HENRY GRIFFITHS, Janesville, Wis. Filed Nov. 13, 1883. (No model.)

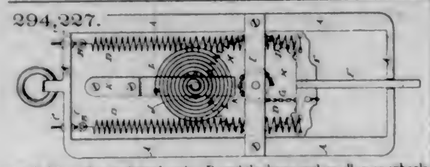


Claim.—1. In a grain scouring and cleaning machine, the framework and a cylindrical perforated casing forming at one portion thereof the funnel-shaped compartment, in combination with the vertical shaft, provided with suitable bearings, the revolving emery-disks F *d'* and their metal plates, the stationary disks D and *d*, provided with brushes, and the radial and diagonal arms forming beaters, the whole being operated substantially as set forth and described.

2. The plates K K', the stationary disks provided with brushes, the vertical and revolving shaft, the emery-disks, and arms or beaters, in combination with the perforated casing having air and discharge openings, substantially as shown and described.

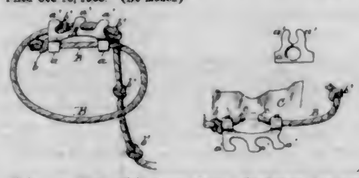
3. The stationary brushes and revolving emery-disks, and the radial and connecting diagonal arms, the whole being surrounded by a perforated casing, in combination with the fan having adjustable blades, and mechanism for operating the same, all substantially as shown and described.

294,226. STEAM-ENGINE. JOHN EMIL GUENTHER, Fort Wayne, Ind. Filed Nov. 13, 1883. (No model.)



Claim.—The combination of the casing, the back wall having steam and exhaust passages, the steam chest and valve, the shaft mounted transversely upon the back wall and carrying the piston, and the valve-gear with the cranks upon the ends of the piston-shaft, a bail connecting the said cranks and having a forwardly-extending arm or arms, the cross head or heads connected pivotally with the said arm or arms, and a pitman connecting the said cross head or heads with the crank upon the main shaft, substantially as set forth.

294,227. SPRING-BALANCE. HUGO HAENTER, New York, N. Y. Filed Jan. 4, 1884. (No model.)

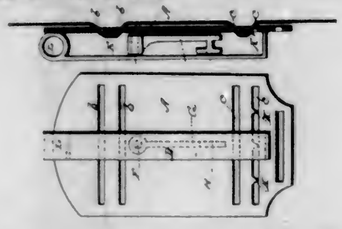


Claim.—1. A spring-balance constructed substantially as herein shown and described, with a large and a small gear-wheel meshing into each other, and connected with a cross-bar suspended from the graduated springs by a chain passing around the hub of the large gear-wheel, and provided with a coiled spring connected with the journals of the small gear-wheel, as set forth.

2. In a spring-balance, the combination, with the cross-bar E, suspended from the graduated spring D, and the large and small gear-wheels H J, of the chain G, and the coiled spring L, substantially as herein shown and described, whereby great accuracy in weighing is secured, as set forth.

294,227.

294,228. BAG-FASTENER. WILLIAM B. HANLON, Bridgeport, Ohio. Filed Oct. 10, 1883. (No model.)



Claim.—1. As an article of manufacture, the fastener A, comprising the T-headed and perforated lugs *a*, and the successive pairs of oppositely-arranged bent lugs *a'*, having hook-shaped sides, substantially as shown and described.

2. The combination of a fastener provided with a series of pairs of hooked lugs, *a'*, and perforated lugs *a*, and a bag, C, perforated, as at *c c*, with a cord, B, passing through the perforations *c c* of the bag, substantially as shown and described.

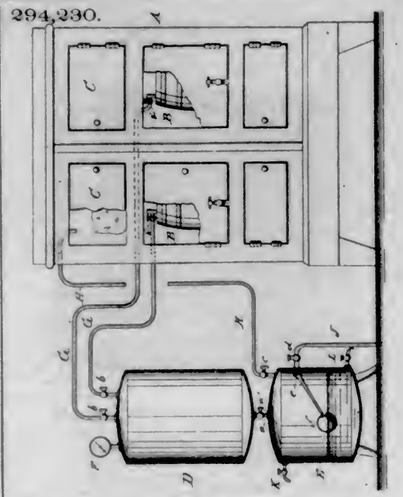
3. A fastener provided with a series of hook-shaped bent lugs, *a'*, and perforated lugs *a* at each end, in combination with a knotted rope, substantially as shown and described.

294,229. BACK-BAND HOOK. FRANK HAYNES, Monticello, Ark. Filed Dec. 15, 1883. (No model.)

Claim.—1. The horizontally-slotted back-band plate, having a vertical central stay connected thereto, the pivot-bearing connecting the plate and stay, and the pendent vibratory trace-hook pivoted on said bearing, substantially as specified.

2. The back-band plate having an outer stay and a pendent pivotal trace-carrier having its lower end turned outward in ⊣ form, substantially as specified.

3. The back-band plate having a pendent vibratory trace-hook between said plate and a stay, and at the upper end of the latter a ring or loop for the passage of a plow-line, substantially as specified.



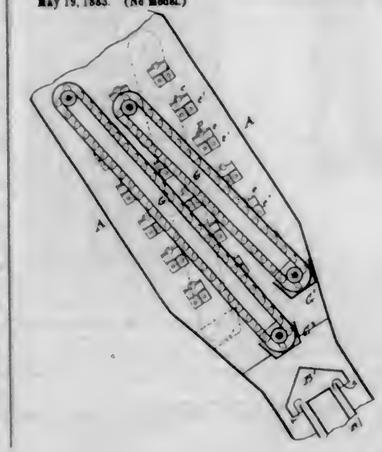
294,230. AIR-PRESSURE APPARATUS FOR BEER-KEGS, &c. CHRISTIAN HENTZ and GEORGE M. HENTZ, Buffalo, and ANDREW DOTTERWICH, Dunkirk, N. Y. Filed Feb. 14, 1883. (No model.)

Claim.—1. The superposed air-chamber D, having a pipe, G, leading to the beer-chamber, and provided with a cock, *b*, in combination with the water-chamber E, connected to the chamber D by a pipe, *a*, having a cock, *a'*, and supply-pipe J, having a cock, *d*, and leading to the head of water, substantially as and for the purpose set forth.

2. The combination, with the ice-box C and pipe H, of the water-tank E, water-pipe J, having valve *e* and cock *d*, and float *f*, substantially as shown and described.

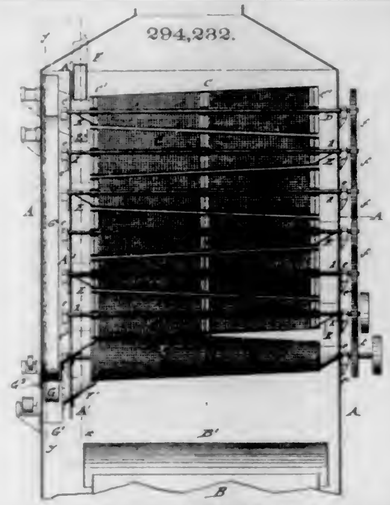
3. The combination, with the ice-box C and pipe H, having cock *c*, of the water-tank E and discharge water-cock I, and the supply-pipe J, having valve *e*, cock *d*, and float *f*, the supply-pipe J having a greater area than the discharge-cock, and first partially filling the water-tank until the rise of the float causes the supply and discharge pipes to be equal in area, substantially as shown and described.

294,230.



294,231. GLASS WATER-TRAY. AUGUSTUS H. HEISEY, Idlewood, Pa. Filed Dec. 29, 1883. (No model.)

Claim.—1. A glass pitcher provided with journal-bearings, in combination with supporting-standards having journals and provided with a suitable base, substantially as and for the purposes described.



2. A glass base or tray of sufficient width to hold a row of tumblers, provided with standards having journals, in combination with a pivoted or swinging pitcher mounted thereon, substantially as and for the purposes described.

3. A glass base or tray having standards for supporting a swinging pitcher, and provided with brackets on the standards, for receiving and supporting goblets and similar articles, substantially as and for the purposes described.

294,232. MALT-DRIER. HENRY HERRMANN, Brooklyn, N. Y. Filed May 19, 1883. (No model.)

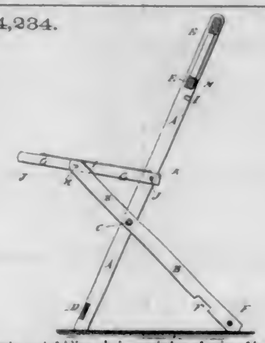
294,232.

Claim.—1. The combination, substantially as set forth, of a casing, two or more vertical series of conically-tapered horizontal rotary drums, the drums of each series and the adjacent drums of adjoining series being alternately reversed, so that the smaller ends alternate with the larger, both in vertical and lateral directions, means for conducting the malt from drum to drum of a series, and an elevator or elevators for conveying the malt from the lower drum of one series to the upper drum of another series.

2. The combination, substantially as described, of a casing, two or more vertical series of conically-tapered horizontal rotary drums, the drums of each series and the adjacent drums of adjoining series being alternately reversed, so that the smaller ends alternate with the larger, both in vertical and lateral directions, means for conducting the malt from drum to drum of a series, an elevator or elevators for conducting the malt from the lower drum of one series to the upper drum of another series, and means for supplying heated air to said casing.

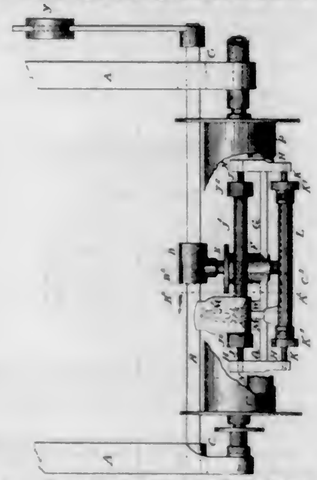
294,233. WINDOW-BLIND. ALEXANDER H. HILL, Oskaloosa, Iowa. Filed Aug. 7, 1883. (No model.)

Brief.—A window-blind consisting of grooved strips to guide the blinds, strips and blinds arranged inside of the window-sash and taking the place of the inside stop of the sash.



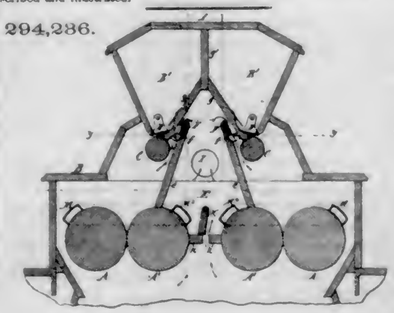
Claim.—1. The combination of a window-frame, the outer and parting stops, the sashes, the grooved strips secured to the inner sides of the frame, and forming the stops or beads for the inner sash, and a series of blinds mounted to slide in the said strips, one of said blinds being equipped with pivoted slats, as set forth.

2. The blind J, having side stiles provided with the beads *e*, and center strip, *f*, in combination with the slats pivoted in said beads and center strip, as set forth.



294,234. FOLDING CHAIR. JONATHAN HILL, New York, N. Y. Filed July 31, 1883. (No model.)

294,234.



Claim.—A folding chair consisting of pairs of legs crossed and pivoted or jointed together, the upper rear extension of the front legs being constructed to form the chair-back, and having transverse locking-recesses K L on their back edges, in combination with a rigid seat-board pivoted or jointed to the tops of the front legs at or near the middle of the seat-board, and having its rear edge wholly disconnected from the back, and provided with locking-pins adapted to fit into the recesses K L to secure the chair in its two positions, substantially as shown and described.

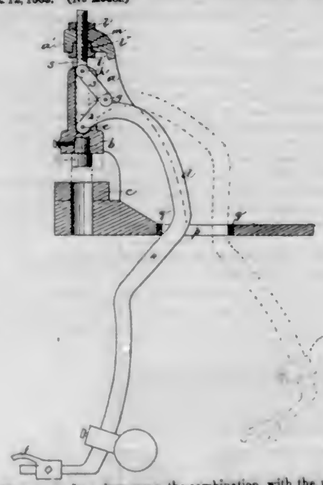
294,235. APPARATUS FOR PRESSING OR LEVELLING YARN ON WEAVERS' BEAMS IN WARP-SIZING MACHINES. ALFRED HITCHON, Barrowford, near Burnley, County of Lancaster, England. Filed Oct. 19, 1881. (Model.) Patented in England June 29, 1880, No. 2,661.

Claim.—The combination of the roller N with the long collar J', having enlargements J^2 J^3, worm R, wheel S, pin T, arm W, tongue M, cover L, and spindle K, having friction-disks K' K', substantially as described and illustrated.

294,236.

294,236. ROLLER-MILL. NOAH W. HOLT, Buffalo, N. Y. Filed Sept. 11, 1883. (No model.)

Claim.—1. The combination, with a revolving roller, of an air passage or conduit fitted with its open side lengthwise against the roller, and mechanism whereby an air-current is caused to flow through said conduit or passage along the portion of the roller-face which is covered by said conduit or passage, substantially as set forth.



2. The combination, with two revolving rollers, of air passages or conduits fitted with their open sides lengthwise against the rollers, a conduit whereby said passages are connected, and mechanism whereby an air-current is caused to flow successively along both rollers through both of said conduits or passages, substantially as set forth.

3. The combination, with rollers A A', of air-conduits arranged along the rollers, a chamber, E, into which the several air-conduits open, and an exit-spout, I, through which the air is discharged from the chamber E, substantially as set forth.

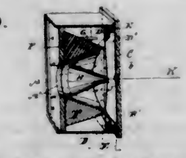
4. The combination, with the reducing-rollers A A', feed-rollers C, and inclosing-casing B, of an air-chamber, E, having openings *f* and *k'*, substantially as set forth.

5. The combination, with the reducing-rollers A A', feed-rollers C, and inclosing-casing B, of an air-chamber, E, having openings *f*, and air-conduits M', opening into the chamber E, substantially as set forth.

294,237. DROP-PRESS. JAMES A. HORTON, Reading, Mass. Filed Oct. 12, 1883. (No model.)

Claim.—1. In a drop-press, the combination, with the plunger and body, of the gravitating foot-lever pivoted at one end directly to said plunger, and a link connecting the lever to a fixed support on the body of the press, said link and the end of the foot-lever constituting the members of a toggle-joint, as set forth.

2. The combination, with the plunger, the foot-lever pivoted to the plunger, and the link 3, pivoted to said foot-lever, of an adjustable support to which said link is pivoted, and means for positively holding said support at any position to which it may be adjusted, whereby the plunger may be adjusted to the different heights, as set forth.



3. The combination, with the plunger, the foot-lever pivoted to the plunger, and link pivoted to the foot-lever, of the screw-threaded rod to which the link is pivoted, said rod passing loosely through an orifice in the frame of the press, and check-nuts engaged with said threaded rod and bearing, respectively, on the upper and lower sides of the portion of said body through which said rod passes, as set forth.

4. The combination of the body *a*, having the recess *m*, the threaded rod supporting the link, foot-lever, and plunger, the upper check-nut, *l*, bearing on the upper surface of the body, and the lower check-nut, *l'*, bearing against the lower surface of said body, and having an extension, *B*, projecting into the recess *m*, as set forth.

5. The combination of the plunger, the link pivoted to a fixed support, the foot-lever pivoted to said link and plunger, and formed as a member of a toggle-joint between the link and plunger, and having the portion 4, which is substantially parallel with said toggle-joint member, and stops or buffers *q q*, arranged to limit the movements of the portion 4, as set forth.

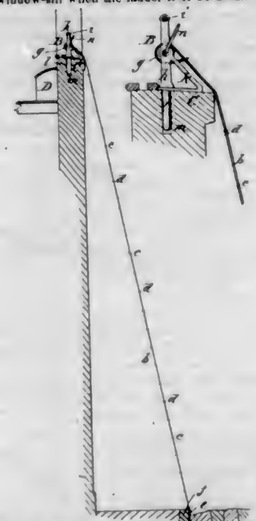
294,238. ACOUSTIC TELEPHONE. HARVEY E. HUSTON, Monticello, Ill. Filed Aug. 28, 1883. (No model.)

294,239.

Claim.—1. An acoustic telephone constructed with a ring having a wedge-shaped cross-section and resting on the diaphragm, the inner wall of said ring being flared toward its rear edge, and a funnel held within the ring, to concentrate the sound-waves in the middle of the diaphragm, substantially as herein shown and described.

2. In an acoustic telephone, the combination, with the box B and the diaphragm C, of the ring F, having a wedge-shaped cross-section and resting on the diaphragm, and of the funnel H, held within the ring F by wires, substantially as herein shown and described.

3. In an acoustic telephone, the combination, with the box B, of the board D, having an aperture, D', the diaphragm C, stretched over the aperture, and the ring F, having a wedge-shaped cross-section and resting on the diaphragm within the edges of the aperture D', the inner wall of said ring being flared toward its rear edge, substantially as herein shown and described.

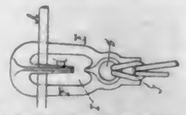


4. In an acoustic telephone, the combination, with the box B, of the front or top board, A, the board D, having an aperture, D', the diaphragm C, the ring F, the inner wall of said ring being flared toward its rear edge, and the bolts G, substantially as herein shown and described.

5. In an acoustic telephone, the combination, with the box B, of the apertured board D, the strengthening-ribs E, the diaphragm C, the ring F, having a wedge-shaped cross-section, and its inner wall flared toward its rear edge, the funnel H, the top or front board, A, and the bolts G, substantially as herein shown and described.

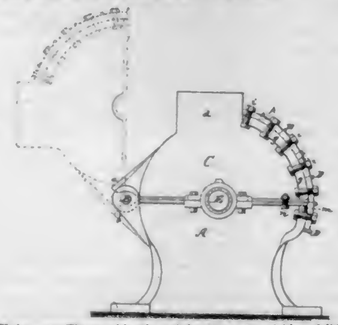
6. In an acoustic telephone, a diaphragm formed of alternate layers of animal-skin and textile fabric, substantially as and for the purpose set forth.

294,239. FIRE-ESCAPE. WILLIAM JENSEN, Victoria, British Columbia, Canada. Filed Sept. 14, 1883. (No model.)



Brief.—The flexible ladder is wound upon a portable windlass, the lower part of which is provided with legs which are entered into cavities in the window-sill when the ladder is to be used.

Claim.—In a combined windlass and flexible-ladder fire-escape, the combination of the portable windlass B, having lower pins or legs, *l*, for entry within cavities in the window-sill of a building, the wire-rope ladder A, having its outer longitudinal strands arranged to diverge from one another in an outward direction, and the fastening-pins *e* at the outer ends of the longitudinal strands of the ladder, substantially as shown and described.

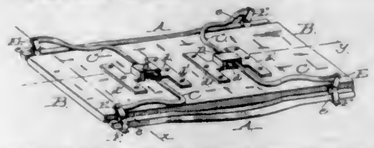


294,240. TRELLIS-HOOK. JOHN JUDD, Cherry Valley, N. Y. Filed Apr. 7, 1883. (No model.)

294,240.

Claim.—A trellis-hook consisting of the frame F, having at one end the jaw G and at the opposite end the recess J and eye S, said recess being in the lower edge of the frame for receiving the loop or knot of the cord tied in the eye, to prevent the loop or knot from turning, substantially as described.

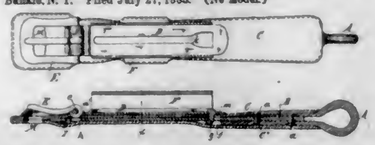
294,241. COTTON-SEED-HULLING MACHINE. DAVID KAHNWEILER, New York, N. Y. Filed Nov. 12, 1883. (No model.)



Claim.—1. The combination of the frame A and hinged lid C with the hollow cylinder F, having end openings, and the knives G, all arranged so that the knives G can be taken out endwise and reinserted when the lid C is swung back, substantially as specified.

2. The combination of the frame A and hinged lid C, carrying knives D, with cylinder F, carrying knives G, and a single adjusting-screw, *m*, for supporting the lid C and regulating the coarseness or fineness of the cut, substantially as specified.

3. The combination of the frame A, the hinged lid C, having knives D, and cylinder F, having knives G, with the supporting and adjusting screw *m* and holding-bolt *n*, substantially as specified.



4. The combination of the lid C, having slotted flanges *g*, and the ribs H, having slotted end portions, A, with the knives D and fastening-bolts *i* and *j*, substantially as herein shown and described.

294,242. VEHICLE-SPRING. SHIELDS D. LANCE, Columbus, Ohio. Filed Sept. 28, 1883. (No model.)

Claim.—In a side-bar vehicle, the bars A, provided with the clips F, eyes *a*, and shackles E, in combination with the springs C and plates D, all constructed to operate substantially as and for the purpose set forth.

294,243. HAME-TUG. ERNST G. LATTA, Friendship, N. Y., assignor of two-thirds to Adrian C. Latta, same place, and Harvey D. Blakeslee, Buffalo, N. Y. Filed July 27, 1883. (No model.)

Claim.—1. In a hame-tug, the combination, with the clip A, of a draft-bar, B, a trace-buckle, E, and a coupling-plate, D, provided with fastening devices I, whereby it is attached to the draft-bar, substantially as described.

2. In a hame-tug, the combination of a leather cover or sheath, closed at its edges except at the front end, and a draft-bar and clip seated in said cover, and adapted to be drawn out through the opening at its front end, whereby the clip can be removed without defacing the leather cover, substantially as set forth.

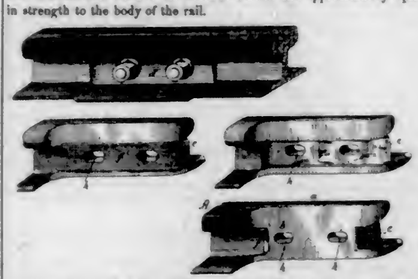
3. The combination, with the clip, of a draft-bar having openings *f* and *h*, and a coupling-plate having a hook, *g*, and head I, substantially as set forth.

4. The combination, with the clip and draft-bar, of a loop and a coupling-plate having spurs adapted to penetrate the loop, and means whereby the coupling-plate is attached to the draft-bar, substantially as set forth.

5. In a hame-tug, the combination, with a draft-bar, B, having an elongated opening, *h*, of a coupling-plate, D, having a head, I, constructed with lateral projections *i*, substantially as set forth.

6. In a hame-tug, the combination, with a draft-bar, B, having openings *f* and *h*, of a coupling-plate, D, having a hook, *g*, a head, I, and a socket, *j*, substantially as set forth.

294,244. FILTER. JAMES T. A. LEWIS and CHARLES A. WOLFF, Boston, Mass. Filed May 14, 1883. (No model.)



Claim.—1. The improved filter composed of the part *b*, having the annular seat *c*, adapted to support a filtering-disk, and provided with an annular groove, *f*, and the part *a*, having an annular end provided with an annular bead, *g*, adapted to project into said groove and co-operate with the latter in holding the edges of the filtering-disk, said parts *a* and *b* being connected by screw-threads formed thereon, as describe l, whereby said parts may be adjusted to cause the bead and groove to either bind or release the edges of the filtering-disk, as set forth.

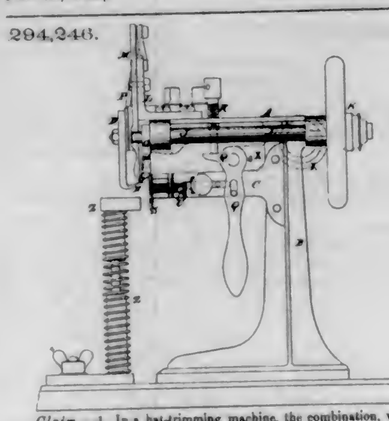
2. In a filter, the combination of the threaded part *b*, having the annular seat *c*, provided with the annular groove *f*, the part *a* threaded to engage with the threaded surface of the part *b*, and having an annular end provided with the annular bead *g*, adapted to project into said groove, and the filtering-disk having its edges interposed between said bead and groove, and co-operating with said bead and groove in forming a water-tight joint between the parts *a* and *b*, as set forth.

3. The improved filter composed of the parts *a b*, separably connected, as described, and adapted to clamp a filter-disk between their proximate surfaces, the part *b* having a flange, *b'*, and a strainer, *i*, supported by said flange, as set forth.

294,245. RAILROAD-RAIL. FRANCIS LIGHTFOOT, Media, Pa. Filed Oct. 19, 1883. (No model.)

Brief.—A railway-joint made by swaging or pressing the ends of the rails aside and lapping them by each other in such a manner as to form a continuous tread of the width of the rail and approximately equal in strength to the body of the rail.

Claim.—1. Railway-rails having their ends swaged or pressed aside, and at the same time thickened in the web and elongated, the swaged, thickened, and elongated ends of the adjoining rails being adapted to lap by each other, and thereby form a continuous tread equal in width to that of the rail, and equal or approximately equal in strength to the body of the rail, substantially as set forth.



2. A railway-joint consisting of two laterally-swaged rail ends lapping onto each other in or approximately in the vertical central plane of the rails, each thickened in its web, but having in cross-section a less area of metal than the original rail, substantially as set forth.

3. A railway-rail swaged or pressed aside, and having a longitudinally-projecting tongue, *c*, a recess, *e*, formed by said tongue and the head and flange of the rail, and having a projection, *f*, forming a continuation of the web on the recessed side of the rail, in combination with an adjoining rail having a similarly-formed end, substantially as set forth.

294,246. APPARATUS FOR PARING THE BRIMS OF SILK AND FELT HATS, &c. LEWIS FAIRBURN MARSH, Bristol, County of Gloucester, and JAMES CREE, Denton, County of Lancaster, England. Filed Aug. 30, 1883. (No model.) Patented in England Apr. 13, 1883, No. 1,963.

Brief.—Improvement on the invention of Letters Patent No. 206,298, granted to John R. Kelsey, dated January 27, 1882.

294,246.

Claim.—1. In a hat-trimming machine, the combination, with a feeding-tool and a reciprocating knife, of an adjustable face-plate against which the hat rests during the operation of trimming, substantially as described.

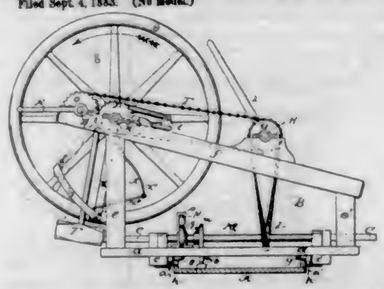
2. The combination, with a hooked gage-plate upon which the edge of the hat-brim rests, of a feeding-tool, a guillotine-knife, and an adjustable face-plate, substantially as described.

3. The combination, with the adjustable face-plate, of the end pieces jointed thereto, and means, substantially as described, for adjusting the same to suit hats of different sizes, substantially as described.

4. The combination, with the adjustable face-plate, of the weighted lever having a finger upon its end and a set-screw bearing thereon, and serving to adjust the position of the lever, substantially as described.

5. The combination, with the gage-plate having a hooked end, of the feeding-tool actuated by a cam upon the shaft of the machine, and a spring drawing said tool downward and to one side, substantially as described.

6. The combination, with a reciprocating knife, of a feeding-tool and means, substantially as described, for actuating the same.



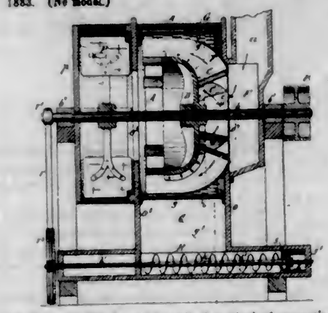
7. The combination, with a reciprocating or guillotine knife, of a gage-plate which supports the hat-brim during the operation of trimming, and means for actuating said knife, substantially as described.

8. The combination, with the feeding-tool M, having a slot, *m*, of the spring P and shaft J, having a cam, N, substantially as described.

9. The combination, with the face-plate S, of the pivoted end pieces, S', steel springs Y Y, and means for adjusting said end pieces relatively to the face-plate, substantially as described.

10. The combination, with the gage-plate D, having hooked end E, of the knife F, carried by the plate G, pivoted to stud H, and having a loop, *g*, the cam I, and shaft J, substantially as described.

294,247. MINING-MACHINE. JAMES H. MCDONALD, Worden, Ill. Filed Sept. 4, 1883. (No model.)



Claim.—1. In combination with the shaft R, having the arm *s* fixed thereto, and the hammer pivotally secured in said arm, the harness for the hammer, consisting of the arm *x*, secured to the shaft R, and the loop *x'*, provided with elastic cushions x^2, substantially as and for the purpose set forth.

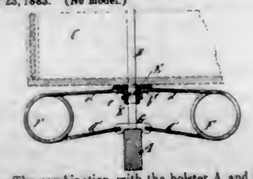
2. In combination with the shaft R, having the arm *s* fixed thereto the hammer pivotally secured in said arm, and the harness for the hammer, consisting of the arm *x*, secured to the shaft R, and the loop *x'*, provided with elastic cushions x^2, and the spring-arm x^4, provided with the stirrup x^3, substantially as and for the purpose set forth.

3. In combination, the gear-wheel E, fixed to the power-shaft, the wheel G, suitably connected to the wheel E, and having fixed to its shaft the lever I and sprocket-wheel K, the latter suitably connected with the wheel L on a shaft, M, having the cam r, the lever N, provided with lug P, and the drill-bar C, having the twisted gear J, adapted to engage with the lugs P on the lever N, and the lug *i*, adapted to engage with the lever I, substantially as and for the purpose set forth.

294,248. METHOD OF AND APPARATUS FOR SEPARATING DUST FROM AIR. JOHN M. MCINTYRE, Lockport, N. Y. Filed July 5, 1883. (No model.)

Claim.—1. The herein-described method of separating dust from air, which consists in driving the dust particles out of the air-current by centrifugal force into a closed receiving-chamber, while the air which has been freed from dust is permitted to escape in a different direction, substantially as set forth.

2. In a machine for separating dust from air, the combination of revolving beaters, and a closed receiving-chamber having an inner perforated wall surrounding said beaters, and inlet and outlet openings through which the dust-laden air is conducted to the beaters, and the purified air is permitted to escape therefrom, substantially as set forth.



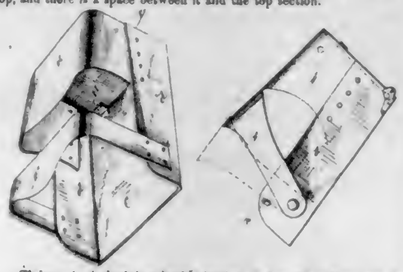
3. In a machine for separating dust from air, the combination of revolving beaters, and a closed receiving-chamber having an inner perforated wall surrounding said beaters, and inlet and outlet openings through which the dust-laden air is conducted to the beaters, and the purified air is permitted to escape therefrom, and a trapped discharge device, whereby the dust is removed from the closed chamber without permitting the air to escape therefrom, substantially as set forth.

4. In a machine for separating dust from air, the combination of revolving beaters, and a closed receiving-chamber having an inner perforated wall surrounding said beaters, and inlet and outlet openings through which the dust-laden air is conducted to the beaters, and the purified air is permitted to escape therefrom, and an auxiliary fan, whereby the air is caused to flow through the separator, substantially as set forth.

5. In a machine for separating dust from air, the combination of revolving beaters with a closed receiving-chamber having its inner wall constructed with openings having inwardly-projecting rear edges, substantially as set forth.

6. The combination, with the chamber G, having an inner perforated wall, *g*, of revolving beaters C, a head, D, to which the beaters are secured, and a hood, F, by which the spaces between the receiving portions of the beaters are closed, substantially as set forth.

294,249. BOLSTER-SPRING FOR WAGONS. BERNARD G. MEINKEN, Newtown, assignor to himself, and Charles Cook, New York, N. Y. Filed May 23, 1883. (No model.)

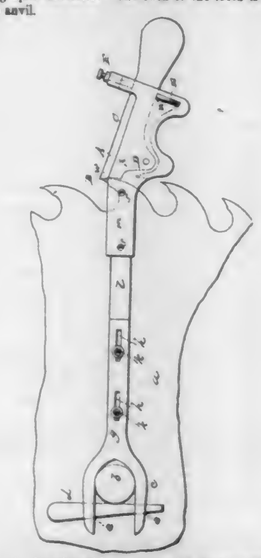


Claim.—The combination, with the bolster A and its stakes B, of the bearers composed of the pieces or bars E, extending at their ends on opposite sides of the stakes, and the adjustable spacing pieces or blocks *a*, and the coiled springs having their ends connected with the bolster and bearer, substantially as herein described.

294,250. DREDGING-BUCKET. JOSEPH MENGE, New Orleans, La. Filed Oct. 18, 1883. (No model.)

Brief.—The dredger-bucket, constructed of upper and lower sec-

tions and a bottom, has a pivoted cutter-bar conforming in outline to the periphery of the bucket. Such cutter is limited in forward play by a stop, and there is a space between it and the top section.



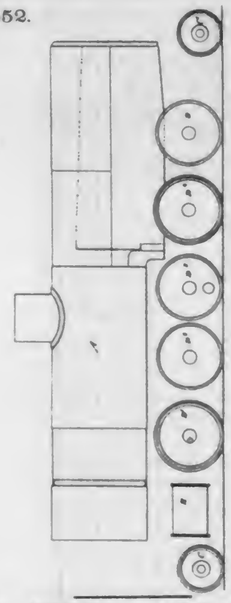
Claim.—1. A dredging-bucket having at the upper front end, in advance of the top section, an attached cutter having a similar peripheral outline and an intermediate space between the top section and cutter-bar substantially as described.

2. A dredging-bucket having the cutter pivotally connected to the sides of the bucket and arranged in advance of the top section of the bucket, and stop means, substantially as and for the purpose set forth.

3. The improved dredging-bucket consisting of the lower section, upper section, bottom, and cutter having peripheral outlines to correspond with the upper section, with the intermediate space, substantially as described.

294,251. SAW-SWAGE. JOHN MILLER, La Otto, Ind. Filed May 26, 1883. (No model.)

Brief.—The metal at the point of a saw-tooth is spread by striking with the tool G, or striking the point *x* of the tool with a hammer, the edge 2 resting upon the tooth. The back of the tooth is supported by an adjustable anvil.



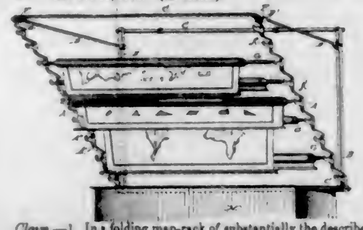
Claim.—1. An adjustable saw-swaging device consisting of the forked shank end *c* and tapering key, the adjustable shank *l*, and cleft head *m*, the lateral adjustable slip-bearing *t*, and the adjustable swage-anvil A, pivoted in the cleft head, the said device being adapted for operation in connection with the instrument G, substantially as specified.

2. The combination with an extensible shank, of a reversible cleft head, carrying attached to one of its arms an adjustable lateral bearing, and having pivoted between its walls an anvil-piece, adjustable between a rear tapering key and a front key or set-screw, substantially as specified.

294,252. LOCOMOTIVE. ALEXANDER MITCHELL, Wilkes-Barre, Pa. Filed July 31, 1883. (No model.)

Claim.—A locomotive-engine having three, four, five, or more pairs of driving-wheels, and a truck at each end of the boiler, the rear driving-wheels having plain or flangeless tires, substantially as set forth.

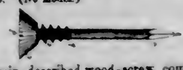
294,252.



294,253. BOOT OR SHOE. CHARLES W. MONSON, Lagro, Ind. Filed Oct. 11, 1883. (No model.)

Claim.—1. The combination, with a boot or shoe sole and upper, of a cord inserted beneath the loops of the sole-edge stitches and upon the leather, substantially as and for the purpose set forth.

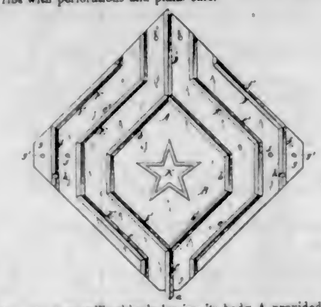
2. The method herein described of securing the sole and upper of a boot or shoe, consisting of passing a cord of suitable size back and forth between the loops of the sole-edge stitches and the surface of the leather, whereby the bearing-surface of the stitches is increased and cutting of the leather prevented, substantially as shown and described.



294,254. FOLDING MAP-RACK. FRANK P. MONTGOMERY, San Jose, Cal. Filed Oct. 13, 1883. (No model.)

Claim.—1. In a folding map-rack of substantially the described construction, the combination of the front end pieces, A A, bent to form steps A′, and provided with eyes A″, adapted to receive the ends of the spring-rollers, upon which the maps or charts are mounted, and having rings F secured upon them at their upper extremities, rear end pieces, B B, connecting horizontal rods C C C, and hinged rods D D, having hooks D′, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

2. The combination of the folding map-rack herein shown and described, consisting of the front end pieces, A A, bent to form steps A′, and provided with eyes A″ and rings F, rear end pieces, B B, connecting horizontal rods C C C, and hinged rods D D, having hooks D′, with the box H firmly secured to the lower horizontal rod, C, of the rack-frame, as set forth.

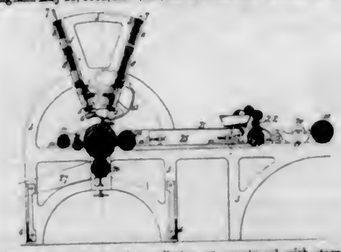


294,255. WOOD-SCREW. SAMUEL MONTGOMERY, New York, N. Y. Filed Oct. 24, 1883. (No model.)

Claim.—The herein-described wood-screw, composed of the head, a threaded portion adjacent thereto, and a cylindrical or plain portion, pointed as explained, substantially as shown and described.

294,256. METALLIC SHINGLE. LEVI H. MONTROSS and JOHN C. WENT, Simcoe, Ontario, Canada, assignors of one-third to James Peachey, same place. Filed Nov. 23, 1883. (No model.)

Brief.—Consists of a square plate having a central plane portion inclosed by a rib, and ribs extending upward and downward from the upper and lower corners of the central rib to the upper and lower corners of the main plate. A lip depends from the lower corner of the main plate. Ribs are arranged on the outside of the central rib, and beyond these are ribs with perforations and plane ears.

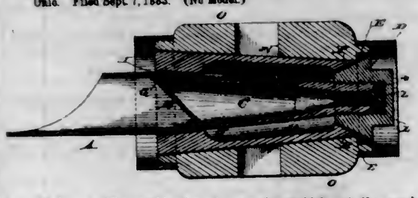


Claim.—1. A metallic shingle having its body A provided with a central plane portion, B, inclosed by a rib, *b*, and ribs C and D, extending downwardly and upwardly from the lower and upper corners of the rib *b* to the lower and upper corners of the body A, substantially as set forth.

2. A metallic shingle having its body A provided with a central plane portion, B, inclosed by a rib, *b*, ribs C and D, extending downwardly and upwardly from the lower and upper corners of the rib *b* to the lower and upper corners of the body A, and upright ribs E E and F F, arranged on opposite sides of the central rib, *b*, substantially as set forth.

3. A metallic shingle having its body provided with a central plane portion, B, inclosed by a rib, *b*, a rib, D, extending upwardly from the upper corner of the rib *b*, a rib C, extending downwardly from the lower corner of the rib *b*, and provided with a lip, *a*, and outer ribs, F, having openings *h*, substantially as set forth.

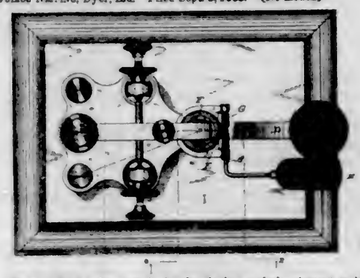
4. A metallic shingle having its body provided with a central plane portion, B, inclosed by a rib, *b*, a rib, D, extending upwardly from the upper corner of the rib *b*, a rib, C, extending downwardly from the lower corner of the rib *b*, and provided with a lip, *a*, outer ribs, F, having openings *h*, and plane ears *g*, arranged outside of the ribs F, substantially as set forth.



294,257. MACHINE FOR EMBOSSING AND BACKING WALL-DECORATING MATERIALS. WM. SCOTT MORTON, Edinburgh, County of Mid-Lothian, Scotland. Filed June 18, 1883. (No model.) Patented in England May 23, 1882, No. 2,420, and in France Nov. 23, 1882, No. 152,258.

Claim.—1. An embossing-cylinder, 11, combined with stampers 6, which are lifted by rotating cams 9, and are made by springs 8 to press the material into the intaglio parts of the cylinder, substantially as set forth.

2. In combination with the embossing-cylinder 11 and the stampers 6 and their actuating mechanism, apparatus, substantially as described, for moistening, pasting, warming, and applying backing-paper, substantially as set forth.



294,258. SPINDLE FOR VEHICLES. CHARLES E. MURRAY, Brandt, Ohio. Filed Sept. 7, 1883. (No model.)

Claim.—1. The combination of a tapering vehicle spindle or axle having a screw-threaded end, a wheel-hub having an inverted conical outer end in its perforation, a screw-cap fitting upon the end of the spindle and having an inner conical end, and a number of washers bearing against the end of the spindle and the inside of the screw-cap, as and for the purpose shown and set forth.

2. The combination of a hollow spindle forming an oil-receptacle, and adapted to be attached to the end of an axle-tree having a longitudinal groove upon its upper side opening into the interior of the spindle through two perforations, one at each end of the groove, having a perforation at its lower side opening into the interior, and provided with a screw-threaded open neck at its outer end closed by a removable plug, a vehicle-hub having the outer end of its bore beveled inwardly, and forming an annular recess near the said end, a screw-cap having a conical inner end, and a number of washers fitting inside said cap, as and for the purpose shown and set forth.

294,259. CIRCUIT-CLOSER FOR TELEGRAPHIC INSTRUMENTS. JULIUS NEPPING, Dyer, Ind. Filed Sept. 8, 1883. (No model.)

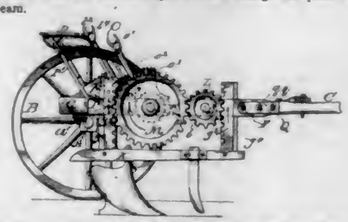
Claim.—1. An improved circuit-closing switch adapted to be applied to an ordinary operator's instrument, so that the circuit is opened by the hand of the operator in the act of manipulating the key and automatically closed when his hand is removed, said switch consisting of the combination of the securing-plate *a*, the spring-arm A, pivoted thereon, and the contact-stud E, carried by the spring-arm, substantially as set forth.

2. The herein-described circuit-closing switch adapted to be applied to an operator's instrument, consisting of the combination of the bifurcated securing-plate *a*, the spring-arm A, pivoted thereon, and the contact-stud *c*, carried by the spring-arm, substantially as set forth.

3. The combination of the securing-plate, the spring-arm pivoted thereon, the adjustable thumb-piece mounted on the outer end of the spring-arm, and the contact-stud carried on the inner end of the arm, substantially as and for the purpose specified.

294,260. TRUNK. JOHN O. NILES, Saratoga Springs, N. Y. Filed Oct. 2, 1883. (No model.)

Claim.—1. The combination, in a trunk, of the re-enforcing heads setting within the ends of the trunk, and recessed, as described, the end sections of the trunk, and the sides thereof, the heads having central aper-



tures, through which extend the handles secured to the end sections, substantially as and for the purposes specified.

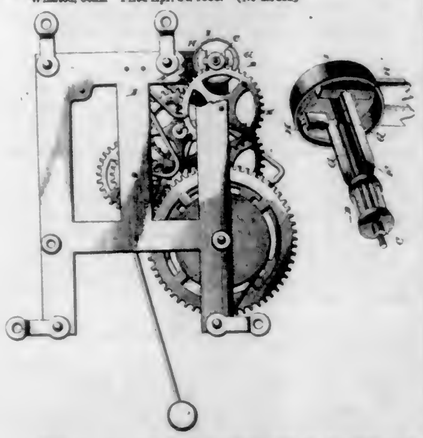
2. In combination with the sides and ends of a trunk constructed and arranged as described, the strengthening-battens at the sides and bottom, and the rabbeted batten at the top, substantially as and for the purposes set forth.

3. The combination, with a trunk, of a series of drawers provided with removable backs, whereby the contents may be readily handled in unpacking and the dust removed, substantially as specified.

294,261. WHEEL-PLOW. E. FRANK O'HAVER, Murphysborough, Ill. Filed Dec. 18, 1883. (No model.)

Brief.—The rear vertical rack-bar slides in a guide-block placed upon an arm that has vertical adjustment to change the pitch of the plow-beam.

Claim.—1. In a wheel-plow, a plow-supporting beam having at each end front and rear guide-blocks and rack-bars, the combination of a master-gear and pinion arranged parallel with the beam and meshing with each other and with said rack-bars, and a lever adapted to operate the master-gear, substantially as specified.



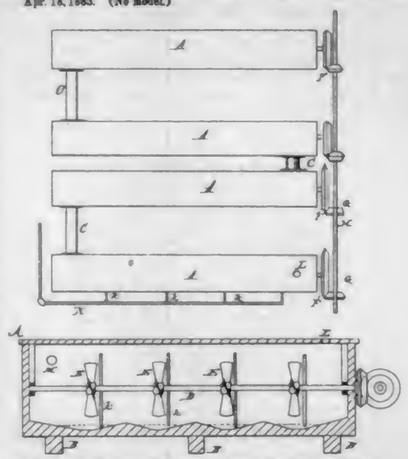
2. The combination of a plow-supporting beam having a front guide-block and rack-bar with a rear guide-block and rack-bar pivotally supported thereon, a master-gear and pinion meshing with each other and with said rack-bars, and means for operating at will either the master-gear or the pivotally-supported block and rack, substantially as specified.

3. The combination of the beam G, gear M, pinion L, arm P, rack-bars g^2 g^3, and levers O P', substantially as shown and described.

4. The combination of beam G, segmental ratchet *p*, arm P, lever P', rack-bar g^3, plow-beam K, and rack-bar g^2, substantially as shown and described.

5. The combination of the beam G, segmental racks *p* o^3, levers P' O, the latter having pawls o^3 *o*, ratchet N, gear M, pinion L, rack-bars g^2 g^3, and plow K, substantially as shown and described.

294,262. STRIKING MECHANISM FOR CLOCKS. GEO. B. OWEN, Winsted, Conn. Filed Apr. 24, 1883. (No model.)

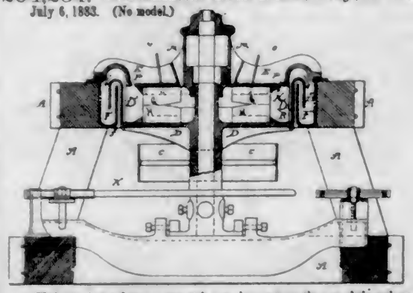


Claim.—1. In a clock, the combination, with the fan-arbor of the strike-train, of a speed-regulator attached to the fan-arbor and actuated thereby, said regulator consisting, essentially, of springs and weights constructed and arranged to regulate the rate of speed of the striking-train substantially as set forth.

2. In a clock, the combination, with the fan-arbor of the striking-train, of a speed-regulator attached to the fan-arbor and actuated thereby and constructed and arranged to regulate the rate of speed of the striking-train by varying frictional resistance, substantially as set forth.

3. In a clock, the combination, with the fan-arbor of the striking-train, of a speed-regulator attached to the fan-arbor and actuated thereby, said speed-regulator constructed and arranged to be adjusted and insure any predetermined uniform rate of speed to the striking-train, substantially as set forth.

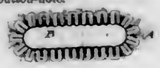
4. In a clock, the combination, with the fan-arbor of the strike-train, of a speed-regulator consisting, essentially, of spring-arms attached to the fan-arbor, weights attached to the outer ends of said arms, and a stationary frictional surface with which said weights engage, substantially as set forth.



294,263. AMALGAMATOR. AUSTIN B. PAIGE, Chicago, Ill. Filed Apr. 18, 1883. (No model.)

Claim.—1. The combination of a series of chests, A, having a series of depressions therein, shafts D, provided with radial arms E, working in said depressions, and means whereby shafts D and radial arms E are revolved at different rates of speed, substantially as set forth, for the purposes specified.

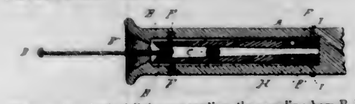
2. The combination of a series of chests, A, connected by pipes C, said chests having a series of depressions for mercury along the bottom thereof, a series of shafts D, having radial arms E, working in said depressions, means for revolving said shafts at different rates of speed, and a series of pipes, *k*, for discharging steam upon the mercury and pulp in the bottom of said depressions, substantially as and for the purposes set forth.



294,264. AMALGAMATOR. AUSTIN B. PAIGE, Chicago, Ill. Filed July 6, 1883. (No model.)

Claim.—As an improvement in amalgamators, the revolving chamber N, surrounding the grinding-plates G and H, and provided with recesses R, in combination with the water-inlets P and overhanging lip D'', substantially as and for the purposes set forth.

294,265. EYELET. CHARLES K. PECKHAM, St. Louis, Mo. Filed May 31, 1883. (No model.)



Brief.—The eyelet is formed from a thin narrow strip of metal, or from fine wire bent back and forth to form a series of open-end loops, its two ends brought together and secured, when the eyelet is ready to be inserted within a button-hole.

Claim.—1. An expansible and contractible metallic eyelet for button-holes.

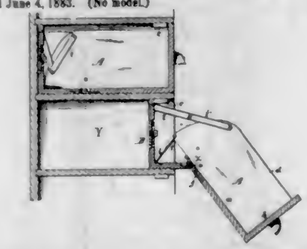
2. An expansible and contractible eyelet for button-holes, consisting of a thin strip or piece of metal bent and formed substantially as shown and described.

294,266. CAR-COUPLING. HIRAM PEDOCK, Burlington Junction, Mo. Filed Nov. 28, 1883. (No model.)

Claim.—In a barbed-link car-coupling, the coupling-bars B, hinged in the manner shown, the socketed tension-springs F, and the shaft J', provided with lever K, for operating the cam C from the ground, in combination with the draw-bar, having inward projections covering the ends of the coupling-bars, and the ordinary link-pin hole, all constructed and arranged to operate substantially as specified, for the purpose set forth.

294,267. WEATHER-STRIP. DEVOLCO C. POTTER and JOHN STONE, Pittsburg, Pa. Filed Jan. 19, 1884. (No model.)

Brief.—An elastic weather-strip formed in one piece and consisting of a main body, an oblique apron, and a longitudinal bead on the rear face of the main body. Strengthening-ribs are secured at intervals to the oblique apron and main piece.



Claim.—1. A weather-strip for doors, consisting, essentially, of a main body and an oblique apron, constructed in such manner as that when the door is closed the lower edge of said main body will lie between the lower outer edge of the door and the elevation upon the sill, and the lower edge of the apron will press upon the upper surface of the sill, substantially as and for the purposes described.

2. A weather-strip for doors, consisting of the main body A and the apron A', constructed in a single piece, as and for the purposes described.

3. A weather-strip for doors, consisting of a main body, A, provided upon one side with a longitudinal bead, *a*, and upon the opposite side with an oblique depending apron, A', substantially as and for the purposes described.

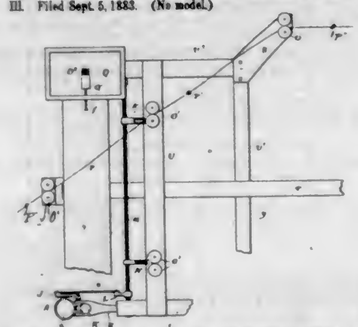
4. The within-described weather-strip, consisting of a main body, A, provided with bead *a*, and apron A', secured to said main body, and provided with strengthening-ribs a^2, connecting it with the body, substantially as and for the purposes set forth.

294,268. PAPER-FILE BOX. FRED. W. PRATT, Washington, D. C. Filed June 4, 1883. (No model.)

Claim.—1. A file-box consisting of a receptacle having closed sides, bottom, and ends, and divided transversely into two sections hinged together, adapted to slide into the compartment of a file-case, and a stop limiting the sliding motion of the rear section substantially as set forth.

2. A file-box consisting of an outer section, constituting the receptacle for the papers, an inner section hinged to the outer section at the bottom thereof, and adapted to support the same when withdrawn from the case, and means for limiting the downward movement of the outer section when so withdrawn, and the sliding movement of the inner section, substantially as set forth.

3. A file-box composed of two sections, A B, hinged together at the bottom, and provided with means, substantially as described, for limiting the movement of the outer in respect to the inner section, substantially as described.



4. The inner section of a file-box, hinged to the outer section, consisting of two pieces, the upper of which is connected adjustably to the lower, for the purpose specified.

5. The combination, in a file-box, of a rear section, B, a leaf, *f*, hinged directly to the bottom thereof, and a receptacle connected to the leaf, substantially as set forth.

6. The combination, in a file-box, of the sections A B, hinged together, and jointed arms *i i'*, for limiting the movement of the outer section; substantially as set forth.

7. The combination, with a file-case provided with stops, as *c*, of sliding file-boxes, each consisting of two sections hinged together, and provided with devices, substantially as described, for limiting the movement of the sections, the end of the inner section being made adjustable, substantially as described.

294,269. CHECK-ROW CORN-PLANTER. EDMUND W. QUINCY, Peoria, Ill. Filed Sept. 5, 1883. (No model.)

Claim.—1. The combination, with the machine-frame, of the line-guiding sheaves arranged diagonally upon said frame in line one with the other, whereby the check-line may be conducted in a direct line diagonally across the machine.

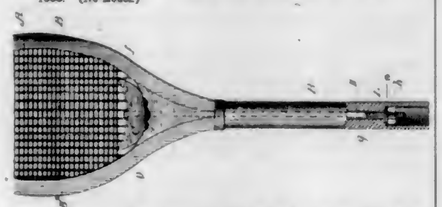
2. The combination, with the machine-frame, of the line-guiding sheaves O O^2 and intermediate guiding-sheaves, O', arranged diagonally upon said frame, and the rock-shaft, carrying the rock-arms, arranged relatively to the sheaves O', to be engaged positively by the diagonally-passing check-line.

3. The combination, with the machine-frame, the line-guiding sheaves, and the rock-shaft carrying the rock-arms, of the pivoted cup secured upon a counter-shaft, the seed-cup, and the seed hopper and spout, substantially as and for the purposes set forth.

4. The combination, with the frame, the projections or brackets S, carrying sheaves O, the sheaves O', mounted upon said frame, and the bracket carrying the sheaves O^2, of the rock-shaft M, the rock-arms L N, the spring *s*, the link K, shaft D, arm J, cup A, and the seed-cup B C F, substantially as and for the purposes described.

294,270. COMMUTATOR FOR DYNAMO OR MAGNETO ELECTRIC MACHINES. FRANK B. RAE and CLARENCE L. HEALY, San Francisco, Cal. Filed Mar. 12, 1883. (No model.)

Claim.—1. In a commutator for dynamo or magneto electric machines, a series of rings or sections composed of four segments each, two of which, diametrically opposite, are of a length proportionate to the neutral space of the machine and electrically connected together, substantially as set forth.



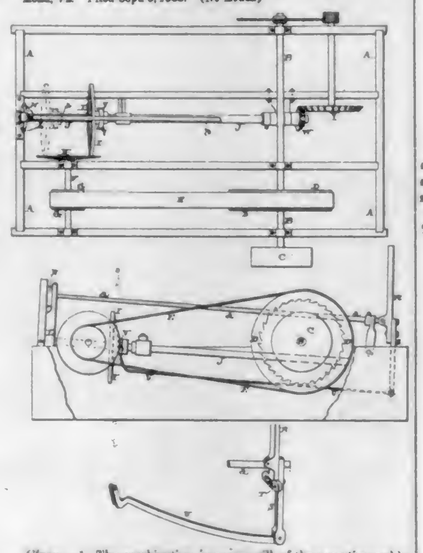
2. In a commutator for dynamo or magneto electric machines, a series of rings or sections composed of four segments each, two of which, diametrically opposite, are connected with the free ends of a coil or coils, substantially as set forth.

3. A commutator for dynamo or magneto electric machines, consisting of a series of metal rings or sections, each made in four parts and connected in pairs, as described, in combination with a series of brushes, so that a current of constant direction passes from one coil to the next through a brush adapted to bear upon the commutator-sections of both such coils, substantially as set forth.

4. A commutator for dynamo or magneto electric machines, consisting of a series of rings composed of four sections or parts connected as

described, and brushes arranged substantially as described, so that all the active coils are connected in series, and their current is shunted around the inactive coil or coils, substantially as set forth.

294,271. RACKET. ROBERT REACH, Philadelphia, Pa. Filed Dec. 3, 1883. (No model.)

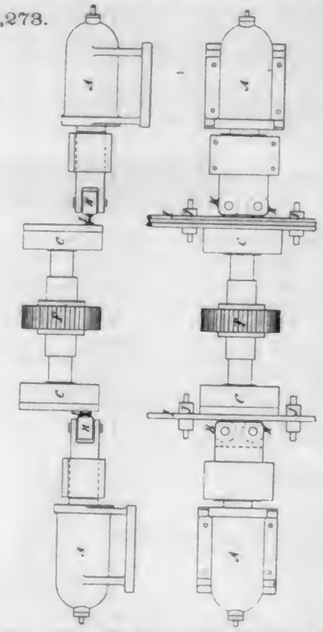


Claim.—1. The combination of handle B', having orifice *g* and shoulder L, nutted screw-rod D, tongue C, having semicircular arches *f*, and frame B, substantially as shown and described.

2. The tongue C, having perforated plate E, wings F, and arches *f*, for tightening the strands of net A, in connection with tightening-rod D, substantially as shown and described.

3. The tongue C, having arches *f* to protect the strands of net A against being cut or worn by plate E, substantially as shown and described.

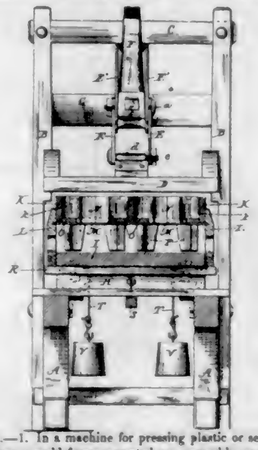
294,272. SAW-MILL-FEED MECHANISM. THOMAS J. REANY, Richmond, Va. Filed Sept. 3, 1883. (No model.)



Claim.—1. The combination, in a saw-mill, of the operating-rod by means of which the friction-disk and flange are thrown in and out of contact with the lever R S, which is loosely attached to one end of the operating-rod, the rod U, which is loosely connected to the lower end of the lever, the yoke V, which is connected to the friction-disk, and the shaft J, upon which the friction-disk is placed, substantially as set forth.

2. The combination of the operating-rod A, for moving the friction-disk in and out of contact with the flange, and the operating-lever R S, loosely connected to one end of the rod A, the lower end of the part R being slotted, and the part S being connected to the part R through the slot, with the connecting-rod U, yoke V, the friction-disk, and the shaft J, substantially as specified.

3. In a saw-mill, the combination of the saw-shaft, a short driving-shaft located to one side thereof, and a driving-belt for both shafts, with the friction-disk secured to one end of the short shaft, the friction-wheel adapted to be moved back and forth past the center of the disk, the shaft J, having the friction-wheel applied to one end and a pinion for driving the carriage upon the other, and a rod for moving the friction-wheel in and out of gear with the disk, substantially as shown.



294,273. APPARATUS FOR STRAIGHTENING RAILS. LEWIS RICHARDS, Dowlais, County of Glamorgan, England. Filed July 27, 1883. (No model.) Patented in England Oct. 30, 1882, No. 5,145.

294,273.

Claim.—The combination, in an apparatus for straightening rails, of a rotary disk and a roller or rollers arranged opposite the face of the disk and adapted to rotate in a plane at right angles to the face of the disk, substantially as herein described.

294,274. MACHINE FOR COMPRESSING PLASTIC MATERIAL. CYRUS J. RIDENOUR, Springfield, Ohio. Filed Jan. 15, 1884. (No model.)

Claim.—1. In a machine for pressing plastic or semi-plastic material into form, a mold-frame mounted on a movable supplemental frame located therein, said mold-frame being adapted to yield to the force exerted thereon by the pressure-plate, and provided with mold-bottoms having legs adapted to rest upon the floor of the supplemental frame and receive the impact of the pressure-plate, as set forth.

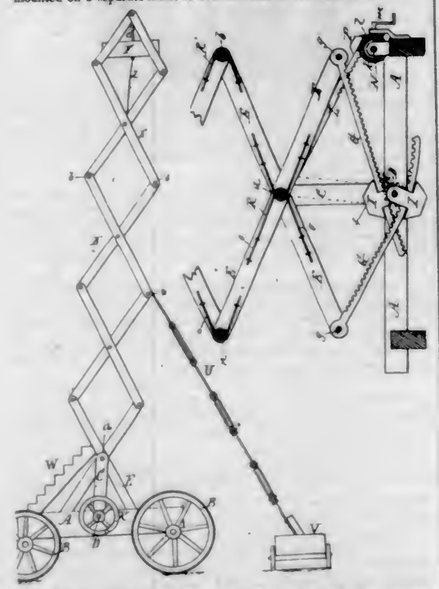
2. In a machine for pressing plastic material into form, a vertically-sliding mold-frame provided with mold-compartments, and an elastic strip, M, carrying the cores N, secured to the under side of the mold-frame, as and for the purpose set forth.

3. In a machine for molding and pressing plastic material into form, a supplemental frame, H, adapted to be moved laterally to and from the pressure-platen provided with the floor I, in combination with a vertically-moving mold-frame and mold-bottoms, as set forth.

4. In a machine of the character described, a supplemental frame, H, adapted to be moved laterally to and from the pressure-platen, in combination with a vertically-moving mold-frame, said mold-frame being connected to the supplemental frame by elastic connections, which will permit the mold-frame to yield or move down under pressure and be returned again to an elevated position when released from such pressure, as set forth.

5. In a machine of the character described, the supplemental frame H, provided with the sheaves or pulleys J, in combination with the vertically-moving mold-frame provided with weighted cords passing over said pulleys, whereby the mold-frame is held in an elevated position, as set forth.

6. In a machine of the character described, the vertically-moving mold-frame adapted to slide over and connected to the supplemental frame by means of the cross-bar R, in combination with the lever S, whereby the mold-frame is drawn down and the articles ejected therefrom by means of the mold-bottoms, the legs of which come in contact with the floor of the supplemental frame, located within the side extensions of the mold-frame, as set forth.



7. The combination of the hand-lever F and toggle-levers E and E', pivoted as described, with the cross-bar G, hinge A, and staple *i*, as and for the purpose set forth.

8. In a mold for shaping plastic material, an elastic bar secured to the under side of the mold-frame, and provided with stationary cores secured thereto, which project up into the mold-cavities, as and for the purpose set forth.

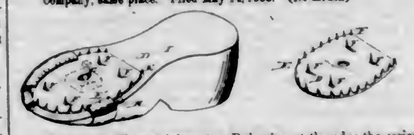
9. A mold-frame provided on its under side with a bar or bars, M, to which are secured the cores N, in combination with a movable mold-bottom resting loosely upon and held in position by said bars M, and adapted to have the cores pass therethrough, as and for the purpose set forth.

294,275. FIRE-ESCAPE. CHESTER A. ROBERTS, Caledonia, N. Y. Filed June 29, 1883. (No model.)

Brief.—Racked bars are secured by one end to the top of the pivoted standards, and at the other end engage with gears on the truck, by which the standards can be adjusted to any angle of inclination; also, racked bars are pivoted by one end to the outer ends of the lower lazy-tongs arms, and also engage pinions on the truck to raise the structure. Guide-blocks hold the racks to the pinions. A lazy-tongs brace is mounted on a separate frame and is swiveled to the main structure.

Claim.—1. In a fire-escape, the combination, with the extension-bars, of pivoted standards which support the bars, racks attached to the top of the standards, and engaging at their outer ends with gears, by which the standards can be adjusted to any position, and racks attached to the bottom of the lower set of bars, extending inward and engaging with gears on a shaft turning on the same center with the standards, for the purpose of raising and lowering the extension-bars, as herein set forth.

2. In a fire-escape, the combination of pivoted standards for supporting the extension-bars, a set of extension-bars pivoted to the top of the standards, a set of gears on a shaft in the same center as the pivots of the standards, and a set of racks attached to rods connecting the ends of the bottom bars, and engaging with the gears on the shaft, as herein set forth.



3. In a fire-escape, the combination of the pivoted standards C C, the set of extension-bars E E, the gears H H on the shaft D, the racks G G, attached to the bottom of the extension-bars and engaging with the gears, and the guide-blocks I I, turning on shaft D and holding the racks in place, as herein shown and described.

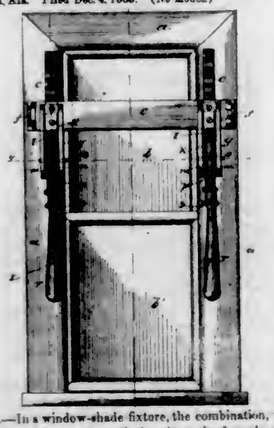
4. In a fire-escape, the combination, with the pivoted standards C C and extension-bars E E, of the main spring R, having its fulcrum on the cross-rod *o* at the top of the standards, and connected with the two lower bars, and the springs R' R', connected with the outer joints, as set forth.

5. In a fire-escape, the combination, with the axle S, of the bracket T, provided with the dovetailed slot *p*, the journal Q, provided with a dovetailed tongue, *r*, which rests in the slot, and a screw, *s*, passing through the axle and into the tongue, as and for the purpose specified.

6. In a fire-escape, the combination, with the main extension-bars E E, resting on the pivoted standards C C, of the secondary extension-bars U, mounted on a separate frame, and standing at right angles to the main bars, and attached by a swivel to one of the pivots of the main bars, as herein shown and described.

294,276. DEVICE FOR LASTING BOOTS AND SHOES. WARNER ROGERS, Cincinnati, Ohio, assignor to the Warner Rogers Flexible Shoe Company, same place. Filed May 14, 1883. (No model.)

Claim.—1. The retaining-plate D, having at the edge the series of pins or hooks E and in the body thereof the pins or points F, for holding the sole and upper, substantially as herein set forth.



2. The retaining-plate D, having at the edge the series of pins or hooks E and in the body thereof the pins F, projecting upward, in combination with the sole and upper, substantially as herein set forth.

294,277. LOCK FOR ADJUSTING FINGER-RINGS, BRACELETS, &c. FRANZ J. SCHINDLER, New York, N. Y. Filed Dec. 20, 1883. (No model.)

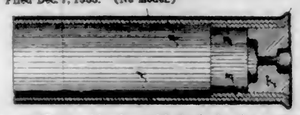
Claim.—The combination, with a finger-ring or bracelet having its shank left detached from the head thereof, of the rotating lock-plate arranged in the head on a suitable key-arbor, and constructed with one or more cam-slots, and the studs of the shank engaging the slots of the rotating plate, substantially as shown and described.

294,278. WINDOW-SHADE FIXTURE. ANTON SCHNACKERS, Birmingham, Ala. Filed Dec. 4, 1883. (No model.)

Claim.—In a window-shade fixture, the combination, with the window-frame having a pair of vertical racks on its face along the vertical

edges of its upper half, of the grooved and shouldered brackets having springs in their front grooves, and dogs with operating-handles pivoted in said grooves, said brackets being secured at their upper ends to a cross-strip for carrying the castings for the shade-roller, substantially as specified.

294,279. PAPER-FILE HOLDER. AUGUSTUS C. SCHOOLEY, Chicago, Ill. Filed Nov. 15, 1883. (No model.)



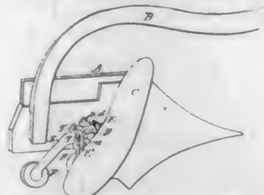
Claim.—1. The combination, with the back A, flange-strip A', and puncturing-wires a^2, forming the essential parts of the body, of a presser, B', and springs B^2, and devices for detachably securing the presser to the body, substantially as described.

2. The combination, with the back A, flange-strip A', and puncturing-wires a^2, of a bar, B, presser B', springs interposed between the bar and presser, and devices for holding the bar upon the body, substantially as described.

3. The combination, with the back A, flange-strip A', puncturing-wires a^2, and end blocks, a a', of the presser-strip B', fitted to drop over the wires a^2 and between the end blocks, a bar, B, fitted to rest on the end blocks, springs B^2, interposed between the bar B and the presser B', and spring-catches A^3, arranged to engage the bar B to the body of the structure, substantially as described.

4. The combination, with the body and the bar B for holding the presser, of spring-catches arranged to engage the ends of said bar, and a detachable clamp arranged to secure the middle of said bar to the body, substantially as described.

294,280. CARTRIDGE-SHELL. OTTO FERDINAND SEBOLD, Brooklyn, N. Y. Filed Dec. 7, 1883. (No model.)



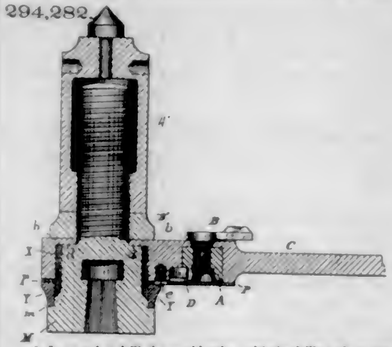
Claim.—1. The combination, with the body of a paper shell, and with its re-enforcement, its base, and its metallic head, of a protecting-tube which embraces the body and the base of the shell, substantially as and for the purpose described.

2. The combination, with the body of a paper shell, and with its re-enforcement and base, of a metallic head embracing the entire body and the base of the shell, substantially as and for the purpose set forth.

294,281. PLOW. RUSSEL B. SHAPCOS, Meadota, Ill. Filed Sept. 21, 1883. (No model.)

Brief.—A cluster of bearing-wheels on adjustable arms that may be adjusted to throw the plow upon the point or heel, or upon either side.

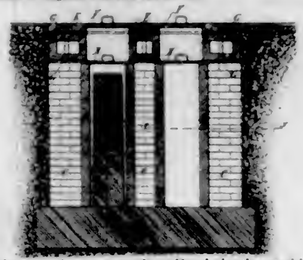
Claim.—1. The combination, in a plow attachment, of a body carrying wheel-arms, circular wedge-plates C C', adapted to support the body on the plow-brace, and a hooked rod for securing the body to the brace, with a tightening-nut and washer, substantially as described.



2. The combination, with body D and means for securing it to the plow-brace, of adjustable wheel-arms having slotted shoulders and bolts for securing them in adjustment, as set forth.

3. The combination, with brace a of a plow, of plates c c', bolt b', body D, washer d, and adjustable wheel-arms, as described.

294,282. RATCHET-DRILL. JOHN E. SINCLAIR, Worcester, Mass. Filed Aug. 11, 1883. (No model.)



Claim.—1. The combination, with the drill-stock provided with the shoulders d and m, the threaded stem, and ratchet-teeth, of the handle having the aperture a and interior shoulder, b, the collar Y, nut B', and means for actuating the spring-pawls contained in the handle, substantially as specified.

294,282.

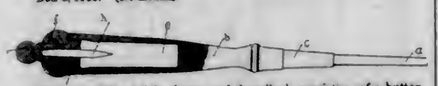
2. In a ratchet-drill, the combination, with the drill-stock constructed as described, of the handle provided with the under recess, H, the thumb-latch B, perforated block A, having shoulders c c, to engage the rear ends of the spring-pawls D D_1, the securing-plate P, and bolt L, with means for securing the stock to the handle, substantially as specified.

294,283. APPARATUS FOR TREATING STEEL INGOTS. GEORGE JAMES SHIELD, Workington, England. Filed Oct. 3, 1883. (No model.) Patented in England Feb. 22, 1883, No. 980.

Claim.—1. An apparatus for uniformly heating steel ingots, consisting, essentially, of a steel casing, B, sunk in the ground, a metallic frame secured over the upper end of the casing, and having an opening leading into the latter, an inner lid, H, for covering the upper open end of the casing, and an outer lid, F, for covering the opening in the metallic frame, substantially as described.

2. The combination of the steel casing B, sunk in the ground, the metallic frames D and E, arranged over each other above the casing, and each having an opening, bolts connecting the two frames, an inner lid, H, for covering the upper end of the casing, and an outer lid, F, for covering the opening in the upper metallic frame, E, substantially as described.

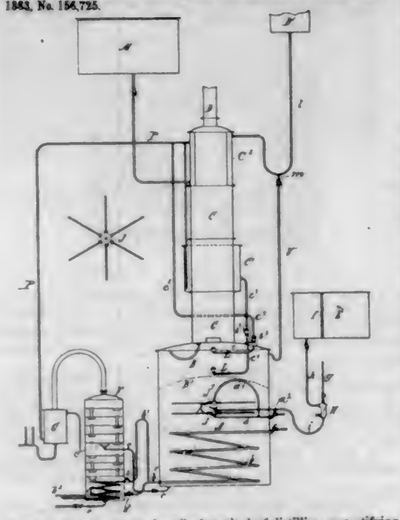
3. The combination of the steel casing B, sunk in the ground, the metallic frames D and E, bolted together above the casing, and each having an opening through it, non-conductors arranged, respectively, between the two frames and between the casing and the lower frame, and lids H and F, for covering the upper end of the casing and the opening in the upper frame, substantially as described.



4. The combination of a series of steel casings, B, inclosed by brick-work in the ground, a metallic frame secured over the casings, and having a series of openings—one for each of the latter—and lids H and F, for covering the upper ends of the casings and the openings in the metallic frame, substantially as described.

5. The combination of a series of steel casings sunk in the ground and surrounded by brick-work, metallic frames D and E, bolted together above the casings, and each having a series of openings leading to the casings, and lids H and F, for covering the upper ends of the casings and the openings in the metallic frames, substantially as described.

6. The combination of a series of steel casings sunk in the ground, the brick-work C, surrounding the casings, the metallic frames D and E, attached one upon the other above the casings, and each having a series of openings leading to the latter, non-conducting layers interposed between the two metallic frames and between the brick-work, the casings, and the under frame, D, and lids H and F, for covering the upper ends of the casings and the openings in the top frame, E, substantially as described.



7. A soaking-pit for uniformly heating steel ingots, having an upright lining of steel, in combination with the metallic frames D and E, united by bolts, and having openings leading to the pit, and lids H and F, for covering the top of the pit-lining and the opening in the top frame, E, substantially as described.

294,284. SHOE-BUTTONER. JOHN L. SOMMER, Newark, N. J. Filed Dec. 6, 1883. (No model.)

Claim.—The article shown and described, consisting of a button-hook having a recessed handle, and provided with a removable cap for closing its end, with a piercer or cutting-blade secured to said cap and inclosed within the handle, as and for the purpose set forth.

294,285. PROCESS OF AND APPARATUS FOR THE PRODUCTION OF HIGHLY-PURIFIED ALCOHOL. JULIUS ALFRED STELZNER, Alt Chemnitz, Saxony, Germany. Filed Apr. 2, 1883. (No model.) Patented in Germany Dec. 9, 1882, No. 25,773; in England Feb. 2, 1883, No. 577; in Italy May 23, 1883, XVI, 15,068, and XXX, 434, and in France Nov. 7, 1883, No. 156,725.

Claim.—1. The herein-described method of distilling or rectifying alcohol, which consists in injecting the crude alcohol into the still in the form of spray, vaporizing and purifying the same by means of steam injected into the sprayed alcohol, and injecting water in the form of spray into the combined steam and alcohol vapors, to dilute and purify the same, as set forth.

2. The herein-described method of distilling or rectifying alcohol, which consists in injecting the crude alcohol into the still in the form of spray, vaporizing and purifying the same by means of steam injected into the sprayed alcohol, and injecting water in the form of spray of gradually-diminishing temperature into the combined steam and alcohol vapors as they rise on their way to the rectifying-column, as set forth, for the purposes specified.

3. The herein-described method of distilling or rectifying alcohol, which consists in injecting the crude alcohol into the still in the form of spray, vaporizing and purifying the same by means of steam injected into the sprayed alcohol, subjecting the latter to the action of an alkali or an oil, and injecting water in the form of spray into the alcohol-vapors, substantially as described, for the purposes specified.

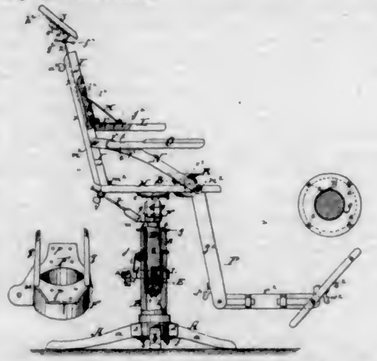
4. The herein-described method of distilling or rectifying alcohol, which consists in injecting steam in the form of spray into the sprayed alcohol, subjecting the latter to the action of an alkali in solution, or an oil, and injecting into the combined sprayed liquids and vapors water in the form of spray, and of gradually-decreasing temperature, as said vapors pass from the still to the rectifying-column, substantially as described, for the purposes specified.

5. In a distilling or rectifying apparatus, the combination, with a rectifying-column and a still divided into a series of distilling-chambers, of an injector, a heater, and steam-spraying devices for injecting the alcohol in the form of spray into one of the stills, vaporizing the same and injecting steam in the form of spray into said alcohol-vapors before they reach the second still, and spraying devices for injecting water in the form of spray into the combined vapors as they enter the second still and before they reach the rectifying-column, substantially as described, for the purpose specified.

6. In a distilling apparatus, a still divided into a series of distilling chambers or compartments by means of perforated diaphragms, a rectifying-column, a cooler at the upper end thereof, and a dephlegmator, in combination with a second cooler, C', applied to said rectifying-column between the still and upper cooler, and a connection for connecting the dephlegmator, through one of the coolers, with the still, substantially as described, for the purpose specified.

7. In a rectifying apparatus, the combination, with a rectifying-column, of a refrigerator located at its upper end, a still divided into two or more compartments by means of perforated diaphragms, an injector, heater, and steam-spraying devices located in the initial compartment, into which the alcohol is injected in the form of spray, spraying devices located in the terminal compartment, for injecting water in the form of spray into the combined vapors as they arrive from the initial compartment, and a second refrigerator, C', located on the rectifying-column intermediate of the terminal compartment of the still and the upper refrigerator on the column, all combined for co-operation, substantially as described, for the purposes specified.

8. In a distilling or rectifying apparatus, the combination, with a rectifying-column and a still, of two or more superposed spraying devices, L L', for injecting water at gradually-decreasing temperatures into the alcohol vapors on their way to the rectifying-column, substantially as described, for the purposes specified.



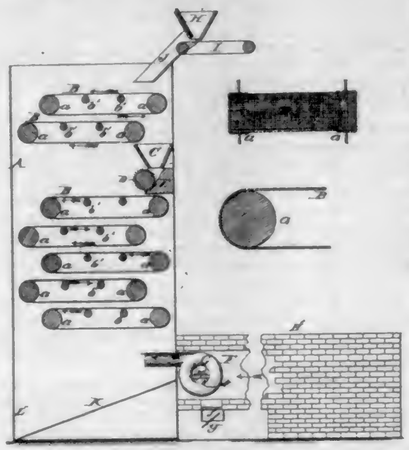
9. In a distilling and rectifying apparatus, the combination, with a distilling and rectifying column, a still, its steam heating-coil, and the exhaust-pipe thereof, of an auxiliary rectifying-column, F, and its steam heating-coil d, connected with the exhaust-pipe of the coil of the still, substantially as described, for the purpose specified.

10. In a distilling and rectifying apparatus, the combination, with a distilling and rectifying column, a still, its steam heating-coil, and the exhaust-pipe thereof, of an auxiliary rectifying-column, F, its steam heating-coil d, and the exhaust-pipe thereof, both connected with the exhaust-pipe of the coil of the still, substantially as and for the purposes specified.

11. In a distilling apparatus, the combination, with a still and a distilling and rectifying column, of a dephlegmator connected by a siphon-pipe with the rectifying-column and by a discharge-pipe with the still, substantially as and for the purposes specified.

12. In a distilling and rectifying apparatus, the combination of a still, an injector provided with a spraying-nozzle for injecting the liquid into the still in the form of spray, and two steam-spraying pipes, J J', located, respectively, above and below the injector spraying-nozzle, substantially as described, for the purposes specified.

294,286. DENTAL CHAIR. EDMUND P. STILES, Austin, Tex. Filed Apr. 24, 1883. (No model.)



Claim.—1. The dental chair, combined with the downwardly-projecting post D, swiveled block E, roller h, longitudinally-grooved pedestal-cylinder B, cable i, roller j, and windlass k, substantially as described, the cable i passing through two apertures that pierce the cylinder B, and resting in the grooves of said cylinder, substantially as specified.

2. The clamp F, having ears p and lugs q, combined with the bar G, having trunnions r, and with the post D, base-support A B, and seat H, having bearings s, substantially as and for the purpose specified.

3. The child's seat I, combined with the plates J^2, having upright perforated ears I^2, and with the detachable brackets M M, having horizontal pins that extend through said ears, and having downwardly-projecting hooks I^3, and with the perforated plates i^2 and recessed chair-back I, substantially as and for the purpose herein shown and described.

294,287. GRAIN-DRIER. MOSHER A. SUTHERLAND, New York, N. Y. Filed Mar. 4, 1882. (No model.)

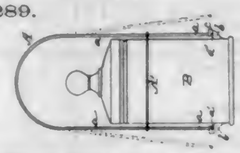
Claim.—1. The combination, in apparatus for drying malt and brewers' grains, of a substantially-closed vertical flue or trunk open at the top for a direct draft, and having a bottom opening, L, and a series of perforated endless aprons, with a furnace and a blower arranged to inject the hot gaseous products of combustion into the bottom of said trunk, substantially as described, for the purpose specified.

2. An organized apparatus for drying grain, malt, brewers' grains, &c., composed of the following elements, viz: a flue or vertical chamber open at the top, connected with a suitable furnace, to receive the hot gaseous products of combustion therefrom, a series of perforated endless aprons arranged within said flue or chamber to transmit the material to be dried from one to the other of said aprons successively from above downward, and subjected to the action of the gaseous products of combustion, a blower arranged to inject the hot gaseous products of combustion into said flue or chamber, and devices, substantially as described, for separating or disintegrating the material while subjected to the action of said products of combustion, all substantially as and for the purpose herein set forth.

3. An organized apparatus for drying grain, brewers' grains, &c., composed of the following elements, viz: a flue or vertical chamber open at the top, connected with a suitable furnace to receive the hot gaseous products of combustion therefrom, a series of perforated endless aprons arranged within said flue or chamber to transmit the material to be dried from one to the other of said aprons successively from above downward, and subjected to the action of the gaseous products of combustion, and a blower arranged to inject hot gaseous products of combustion into said flue or chamber, a valve and inlet-passage so placed as to control the admission of air to the flue, and devices, substantially as described, for separating or disintegrating the material while subjected to the action of said products of combustion, all substantially as and for the purpose herein set forth.

4. The combination, in apparatus for drying grain, of a flue or vertical trunk open at the top, a furnace connected with it at the bottom to deliver the gaseous products of combustion into said flue or trunk, a series of endless foraminated aprons arranged within and across said flue to transmit the material to be dried and to allow the hot products of combustion to pass directly through the moving substance, with means, substantially such as described, for separating and disintegrating the material while subjected to the action of said products of combustion.

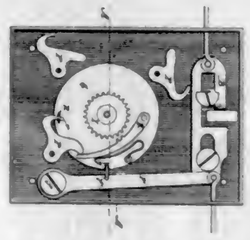
294,288. MEDICAL COMPOUND. GEORGE TAYLOR, Redding, Cal. Filed Aug. 13, 1883. (No specimens.)



Claim.—The herein-described composition of matter, consisting of pulverized buckeye-nuts, Cayenne pepper, and ground ginger, in the proportions specified.

294,289. DETACHABLE HANDLE FOR GLASS AND EARTHENWARE DISHES. JOHN B. TIMBERLAKE, Jackson, Mich. Filed Dec. 14, 1883. (No model.)

Claim.—1. The combination, with a dish having resisting walls upon opposite sides, of a handle having downwardly-extending elastic legs, which are adapted, substantially as set forth, to be pressed outward against said resisting walls by their elasticity, to hold the handle in place upon the dish, substantially as set forth.



2. The combination, with a dish having two horizontally-arranged walls or surfaces opposite to each other, of a handle having outwardly-extending elastic legs, provided with outwardly-projecting parts which lie under the said walls or surfaces on the dish, and which by their elasticity are pressed outward to engage with said walls or surfaces, substantially as set forth.

294,289.

3. The combination, with a dish having seats or recesses opposite to each other, of a handle having downwardly-extending elastic legs, and the foot-pieces hinged to said legs, and which by the elasticity of the legs are forced outward to engage with the dish in the said seats or recesses, substantially as set forth.

294,290. COMBINATION-LOCK. CHARLES TRESCONIS, Lead City, Dak. Filed Sept. 18, 1883. (Model.)

Claim.—1. The combination, with the sliding bolt of a lock, of one or more levers or latches, D, a spring engaging the same to retain it at either end of its arc of motion, and a wire or other means for connecting said latch with said bolt, substantially as specified, whereby the latch may slide the bolt.

2. A spindle, a toothed wheel fixed thereon, a disk adjustably secured on the same, and a spring-pawl on the disk, arranged to engage said toothed wheel, in combination with an arm pivoted in the frame to be set into or out of the path of said pawl, substantially as and for the purpose specified.

3. The disk G, the pawl K, pivoted thereon, and the staple R, secured thereto, in combination with the arm P, having the hook *r*, pivoted to the lock-case, as shown and described.

4. The disk G, the pawl K thereon, and the arm P, journaled to the frame to engage said pawl, in combination with a handle, Q, attached to said arm, a stud in said handle, and the lock-plate provided with notches to receive said stud, as shown and described.

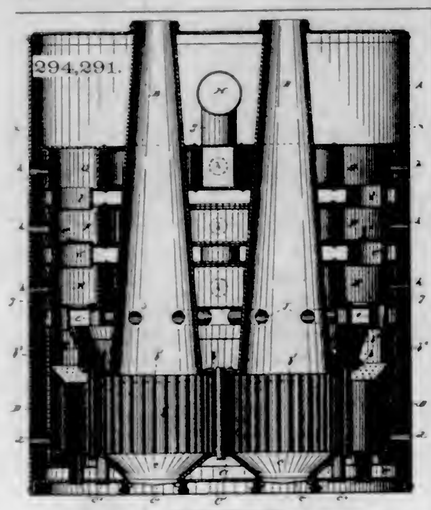
294,291. STEAM-GENERATOR. JAS. W. UPSON, Cleveland, assignor to James E. Upson, Shawnee, Ohio. Filed May 23, 1883. (No model.)

Claim.—1. In an upright steam-boiler or water-heater, the combination of two vertical fuel-magazines, each in the shape of a truncated cone, and each provided with horizontal cold-air tubes, substantially as shown and described.

2. In an upright steam-boiler or water-heater, the combination, with one or more truncated-cone-shaped fuel-magazines, each provided with horizontal cold-air tubes, of the vertical tubes b', substantially as set forth.

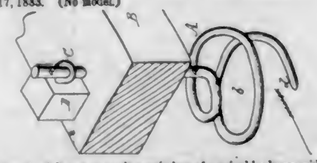
3. In an upright steam-boiler or water-heater, the combination, with the plate b^2, having the sheet C secured thereto, of the plate D, having a perforated sloping top extending to and against the plate b^2, and forming an air-chamber, and the tubes *d*, adapted to supply the said chamber with air, substantially as shown and described.

4. In an upright steam-boiler or water-heater, the combination, with the horizontal crown-sheet having the sloping part b^2, of the plate b^2, the latter forming a support for the former, substantially as shown and described.



5. One or more funnel-shaped disks, *c*, adapted to connect the plates C and C', and adapted to support the grates, substantially as described, and for the purpose specified.

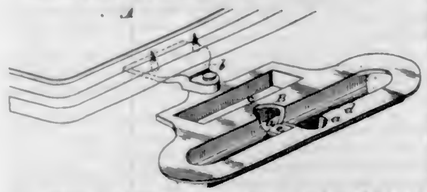
6. In an upright boiler or water-heater, the combination, with the chambers E and F, of the tubes *d* and dampers adapted to close said tubes, substantially as set forth.



7. In an upright steam-boiler or water-heater, the combination of the hot-air chambers E, F, and G, connected with the outer air by the tubes A, and with each other by the tubes *f* and *d'*, the latter being provided with dampers e^2, substantially as shown and described.

8. The hot-air chamber F, provided with the dampers e^2, substantially as described, and for the purpose specified.

294,291.



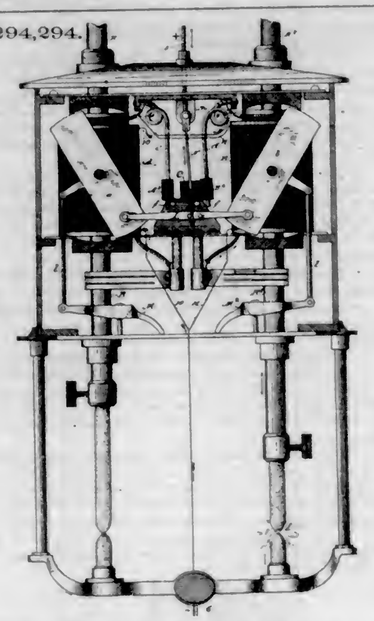
294,292. HARROW-TOOTH. PLATT R. VIELE, Rochester, N. Y. Filed Dec. 17, 1883. (No model.)

Claim.—1. A harrow-tooth consisting of a spiral body provided with a projecting point at the lower end, the coils standing horizontally, as herein shown and described.

2. The combination of a harrow-tooth consisting of a spiral body provided with a projecting point at the lower end, and a clamp for securing the tooth fast to the supporting-bar, whereby the tooth can be adjusted axially to bring its point forward as it wears away, as set forth.

294,293. COMBINED CIGAR AND MATCH HOLDER FOR TABLES. JOHN P. WALCH, Sutro, Nev. Filed Aug. 7, 1883. (No model.)

Claim.—1. In combination with a table, A, the holder B, pivoted under its edge, said holder having an elongated chamber, *d*, with a central block or piece, *c*, and side apertures, *a*, substantially as herein described.



2. In combination with a table, A, the holder B, pivoted under its edge, said holder having a chamber, *c*, for matches, and an elongated chamber, *d*, for a cigar, said chamber *d* having a central block or piece, *c*, and side apertures, *a*, substantially as herein described.

294,294. DOUBLE ELECTRIC-ARC LAMP. ADDISON G. WATERHOUSE, New York, N. Y., assignor, by mesne assignments, to the Schuyler Electric Light Company, same place. Filed June 12, 1883. (No model.)

Claim.—1. The combination, substantially as described, in a double-carbon lamp, of two sets of carbons, two magnets, one connected with each set, and a circuit-controlling device upon which said magnets act in opposite directions, so as to determine which of the two sets of carbons with its feed-regulating magnet or magnets shall be in circuit.

2. The combination, in a double-carbon lamp, of a reciprocating switch-contact connected to the circuit on one side of the lamp, two switch-contacts or connecting-points, with one or the other of which said reciprocating contact closes the circuit, according to the direction in which it is drawn, and two magnets or coils in circuits respectively from said contacts and acting on said reciprocating contact, as and for the purpose described.

294,294.

3. The combination, substantially as described, of two sets of carbons arranged in branch or multiple-arc connections, a magnet in each branch, and a circuit-controller that breaks the circuit of one branch and completes the circuit of the other, or vice versa, according to the direction in which it is drawn by said magnets, as and for the purpose described.

4. The combination, in a double-carbon lamp, of two sets of carbons, two magnets, each wound with a coarse and a fine wire, and having mechanically-connected armatures or cores, and a circuit-controller operated by said armatures for completing the circuit through the coarse wire of one magnet and a set of carbons, and through the fine wire of the other in derived circuit around said carbons, while at the same time disconnecting the remaining coarse and fine wires of the two magnets and the other set of carbons, or vice versa, as described.

5. The combination, substantially as described, of two sets of carbons, magnets, or cores—one in connection with each set—and a circuit-controller acted upon by said magnets in opposite directions, for the purpose of completing the circuit through one set of carbons and breaking it to the other, or vice versa, according to which of the two magnets exerts the greater force.

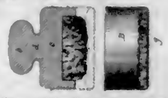
6. The combination of two switch-contacts—one connected with one set of carbons and the other with the other set—two magnets—one in a connection from each contact—an intermediate switch-contact connected with the main circuit, and means connected with the armatures of said magnets for moving said switch-contact in one or the other direction, according to the relative flow of current in the two connections.

7. The combination, with two sets of carbons, of two magnets having mechanically-connected armatures or cores, clamps, or clutches—one for each set of carbons connected with the common armature system—main and derived circuit coils on the magnets, and an electric switch controlled by the armatures for throwing the main-circuit coil on one magnet and the derived circuit on the other into circuit, or vice versa, according to the relative resistance of the two branches, including the switch-contacts and the sets of carbons.

8. The combination, in a double-carbon electric lamp, of magnets A B, each wound with coarse and fine wire, armatures therefor mechanically connected, two switch-contacts on either side of a contact connected with the general circuit, a connection from one of the exterior contacts to the main-circuit or coarse-wire coil on one magnet and the fine-wire coil on the other, and connections from the other contact to the coarse-wire coil of the latter magnet and the fine-wire coil of the first-named magnet, said coarse-wire coils forming each a portion of the

main circuit with one set of carbons, and said fine-wire coils being in derived circuits around said carbons.

9. The combination, in a double electric lamp, of a switch-lever working between two swinging contacts, each connected with one of the sets of carbons, magnets—one in each connection from said contacts, and having mechanically-connected armatures acting on said switch-lever—and suitable contact-stops for limiting the movement of the switch-contacts, to prevent them from following and remaining in contact with the switch-lever when it is moved to one side.

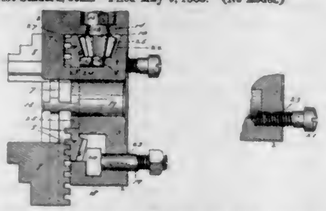


10. The combination, substantially as described, of the magnets A B, armatures therefor, contact C, contacts A^3 B^3 on either side thereof, connected with the fine and coarse wire coils of the magnet in the manner described, and clutches—one for each carrier—operated by the connected armature, as described, so that as one clutch is raised the other is lowered.

11. The combination of the magnets A B, wound with coarse and fine wire, the armatures *a b*, connecting-link for the latter, double contact-switch controlling the circuit of the coarse and fine wire coils in the manner described, clutches M M^3, and devices connecting said clutches with the armatures.

12. The combination, with the contact C, connected with the general circuit, of two sets of carbons, two contacts, A^3 B^3, each connected with a magnet or coil and a set of carbons, and mechanism connected with said magnets for breaking the connection with contact C of either of the contacts A^3 B^3, and preserving the connection of the other, as and for the purpose described.

13. The combination, with two sets of carbons, of a magnet or coil connected with each set, and a circuit-controlling apparatus operated by said magnets for throwing the two sets of carbons into and out of circuit automatically in accordance with the strength of said magnets as dependent on the resistance between the two carbons of a set.

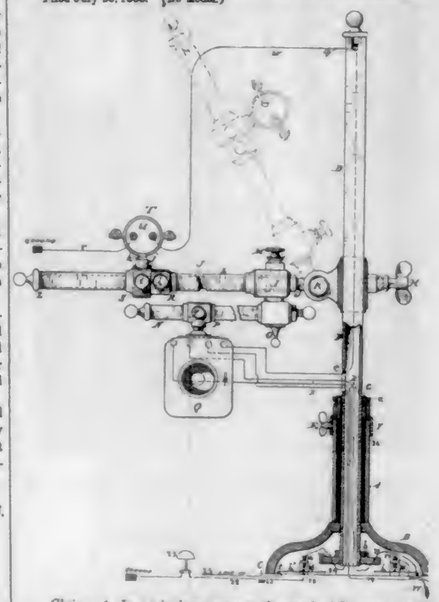


294,295. SLATE-ERASER. WILLIAM M. WHITING, Elizabeth, N. J. Filed Oct. 17, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a handle, a mass of absorbent material attached thereto, a cup into which said handle is adapted to fit tightly, and a second mass of absorbent material contained within said cup.

2. As an article of manufacture, a slate-eraser consisting of a handle, a drying-sponge attached to one end of the same, a moistening-sponge attached to the other end of the same, and a cup inclosing the last-named sponge.

294,296. LATHE-CHUCK. DAVID E. WESTON and LUCIUS E. WESTON, West Stafford, Conn. Filed May 9, 1883. (No model.)



Claim.—1. In a geared scroll-chuck, the shell or case 2, provided with tapered holes for pinion-bearings, in combination with a series of pinions, each having a tapered journal to revolve in one of said tapered holes in the shell, and a back plate fitted to the open rear end of said shell, substantially as described.

2. In a geared scroll-chuck, the shell or case 2, having its rear end open, in combination with a back plate fitted into said open end, and holes made partly in said plate and partly in said shell at the joint, and screw-bolts adapted to extend through the chuck-plate of a lathe and fitted into said holes, whereby said back plate is secured in place and the chuck secured to the chuck-plate of the lathe by the same set of screw-bolts, substantially as described.

3. In a geared scroll-chuck, the shell or case 2, provided with tapered holes for pinion-bearings, in combination with a back plate fitted and secured in the open end of said shell, a series of pinions, each having its outer journal tapered and adapted to revolve in one of the tapered holes in said shell, and its inner journal supported in a bearing in said back plate, the toothed scroll-disk, the jaws adapted to move in the radial guideways, and the screw-bolts fitted to the holes at the joint in the back plate and the shell or case, and adapted to extend through the chuck-plate of a lathe, substantially as described.

294,297. TELEPHONE-SUPPORT. GEO. A. WILKINS, Philadelphia, Pa. Filed July 20, 1883. (No model.)

Claim.—1. In a telephone-support, the standard D, provided with the studded collet G, in combination with the pedestal A, provided with the cam-sleeve F, substantially as and for the purpose described.

2. In a telephone-support, the disk *m*, in combination with the button 15, switches *h h'*, screws 14 17, standard D, proper conducting-wires, and means for raising and depressing said disk to close and open the circuits, substantially as set forth.

3. The combination of a pedestal or support provided with a cam-sleeve, a standard adapted to turn in said pedestal, provided with a studded collet, and a swinging arm attached to said standard and carrying a receiver, substantially as described.

4. In a telephone-support, the carrier R, provided with the screw *h*, in combination with the sleeve S, provided with the screw *i*, clamp T, sleeve L, and arm J, substantially as described.

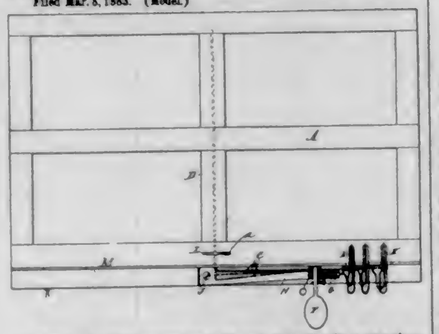
5. In a telephone-support, the arm J, carrying the receiver U, and provided with the joint K, in combination with the standard D, substantially as and for the purpose set forth.

6. In a telephone-support, an extensible swinging arm carrying a receiver, in combination with means for supporting said arm and moving it out of the way of the operator automatically when released after using the receiver, substantially as set forth.

7. In a telephone-support, an extensible swinging arm carrying a receiver, and provided with an auxiliary swinging arm carrying a transmitter, in combination with means for supporting said arms and moving them out of the way automatically when released after using the receiver or transmitter, substantially as set forth.

8. In a telephone-support, the slide I, provided with the screw M, in combination with the sleeve L, arms J N, and transmitter Q, substantially as set forth.

9. In a telephone apparatus substantially such as described, a switch or switches operated by the vertical movements of the standard by which the receiver or transmitter is supported for switching the main-line current from the signal-bell through the receiver and transmitter, and proper conducting-wires, substantially as set forth.



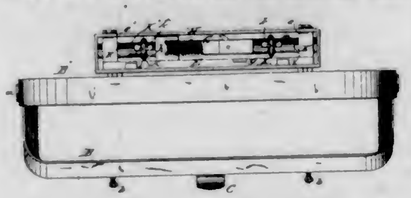
10. In a telephonic apparatus substantially such as described, the switches *h h'*, screws 14 17, button 15, and wires 22 23 24 25 20 21, in combination with the disk *m*, supporting-standard D, and means for giving said standard vertical movements to close and open the circuits, substantially specified.

11. In a telephonic apparatus substantially such as described, a standard carrying a receiver or a transmitter, or both, in combination with means for rotating or partially rotating said standard to move the receiver or transmitter out of the way of the operator after using the same, with means for raising and depressing the standard to close and open the circuits, and with means for adjusting the standard in reference to its pedestal or support, substantially as described.

12. In a telephonic apparatus substantially such as described, the hard-rubber disk *m*, in combination with the standard D, springs *h h'*, button 15, screws 14 17, proper conducting-wires, and means for moving said disk to open and close the circuits, substantially as set forth.

13. A pedestal for telephone-supports, provided with a cam-sleeve, the lower part of which is adapted to fit over and form a cap for said pedestal, to prevent the entrance of dust and other foreign substances to the interior thereof.

294,298. MUSIC-LEAF TURNER. JOHN M. WHITMAN, St. Mary's, Pa. Filed Mar. 8, 1883. (Model.)



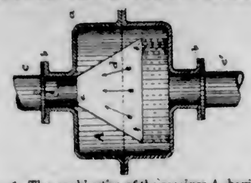
Claim.—1. The combination, with rack A, having its center piece, D, grooved upon its rear side, and angular spring-arms C, of unequal length, having clamps on their outer ends, slotted upright O, trigger F, having notches V U and cam *n*, and spring G, substantially as described.

2. The combination, with rack A, having its center piece, D, provided with a narrow groove on the rear side, right-angular spring-arms C, of unequal length, fitting in said groove, and having clamps on their outer ends, and perforated plate M, of a plate, H, provided with adjustable upright O, having an angular slot, F, trigger F, provided with notches V U and cam *n*, spring G, and card-board R, substantially as specified.

3. The combination, with the music-rack A, having holes *a*, of the iron hooks L, having one of the ends of each hook T split, substantially as described, and for the purpose set forth.

294,299. BAG-LOCK. TWEETMAN WOOD, Westport, Conn., assignor of one-half to John D. Wood, same place. Filed June 28, 1883. (Model.)

Claim.—1. The satchel lock and clasp case consisting of a metallic shell of rectangular form with end and side walls, the side walls being deeper or wider than the end walls, so as to embrace the mouth-irons of the bag, and one of said side walls being provided with hinges or hinge-sections for attachment to one of the mouth-irons, substantially as set forth.



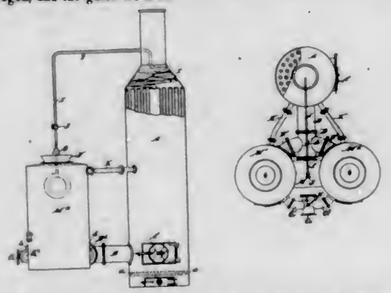
2. The hinged lock-case provided with the bar E and the notched and beveled catches E', for engagement with the studs *b b*, in combination with the mouth-irons B B' of the bag, substantially as described.

3. The combination of the hinged lock-case D and the spring-tongue C with the mouth-irons B B', the studs *b b*, attached thereto and located on either side of the tongue, and the beveled catches *e e*, forming parts of the latch mechanism, substantially as described.

4. The combination, with the lock-case D, having slots near either end in one of its side walls, of the spring-bar E, arranged within said case and adapted to move lengthwise, the notched and beveled catches E', connected with said bar and projecting through the slots, the mouth-irons B B', having the studs *b b*, connecting with said catches, and the knob or thumb-piece *j*, connected to said bar E, substantially as described.

5. In a lock for traveling-bags and satchels, the combination, with the slotted lock-case D, of the detachable handle-rings K, fitting the slots *k*, and the key-pieces *k' k'*, constructed and arranged to embrace the metal of the rings and to hold the rings in place, substantially as described.

294,300. APPARATUS FOR SEPARATING LIQUIDS FROM GASES AND STEAM. WILLIAM H. WOOD and GEORGE RICHMOND, New York, N. Y. Filed Feb. 20, 1883. Renewed Jan. 26, 1884. (No model.)



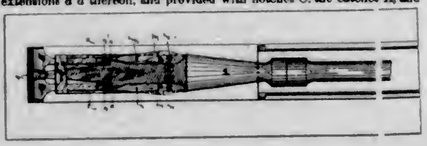
Claim.—1. The combination of the receiver A, having flanged necks *b b*, inlet-pipe *c'*, inverted funnel *d*, having knife-edge *f*, means for securing the funnel in the upper flanged neck of the receiver, and outlet-pipe *e*, substantially as and for the purpose shown and specified.

2. The combination of the receiver A, having flanged necks *b b*, inlet-pipe *c'*, inverted funnel *d*, having knife-edge *f*, ferrule *e*, and outlet-pipe *e*, substantially as and for the purpose shown and specified.

3. The combination, with the outlet-pipe *e* of a steam-boiler or gas-generator, of the inverted funnel *d*, having knife-edge *f*, and fitting with its upper contracted end into the outlet, substantially as and for the purpose herein shown and set forth.

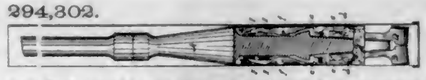
294,301. APPARATUS FOR PRODUCING AND BURNING GAS. LEVI D. YORK, Portsmouth, Ohio. Filed Jan. 14, 1884. (No model.)

Brief.—Gas is produced for heating and other purposes by passing air through ignited gas-producing coal, so as to produce perfect combustion in the lower part thereof, forming carbonic acid, then converting such gas into carbonic oxide, and at the same time distilling off the heavy hydrocarbons by passing the carbonic acid up through the mass of coal, then introducing superheated steam into the gaseous products, and finally passing them down through a bed of incandescent carbon, whereby the added steam is decomposed, forming an additional volume of carbonic oxide and hydrogen, and the gases are fixed.



Claim.—1. The steam-boiler A, and furnace for burning solid fuel to maintain an igniter for the gas, the pipe B, valve D *d*, and branches B' B³, and the two gas-producing furnaces M' and M³, with connecting-passage M, combined and arranged for joint operation as herein specified.

2. The two furnaces M' M³ and connection M, in combination with means, I, for introducing superheated steam into M to mingle with the gaseous products of combustion and traverse therewith down through the second furnace, and with means, as D H, for causing the flow alternately in opposite directions, as herein specified.



3. In combination with the steam-boiler A, the cylinders M' M³ and their connections, as described, and air-inlet, the valves D and H, adapted to be operated simultaneously to direct the flow of gas through the furnaces alternately in reverse directions, as may be required, substantially as set forth.

294,302. EXPANSIBLE DRILL. ORRIN ALLEN, Denver, Colo. Filed Jan. 28, 1884. (No model.)

Claim.—1. The hereinbefore-described expansible drill, consisting, substantially, of the stem A, having grooves *a a* made therein, and the guard B, affixed thereto, as set forth, the supplemental drills D D, having extensions *d d* thereon, and provided with notches C, the catches E, and

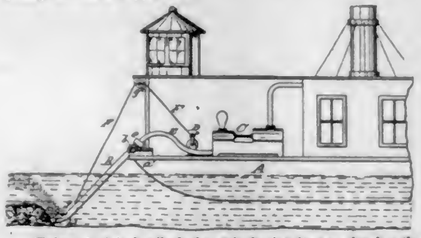
294,302.

spring F, all operating as described and specified, and for the purpose set forth.

2. The stem A, having grooves *a a* therein, and guard B, attached thereto, as specified.

3. The supplemental drills D D, pointed at their lower extremities, and provided with notches C.

4. The catches E, fulcrumed between the sides of the stem A, by which the supplemental drills are sustained in position.

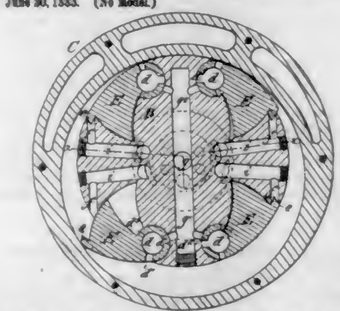


5. In an expansible drill, the combination, with the stem A, having grooves *a a* therein, and the guard B, attached thereto, as set forth, of the supplemental drills D D, as specified and described.

6. In an expansible drill, the combination, with the stem A, having grooves *a a* therein, and the guard B, attached thereto, and the supplemental drills D D, of the catches E E and springs F, all operating as described and specified.

7. In an expansible drill, a stem forming a drill, supplemental drills by which the cutting-surface is increased, suitable means of retaining the drills in position to penetrate rock or other materials, and suitable means of retaining the drill in position to be raised and lowered through the casing, as described and specified.

294,303. HYDRAULIC DREDGE. JOHN H. ANDERSON, Shelby, Nebr. Filed Sept. 20, 1883. (No model.)



Brief.—An ejection-tube having trunnions at the upper end to permit its vertical play has at the lower end a nose provided with upwardly-opening valves on its upper face.

Claim.—1. A hydraulic dredge-tube having its nose closed at the end and provided on top with upwardly-opening valves *b*, as and for the purpose specified.

2. The dredge-pipe B, constructed substantially as described, with the nose b^2, valves b^4, and trunnions *b*, and adapted to be secured to the boat A and to have a vertical motion about the trunnions *b* and to carry a stream of water, as set forth.

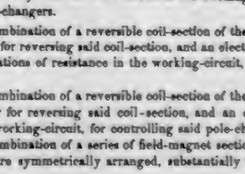
294,304. REVOLVING-CYLINDER ENGINE. JOHN J. BLAIR, Tacoma, Wash., assignor to himself, and Robert R. Blair, Aurora, Ind. Filed June 30, 1883. (No model.)

Claim.—1. In a revolving-cylinder engine, the combination, with the packing between the gland and solid part *c*, of the stationary shaft A, having between its ends the disk B, the ring C, and the plates *a*, provided with boxes D, whereby said shaft A and disk B may be inclosed, so as to press the packing, as described.

2. The combination, with the swinging gates E, having hollow journals *d* and projections *e*, of disk B, formed with passages *i g f*, and shaft A, having longitudinal passages *g m*, substantially as shown and described.

3. The combination of ring C, plates *a*, boxes, packing-glands *b*, shaft A, having steam-passages, and disk B, having longitudinal and radial passages, substantially as described.

4. The shaft A, having a reduced or shouldered portion, and formed with a solid projection, *c*, combined with box D, so as to form a steam and valve chest, *l*, substantially as shown and described.



5. The combination of the fixed ring *o* and valve-rings *p q*, provided with ports, and formed with lugs *p' q'*, combined with shaft A, having steam-passage *m*, and the box D, having grooves p^3, substantially as described.

6. The swinging gates E, having hollow journals *d* and ports *d''*, combined with disk B, having passages $g' g^3$, substantially as described.

7. In a revolving-cylinder engine, the gates E, having their journals or ends *d* made hollow and with ports *d''*, in combination with shaft A, having passage *g*, and the disk B, having transverse passages $g' g^3$ and ports d^3, whereby steam may be exhausted from the steamway, as described.

8. The valves m^2, combined with the shaft and disk having passages *m' i*, and the valve-rings *o p q*, substantially as described.

294,305. CURRY-COMB. HENRY C. BULL, Southington, Conn., assignor to the Southington Cutlery Company, same place. Filed Oct. 5, 1883. (Model.)

Claim.—The herein-described curry-comb, consisting of a series of double comb-bars of a curved form and with a curved and solid back between each adjoining pair, each back and two comb-bars being made integral from blank of form shown in Fig. 3, and secured to the main frame, substantially as described, and for the purpose specified.

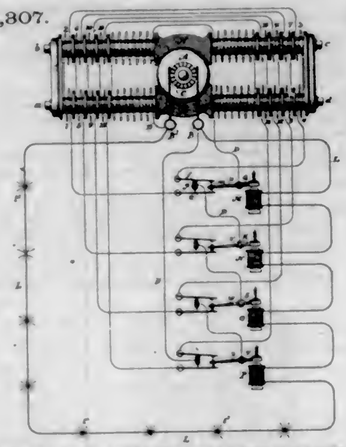
294,306. CAR-BRAKE. WILLIAM BRUMMER, Baltimore, Md. Filed Jan. 19, 1884. (No model.)

Claim.—1. In a railway-car brake, the metal plates F F', constructed substantially as shown, in combination with a lever, D, and connecting-bars E E', substantially as herein set forth.

2. A brake for railway-cars, consisting of the metal plates F F', carrying the rubber blocks, the lever D, connected to said plates by rods E E', and a spring, *e*, all arranged to operate substantially as and for the purpose specified.

3. In a railway-car brake, the metal plates F F', having inwardly-projecting portions H, and slotted outer ends, in combination with connecting-bars, and a lever for operating the same, substantially as and for the purpose set forth.

294,307. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. CHAS. L. BUCKINGHAM, New York, N.Y. Filed Dec. 17, 1883. (No model.)



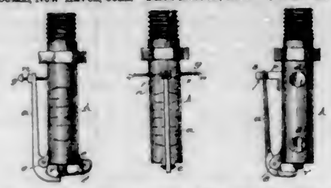
Claim.—1. In a dynamo-electric machine, the combination of a series of coil-sections of the field-magnets, and a series of pole-changers for reversing the circuit through any one or all of the coil-sections, and means, controlled by variations of current in the working-circuit, to operate said pole-changers.

2. The combination of a reversible coil-section of the field-magnets, a pole-changer for reversing said coil-section, and an electro-magnet controlled by variations of resistance in the working-circuit, to operate said pole-changer.

3. The combination of a reversible coil-section of the field-magnets, a pole-changer for reversing said coil-section, and an electro-magnet placed in the working-circuit, for controlling said pole-changer.

4. The combination of a series of field-magnet sections whose component parts are symmetrically arranged, substantially as described, a

294,307.



pole-changer for reversing said section, and an electro-magnet for controlling said pole-changer by variations of current in the working circuit.

5. The combination of a series of reversible field-magnet sections, a corresponding series of independent pole-changers, a mechanical device for operating said pole-changers in succession, and an electro-magnet for controlling said mechanical device for controlling the pole-changers.

6. The combination of a series of field-magnet sections and a corresponding series of devices, each of which is adapted to short-circuit its corresponding field-section, a mechanical apparatus for operating said devices, and an electro-magnet placed in the working-circuit, for controlling said mechanical apparatus.

7. The combination of electro-magnet M', placed in the working-circuit, a series of circuit-controlling arms, Q R S T, a series of field-coil sections, and means for bringing said arms successively into operation, substantially as specified.

294,308. FIRE-EXTINGUISHER AND FIRE-ALARM. CHARLES E. BULL, New Haven, Conn. Filed Nov. 20, 1883. (No model.)

Claim.—1. A sprinkler provided with a screw-threaded portion and with means for spreading the water, combined with a valve for closing the sprinkler and a lever having a fusible adjunct, whereby said valve is held normally closed, said lever being attached to the sprinkler without the application of heat, substantially as set forth.

2. As a new article of manufacture, a lever provided with a fusible adjunct and adapted to be attached to a sprinkler without the interposition of heat, substantially as set forth.

3. The combination, with a sprinkler and a valve for closing the same, of a lever pivoted to the sprinkler and provided with a fusible adjunct, and means whereby one arm of the lever is caused to hold the valve closed while the other arm is pressed outward from the sprinkler until released by heat, substantially as set forth.

4. A sprinkler constructed to deliver opposed streams, and provided with a valve governing the water-supply, combined with fusible devices adjustably attached to the sprinkler, and connected thereto without the interposition of heat, substantially as set forth.

5. The sprinkler A, provided with a valve, as described, combined with the pivoted lever *a* and means whereby one arm of the lever is pressed outward from the sprinkler, while the other arm is caused to exert a pressure upon the valve, substantially as set forth.

6. The sprinkler A, provided with a valve, as described, combined with the pivoted lever *a*, having a fusible adjunct, and the screw *g*, substantially as set forth.

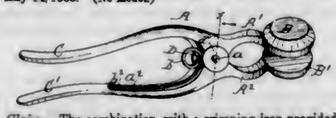
7. The sprinkler A, combined with the pivoted lever *a*, valve-stem *o*, and intermediate device, *f*, substantially as herein set forth.

8. A sprinkler constructed to deliver opposed streams, combined with fusible devices adjustably attached to the sprinkler upon its exterior, and connected thereto without the interposition of heat, substantially as set forth.

9. The sprinkler A, having arms provided with openings *d d*, combined with the valve *v'*, pivoted lever *a*, screw *g*, and nut *n*, the whole constructed to operate substantially as set forth.

10. A sprinkler consisting of a screw-threaded portion, *a*, distributing portion secured thereto and provided with outlets adapted to discharge opposed streams, a valve seated against the screw-threaded portion, so as to exclude water from the distributing portion, and fusible devices located upon the outside of the sprinkler, for holding said valve to its seat until released by the action of heat, substantially as described.

11. The combination, with a sprinkler, of electrical-circuit connections insulated therefrom, and constructed to be actuated by the gravity of the moving parts, or by the pressure of water upon the moving parts of said sprinkler, to make operative an electric circuit when said sprinkler becomes open.



12. The combination, with a sprinkler, of electrical-circuit connections insulated therefrom and adapted to be actuated by the pressure of water acting upon the moving parts of the sprinkler, for making operative an electric circuit when said sprinkler becomes open.

13. The combination, with the sprinkler A, of the contact-plates 1 and 2 and means for holding them in contact with each other until the sprinkler becomes open.

14. The combination, with a sprinkler, of electrical-circuit-controlling devices insulated therefrom and adapted to make operative an electric circuit when said sprinkler opens, and so arranged in relation to the moving parts of said sprinkler as to neither accelerate nor retard their motion when said moving parts are released.

15. The combination, with a sprinkler, of electrical-circuit-controlling devices insulated thereon in a manner to become detached therefrom when said sprinkler opens.

294,309. HAIR-CRIMPER. MARK CAMPBELL, Chicago, Ill. Filed May 14, 1883. (No model.)

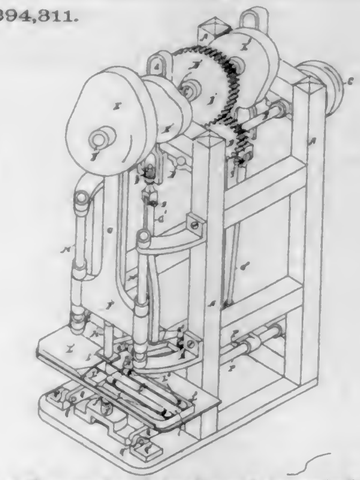
Claim.—The combination, with a crimping-iron provided with shallow recessed grooves on the inner side of the handles thereof, of the spring D, having a tension-loop formed in the middle, and the washers *d d'*, placed on the fulcrum-rivet, substantially as described.

294,310. CHECK-REIN HOOK. THOMAS A. CRABTREE, East Surry, assignor of one-half to Eugene Hale, Ellsworth, Me. Filed Dec. 12, 1883. (No model.)

Claim.—As an improved article of manufacture, a check-rein hook consisting of a standard for holding the rein, a rear standard having a horizontal guard extending forward past the standard which holds the rein, with a space between it and the said standard to admit the rein, the whole being provided with an extension for attachment to the saddle, substantially as described.

294,311. PRESS FOR PRESSING AND STAMPING. JOHN DENNIS and GEORGE B. CORAM, Lowell, Mass., assignors, by direct and mesne assignments, to Joseph A. Coram and Nathan Crosby, same place. Filed June 8, 1883. (No model.)

Claim.—1. A press provided with a positive automatic picking-off device, as and for the purpose specified.



2. The combination of the die-box K, the lower die, I', and means for giving to said die a positive motion in both directions, as and for the purpose specified.

3. The combination of the dies, means for raising the same, means for causing the same to rest, means for causing the same to draw away from each other and the nippers, and means for causing the same to advance and close, as and for the purpose specified.

4. The combination of the dies, means for raising the same, means for causing the same to rest, means for causing the same to draw away from each other, the nippers, and means for causing the same to advance and close, and means for causing said nippers to rest until the dies have separated from the stamped bar, as and for the purpose specified.

5. The combination of the lever Q, means for reciprocating the same, the nippers R R, hinged to said lever, and provided with the projections R' R', and the dead-points R^2 R^2, as and for the purpose specified.

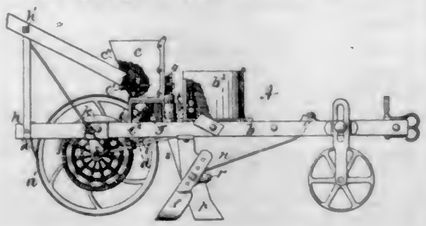
294,311.

6. The combination of the lever Q, means for reciprocating the same, the nippers R R, hinged to said lever, and provided with the projections R' R', the dead-points R^2 R^2, and means for opening said nippers, as and for the purpose specified.

7. The combination of the lever Q, provided with the arm Q^2, the cam E', means for rotating the same, and the rod G', provided with the stud k', and adjustably connected to said arm Q^2, as and for the purpose specified.

8. The combination of the die-box K, the table provided with an opening to receive said die-box, and means for adjusting the upper surface of said table to fit said die-box, as and for the purpose specified.

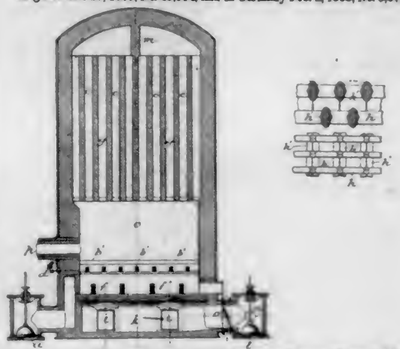
9. The combination of the die-box K, the bed-piece L, and the top pieces, L' L^2 L^3 L^4, and means for adjustably securing said top pieces to said bed-piece, as and for the purpose specified.



294,312. DEVICE FOR HOLDING AND CUTTING PAPER FROM ROLLS. JOHN H. EARL, Chicago, Ill., assignor to the National Roll Wrapping-Paper Company, same place. Filed Nov. 9, 1883. (No model.)

Claim.—1. The combination, with a receptacle or case, as described, of the projecting lips C C', provided with the central aperture, *d*, and a roll of wrapping-paper inserted loosely in said case, the loose end whereof is adapted to be drawn through between and severed by said lips into sheets of the required size, substantially as set forth.

2. In a roll wrapping-paper holder and cutting device, the combination, with the case A, of the lateral projecting lips C C' and the encircling-bands *a a'*, provided with the clamping-lugs a^2, substantially as and for the purpose set forth.

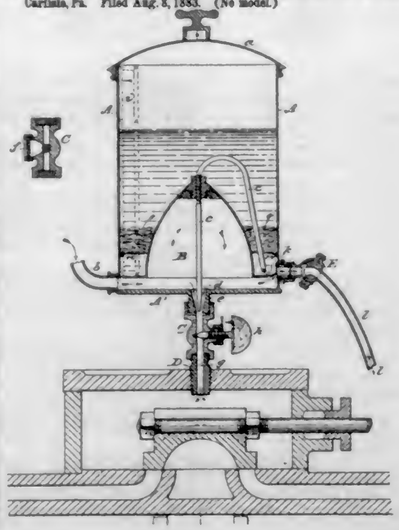


294,313. COMBINED DRILL AND FERTILIZER-DISTRIBUTER FOR ONE-HORSE PLANTERS. AUSTIN C. EVANS, Springfield, Ohio. Filed June 21, 1883. (No model.)

Claim.—1. A bottom plate for a fertilizer-hopper, having an inclosed ring cast upon or attached thereto under the feed-disk, whereby the latter is elevated above said bottom plate, and the fertilizer substance prevented from packing between the disk and the bottom plate of the fertilizer-hopper.

2. In a bottom plate for a fertilizer-hopper having a horizontal feed-disk rotating over the same, a chamber formed under the middle portion of said disk in the hopper-bottom by means of an endless flange or ring, upon which said disk rotates, said chamber having a hole or holes leading out through the bottom plate under it, to allow the escape of any fertilizer-dust that may have worked its way between the bearing-ring and the body of the disk.

294,314. REGENERATIVE HOT-BLAST STOVE FOR BLAST-FURNACES. BENJAMIN FORD, Middlesbrough-on-Tees, and JOHN MONCUR, Distington, England. Filed Mar. 10, 1883. (No model.) Patented in England Aug. 15, 1882, No. 3,897; in France Jan. 27, 1883, No. 141,105; in Belgium Jan. 27, 1883, No. 43,914, and in Germany Feb. 2, 1883, No. 5,072.



Claim.—1. The combination, with the several compartments *h* into which the regenerator is divided, of the corresponding internal valves, *i*, and the flue *k*, substantially as and for the purposes described and shown.

2. In combination, the compartments *h*, valves *i*, combustion-chamber *c*, air-flues *f f*, openings *f'' f''*, gas-flues *b b*, and openings *b' b'*, substantially as described and shown.

3. The combination of the separate compartments *h* of the regenerator, the internal valves, *i i*, flue *k*, and external valve or valves, *o*, for the purpose of removing and carrying away deposit from combustion, substantially as described and shown.

4. The triangular or lozenge-shaped stays *h'*, located between the walls of the regenerator *h*, substantially as described and shown.

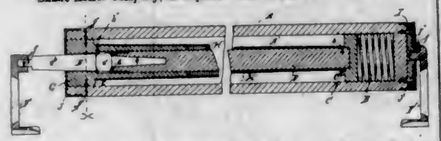
294,315. LUBRICATOR. WILLIAM S. GERHEYER and JOHN A. DURKIN, Carlisle, Pa. Filed Aug. 8, 1883. (No model.)

Claim.—1. In a lubricator, a reservoir provided with a receptacle for steam connected to the steam-space, and having a siphon-connection with the lubricant in said reservoir, and acting as an injector to force the lubricant to the desired place, substantially as specified.

2. In a lubricator, a reservoir provided with a steam-receptacle, and having a siphon-connection with the lubricant in said reservoir, and acting as an injector to force the lubricating material regulated by a needle-valve to the desired place, substantially as shown, and for the purpose set forth.

3. A lubricator provided with a steam-receptacle, as shown, and having a pipe provided with a universal joint and a receptacle for asbestus at its lower end for lubricating the piston-rod, substantially as described.

4. The combination of a reservoir, A, provided with a steam-receptacle, B, connected to the steam-space of boiler, and by siphon-pipe *c* to lubricant in reservoir, with the openings *d* and *g*, arranged substantially as set forth.



5. The combination of a reservoir, A, constructed, as shown, with the wire screen *n* and asbestus filling *o*, all arranged as and for the purpose specified.

6. The combination of a reservoir, A, provided with steam and siphon connections, as shown, with a pipe, F, having branches F', and the guides of an engine, substantially as and for the purpose set forth.

7. The combination of a reservoir, A, provided with steam and siphon connections, as shown, with opening *g* and needle-valve C, provided with sight-glass *f*, all substantially as specified.

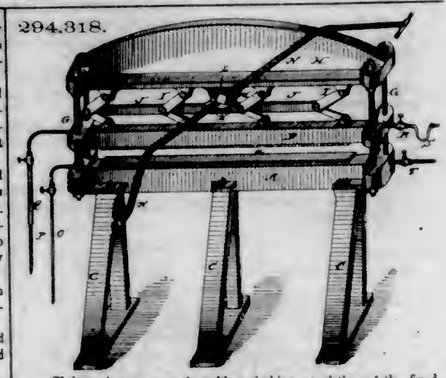
8. The automatic lubricator herein described, consisting of reservoir A, steam-receptacle B, steam-pipe *b*, siphon-pipe *c*, opening *d*, needle-valve C, having sight-hole *f*, and handle *h*, provided with indicator, and a pipe leading to the piston-rod, all substantially as specified.

294,316. SPRING SHADE-ROLLER. MARSHALL E. GRAVES and PRESCOTT C. GATES, Lowell, Mass., assignors to the Shorey Spring Bed and Shade Roller Company, same place. Filed Sept. 3, 1883. (No model.)

Claim.—1. The combination of the hollow barrel, the spindle having a portion angular in cross-section, means of imparting a longitudinal outward motion to said spindle, the plug secured within said barrel, and having a longitudinal central opening adapted to fit said spindle, and thereby to prevent rotation of the same, as and for the purpose specified.

2. The combination of the hollow barrel, the spindle having a portion angular in cross-section, the locking-spring, the sliding bearing, the plug secured within said barrel, and having a longitudinal central opening, a portion of said opening being angular in cross-section to fit said spindle, and thereby prevent the rotation of the same, all constructed and arranged substantially as set forth.

294,317. PENCIL AND ANALOGOUS ARTICLES. GEORG HACKER, Nuremberg, Bavaria, Germany, assignor to Gustavus Schwanhaeusser, same place. Filed Jan. 4, 1884. (No model.)

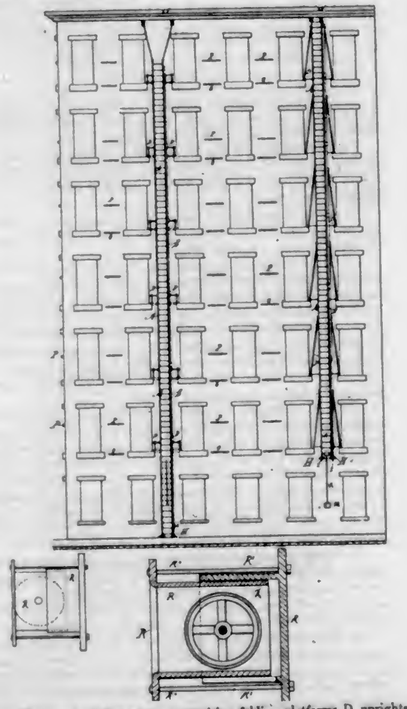


Claim.—1. The combination of the ring E, with means, substantially as described, for imparting a reciprocating movement to it, with the spring-jaws *d e*, and means, substantially as described, for moving the same, and with the outer tube, A A^3, all arranged so that the object B, which is embraced by the ring E, can be pushed out by said ring, and will then be retained and prevented from returning to its former position by the spring-jaws *d e*, substantially as described.

2. The combination of the tube A A^2 with the push-button C, spring *b*, tubes D F, the tube D having lugs *g*, for engaging the tube F, and with the push-ring E and spring-detents *d e*, substantially as herein shown and described.

3. The combination of the tube A A^2 with the push-button C, spring *b*, tubes D and F, push-ring E on tube D, and spring-detents *d e* on tube F, substantially as herein shown and described.

4. The combination of the tube A A^2 with the push-button C, spring *b*, tube D, arms *f*, ring E, tube F, shoulder *i*, and spring-detents *d e*, substantially as herein shown and described.

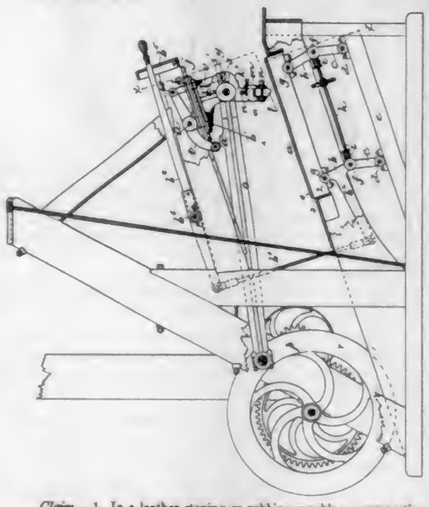


294,318. STAY-PRESS FOR RUBBER CLOTHING. THEODOR HAWLEY, Fairfield, Conn., assignor of one-half to E. W. Harral, same place. Filed Oct. 18, 1883. (No model.)

Claim.—A stay-press for rubber clothing, consisting of the fixed bed A, having steam-chamber B and raised portion *a*, movable platen D, having steam-chamber E, and recessed on its under side at *d*, elastic cushion F, means for actuating the movable platen D, fixed steam-pipe O, steam-pipe P, having telescopic joint Q, fixed exhaust-pipe T, and exhaust-pipe R, having flexible joint S, the whole constructed and combined substantially in the manner and for the purpose herein shown and described.

294,319. FOLDING FIRE-ESCAPE LADDER. FERDINAND W. HOFELE, New York, assignor to Eben S. Allen, Larchmont, N. Y. Filed Apr. 17, 1882. (No model.)

Brief.—A ladder adapted to be folded close against the building, one upright of which is formed of a water-supply pipe, and is provided with folding platforms and railings. An extension-pulley is arranged in the wall of the building, through and over which the counter-weight ropes pass.



Claim.—1. A fire-escape comprising folding platforms D, uprights E and hand-rails F, and a ladder, one upright of which ladder is formed of a water-supply pipe.

2. The combination, with a ladder adapted to fold up against the building, of the platforms D with the upright posts E and rails F, substantially as set forth.

3. In a folding-platform fire-escape, the combination of the extension-pulleys R and bolts R', substantially as described, and for the purpose set forth.

4. A fire-escape comprising folding platforms and a ladder, one upright of which ladder is formed of a water-supply pipe, as and for the purposes set forth.

294,320. LEATHER-STONING MACHINE. JOHN H. HOVEY, Woburn, Mass., assignor of one-half to E. L. Shaw & Co., same place. Filed Dec. 19, 1883. (No model.)

Claim.—1. In a leather stoning or rubbing machine, a supporting bed or table composed of a rigid base, a sheet of elastic rubber, and a covering of flexible sheet metal, as set forth.

2. The combination of a bed or table, a rubbing-tool reciprocating in fixed guides, and means, substantially as described, for varying the height of said bed and holding it at any height to which it may be adjusted, as set forth.

3. The combination of a bed or table, a rubbing-tool reciprocating in fixed guides, and means, substantially as described, for varying the inclination of said bed, as set forth.

4. The combination of a bed or table, fixed rectilinear guides, a cross-head adapted to move in said guides, a rotating wheel or crank, and a connecting-rod actuated thereby, whereby the cross-head is reciprocated, a tool-holder pivoted to the cross-head, and adapted to oscillate independently of the cross-head and connecting-rod, and shoulders or bearings, as *s s'*, formed on the cross-head and tool-holder, and adapted to make the tool-holder rigid when the cross-head is moving forward, the pivotal connection of the tool-holder to the cross-head enabling it to yield when the cross-head is moving backward, as set forth.

5. The combination of a bed or table, a cross-head movable in fixed guides, mechanism for reciprocating said cross-head, a tool-holder pivoted to the cross-head, and means, substantially as specified, whereby the tool-holder is thrown back to raise the tool from the leather during the backward movement of the cross-head, and thrown forward to present the tool to the leather during the forward movement of the cross-head, as set forth.

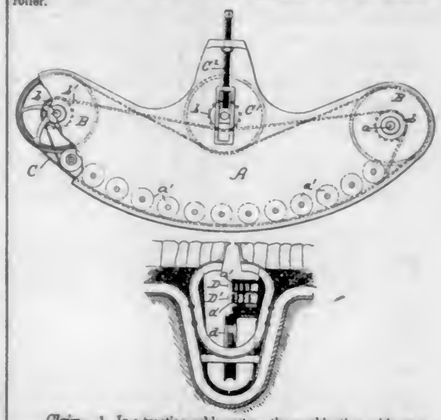
6. The combination of the bed or table, the jointed legs or supports therefor, having oppositely-threaded sockets *i i*, and the rod *k*, having oppositely-threaded ends engaged with said sockets, as set forth.

7. The combination of the bed or table, the jointed legs or supports therefor, the arm b^2 on one of said legs, the connecting-rod b^3, the pivoted lever b^4, and locking devices for said lever, as set forth.

8. The cross-head having the shouldered arm *k'*, combined with the shouldered tool-holder k^2, pivoted to said arm, as set forth.

9. The combination of the cross-head having the shouldered arm *k'*, the shouldered tool-holder k^2, pivoted to said arm, the connecting-rod *o*, the lever *t*, pivoted to the cross-head, the link *v*, connecting the lever *t* with the tool-holder, and the spring *b'*, connecting the lever *t* with the cross-head, as set forth.

294,321. TRUSS. ELSBRIDGE HOWE, Peterborough, N. H. Filed Dec. 3, 1883. (No model.)

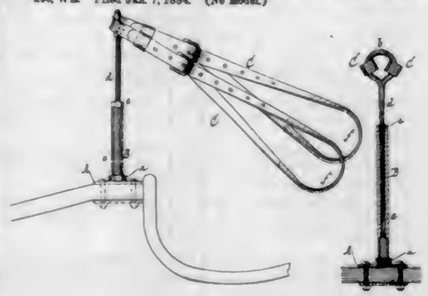


294,321.

Claim.—In a truss, the combination of a plate secured upon the pad, and forming a concavo-convex cup upon its outer end, provided with corrugations upon its convex side, and having a large central aperture, a plate secured upon the end of the spring, and forming a concavo-convex cup upon its outer end, provided with corrugations upon its concave side, and having a small central aperture, a set-screw fitting in the smaller aperture and playing in the larger aperture of the cup, and a concavo-convex nut fitting upon the inner end of the screw, as and for the purpose shown and set forth.

294,322. MECHANISM FOR CARRYING WIRE CABLES AROUND CURVES. GEORGE JUDGE, Chicago, Ill. Filed July 11, 1883. (No model.)

Brief.—To prevent wear of the cable by contact with the pulleys on curves, an endless traveling belt overlies the pulleys and receives the friction of the cable. The slack of the belt is taken up by an adjustable roller.



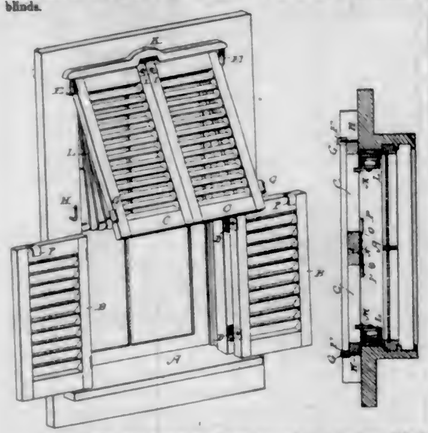
Claim.—1. In a traction-cable system, the combination, with an operating-cable, of two or more sets of revolving drums, a series of rollers arranged in a curved plane between said drums, and an endless carrying-belt interposed between said rollers and cable, whereby said cable is provided with a continuous bearing-surface, substantially as and for the purpose set forth.

2. In a traction-cable system, the combination, with a number of revolving drums, of a series of rollers arranged in a circular plane, an endless belt, an adjustable tightening-pulley, and an adjusting-screw, substantially as set forth.

3. The combination, with a wire cable used in operating street-cars around a curve, of an endless belt supporting and carrying said cable by frictional contact, said belt traveling over a series of drums and rollers, whereby the wear and strain on the cable are distributed over all parts alike.

4. The combination, with the drums B B', of the tightener-pulley C', the sprocket-wheels *b*, and the chain belt *b'*, as and for the purpose described.

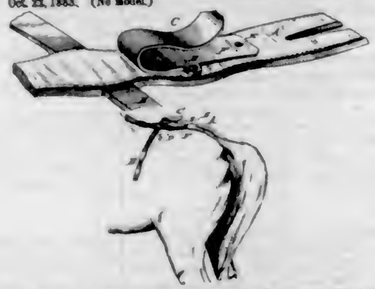
294,323. SCHOLAR'S SHOULDER-BRACE. ISIDOR KELLER, Milwaukee, Wis. Filed Jan. 7, 1884. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, of the bracket, the standard secured in said bracket, and the shoulder-straps secured to the standard.

2. The combination, substantially as hereinbefore described, of the bracket A, the tube *c*, secured to said bracket, the rod *d*, fitting the tube *c*, and made adjustable therein, and the looped shoulder-straps secured to the rod *d*.

3. The combination, substantially as hereinbefore described, of the tube *c*, the rod *d*, fitting the tube *c*, and made adjustable therein, and the shoulder-straps secured to the rod *d*.

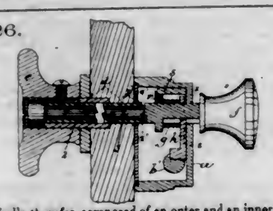


294,324. WINDOW BLIND AND AWNING. EDWARD LEE, Dannemora, N. Y., assignor of one-half to Aaron T. Clark, Warnerville, Mass. Filed Sept. 5, 1883. (No model.)

Brief.—Detachable fan-shaped leaves form the sides of the awning portion. Means are provided for detachably connecting the upper and lower halves, when they may be opened horizontally, like ordinary blinds.

Claim.—The combination of the window-frame, the lower blinds, the upper blinds, hinged in such a manner as to be capable of swinging either in a vertical or horizontal plane, the fan-like leaves, pivoted to the upper inner corners of the window-frame and adapted to be detachably connected with the upper blinds, means for connecting the upper blinds together, and means for connecting the upper blinds detachably with the lower blinds, substantially as set forth.

294,325. REIN-HOLDER. NATHAN CARTER MOODY, Newburyport, Mass., assignor of one-half to Charles H. Richardson, same place. Filed Oct. 22, 1883. (No model.)



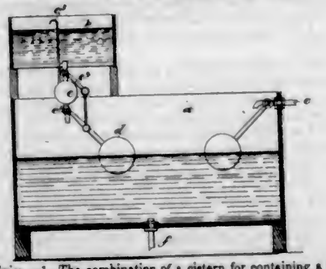
Claim.—A rein-holder consisting of a flat rearwardly-pointing spring-hook having two perforated laterally-projecting lips upon the sides of its base-plate, and a perforation in the rear end of the base-plate for the reception of fastening-rivets, in combination with the crupper-strap of a set of harness, as and for the purpose shown and set forth.

294,326. DOOR-LATCH. EPHRAIM S. MORTON, Plymouth, assignor of one-half to SAMUEL LORING, Duxbury, Mass. Filed Dec. 11, 1883. (No model.)

Claim.—1. In a latch and lock, the combination of a bolt, a rotary

294,326.

operating-spindle therefor, composed of an outer and an inner section having operating knobs and handles at their outer ends and interlocking teeth at their inner or meeting ends, the inner section being engaged with the bolt, and adapted to be separated from the outer section, to render the latter inoperative, and means for locking the inner section when it is separated from the outer section, as set forth.



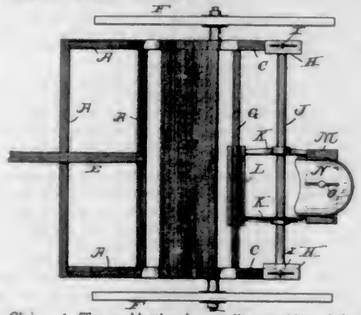
2. The combination of a bolt, a rotary operating-spindle therefor, composed of an outer and an inner section having operating knobs or handles at their outer ends and interlocking teeth at their inner or meeting ends, the inner section being adapted to be separated from the outer to render the latter inoperative, an arm or lever whereby the inner section is connected with the bolt, a spring arm or detent adapted to engage with the inner section when it is disconnected from the outer, to hold the two sections apart, and a spring whereby the inner section is engaged with the outer when disengaged from said arm or detent, as set forth.

3. In a latch and lock, the combination of the following elements, viz: first, a bolt; secondly, a rotary operating-spindle therefor, composed of two separable sections automatically engaged, as described, and provided with operating knobs or handles, and a key-hole extending through the outer and into the inner section, the latter having an eccentric socket for the end of a key-shank, a notch or transverse slot for a spring locking-arm, and an arm or lever engaged with the bolt; thirdly, a spring locking-arm adapted to automatically engage with the slot of the inner section when the latter is separated from the outer section; and, fourthly, a key adapted to be inserted in the key-hole of the tubular sectional spindle, to disengage said spring-arm from the inner section, as set forth.

4. The combination of the bolt, the rotary operating-spindle composed of automatically-engaged separable outer and inner sections, and provided with a key-hole extending through the outer and into the inner section, an arm or lever engaging the bolt with the inner section of the spindle, a spring arm or detent adapted to automatically engage and hold the inner section of the spindle when the same is separated from the outer section, to hold the two sections apart, and a rotary button or cam adapted either to lock said spring-arm in engagement with said inner section or to hold it away from said section, as set forth.

5. In a latch and lock, the bolt-operating spindle composed of the separable and automatically-engaged sections 2 3, the latter having an arm, *h*, engaged with the bolt, a stud, *r*, and a transverse notch or slot, *k*, combined with the fixed lug or shoulder *s*, and the spring arm or latch *j*, adapted to engage with the stud *r* and notch *k* when the section 3 is separated from the section 2, and prevent both longitudinal and rotary movement of said section 3, as set forth.

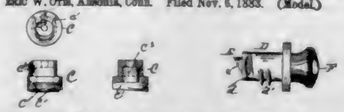
294,327. DEODORIZING AND DISINFECTING APPARATUS. GEO. NOSER, 27 Dudley Grove, Harrow Road, County of Middlesex, assignor to John William Raimes, Acaster Malbis, England. Filed Apr. 20, 1883. (No model.) Patented in England Aug. 30, 1882, No. 4,136.



Claim.—1. The combination of a cistern for containing a fluid disinfectant, a cistern for containing a supply of water, means for automatically maintaining a supply of water in the latter, a disinfectant-holder arranged between the two cisterns, and connected with the cistern containing the fluid disinfectant and discharging directly into the water-supply cistern, a vent to the holder, two cocks arranged, respectively, on opposite sides of the holder, and means for operating the valves by the rise and fall of the water-level in the water-supply cistern, the falling of the water-level opening the cock between the holder and the fluid-disinfect-

ant cistern, and the rising of the water-level closing said cock and opening the other cock to discharge the contents of the holder into the water-supply cistern to charge the water therein with the disinfectant-fluid.

2. The combination of the water-supply cistern *a*, a supply-pipe, *c*, therefor, the fluid-disinfectant cistern *b*, the holder *e*, connected with the said cisterns, connected valves arranged on opposite sides of the holder, and a ball in the water-supply cistern, raised and lowered by the change of water-level in the water-supply cistern to control the two connected valves, substantially as described.



294,328. SEEDING-MACHINE. ALBERT N. NORRIS and HARRISON D. SPAULDER, Rushville, Ind., assignors to Norris & Brother, same place. Filed Nov. 10, 1883. (No model.)

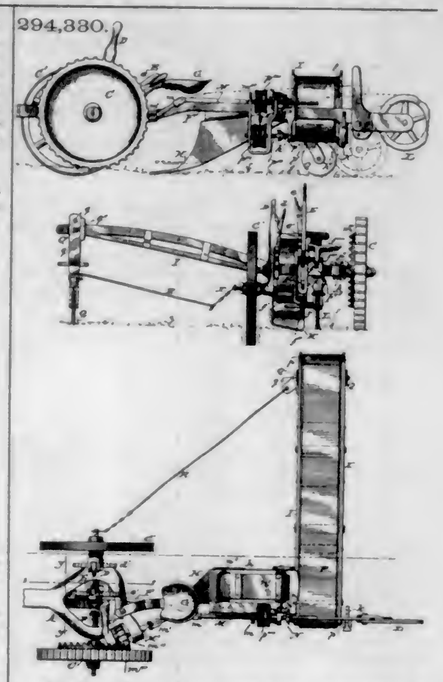
Claim.—1. The combination, in a seeding-machine, of the bar J, attached to the frame of the seeder, and fitted to adjust thereon, the seat-support pivoted thereon, and the seat fitted to adjust upon its support, substantially as and for the purpose specified.

2. In a seeding-machine, the combination of the bar J, secured to the rear of the frame, and a driver's seat pivoted on said bar and fitted to slide along the same.

294,329. FASTENER FOR MEETING-RAILS OF SASHES. FREDERIC W. OTIS, Ansonia, Conn. Filed Nov. 6, 1883. (Model.)

Claim.—1. In a sash-fastener, the combination of the socket-piece C, having the central bore, C^2, and face-opening *c*, with undercut sides *c'*, the catch E, and barrel D, having the depressions *d d* on the sides, for engagement with the undercut sides, as set forth.

2. The sash-fastener described, composed of the socket-piece C, having fin c^3, central bore, c^2, face-opening *c*, with undercut sides *c'*, and the inclined face described, and the barrel D, having depressions *d d* and fins *d''*, catch E, spring E', non-circular stem *e'*, and head F, all substantially as set forth.



294,330. ROAD GRADING AND DITCHING MACHINE. JOHN W. OTTERMAN, Fort Byron, and CHRISTIAN A. R. L. VER GENNIS, Galesburg, Ill.; said Ver Gennis assignor to said Otterman. Filed Feb. 2, 1883. (No model.)

Brief.—The front end of the plow-beam is swung by a link from an angle-lever pivoted in a block carrying a locking rack-bar or arc for such lever, and a slotted pendant embracing and preventing lateral play of the beam, but permitting adjustment on the carrying-axle, and having a set-screw and slotted bracket below and a cam-lever at top to secure in adjustment. The beam carries a plow with an elevator-belt driven by gearing from a double universally-jointed shaft, which also gives motion through pulleys to a transverse carrier universally jointed at one side to the plow-beam, and having at the other side a slotted connection, and having at its outer end a vertically-adjustable caster-wheel and an adjustable rod-connection to the main axle. A lever bent to project rearward and carrying a wheel is pivoted to the rear end of the plow-beam.

Claim.—1. In combination with the wheeled frame, plow, carrier-belt *n'*, and lateral frame I, carrying the dirt-belt, the shaft M, having universal joints *m' m''*, and geared with the wheel C and said carrier-belt *n'* and the dirt-carrying belt, substantially as and for the purpose specified.

2. In combination with the wheeled frame, plow, and dirt-carrying belts, the lever E, journaled on the axle and connected with the forward end of the plow-beam by a link, *f*, substantially as and for the purpose specified.

294,330.

3. The combination of the wheeled frame, axle, plow-beam, the lever E and its segmental rack-bar, and the pendant *f''*, adapted to slide laterally on the axle and to be held by the cam-lever *f'''*, substantially as and for the purpose specified.

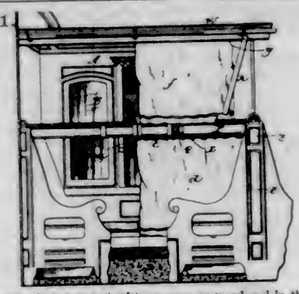
4. In combination with the wheeled frame and plow-beam, the pendant *f''*, adjustable laterally at its upper end on the axle and at its lower end in the slotted brace *f'''*, substantially as and for the purpose specified.

5. In combination with the wheeled frame, plow, and dirt-carrying belts and frame I, the wheel having its rearwardly-projecting bent lever hinged to the rear end of the plow-beam, adapted to operate substantially as and for the purpose specified.

6. In combination with the plow, the adjustable rod R and adjustable caster-wheel Q, the lateral belt-carrying frame I, hinged to the plow-beam, to permit swinging the outer end of said frame I laterally and vertically, substantially as and for the purpose specified.

7. In combination with the plow, the laterally-extending frame I, hinged at one side to the plow-beam by a universal joint and at its other side by a slotted connection which permits swinging said frame I laterally, substantially as and for the purpose specified.

8. The combination of the wheeled frame, the plow-beam hinged thereto, the lateral belt-carrying frame I, having a pulley upon its lower shaft, the carrier-belt *n'*, having geared shaft *n N'*, and a shaft, M, having a gear-wheel, N, which meshes with gear-wheel N', and a pulley connected with the pulley on the shaft of frame I by a band, substantially as described.



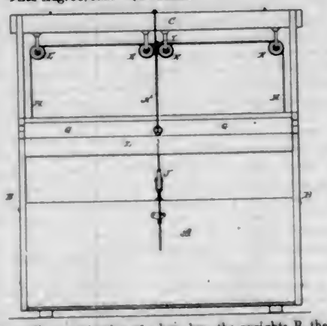
294,331. SLEEPING-CAR. THOMAS CLARKE, Truro, Nova Scotia, Canada, WILLIAM H. PAULDING, Peekskill, and GEORGE RENT, New York, N. Y. Filed June 29, 1882. (No model.)

Claim.—1. In a sleeping-car, the semi-tubular gutters hinged to the ends of the top bars of the berth, adapted to receive and cover the curtains of the upper berth, and having means for fastening their free ends at the center of the top bar of the berth, as and for the purpose shown and set forth.

2. In a sleeping-car having stationary seat-supports and back panels, the rods hinged to the upper corners of the back panels, near the aisle, having the curtains sliding upon them, and adapted to be swung out, covering the sides of the berth, and to be swung back, covering the back panels of the seat-supports, as and for the purpose shown and set forth.

3. In a swinging back for sleeping-car seats, the hinges for the swinging backs, consisting of the plate fastened upon the inner side of

294,331.



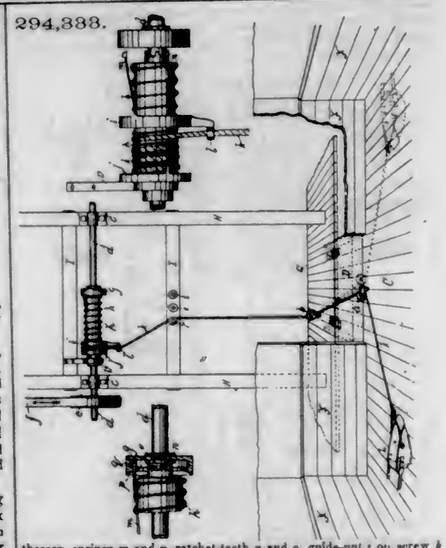
the frame and the bolt fastened with its inner reduced end in the plate, and projecting through the side piece of the frame, beyond the outer side of the same, as and for the purpose shown and set forth.

4. In a sleeping-car, the combination, with the sliding partitions, having a vertical series of notches upon one side, near their outer edge, of the spring-catches, consisting of a flat spring fastened at its lower end upon the inner side of the back panel, forming a shoulder or offset at its upper end, engaging the notches in the sliding partition, and provided with a bar having a transverse eye, fastened into the upper shouldered end, and having a bolt provided with a handle upon its outer end, and turning in horizontal bearings upon the back panel, fastened in the said eye, as and for the purpose shown and set forth.

5. The combination, in a sleeping-car, of the seat-supports, forming a vertically-slotted recess at the point where the seats adjoin, the back panels of the seats, the sliding partition having a handle projecting from the lower end of its outer edge, and having a notch in the lower outer corner of one of its surfaces, the spring-catch, and the hinged door, and the upper hinged panel, as and for the purpose shown and set forth.

6. The combination, in a sleeping-car, of the spring-catches, fastened at their lower ends to the window-frames in the side of the car, sliding horizontally and transversely to the length of the car, with their upper horizontal portions in slots in the same, and engaging under the frame of the swinging backs or upper-berth bottoms, as described, with the rods sliding transversely in the outer ends of the swinging backs, bent downward at one end, bearing against the upper ends of the spring-catches, adapted to push them in, releasing the backs, forming a handle or catch for the fingers, and having a spring keeping the sliding rod away from the spring-catch, as and for the purpose shown and set forth.

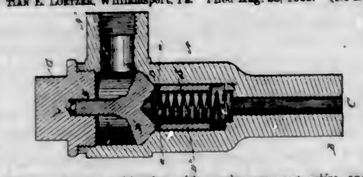
294,332. SHADE FOR HOP-BOXES. THOMAS PRIOR, Westmoreland, N.Y. Filed Aug. 31, 1883. (No model.)



Claim.—The combination of a hop-box, the uprights B, the cross-beam C, a shade which is made of the three parts G L hinged together, the cords N, and a mechanism for raising and lowering the shade upon the standards, substantially as shown and described.

294,333. AUTOMATIC GRAIN-SHOVELER. JESSE B. POGE, Indianapolis, Ind. Filed Dec. 7, 1883. (No model.)

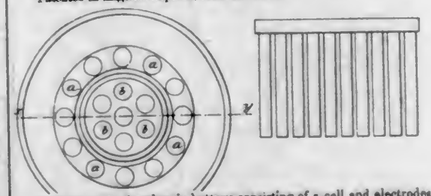
Claim.—1. The combination, in an automatic grain-shoveler, of a shaft, *d d*, to which ratchet-teeth *o* and head *g*, with rim *p*, are attached, and a cylinder bearing screw *h h* on its outer surface, and to which ratchet-teeth *n* and spring *m* are attached, and guide-nut *i*, with its arm *l*, through which rope *k k* works, all substantially as described, and for the purposes specified.



2. The combination, in an automatic grain-shoveler, of a scraper, L, rope *k k*, leading-blocks *a* and *b*, leading-rollers *r s t*, head *g*, bearing rim *p* on its inner surface, attached to shaft *d d*, cylinder bearing screw *h h* on its outer surface, encircling shaft *d d*, and having lateral movement

294,333.

thereon, springs *m* and *v*, ratchet-teeth *n* and *o*, guide-nut *i* on screw *h h*, with arm *l* and guide-nut *j*, all substantially as described, and for the purposes specified.

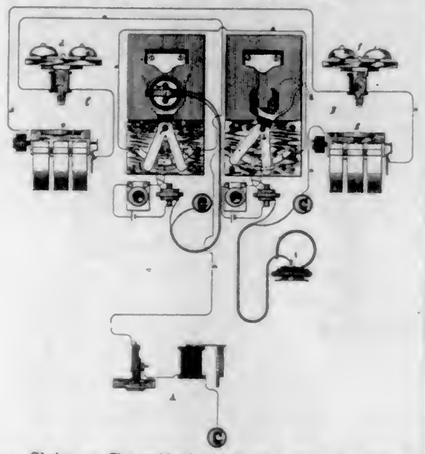


294,334. AUTOMATIC CYLINDER-COCK. ROBERT REED and CHRISTIAN E. LOETZER, Williamsport, Pa. Filed Aug. 22, 1883. (No model.)

Claim.—1. In combination with a valve-box cast entire, and having a vertical branch bored out, and constructed with a valve-seat, D, and a horizontal branch, the screw-cap G, and a valve having a perforated hollow skirting on one end and a valve-stem on the other end, substantially as described.

2. In an automatic cylinder-cock, a puppet-valve having a skirting which is perforated at *a*, in combination with a helical spring, the seat *h* therefor, and the valve-seat D, substantially as described.

294,335. GALVANIC BATTERY. OWEN C. DALHOUSIE ROSS, 50 Trafalgar Road, County of Surrey, England. Filed May 11, 1883. (No model.) Patented in England Sept. 13, 1882, No. 4,355.



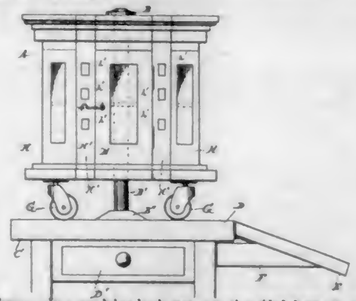
Claim.—1. A galvanic battery consisting of a cell and electrodes composed of an outer group of carbon rods or plates, *a*, and an inner group of zinc rods or plates, *b*, all united at the top by a cap-plate.

2. The combination of the group of carbon rods or plates *a*, the group of zinc rods or plates *b*, and metal plates connecting all the upper ends of the respective groups of rods or plates with a single cell having a diaphragm separating the carbon from the zinc rods or plates, substantially as shown and described.

294,336. TELEPHONE-CIRCUIT. CHARLES E. SCRIBNER, Chicago, Ill. Filed Oct. 11, 1881. Renewed Dec. 31, 1883. (No model.)

Brief.—The circuit from the central office passes first through all

the subscribers' switches to the last station on the line, and then returns through all the bells and generators. The grounding of the line at any subscriber's station therefore cuts out the switches of all stations beyond it, and the bells and generators of all stations on the line.

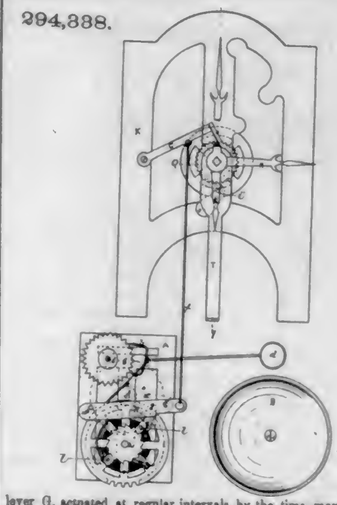


Claim.—1. The combination, at the sub-stations of a telephone-line, of switches, bell-magnets, and generators, (one switch, one bell-magnet, and one generator being at each sub-station,) said switches being connected in line in the telephone-line, so as to be in circuit nearer the central office than any of said bell-magnets or generators, whereby any subscriber, by moving the switch of his station, may cut off all generators and bell-magnets upon the line, substantially as and for the purpose specified.

2. A telephone-line extending from the central office through two, three, or more subscribers' stations, and back through signaling apparatus at said stations, in combination with switches placed in line in said telephone-line, one at each subscriber's station, whereby the signaling apparatus of all subscribers' stations on the line may be cut off at any one of said subscribers' stations.

3. A telephone-line extending through signaling apparatus at each of two or more stations, in combination with telephones, one in the ground-line of each station, and switches, one at each station, whereby all the signal-instruments may be cut off from the portion of the line which is being used for conversation.

294,337. REVOLVING BOOK-CASE. WILLIAM C. SELDOMRIDGE, Coal City, Ind., assignor of one-half to William J. Clark, same place. Filed Apr. 24, 1883. (No model.)



Claim.—In a revolving book-case, a twelve-sided drum, A, supported by casters, having at the top thereof a cap, B, to receive and hold the upper end of shaft B', and the shaft B', in combination with a socket, B'', permanently secured to the top of a table, D, as shown and described.

294,338. ALARM APPARATUS FOR CLOCKS. WILLIAM D. SMITH, Pittsburg, Pa., assignor to himself and Emil G. Stuckey and Robert Frew, both of same place. Filed Feb. 19, 1883. (Model.)

Claim.—1. In an alarm apparatus consisting of a train of wheels operating a bell-ringing device, and connected mediately or immediately with an independent time-movement, the combination of the starting-

294,388.

lever G, actuated at regular intervals by the time-movement, a stop-latch, *g*, pivoted to said lever, the locking-rod of the alarm device, and one or more locking-studs connected and revolving with the shaft of one of the wheels of the alarm-train, and engaging the stop-latch, so as to raise it into contact with the locking-rod of the alarm device, for the purpose of starting and stopping the alarm at regular intervals, substantially as described.

2. In an alarm apparatus, the combination of the notched disks D and E, actuated by a clock or time-movement, one revolving in twelve hours and the other in twenty-four hours, the lever C, and connecting-rod *f*, an alarm-train and bell-ringing device operated thereby, and having a locking-rod, the starting-lever G, and stop-latch *g*, and one or more locking-studs, *l*, connected and revolving with the shaft of one of the wheels of the alarm-train, to raise the starting-lever in contact with the locking-rod of the alarm, substantially as and for the purposes described.

3. In an alarm apparatus, a time-movement or clock having a disk fixed to the hour-hand shaft and revolving therewith, with a notch at one point in its periphery, a ratchet-wheel fixed to a sleeve on the hour-hand shaft, with a pin on said wheel to engage said notch in the disk when the alarm is to be sounded, and a hand for setting the alarm by the figures on the hour-circle of the clock, fastened to the sleeve and moving with the ratchet-wheel, in combination with a lever connected with and operating the starting and stopping device of an alarm-movement, said lever engaging and operated by the said ratchet-wheel of the time-movement, substantially as and for the purposes described.

4. In an alarm apparatus, the combination of a notched disk fixed to and revolving with the hour-hand shaft of the time-movement, having a cam, *y*, near its periphery, a loose disk having pins *i i'* projecting from its side, a ratchet-wheel, Q, fixed to a sleeve on the hour-hand shaft, and having a pin, *w*, which is in contact with the faces of the disks as they revolve, a hand, S, attached to the sleeve or hub of the ratchet-wheel and indicating time on the hour-circle of the clock-face, and a lever, C, engaging and operated by the ratchet-wheel, said lever being connected with and operating the starting and stopping device of an alarm-movement, substantially as and for the purposes described.

5. A device for setting an alarm-clock by means of a hand pointing to the required time for the sounding of the alarm on the hour-circle of the time-piece, consisting of a ratchet-wheel or equivalent device fixed to a sleeve on the hour-hand shaft of the clock, a clock-hand fixed to the same sleeve, a notched disk or equivalent device fixed to the hour-hand shaft, a pin on the face of the ratchet-wheel which enters the notch in the disk when the alarm is to ring, and a lever connected with and operating the starting and stopping device of the alarm-movement, and also engaging the teeth of the ratchet-wheel and operated thereby, constructed and operating substantially as and for the purposes hereinbefore set forth.

6. In an alarm apparatus operated by a clock or time-movement, the alarm-dial movably attached to hour-hand shaft of the clock, and having ratchet-teeth on its periphery, or a ratchet-wheel fastened thereto, in combination with an arm and a pawl pivoted thereto and engaging said ratchet-teeth, substantially as and for the purposes described.

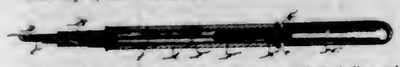
7. In an alarm apparatus operated by a clock, the combination of the clock-face, the alarm-dial having the hour-circle marked thereon movably attached to the shaft of the hour-hand, and a central face-plate rig-

idly attached to the shaft of the hour-hand, so as to move therewith, and having an aperture for exposing to view the figures denoting the time for which the alarm is set, substantially as described.

8. The arrangement of the alarm-dial relatively to the notch in the disk by which the alarm is set off, and of the alarm-dial and movable face-plate, such that the figures XII of the alarm-dial are situate at any point from one to eleven twelfths of the circle distant from the notch in said disk, and that the aperture in the central face-plate for exhibiting the hour at which the alarm is set is fixed on the hour-hand shaft in the same relative position (in twelfths of a circle) from the hour-hand, for the purpose of enabling the alarm to be set without covering with the hour-hand the figures on the alarm-dial indicating the time for which the alarm is set, substantially as described.

294,339. PIPE-CUTTER. WILLIAM L. SWEETLAND, New Haven, Conn., assignor of one-half to Felix Chillingworth, same place. Filed Nov. 28, 1883. (No model.)

Claim.—1. In a pipe-cutter, in combination with the cutting device, means for cutting into and crushing down the burr formed at the edges of the cut, substantially as shown and described.

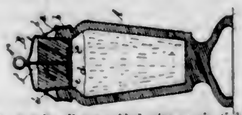


2. In a pipe-cutter, the knurled or toothed roller adapted to cut and roll down the burr formed on the end of the pipe in the process of cutting, substantially as shown and described.

3. The roller for cutting and rolling down the burrs formed by pipe-cutters upon the pipe at the edges of the cut, provided on its face with knurled or toothed portions, each adapted to come in contact with and press upon one of said burrs, substantially as shown and described.

4. In combination with the cutter-wheels of a pipe-cutter, the roller, formed with a sharp rib in the same plane with the edges of the cutter-wheels, and having its face on each side of the rib knurled or provided with sharp teeth, substantially as and for the purpose set forth.

5. The burr cutting and removing roller for pipe-cutters, having the sharp rib adapted to cut into but not through the pipe, and the portions of its face on each side of the rib knurled or provided with sharp teeth, substantially as and for the purpose set forth.



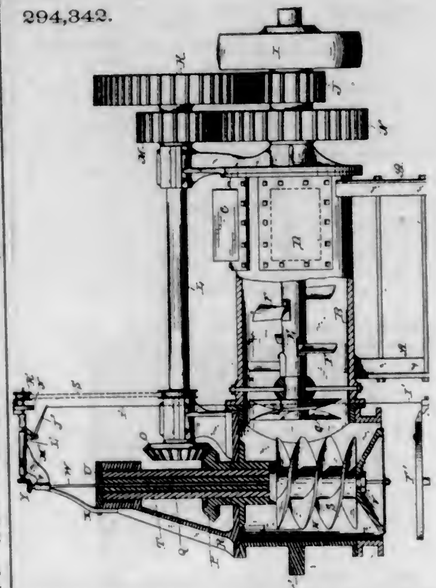
294,340. FOUNTAIN-PEN. EDWARD TYRRELL, Cincinnati, Ohio. Filed May 19, 1883. (No model.)

Claim.—1. In a fountain-pen, in combination with the hollow valve-rod or air-conduit F, adjustably secured within sleeve or guide-tube E, the rubber tubing F', secured to and uniting said rod and guide-tube, and adapted to operate as a spring to withdraw the valve-rod from its seat, substantially as herein set forth.

2. The combination, with the ink-chamber A, the guide-tube E, secured therein, and the valve-rod F, arranged to slide in the guide-tube, of a shield, F', arranged around the valve-rod and the inner end of the guide tube, to exclude ink from the latter, substantially as described.

294,341. SALT-CELLAR. STEPHEN CLARK WILCOX, Dubuque, Iowa, assignor to Le Roy Delos Randall, same place. Filed Sept. 8, 1883. (No model.)

Claim.—1. A salt-cellar provided with an air-tight closing cover or plug and a perforated diaphragm, substantially as and for the purpose described.



2. A salt-cellar provided with a ring having a perforated bottom, whereby chambers *d* and *d'* are formed within the vessel for containing the salt, and with a yielding plug or cover, which fits down into the chamber *d'* and seals the chamber *d* hermetically, substantially as described.

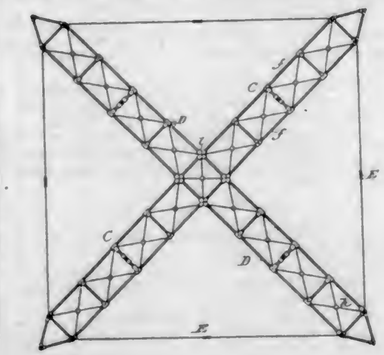
3. A salt-cellar, as a new article of manufacture, provided with a yielding plug or cover, whereby the salt contained in it is excluded from air and prevented from caking, substantially as described.

294,342. TILE-MACHINE. WM. J. WOOLLEY, Hilliard, Ohio. Filed Dec. 8, 1883. (No model.)

Claim.—1. The combination of the core, the cross-bar Z, operating-shaft, arm A'. rod B', cutter C', and spring, substantially as shown.

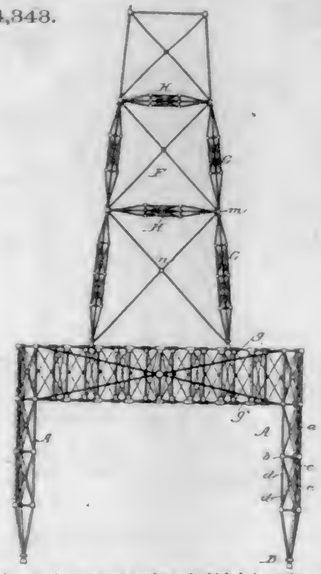
294,342.

2. The combination of the two cylinders B H and their operating mechanisms with the stand A, the cylinder B, having two openings through its sides, and provided with the interchangeable hopper C, and plate D, whereby the cylinders may be used in different positions, substantially as described.



3. The combination of the cylinder B, having the operating-shaft E projecting beyond one end to form a pivot, with the cylinder H, secured to the cylinder B at right angles, and provided with the pivot W', the stand A, upon which the cylinder B rests, and suitable devices for raising the cylinders up so as to turn them on their sides, substantially as set forth.

4. The combination of the core, the frictional cross-bar which is clamped against the under side of the core, and provided with the stop D', the operating-shaft W, arm A', rod B', cutter C', and spring E', substantially as specified.



5. In a tile-machine, the combination of the lever J', shaft L', bent rod O', provided with the dog P', and loose pulley R', provided with the projections Q', substantially as set forth.

294,343. TOWER. JOHN S. ADAMS, Elgin, Ill. Filed Aug. 7, 1882. (No model.)

Brief.—A skeleton tower formed of trussed sections, and supported upon a trussed bridging, supported also upon skeleton uprights, all adapted to be erected at the junction of streets without obstruction of highway.

294,343.

Claim.—1. A tower each upright of which is in sections, said sections being composed of several trussed chords converging toward their extremity, substantially as described.

2. A tower each upright of which consists of several sections, said sections being respectively composed of several trussed chords converging at their extremities, and each section being joined to the adjacent section by a single coupling, substantially as described.

3. A tower the uprights and struts of which are each respectively composed of several trussed chords, said uprights and struts being connected with each other by screw-threaded couplings, substantially as described.

4. A tower each upright of which is in sections composed of several trussed and tubular chords, screw-threaded at their extremities, and each section coupled with the adjacent section or sections, substantially as described.

5. The combination of a bridging supported above a carriage-way with a skeleton tower consisting of two or more sections, the uprights of which rest upon and are supported by said bridging, the base of said tower being less than the area covered by said bridging, substantially as described.

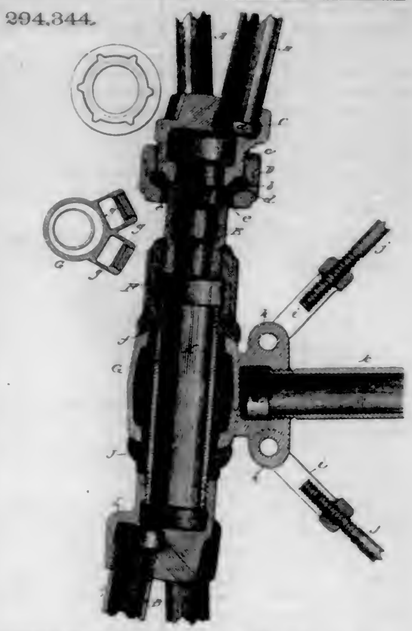
6. The combination, with a tower, of a bridging supported above a carriage-way and composed of several members intersecting with each other and having a common center with the tower at their points of intersection, substantially as described.

7 The combination, with a tower, of a base-support elevating the tower above a carriage-way, the uprights of which support are each composed of several trussed chords, substantially as described.

8. In base-supports elevating towers above a carriage-way, the combination, with uprights, each composed of several trussed chords, of a bridging, likewise composed of several trussed chords, substantially as described.

9. The combination, with a tower, of a base-support elevating the tower above a carriage-way, the uprights of which supports are each composed of several trussed tubular chords, substantially as described.

10. In base-supports elevating towers above a carriage-way, the combination, with uprights, each composed of several trussed tubular chords, of a bridging, likewise composed of several trussed tubular chords, substantially as described.



294,344. SKELETON IRON TOWER. JOHN S. ADAMS, Elgin, Ill. Filed Feb. 20, 1883. (No model.)

Brief.—Adjacent ends of trussed sections of the uprights, girts, and braces are connected by a compound ball-and-socket joint, with fastening-nuts to hold the parts in adjustment.

Claim.—1. In a skeleton tower, the combination, with one element thereof, of another joined thereto by a universal joint, whereby the two may be adjusted at any angle with each other, substantially as described.

2. In a skeleton tower, the combination, with one element thereof,

294,344.

of another element joined thereto by a ball-and-socket joint, whereby the elements may be adjusted at any desired angle with each other, and means for rigidly setting or fixing the joint when the adjustment has been effected, substantially as described.

3. In a skeleton tower, the combination, with one element thereof, of another element joined thereto by a ball-and-socket joint, one of said elements being made to pass axially through the ball and sockets of said joint, substantially as described.

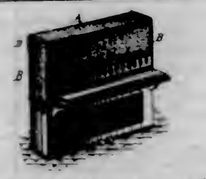
4. In a skeleton tower consisting of several uprights joined by lateral braces and tie elements, which constitute with said uprights a trussed structure, a universal joint uniting said lateral braces with the upright, whereby the two may be adjusted to any required angle with each other and brought into proper relation with each other regardless of the angle of spread between the upright elements.

5. In a skeleton tower, an upright or corner element consisting of two or more sections, one or more of said sections united to its adjacent section by a flexible joint, thus permitting the said adjacent sections to stand at different angles with the axis of the tower, substantially as described.

6. The combination, with the uprights and a coupling connecting the sections thereof, of a girt and a ball-and-socket coupling, the socket of which is formed in two parts opposing each other, substantially as described.

7. The combination, with the uprights and girts, of a tower with a ball-and-socket joint-coupling the socket of which consists of two parts opposing each other, and one of said parts being adjustable and adapted to be tightened upon the ball and the ball in turn upon the opposing socket-piece, substantially as described.

8. In a coupling, the combination of the universal joint, the compound coupling I, and the nipple, all arranged and operated substantially as described.



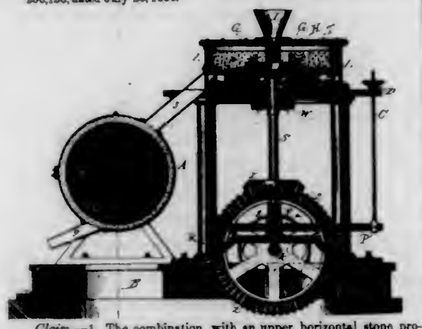
9. The combination of the coupling I, collar J, ball G, concave coupling F, and nipple K with a universal joint having one of its members screw-threaded in the concave coupling F, substantially as described.

10. The combination, with the concave coupling F, the coupler I, ball G, and collar J, of the nipple K, passing through said ball and collar and screw-threaded in the opposing couplings, F and I, substantially as described.

REISSUES.

10,450. COVER FOR UPRIGHT PIANOS. THEOPHILE F. KRAEMER, New York, N. Y. Filed Jan. 2, 1884. Original No. 270,443, dated Jan. 9, 1883.

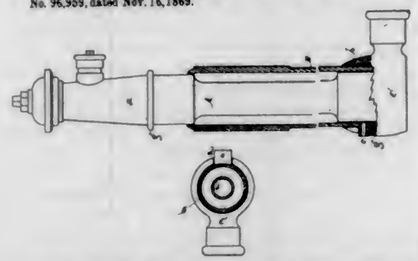
10,450.



Claim.—1. A cover for upright pianos, composed of a top piece or scarf having pendent ends, a connecting front piece, and means arranged at the back of the piano whereby the top and front pieces are retained on the upper part of the piano, substantially as set forth.

2. A cover for upright pianos, composed of a top piece or scarf having pendent ends, a front piece of less length than the pendent ends, and means at the back of the piano whereby the top and front pieces are retained on the upper part of the piano, substantially as specified.

3. A cover for upright pianos, consisting of a top piece or scarf having pendent ends, a front piece of less length than the pendent ends, and adjustable fastening-straps, which extend from the front piece across the ends of the piano to the back of the same, and are applied to a supporting center strap of the top piece or scarf, substantially as set forth.

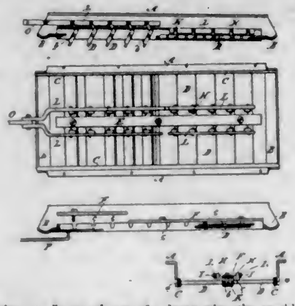


10,451. MACHINE FOR TRIMMING OR SMUTTING WHEAT, &c. WILLIAM LAUHOFF, Detroit, Mich. Filed May 22, 1882. Original No. 230,138, dated July 20, 1880.

Claim.—1. The combination, with an upper horizontal stone provided with a radial slot having closed longitudinal walls, of a slide which fits in the slot and a set-screw which engages with the upper edge of the slide, substantially as described.

2. In a machine for trimming wheat, the combination of a pair of suitably-dressed stones for ending up and trimming the wheat, an inclosing-case for said stones, having an interior grated surface, and means for carrying the grain around and throwing it against the grated interior surface of said case, substantially as described.

10,452. HYDRANT. NANCY RACE, Volney, N. Y., (Administratrix of WASHBURN RACE, deceased,) and SAMUEL R. C. MATHEWS, Philadelphia, Pa.; said WASHBURN RACE and MATHEWS assignors, by mesne assignments, to S. R. C. MATHEWS, RICHARD WOOD, EDWARD R. WOOD, GEORGE WOOD, RANDOLPH WOOD, (I. H. JOHNSON Administrator of said RANDOLPH WOOD, deceased,) and WALTER WOOD, all of Philadelphia, Pa. Filed Oct. 31, 1882. Original No. 96,959, dated Nov. 16, 1869.

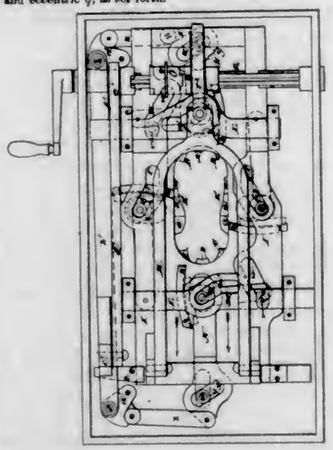


Claim.—1. The detached case or jacket B, combined with a hydrant to have end-play or vertical motion, to compensate for heaving by frost, the said case B forming a comparatively close sliding joint with the hydrant both at top and bottom, the upper part of same passing outside of the main stock of hydrant, so that any change in its position can be easily ascertained and the case driven back to its place without disturbing the hydrant.

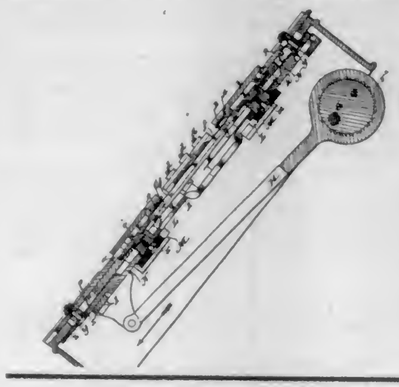
2. The detached case or jacket B, combined and arranged with a hydrant to have end-play or vertical motion, to compensate for heaving by frost, the said case B closely surrounding the hydrant at the bottom and supported by the main elbow, and the upper part of the same passing outside of the main stock of hydrant, so that any change in its position can be easily ascertained and the case driven back to its place without disturbing the hydrant, substantially as set forth.

3. As an improvement on the detached case or jacket surrounding the hydrant-stock shown and described in the former patent of RACE and MATHEWS, dated January 26, 1858, No. 19,206, the case B forming a comparatively close sliding joint both at top and bottom, and made shorter than that portion of the hydrant-stock upon which it is to have end-play, and so that such case shall have a range for vertical motion upon said hydrant-stock, substantially as and for the purpose specified.

10,453. ASH-PAN FOR LOCOMOTIVES. CHARLES F. SMITH, West Bay City, Mich. Filed Dec. 5, 1883. Original No. 281,236, dated July 24, 1883.



Claim.—1. In an ash-pan of a locomotive, the combination of the revolving leaves D, provided with the lugs H, pivoted by the bolts I to the connecting-bar L, with the bed-pieces C and center bed-piece, E, substantially as described.



2. In an ash-pan for locomotives, the hollow bed-piece E, provided with the detachable cap F and the slots *a*, in combination with the revolving leaves D and the pivots *b*, substantially as described and shown.

3. In an ash-pan for locomotives, the hollow bed-piece E, provided with the slots *c* in each side, substantially as shown, and for the purposes specified.

10,454. LASTING-MACHINE. EZRA FLURET EVAL, Everett, MASS., assignor, by mesne assignments, to himself and Stephen Snow, same place. Filed Dec. 4, 1883. Original No. 277,664, dated May 15, 1883.

Claim.—1. In a shoe-lasting machine, the combination of sets of opening and closing jaws with the reciprocating slotted frame I, pitman H, and eccentric *q*, as set forth.

2. In a machine for lasting shoes, the combination of the longitudinal and transverse bars for operating the central heel and toe and side jaws with the bifurcated pitman H, eccentric *q*, shaft G, and suitable mechanism for operating said shaft, as set forth.

3. In a shoe-lasting machine, the pitman H, adapted to be operated by the eccentric *q* on the shaft G, in combination with the parallel bars I and transverse bars L, secured in guides to the bed of the machine, as described, and provided with jaws for clamping the sides and the central portions of the heel and toe of the vamp, as set forth.

4. In a machine for lasting shoes, the continuously-rotating shaft G, provided with the eccentrics *q* and *f'*, and their pitmen connected to the jaw-operating mechanism, as described, in combination with the movable clutch O, whereby the side jaws and central heel and toe jaws are first operated, and then the two side-toe and side-heel jaws, as set forth.

5. In a shoe-lasting machine, the longitudinal bar *b'*, adapted to be moved in guides by the pitman *d''*, in combination with the bell-crank levers *a' a'*, links *z z*, slides *p p*, and jaws B B and C C, as set forth.

6. In a machine for lasting shoes, the pitman *d'*, adapted to be operated by the eccentric *f'* on the shaft G, in combination with the bars *b'*, bell-cranks *a' a'*, links *z z*, slides *p p*, and jaws B B and C C, whereby the side-heel and side-toe jaws are thrust forward to stretch the vamp over the last.

PHOTO-LITH NORRIS PETERS WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE MATTHEWS AND RACE.

Decided January 24, 1884.

1. REISSUE—RULE OF LACHES MORE RIGID WHEN INVENTION IS BROADENED THAN WHEN LIMITED.

Unreasonable delay a bar to reissue, although it is sought to narrow and restrict the claims; but the rule as to laches is more rigid in cases where applicant seeks to broaden claims.

2. REISSUE—NO LACHES UNDER THE CIRCUMSTANCES.

After litigation lasting twelve years the Supreme Court of the United States held that the patent of Matthews and Race covered a broader invention than they had a right to claim as new. Matthews and Race thereupon apply for reissue with claims restricted: *Held* that they might do so, and that six months was not in the particular case unreasonable delay.

APPEAL from the Primary Examiner.

HYDRANTS.

Reissue application filed October 31, 1882.

Mr. R. M. Hunter for the applicants.

BUTTERWORTH, *Commissioner:*

It appears from the records of this case that on November 16, 1869, there was granted to applicants a patent which contained *one broad* claim, which was subsequently—to wit, in 1882—by the Supreme Court held to be broader than they were entitled to. Within a few months after such decision the reissue application under consideration was filed with a view of narrowing the claim. The reissue contains several claims, each of which is more restricted than that contained in the original patent; but whether they are sufficiently narrow, in view of the state of the art and the decision of the Supreme Court above referred to, I am not at present called upon to decide.

The question now presented is whether the delay between the granting of the original patent and the filing of the present application does not operate as a bar to the reissue. The Examiner holds that it does, and in support of his decision refers to a number of cases decided by my predecessor in which two years are indicated as the longest period which may elapse between the date of a patent and the filing of an application for a reissue thereof. I have carefully examined said decisions, and find that they treat of cases in which the object was to *broaden* the claims, and do not contemplate a case where the purpose is to restrict or narrow them.

Section 4916 of the Revised Statutes provides:

Whenever any patent is inoperative or invalid by reason of a defective or insufficient specification, or by reason of the patentee claiming as his own invention or discovery *more* than he had a right to claim as new, * * * the Commissioner shall, on the surrender of such patent, * * * cause a new patent for the same invention * * * to be issued to the patentee.

In construing this section the courts have of late decided that a reissue for the purpose of enlarging the claim is not in terms provided for therein, and that though in a case of undoubted accident or mistake a reissue curing the defect resulting therefrom may be permitted under the general provisions of the law, yet in each case relief must be speedily applied for. (*Miller v. Bridgeport Brass Co.*, 21 O. G., 49.) But in the same decision the court hold that the statute in terms authorized a reissue for the correction of errors in the description and for the purpose of narrowing the claim, and suggest that a reissue may be proper in such cases after a longer delay than would be sufficient to bar a reissue for enlargement. An examination of the decisions upon the question of reissue will disclose the fact that the rule which suggests that laches on the part of the applicant justifies a rejection of the application has generally been applied when the end, aim, and purpose were to enlarge and broaden the claims. I do not mean to say or suggest that a party may not be guilty of such laches as would bar an application for reissue even when it is for the purpose of restricting the claim, but merely indicate that the courts hold applicants who seek in a reissue to broaden or enlarge their claim to a much more rigid rule than in cases where the reverse is true, and for reasons which are obvious.

There is no case reported which decides the question as to what is unreasonable delay in applying for a reissue for the purpose of restricting or narrowing the claim; but the decision already referred to will still be useful in guiding to a right conclusion in this case, as the question of the effect of laches is to be considered.

Section 4922 of the Revised Statutes provides in substance that a party upon disclaiming any definite part of a patented invention may maintain a suit for such other part of the invention as is justly his own, provided he has not unreasonably neglected to file the disclaimer. This section and section 4916, being in *pari materia*, must be construed together. The latter section provides that whenever a patent is "inoperative or invalid by reason of * * *. the patentee claiming as his own invention or discovery *more* than he had a right to claim as *new*, * * * the Commissioner shall, on surrender of such patent," &c.; while the former section provides that he may maintain suit, &c., on such part of a patent as is his own if he has not *unreasonably neglected to file the disclaimer*. Under these sections it is clear to my mind that unreasonable delay in filing a disclaimer of the parts of the invention to which the patentee was not entitled would bar the reissue. The surrender of a patent with a view of narrowing the claims is in effect a disclaimer of all contained in the original claim in excess of what is demanded in the reissue application, and the same rule would apply.

In November, 1869, a patent was issued to applicants, by which it appeared the tribunal duly authorized to adjudicate upon that question had determined that the patentees named in said patent were entitled to have all the claims mentioned and recited therein. The patent vested in them *prima facie* the exclusive right to make, use, and vend, &c., the thing as mentioned and described in their several claims, and until the right so vested was modified or annulled by a competent tribunal, in the absence of proof to the contrary we must presume that the patentees believed they were entitled to all they claimed. They had so sworn, and the examiner, who was by law charged with the determination of that question, had so found, and the contract (patent) had been written in conformity to the finding. The Supreme Court modified the contract, and said the patentees claimed and were allowed more than they were entitled to, and refused a decree in their favor. The Court in fact found the claims were *broader* and covered more than the patentees had a right to claim as *new*. The Court did not draw the line definitely between that which the applicants might and that which they might not have claimed, and whether they would have sustained the patent if narrowed to the extent now presented in the application for reissue I am not at present called upon to decide.

The suit seems to have been pending in the courts for over twelve years, during which time we must suppose the public were paying tribute as if the patent were valid. The patentees have been, in accordance with what they supposed to be their strict legal right, exacting tribute where none was due. The Supreme Court having determined, if not the limit of applicants' legal rights, at least that those theretofore enjoyed under their patent were excessive, they come and ask this bureau to review its former action, and, in the light of the decision referred to, grant a reissue for such claims as they allege might properly have been secured under their original application.

The decision of the Court was in March, 1882, and application for reissue was filed in October of the same year. From what date shall we regard the lapse of time? The issuance of the surrendered patent, or from the date of the decision of the Supreme Court by which the applicants were adjudged to have claimed and been allowed more than they were entitled to? There are some cases directly in point, viz: *O'Reilly* v. *Morse* (15 How., 62) and *Tuck* v. *Bramhill*, (3 Fish., 400.) In the former case the Supreme Court held that it was not unreasonable neglect to file a disclaimer after the Court had held the claim to be too broad, and the same doctrine is announced in the latter case. If these decisions are to serve as guides, and they must until modified or reversed, or the rule they prescribed is changed by statutory enactment, I must hold applicants to be in time, though it may be doubted whether the delay of several months is excusable.

The decision of the Examiner is overruled.

EX PARTE CLARKE.

Decided February 6, 1884.

An application was filed December 11, 1882, certain claims of which were put into interference. Under Rule 125 matter not in interference was withdrawn from the *first* and made the basis of a second application, upon which second application a patent was granted February 20, 1883. Said patent contained a disclaimer covering all features shown but not claimed therein, and also a clause reserving the right to claim such features in an application filed previously. During the pendency of the first application, and after the patent had issued on the second, a third application was filed with claims covering the matter described in both the first application and the patent. *Held* that under the circumstances the third must be regarded as a division of the first application, and therefore the invention claimed in the latter cannot be deemed to have been abandoned by reason of its being described in the patent.

Neither of the applications above referred to should be allowed until amended so as to disclaim the invention shown but not claimed therein, with proper cross-reference to the application in which such claim *is* made.

APPEAL from the Primary Examiner.

REVERSING-GEAR FOR STEAM-ENGINES.

Application of Willard A. Clarke filed March 12, 1883.

Messrs. Doubleday & Bliss for the appellant.

BUTTERWORTH, *Commissioner:*

This is an appeal from the decision of the Primary Examiner holding that the subject-matter of the application has been dedicated to the public by reason of its appearing in a patent previously granted the applicant, but which did not contain a claim thereto. Clarke filed an application December 11, 1882, certain claims of which were put into interference with an application filed by another party. Under Rule 125, Clarke withdrew matter not in interference, and made it the basis of a second application, filed January 23, 1883, which was patented February 20, 1883. In this patent is a disclaimer covering all features not therein claimed, and a clause reserving the right to claim such features in an application filed previously.

On March 13, 1883, Clarke filed an application in which he claimed matter shown, described, and disclaimed in the aforesaid patent which was contained also in a reservation clause. The question is, may he properly claim in this third application the matter disclaimed and reserved as above set forth?

In all the decisions which have been cited against the allowance of Clarke's third application the general proposition announced is that a party cannot claim in a second application matter shown and described but not claimed in a patent previously granted to him. But in each of these cases it will be observed that when the second application was pending at the same time with that upon which the patent was based the rule was held not to apply. Clarke's first and second applications were pending at the same time, and when the patent upon the latter was granted it contained (in compliance with Rule 42) a disclaimer of matter shown, but not claimed therein. It contained also a reference to the first application, in which it *was* embraced. Under these circumstances, there can hardly be a doubt that under the rules and the decisions mentioned the matter now claimed in the *third* could be claimed in the *first* application. But, furthermore, in *Singer* v. *Braunsdorf* (7 Blatchf., 521) it was expressly decided that where two applications were pending simultaneously a patent granted upon one of them which showed and described but did not claim a certain invention did not invalidate a *second patent* based upon the other application, and in which claims to said invention were introduced subsequently to the issuance of the *first* patent, and to the same effect is the decision of my predecessor in *ex parte* Emerson, (C. D. 1880, 143.) Instead of making these claims in the first application, (as we have seen he might have done,) the applicant elected to take the matter from said application and present it in a third. There is no objection to this course, and it is one of common practice. The third application simply stands in lieu of the first to the extent of the matter subtracted from the latter. In other words, it is a division of the first application.

Abandonment or dedication to the public cannot be urged against the third application unless it can be against the first. This proposition involves a familiar principle, and hardly needs the citation of authority in its support; but the case of *Smith* v. *Goodyear Dental Vulcanite Company* (11 O. G., 246) may be mentioned as in point. The Supreme Court in that case held that a second application for the same invention filed during the pendency of the first must be regarded as a continuation of the latter, and though public use for five years before the filing of the second application was proven the invention was not abandoned. I therefore cannot adopt the views of the Examiner in holding that the invention claimed in the third application has been dedicated to the public. The Examiner is instructed, however, that neither application should be allowed until amended so as to disclaim the invention shown but not claimed therein, with proper cross-reference to the application in which such claim is made.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

ADAMS v. HOWARD *et al.*

Decided February 6, 1884.

1. PARTICULAR PATENTS.
   Patents Nos. 47,551 and 55,991, granted, respectively, May 2 and October 24, 1865, to John H. Irwin, construed.
2. INVENTION—SIMPLE CHANGE REMEDYING DEFECTS SUFFICIENT.
   A simple change, which others failed to discover, and which remedied a grave defect, *Held* to constitute a patentable difference.
3. PRIOR USE—PRIOR APPLICATION ALONE NOT SUFFICIENT.
   A prior application for a patent alone, without evidence to show that such a lantern as is described therein was ever constructed, is not sufficient to defeat a patent.
4. PARTIES TO SUIT—NO OBJECTION BEING TAKEN TO NON-JOINDER, DECREE GIVEN.
   A complainant being owner of an undivided third interest in a license, and no objection having been taken by demurrer or the answer to the non-joinder of the other two owners of the license, such non-joinder cannot be insisted on to defeat a decree.
5. DEFENSES—INFRINGEMENTS OF PATENT WITHOUT KNOWLEDGE OF PATENTEE DOES NOT WORK AN ABANDONMENT.
   Where infringements by various parties and for considerable periods have been shown to have taken place during the life of the patent, but the circumstances fail to establish acquiescence in the instances when the infringement was known to the owners of the patent, there exists no such laches as would defeat an accounting.
6. PRACTICE IN COURTS—COURT WILL DETERMINE THE WHOLE CONTROVERSY, EVEN IF PATENT EXPIRES PENDING SUIT.
   There is no doubt of the propriety of decreeing an accounting, although the patent has expired since the commencement of the suit, and although for that reason there should not be an injunction. The jurisdiction of a court of equity having been legitimately invoked by the complainant, he will not be sent away without redress, because all the redress to which he was originally entitled cannot now be awarded to him. The court will retain the cause in order to completely determine the controversy.
7. COSTS.
   Where the defendants infringe only one of two patents sued upon, neither party should recover costs as against the other.

WALLACE, *J.:*

Infringement is alleged of two letters patent for improvements in lanterns, granted to John H. Irwin, one May 2, 1865, and the other October 24, 1865, both of which have been assigned to the complainant.

The second patent only is infringed upon the construction of the claims of the first patent adopted and expressed at the hearing of the cause, which limits it to a lantern having two horizontal guards connected by a hinge or catch, whereby the lantern may be opened at or near the middle of the globe.

Infringement of the second patent is not contested. The claim is to be constructed as one for a loose-globe lantern in which the globe is protected by a basket of guards, and is held in place by the top of the lantern when the lantern is closed, the basket being hinged at its upper horizontal guard to the top of the lantern and opened by a spring-catch opposite the hinge. The special utility of the device over the lantern of the first patent consists in the protection of the loose globe against accident in case the catch is accidentally unlocked, as when unlocked the basket will prevent the globe from falling out.

It is insisted that there is no patentable novelty in the improvement; but, as was suggested at the hearing of the cause, assuming that Irwin's first patent was granted before the lantern of the second patent was invented, it is believed that the change made in the last lantern was not such an obvious one as to negative the exercise of invention. As the lantern of Irwin's first patent approximates to that of the second far more closely than any other preceding device, it is unnecessary to examine further into the prior state of the art. The difference between the lantern of the second patent and that of the first consists only in a new location of the hinge and spring-catch and the employment of a horizontal guard to form the upper rim of the basket for the purposes of this new location. This change of location seems to have been a very simple thing after it was made; but simple as it may have been, it remedied a grave defect in the lantern of the first patent, and the advantages which it introduced were immediately recognized by the public. Others who were actively experimenting in the same field of improvement failed to discover how readily this change could be made and what advantages would result by its being made.

The defense that the patent is anticipated by the lantern described in the prior application for a patent by Anthony M. Duburn is not tenable, because there is no evidence, except his application for a patent, that he ever invented such a lantern. It was conceded by his solicitors upon the application that the model accompanying his application would not answer for use as a lantern, although it was sufficient to illustrate the construction of the device, and the examiner in charge condemned the model as inoperative. As there is no evidence in the case to show that such a lantern as was described in the application and illustrated by the

model was ever actually constructed by Duburne, sufficient does not appear to defeat the novelty of Irwin's invention.

It will not be profitable to consider in detail the numerous objections urged by the defendant to the complainant's title to the patent. The conclusion reached is that the complainant Adams is vested with the title to the patent which was acquired by the Chicago Manufacturing Company October 6, 1866, together with the right of action of that company to recover for infringements since that date. This title is of course subject to the license which had been granted by that company to Archer and others to make and use the invention in this State and elsewhere. The complainant Dietz has acquired an undivided third interest in this license by the transfer of Pancoast of March 24, 1881. No objection having been taken by demurrer or the answer to the non-joinder of the other two owners of this license, such non-joinder cannot now be insisted on to defeat a decree. If these parties are within the jurisdiction of the court, which does not appear, a decree can be made without affecting their rights, and which will completely adjust the rights of all the parties to the suit as between themselves.

In this view the recovery by Dietz must be limited to one-third of the damages and profits by reason of the making and using of the invention accruing since March 24, 1881. The case does not disclose such laches on the part of the owners of the patent as should defeat an accounting. While infringements by various parties and for considerable periods have been shown to have taken place during the life of the patent, the circumstances fail to establish acquiescence in the instances when the infringement was known to the owners of the patent.

No doubt is entertained of the propriety of decreeing an accounting, although the patent has expired since the commencement of the suit, and although, for that reason, there should not be an injunction. The jurisdiction of a court of equity having been legitimately invoked by the complainant, he will not be sent away without redress merely because all the redress to which he was originally entitled cannot now be awarded to him. Under such circumstances the court will retain the cause in order to completely determine the controversy. (*Godfrey* v. *Moerlin*, 14 Fed. Rep., 170.)

Inasmuch as the complainants have united two distinct causes of action in their bill, and upon their allegation that the defendant's lanterns infringed both the letters patent have compelled the defendants to litigate both, and as to one of these causes of action the defendants have prevailed, neither party should recover costs as against the other. (*Strickland* v. *Strickland*, 3 Beav., 242; *Crippen* v. *Heermance*, 9 Paige, 211; *Elfelt* v. *Steinhart*, 11 Fed. Rep., 896–899.)

A decree is ordered for complainants in conformity with this opinion.

42

U. S. Circuit Court—Southern District of New York.

THE TIME TELEGRAPH COMPANY v. CAREY *et al.*

Decided January 30, 1884.

PRELIMINARY INJUNCTION—GRANTED WHERE DEFENDANTS ARE ESTOPPED.

A party having induced a complainant to acquire a patent and to engage in making and selling articles under it, is estopped from contesting the validity of it for the purposes of a motion for a preliminary injunction, and a second party who was cognizant of all the facts and seems to have been the principal promoter of the transaction occupies no better position.

Mr. B. S. Clark, *Mr. Roscoe Conkling*, and *Mr. Edward N. Dickerson, Jr.*, for the complainant.

Messrs. Turner, Lee & McClure and *Mr. B. F. Lee* for the defendants.

WALLACE, *J.*:

The peculiar facts of this case authorize the granting of a preliminary injunction as to some of the defendants, although the complainant's patent is of a recent date and has never been adjudicated.

The defendant Himmer was the inventor and assignor to the complainant of the improvement in electric clocks described and claimed in the letters patent of the complainant. While he was in the employ of the complainant as its superintendent he ordered certain clock mechanism to be made which was identical in parts and arrangement with that now sought to be enjoined, representing it to be one of the modifications of the invention secured by the patent. Special tools and dies were obtained to construct this mechanism, and the complainant's officers, assuming that the complainant was protected by the patent, have embodied this mechanism in their clocks and introduced them to the public. After Himmer left the complainant's employ he induced the manufacturers who were then making this clock mechanism for the complainant to supply him with the various parts sufficient to make a number of complete clocks. These have been put together by him, (or his wife, in whose name the clock-making business is carried on,) and through the agency of the defendant Carey, who seems to have been cognizant of all the facts and to be the principal promoter of the transaction, are now being introduced to the public in competition with the complainant's clocks. Upon these facts Himmer is estopped for the purposes of a motion like this from contesting the validity of the patent or denying that the clock mechanism he employs is covered by the claims of the patent. He cannot be heard to assert either of these defenses after inducing the complainant to acquire the patent and engage in making and selling clocks under it such as he now undertakes to make and vend.

Carey occupies no better position than Himmer does. He is Himmer's *alter ego* in the scheme of pirating the complainant's rights. His general denial of community of interests with Himmer goes for nothing in view of the facts and circumstances which are set forth in the complainant's affidavits, and which are sufficient to call upon him for a full and explicit disclosure of his relations with Himmer in order to exonerate himself.

No case is made for an injunction against the defendants other than Himmer and Carey. As to Himmer and Carey an injunction is granted; as to the other defendants the motion is denied.

Letters patent in question were No. 274,325, dated March 20, 1883, granted to The Time Telegraph Company as assignee of Vitalis Himmer.

DESIGNS.

14,836.—CARPET.—*Julius W. Bassett*, Brooklyn, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 28, 1884. Term of patent 3½ years.

14,837.—BOTTLE.—*Henry Auguste Chalein*, New York, N. Y., assignor to *Cook & Bernheimer*, same place. Application filed November 5, 1883. Term of patent 14 years.

14,838.—LAMP-BRACKET.—*Rodolphe Christeeen*, New Britain, Conn., assignor to *Russell & Erwin Manufacturing Company*, same place. Application filed August 6, 1883. Term of patent 7 years.

14,839 and 14,840.—CARPET.—*Florence E. Cory*, New York, N. Y., assignor to *Vandeventer & Horne*, same place. Applications filed January 28, 1884. Term of patents 3½ years.

14,841.—CARPET.—*James L. Folsom*, Brooklyn, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 28, 1884. Term of patent 3½ years.

14,842.—BLOCK OF MAGNESIA.—*William Griscom, Jr.*, Philadelphia, Pa. Application filed December 17, 1883. Term of patent 7 years.

14,843 and 14,844.—CARPET.—*Arthur L. Halliday*, Yonkers, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Applications filed January 25, 1884. Term of patents 3½ years.

14,845.—CARPET.—*Henry Hunt*, Greenville, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 28, 1884. Term of patent 3½ years.

14,846.—BANNER.—*Seth W. Johnson*, New York, N. Y. Application filed December 12, 1883. Term of patent 14 years.

14,847.—SHADE-PULL.—*Hubert L. Judd*, Brooklyn, N. Y. Application filed November 22, 1883. Term of patent 7 years.

14,848.—CARPET.—*David G. Melville*, Medford, assignor to *The Roxbury Carpet Company*, Boston, Mass. Application filed January 28, 1884. Term of patent 3½ years.

14,849.—CARPET.—*Julius S. Meyer*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed January 28, 1884. Term of patent 3½ years.

14,850 to 14,852, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed January 23, 1884. Term of patents 3½ years.

14,853 and 14,854.—CARPET.—*Julius Pegel*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Applications filed January 28, 1884. Term of patents 3½ years.

14,855.—LADY'S WRAP.—*Sarah Jane Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed January 23, 1884. Term of patent 3½ years.

14,856 and 14,857.—EAR-RING.—*John B. Van Houten*, Newark, N. J. Applications filed November 21, 1883. Term of patents 7 years.

14,858.—EAR-RING PENDANT.—*John B. Van Houten*, Newark, N. J. Application filed November 21, 1883. Term of patent 7 years.

14,859 to 14,862, inclusive.—EAR-RING.—*John B. Van Houten*, Newark, N. J. Applications filed November 21, 1883. Term of patents 7 years.

14,863 and 14,864.—EAR-RING PENDANT.—*John B. Van Houten*, Newark, N. J. Applications filed November 30, 1883. Term of patents 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

10,969.—BANJOS.—*George C. Dobson*, Boston, Mass. Application filed January 21, 1884.
"The word 'VICTOR.'"

10,970.—WHISKY.—*J. H. Rogers & Co.*, Maysville, Ky. Application filed February 6, 1884.
"The word 'LIMESTONE.'"

10,971.—UNFERMENTED GRAPE-JUICE.—*August Werner*, New York, N. Y. Application filed February 4, 1884.
"The words 'GRAPE MILK.'"

10,972.—AGUE-MEDICINE.—*Sanford C. Bolling*, Fort Smith, Ark. Application filed February 6, 1884.
"The word 'BUSTER.'"

10,973.—BAKING-POWDER.—*Bothin Manufacturing Company*, San Francisco, Cal. Application filed January 14, 1884.
"The word 'GIANT.'"

10,974.—LIQUID PURGATIVE COMPOUNDS.—*California Fig Syrup Company*, San Francisco, Cal. Application filed January 15, 1884.
"The representation of a branch of a fig-tree bearing the fruit and leaves of the same."

10,975.—BITTERS.—*E. Büring & Co.*, New York, N. Y. Application filed February 4, 1884.
"The word 'CARÁCAS.'"

10,976.—SKIN-LOTION.—*Goodwin & Thurston*, Minneapolis, Minn. Application filed January 26, 1884.
"Two figures, (representing the Goddess of Power and Æsculapius,) a lake, a water-jar, water and pool, and mountains. The Goddess of Power is in a sitting posture, holding in her left hand a bowl, and in her right hand a serpent which is in the act of thrusting its fangs into the liquid contained in the bowl. At the left of the Goddess of Power, and partly in front, sits Æsculapius, resting his right arm on an overturned water-jar, out of which is flowing a liquid, forming a turbulent pool at his feet, to which he points with the index-finger of his right hand. Æsculapius, with arm outstretched, holds in his left hand a drinking-vessel, grasped by the stem. The Goddess of Power is dressed in a simple, loosely-fitting garment, rather low at the neck, the sleeves coming to just below the elbows. The right foot, which is bare, is partially exposed. Her hair is somewhat curly and falls carelessly upon her shoulders. Æsculapius is nude, save the lower extremities, which are protected by a robe."

10,977.—PILLS.—*James Mitchell Sparks* and *Ada Leonora Belling*, Fort Smith, Ark. Application filed January 24, 1884.
"The word 'BULLETS.'"

10,978.—DANDRUFF-CURE.—*The Speicher Dandruff Cure Company*, Philadelphia, Pa. Application filed January 22, 1884.
"A monogram of the letters 'T C S.'"

10,979.—SUBSTITUTE FOR LARD.—*William Elliott Worth*, Brooklyn, N. Y. Application filed January 26, 1884.
"The word 'CUISINE.'"

10,980.—CIGARS.—*Estabrook & Eaton*, Boston, Mass. Application filed February 4, 1884.
"The words 'CLOTH OF GOLD.'"

10,981.—LAUNDRY-SOAP.—*Lautz Brothers & Co.*, Buffalo, N. Y. Application filed January 25, 1884.
"The pictorial representation of an ox."

10,982.—RIBBONS AND SILK TEXTURES.—*Oberteuffer, Abegg & Darnier*, New York, N. Y. Application filed December 18, 1883.
"A picture, image, or cut representing a woman holding a sword in her right hand, which rests upon her knee, her left hand resting upon a shield, and in front of her a cock with one claw resting on a globe, and adjoining said picture is the word 'GALLIA.'"

10,983.—CIGARS.—*Reid, Murdoch & Fischer*, Chicago, Ill. Application filed February 11, 1884.
"The letters and words 'RIPORD'S MAGIC,' together with the figure or representation of a maid, who has apparently paused in the act of entering a house. She holds elevated in her right hand a lighted lamp, which throws out a bright light. Her left forearm is raised to the height of her waist. The impression of her left knee is seen through her clothing, showing her to have paused with the left foot raised to step and in advance of her right. Her head is inclined slightly forward, and she is looking toward her right-hand side with a pleasant expression on her face. Upon her head is a cap or hood trimmed in front with lace, and which cap or hood hangs down her back. Around her neck, and hanging down over her bosom, is a light bib-like ornament or covering, gathered in loose folds and thrown back over her left shoulder. She has a large rope or cord around her waist, while a smaller cord also depends from her waist and strikes her at the knee, by means of which her dress is caught up in easy and natural folds. Above her head and on a curved line appear the words 'RIPORD'S MAGIC.'"

10,984.—TIME-KEEPING INSTRUMENTS.—*Seth Thomas Clock Company*, Thomaston, Conn., and New York, N. Y. Application filed January 31, 1884.
"The representation of a rectangle and circle."

10,985.—CIGARS AND CIGARETTES.—*John C. Sullivan*, Detroit, Mich. Application filed January 21, 1884.
"The arbitrarily-selected word 'DARDANELLES.'"

LABELS.

3,946.—Title: "LA ROSITA" (FOR CIGARS.)—*R. C. Brown & Co.*, New York, N. Y. Application filed February 11, 1884.

3,947.—Title: "LA MULO" (FOR CIGARS.)—*R. C. Brown & Co.*, New York, N. Y. Application filed February 11, 1884.

3,948.—Title: "SOUR MASH TONIC" (FOR MEDICINES.)—*O. B. Cook & Co.*, Detroit, Mich. Application filed February 11, 1884.

3,949.—Title: "THE IMPERIAL BLOOD AND LIVER TONIC, THE KING OF ALL TONICS."—*Reason Drake*, La Grange, Ind. Application filed February 6, 1884.

3,950.—Title: "DUPUY'S FOUNTAIN BITTERS."—*Willard D. W. Dupuy*, Mount Carroll, Ill. Application filed February 11, 1884.

3,951.—Title: "EARL & WILSON'S COLLAR AND CUFF."—*Earl & Wilson*, New York and Troy, N. Y. Application filed February 11, 1884.

3,952.—Title: "P. V." (FOR MANUFACTURED TOBACCO.)—*G. W. Gail & Ax*, Baltimore, Md. Application filed February 8, 1884.

3,953.—Title: "RIGHT BOWER, PURE OLD RYE."—*Jules A. Gauche*, New Orleans, La. Application filed February 12, 1884.

3,954.—Title: "SOUTHERN BELLE, FINE OLD RYE."—*Jules A. Gauche*, New Orleans, La. Application filed February 12, 1884.

3,955.—Title: "SERENADE, PURE OLD RYE."—*Jules A. Gauche*, New Orleans, La. Application filed February 12, 1884.

3,956.—Title: "DR. JOHN GOODE'S CELEBRATED CHILL AND FEVER TONIC."—*John Goode* and *John M. Kelso*, Magnolia, Ark. Application filed February 11, 1884.

3,957.—Title: "JAPANESE FURNITURE RENEWER."—*Joseph W. Harris*, Chicago, Ill. Application filed February 11, 1884.

3,958.—Title: "DR. DAY'S BLOOD COMPOUND" (FOR A MEDICINE.) *Charles E. Houghtaling* and *George E. Ferguson*, Albany, N. Y. Application filed January 30, 1884.

3,959.—Title: "GRAND DUPLEX" (FOR CIGARS.)—*The Ithaca Cigar Manufacturing Company*, Ithaca, N. Y. Application filed January 24, 1884.

3,960.—Title: "CYCLONE ELIXIR OR BOTTLED LIFE, SLEEP AND BEAUTY." (FOR A MEDICINE.)—*E. Ion McCrary*, Easton, Mo. Application filed February 9, 1884.

3,961.—Title: "GOLDEN SPIKE" (FOR CIGARS.)—*Meade & Hyland*, Penn Yan, N. Y. Application filed February 13, 1884.

3,962.—Title: "HARRIS' CORN SALVE."—*Charles H. Meserve*, Boston, Mass. Application filed February 8, 1884.

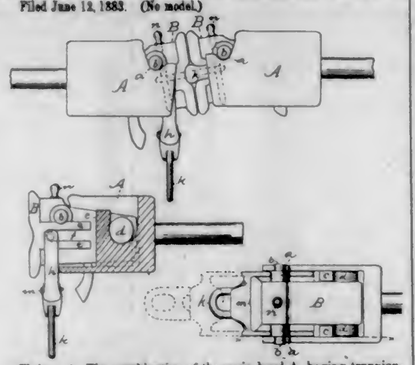
3,963.—Title: "REGATTA" (FOR DRESS SILKS.)—*R. & H. Simon*, Weehawken, N. J. Application filed February 13, 1884.

3,964.—Title: "DURHAM DISTILLING COMPANY RYE."—*Strauss, Fritz & Co.*, Cincinnati, Ohio. Application filed February 13, 1884.

3,965.—Title: "BROWN'S SARSAPARILLA."—*Ara Warren*, Bangor, Me. Application filed February 13, 1884.

3,966.—Title: "THE ARABIAN HEAVE REMEDY FOR HORSES."—*John M. Weber*, Norristown, Pa. Application filed February 12, 1884.

DISCLAIMER.



269,084.—*William W. Smalley*, Roundbrook, N. J. Patent dated October 15, 1878. IMPROVEMENT IN JOURNAL-BEARINGS. Disclaimer filed February 21, 1884, by the present assignee, *The Graphite Lubricating Company*, Jersey City, N. J.

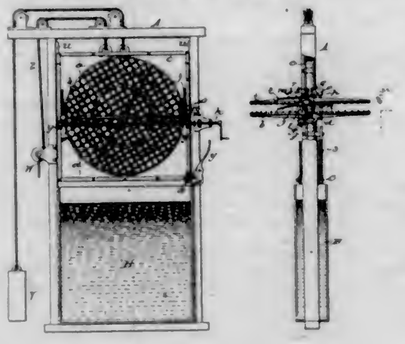
Enters its disclaimer "to that part of the specification which is in the following words, to wit: 'The invention consists in a journal-bearing surrounded by a groove or grooves formed on the interior of the said bearing, and inclined to the longitudinal axis of the said bearing, by which the following advantages are secured: There is always, in every position of the shaft or journal revolving in the said bearing, solid metal for supporting the weight of the shaft, while at the same time the said journal is in every part brought into intimate contact with the lubricating material at every revolution. Moreover, the said inclined position of the groove or grooves relatively to the axis of revolution of the shaft or the journal in said bearing acts to carry out or to force out of or off from the said bearing-surface any dirt or extraneous matters that may accidentally find their way into the said bearing or onto the bearing-surface, thereby keeping the said bearing free from anything that might tend to increase the friction therein.'" Also, to "the word 'spiral' where it occurs in the following clause, 'The form of bearing that I prefer is shown in Figs. 1 and 2. In this bearing there are one or more spiral grooves, *b*, extending the entire length of the said bearing. The said spiral groove or grooves somewhat resemble screw-threads, but they are not screw-threads.'" Also, to "so much of claim No. 2 as is set out in the specification of the patent aforesaid, by disclaiming all constructions covered by said claim except where the grooves, inclined as to their direction, have also their sides inclined to radii drawn from the longitudinal axis, the same being well suited to holding any solid or plastic lubricating material."

PATENTS

GRANTED MAR. 4, 1884.

294,345. CAR-COUPLING. ARTHUR H. ARMSTRONG, Plainville, Conn. Filed June 12, 1883. (No model.)

Claim.—1. The combination of the main head A, having trunnion-recesses *a* at its outer end, and the cheeks *c* upon the inside at its inner end, with the supplementary head B, having trunnions *b* and *d*, the latter of which receives the drawing strain, substantially as described, and for the purpose specified.



2. The combination of the coupling, the longitudinally sliding and swinging bail, and the coupling-link secured within the cross-arm of said bail, substantially as described, and for the purpose specified.

3. The combination of the supplementary head B, having side cheeks, *c*, the longitudinal slot *f*, and the swinging bail *h*, carrying link *k*, and having inwardly-projecting trunnions *g*, for engagement with the slot *f*, substantially as described, and for the purpose specified.

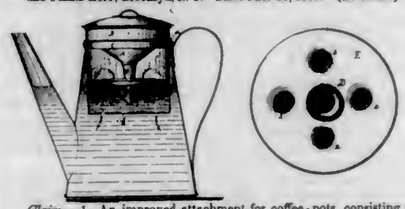
4. The combination of the main head A, supplementary head B, and the sliding and swinging bail carrying the coupling-link, substantially as described, and for the purpose specified.

5. The combination of the main head A, supplementary head B, the bail carrying the coupling-link, and means located within the walls of the main head for guiding the inner end of the bail longitudinally, and also allowing it to swing freely within said walls, whereby the bail is protected from injury, all substantially as described, and for the purpose specified.

294,346. MACHINE FOR DIPPING SAWS. ELIAS C. ATKINS, Indianapolis, Ind. Filed Oct. 17, 1883. (No model.)

Claim.—1. A machine for dipping saws, consisting of the following elements, namely: a pair of skeleton disks adapted to clamp a saw-plate between them and mounted on trunnions in a vertically-sliding frame; means for separating and for forcing together said disks; a frame mounted on vertical ways and adapted to slide thereon; means for turning said disks from a horizontal to a vertical position in said frame; a tank containing liquid and adapted to receive said frame and disks, and means for raising and lowering said sliding frame and disks, all combined and arranged to co-operate substantially as and for the purpose specified.

2. In a machine for dipping saws, the combination of a frame mounted on vertical ways and adapted to slide thereon, and a pair of skeleton disks mounted in said frame and adapted to clamp a saw-plate between them and to turn from a horizontal to a vertical position in said frame, all substantially as specified.



3. In a machine for dipping saws, the combination, with a vertical sliding frame and a pair of disks, one of which is pivoted to said frame and the other movable therein, of a pair of clamping-bars secured to said frame eccentrically to the pivots on which said disk is mounted, and friction-rolls secured to said movable disk so as to come in contact with said bars, whereby said disks are clamped together when turned to a vertical position, substantially as specified.

4. The combination, with disks *b* and *i*, of center pin, *q*, having rack *r*, pinion *s*, and means for turning said pinion, all arranged substantially as and for the purpose specified.

5. The combination, with sliding frame *c* and disk *b*, pivoted thereto, of segment-gears *d e*, secured to said disk, shaft *f*, mounted in bearings on said frame, pinions *g g*, and means for turning shaft *f*, all substantially as and for the purpose specified.

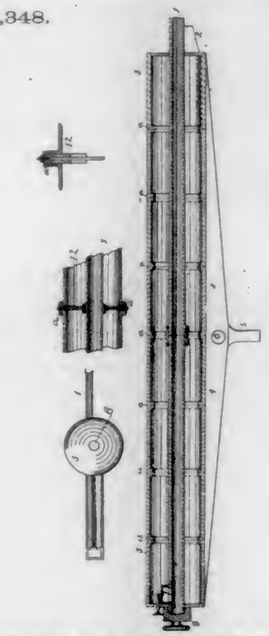
6. The combination, with disks *b* and *i*, pivoted in sliding frame *c*, segment-gears *d e*, pinions *g g*, and shaft *f*, of the detachable crank-shaft *k*, mounted in bearings on frame A, for the purpose set forth.

294,347. COFFEE-POT ATTACHMENT. MORTE BALLIN, New York, and FRANZ HOYT, Brooklyn, N. Y. Filed June 28, 1883. (No model.)

Claim.—1. An improved attachment for coffee-pots, consisting of a funnel, A, the spout of which is surrounded by a cup, E, extending above the orifice of the spout, so as to form a hydraulic seal, substantially as set forth.

2. An attachment for coffee-pots, consisting of a funnel, A, having a rimmed cylindrical portion, B C, at its upper part, and a cup, E, extending around the lower part of spout D, and forming a hydraulic seal therewith, substantially as set forth.

3. The combination of a coffee-pot and strainer with a funnel seated at its upper part in the coffee-pot, and provided at the lower end of its spout with a cup that extends above the orifice of the spout and forms a hydraulic seal therewith, substantially as specified.



294,348. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D. C. Filed Jan. 8, 1884. (No model.)

Claim.—1. A pneumatic cannon in which the gun-tube is inclosed within the air-flask.

2. A pneumatic cannon in which the gun-tube is inclosed within the air-flask for a portion of its length.

3. A pneumatic cannon having the gun-tube within the air-flask and adjustable relatively thereto.

294,348.

4. A pneumatic cannon consisting, essentially, of a gun-tube and an air-flask surrounding and inclosing the same, the whole supported by suitable mechanism, substantially as described, so as to be trained together.

5. The air-flask of a pneumatic cannon and the gun-tube thereof, made in readily-detachable sections, so that the proportions of each may be increased or diminished relatively to the other.

6. The combination, with a cylindrical air-flask, of a gun-tube passing longitudinally through the same, and breech-closing mechanism outside the flask.

7. The combination, with an air-flask, of a gun-tube passing longitudinally through the same and projecting at the muzzle, and a brace for supporting said gun-tube at the muzzle end.

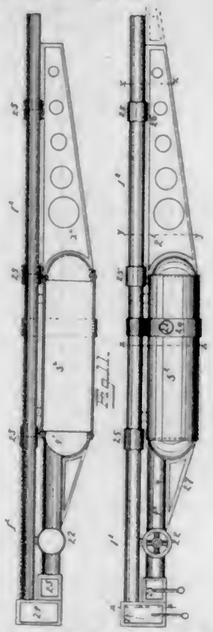
8. The combination, with a gun-tube and an air-flask surrounding the same, as described, of a longitudinal support, as 4, substantially as described.

9. The combination of a gun-tube, an air-flask surrounding and inclosing the same, and trunnions on the flask, by which the air-flask and tube may be trained, as described.

10. The combination of a gun-tube, an air-flask surrounding the same, and screw-bolts passing through the shell of the air-flask, by which the position of the tube within the flask may be adjusted.

11. The combination of a gun-tube, a cylindrical air-flask made up of sections surrounding the same, a ring interposed between two of said sections, and screw-rods passing from the gun-tube through the ring.

12. The combination of a cylindrical air-flask, a gun-tube passing through the same longitudinally, and a passage-way and valve leading from the flask to the tube outside the shell of the flask, substantially as described.



13. The combination of a cylindrical air-flask in sections, the ends of the sections forming turned-out flanges, as a' a', a gun-tube passing through said flask from end to end, a ring, 12, interposed between two of the sections, a collar surrounding the gun-tube, and screw-rods passing from said collar through the ring, all substantially as described.

14. The method of cutting off the gas-supply from the bore of a gun, which consists in closing the valve governing said supply by the passage of the projectile along the bore of the gun, substantially as described.

15. The combination, with a pneumatic gun-tube, an air-flask, and a valve governing the passage from the flask to the tube, of mechanism, substantially as described, whereby the passage of the projectile past a given point in the tube is made to close the valve, substantially as described.

16. The combination, with an air-flask, a gun-tube, and a valve which controls the passage from the flask to the tube, of pneumatic connections leading from the bore of the gun, and mechanism, substantially as described, controlled thereby, whereby the valve is closed when the projectile reaches a given point.

294,349. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D.C. Filed Jan. 8, 1884. (No model.)

Claim.—1. The combination, in a cannon of the character described, of the gas-flask and the gun-tube arranged outside above the flask, so as to be supported and rigidly held thereby, said flask provided with trunnions or equivalent supporting mechanism, whereby the gun and flask may be trained together, as set forth.

2. The combination, with a cylindrical gas-flask, of a gun-tube placed above and rigidly supported by said flask, and supporting-trunnions for the same, substantially as described.

3. The combination, with an air-flask and a gun-tube composed of longitudinal sections secured to and supported by said flask, of movable trunnions, whereby the preponderance of the gun may be changed, as set forth.

4. The combination, with an air-flask, of a gun-tube attached thereto and supported thereby, and a movable band surrounding the flask, said band having trunnions attached thereto, substantially as described.

5. The combination, with a gas-flask and a gun-tube arranged upon and supported by said flask, of a supporting-brace, as 2^9, projecting from the flask to support the gun-tube.

6. The combination, with an air-flask and gun-tube, arranged substantially as described, of a supporting brace or web, as 2^9, made in sections and secured to the flask, so as to support the tube, substantially as described.

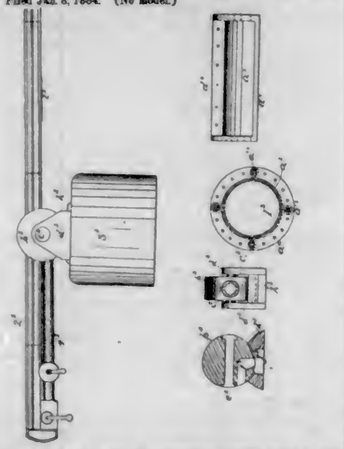
7. The combination, with the air-flask and gun-tube, having projections, as 25, arranged relatively to each other, substantially as described, of a brace-web, as 2^9, provided with notches to receive the projections on the gun-tube, as set forth.

8. The combination, with a gun-tube and air-supply pipe, arranged with open rear ends side by side, of a breech-block having a passage-way leading from one tube to the other, substantially as set forth.

9. The combination, with a cylindrical gas-flask, of a gun-tube arranged on top of and parallel therewith, a supply-pipe arranged alongside the gun-tube and communicating with the flask, a breech-frame in which both tubes terminate, and a breech-block arranged to slide in said frame and form a communication from the supply-pipe to the gun-tube, substantially as set forth.

10. The cylindrical flask, a gun-tube mounted thereon and projecting at each end thereof, the supply-pipe communicating with the flask and with the breech of the gun-tube, the supporting-brace in front of the flask and under the gun-tube, and the supporting-brace behind the flask and under the supply-pipe, all in combination, as set forth.

11. A gun-tube and supply-pipe, a valve controlling the supply-pipe,



mechanism, substantially as described, for actuating said valve, and mechanical connections leading from the muzzle of the gun to a valve-detent, whereby the valve may be closed automatically as the projectile leaves the muzzle, all in combination, substantially as described.

12. The combination, with the supply-pipe, of a valve and a trigger for retaining the same in open or closed position, a sleeve on the valve, spindle adapted to engage therewith, as described, and a spring which tends to rotate said sleeve and through it the valve, substantially as stated.

13. The combination, with a rotary valve, its detent or trigger, and propelling mechanism, of a train of mechanical connections, substantially as described, leading from the muzzle to the detent or trigger, whereby the detent is actuated to permit the closing of the valve by the projectile in its passage from the gun, as set forth.

14. The combination, with an air-flask and supply-pipe, of a breech-closing piece, as 24^3, swiveled on the supply-pipe and forming a passage-way from said supply-pipe to the gun-tube, as set forth.

294,350. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D.C. Filed Jan. 8, 1884. (No model.)

Claim.—1. The barrel or tube of a pneumatic cannon made in sections, the breech-sections of ordinary tubing, (not bored out,) and the muzzle-section of bored and finished tubing, substantially as described.

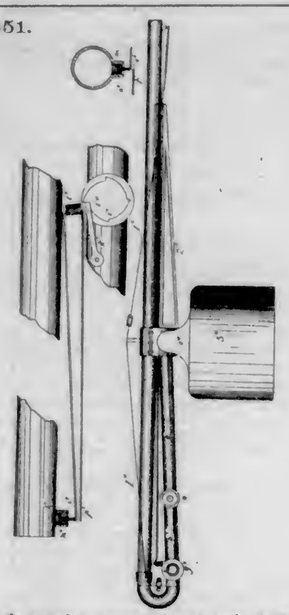
2. The combination, with a gun-tube, of an inclosing-sleeve divided longitudinally into sections, and having radial flanges, and mechanism by which the flanges are secured together, substantially as described.

3. The trunnion-piece having tubular connection with the gas-flask and with the gun-tube, substantially as described, the gun-tube supported by said trunnion-piece, and a strengthening-sleeve for said gun-tube, having a bearing on said trunnion-piece, all in combination, substantially as set forth.

4. The combination, with a gun-tube, of an inclosing-sleeve composed of sections having radial and annular flanges adapted to be united, substantially as described.

5. The combination, with a gun-tube, of a strengthening-sleeve composed of four parts, each having a concavo-convex portion and side and end flanges, as described, which parts, when united, form a cruciform sleeve, substantially as described.

6. The combination, with the air-flask, of the trunnion-piece which supports the gun-tube and supply-pipe, substantially as described, said flask connecting with the trunnion-piece through a chamber, g^9, in part h^3, which part has edges x^3 x^3, made thin to serve as gas-closing joints, substantially as described.



294,351. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D.C. Filed Jan. 8, 1884. (No model.)

Claim.—1. The combination of the gun-tube, the supply-pipe, and a trunnion-piece which unites and furnishes a support for both tubes, and a supporting-brace for the gun-tube, secured to the trunnion-piece, substantially as described.

2. The combination of the gun-tube, the supply-pipe, and a trunnion-piece having a socket, as c^4, for the gun-tube, a socket for the supply-pipe, and a supporting-web for the gun-tube, with a hollow trunnion-support through which and through the trunnion gas is supplied to the supply-pipe and gun, as set forth.

3. The trunnion-piece, substantially as described, having a support

294,351.

or sleeve for the gun-tube, a separate support or socket for the supply-pipe, and hollow trunnion with passage-way to the supply-pipe, substantially as stated.

4. The combination of the trunnion-piece, supply and gun tubes, and hollow trunnion-support, as described, with the hollow trunnion having a gas-closing joint consisting of a thin-edged tube and bearing therefor, all constructed and arranged substantially as described.

5. The flask, trunnion-support, trunnion-piece, and supply and gun tubes, constructed and arranged relatively to each other, substantially as described, and two valves—a relief and an operating valve—arranged in the supply-pipe, as set forth.

6. The method herein described of closing the operating-valve of an air-gun, which consists in causing the passage of the projectile to open or close an electric circuit, and by such circuit controlling the movement of the valve, substantially as set forth.

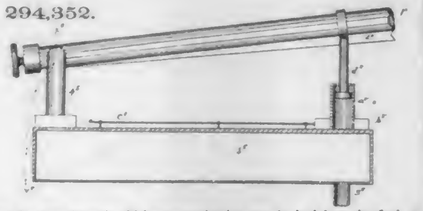
7. The combination, with a pneumatic gun, of electrical connections, substantially as described, arranged to be thrown into operation by the passage of the projectile, and having control of the starting or stopping mechanism of the operating-valve, as set forth.

8. The combination, with the supply-pipe of a pneumatic gun, of a valve, mechanism, substantially as described, to propel such valve, and a trigger or stop under control of an electric circuit, so as to be actuated thereby to permit the opening or closing of the valve.

9. The combination, with the supply-pipe of a gun of the character described, of a spring-valve, a stop or detent for said valve, and electrical mechanism, substantially as described, whereby said detent may be controlled.

10. The combination, with an electric circuit leading from near the muzzle of a gun, of a gas-escape passage from the gun-tube, and mechanism, substantially as described, whereby the escape of gas through said passage will close said circuit, as set forth.

11. The combination, with the air-supply pipe and gun-tube of a pneumatic gun, of a breech-block having a passage-way from one tube to the other, said breech-block being pivoted between said tubes, so as to open or close both tubes when turned on its pivot.



12. The combination of the trunnion-piece, the gun-tube, the brace or web supporting said tube, and tie-rods connecting said brace to the trunnion-piece, as set forth.

13. The combination of the trunnion-piece, the gun-tube, the web or brace secured to the trunnion-piece and supporting the gun-tube, and mechanism, substantially as described, whereby the gun-tube may be adjusted with reference to its supporting-web.

294,352. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D.C. Filed Jan. 8, 1884. (No model.)

Claim.—1. A gas-flask forming the gun-carriage, a gun-tube supported thereon by a support independent of the trunnions, substantially as described, and hollow trunnions and trunnion-supports near the breech

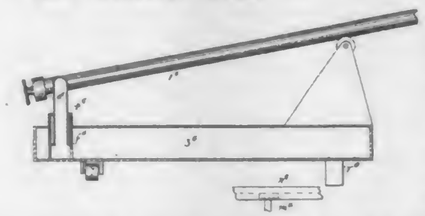
294,352.

of the gun, through which communication may be had from the flask to the gun, all combined substantially as set forth.

2. A gas-flask forming the gun-carriage, and having a passage leading to the bore of the gun, in combination with mechanism, substantially as described, whereby the pressure of gas from the flask is made to elevate the gun.

3. The combination, with the gas-flask and a gun-tube mounted thereon, and having communication with the flask through the trunnions, of a cylinder and piston arranged to elevate and depress the gun by the pressure of gas from the flask, substantially as described.

4. The combination, with the gas-flask and supply-pipe of a gas-pressure gun, of a valve which controls the passage between said flask and pipe, and mechanism, substantially as described, whereby the pressure of gas in the flask may be made to actuate said valve, substantially as set forth.



5. The combination, with the gas-flask and the supply-pipe of a gas-pressure gun, and a valve controlling the passage between the same, of an operating cylinder, piston, and valve, by which the first-mentioned valve may be operated by means of gas-pressure, substantially as described.

6. The combination, with the gas-flask, supply-pipe, and valve controlling the supply, arranged to co-operate as described in a gas-pressure gun, of operative mechanism, substantially as described, whereby the valve may be shifted by the pressure of air from the flask, and mechanism, substantially as described, leading therefrom, by which the same may be controlled, as set forth.

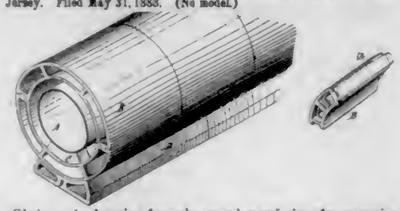
7. The method herein described of closing the operating-valve automatically, which consists in actuating mechanism by the passage of the projectile through the bore, which in turn throws into operation mechanism actuated by the pressure of gas in the flask, substantially as stated.

8. The combination, with the gas-flask, the supply-pipe, and valve controlling the passage between the two, of mechanism, substantially as described, whereby the pressure of the gas in the flask may be made to operate the valve, and mechanism leading therefrom to near the muzzle of the gun, by which the gas-pressure may be operated to close the valve as the projectile leaves the gun, as set forth.

294,353. PNEUMATIC CANNON. WALLACE A. BARTLETT, Washington, D. C. Filed Jan. 8, 1884. (No model.)

Claim.—1. The combination, with a gun-tube and gas-flask, of a supply-pipe connecting the two, said supply-pipe being in sections having a movement relatively to each other, substantially as described.

2. The combination, with an air-flask and gun-tube, of a telescopic supply-pipe connecting the two, substantially as described.



3. The combination, with a gun-tube mounted as described, so as to be free to move lengthwise, of a gas-flask and a telescopic supply-pipe connecting the two, substantially as stated.

4. The combination, with a gas-flask and gun-tube mounted thereon, of a telescopic supply-pipe connecting the two, said pipe being provided with a bearing-surface, by means of which the gas-pressure may be utilized to raise the breech of the gun.

5. The combination, with the gas-flask and the gun mounted thereon, and a pipe connecting the flask with the gun-tube, of mechanism, substantially as described, whereby the gas-pressure in the flask may be utilized to traverse the gun.

6. The combination, with a gas-flask and gun mounted thereon, of a telescopic supply-pipe connecting the two, and a projection from the gas-flask into which a portion of said telescopic tube may enter.

294,354. CONDUIT FOR STEAM-PIPES. LEONARD F. BRICKWITH, New York, N. Y., assignor to the Fire Proof Building Company of New Jersey. Filed May 31, 1883. (No model.)

Claim.—1. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of porous terra-cotta, jointed together, substantially as described.

2. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section, substantially as described.

3. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in horizontal section, substantially as described.

4. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section and in horizontal section, substantially as described.

5. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, substantially as described.

6. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, substantially as described.

7. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in horizontal section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, substantially as described.

8. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section and in horizontal section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, substantially as described.

9. In combination with a casing for metal underground pipes, an invert for drainage, substantially as described.

10. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together, and having an invert for drainage, substantially as described.

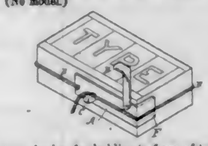
11. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section, and having an invert for drainage, substantially as described.

12. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in horizontal section, and having an invert for drainage, substantially as described.

13. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section and in horizontal section, and having an invert for drainage, substantially as described.

14. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, and having an invert for drainage, substantially as described.

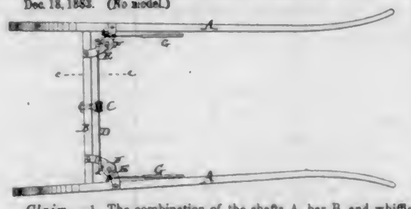
15. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, and having an invert for drainage, substantially as described.



16. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in horizontal section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, and having an invert for drainage, substantially as described.

17. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces, made of burned clay or porous terra-cotta, jointed together by broken joints or tongue-and-groove joints or lap-joints in cross-section and in horizontal section, substantially as described, said casing and metal pipe being so combined as to form an air-space between the metal pipe and the casing, and having an invert for drainage, substantially as described.

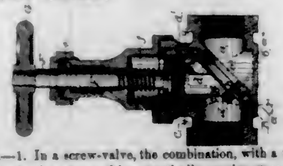
18. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces or bricks, and having an interior filling or layer composed of non-conducting substance—such as mineral wool or plaster—or of non-conducting and water-repelling substance—such as lamp-black—substantially as described.



19. A casing for underground metal pipes for conveying steam, hot water, hot air, gas, smoke, &c., composed of separate hollow pieces or bricks of porous terra-cotta, having their surface covered with coal-tar, asphalt, silicate-paint, glazing, or other water-proof covering, substantially as described.

294,355. TYPE-HOLDER. EDWIN C. BELL, Titusville, Pa. Filed Apr. 27, 1883. (No model.)

Claim.—As a device for holding a form of types together, the bed-piece A, with its booked end E, cord B, stud C, and swinging hook D, all working in combination, substantially as described.

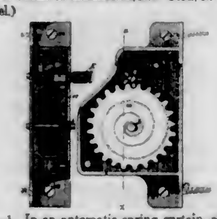


294,356. WHIFFLETREE. HANS H. E. BERT, Brooklyn, N. Y. Filed Dec. 18, 1883. (No model.)

Claim.—1. The combination of the shafts A, bar B, and whiffletree D with the swiveled blocks F F, having projecting ears *a b*, and with two pairs of braces, E E, between which said blocks are swiveled, all arranged substantially as herein shown and described.

2. The combination of the springy whiffletree D with the guide tube or support C, swiveled blocks F F, having projecting ears *a b*, and braces E E, in which said blocks are swiveled, and cross-bar B, all arranged to spring the whiffletree in the middle whenever the draft is unequal at its ends, as set forth.

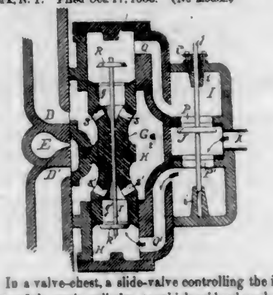
294,357. STOP-VALVE. JAMES H. BLESSING, Albany, N. Y. Filed May 16, 1883. (No model.)



Claim.—1. In a screw-valve, the combination, with a valve-casing and an inclined valve, operated by a vertically-moving stem, of a removable valve-seat arranged in an inclined position and supported by an annular tongue, which prevents a lateral movement of said seat, but permits a slight tilting movement thereof by reason of an elastic packing between said valve-seat and its support, thereby enabling the valve-seat to accommodate itself to the face of the valve, substantially as specified.

2. In a screw-valve, the combination, with a valve-casing provided with a valve-seat arranged in an inclined position, as herein described, and a removable sleeve provided with oppositely-arranged vertical guides, and having its lower end made to conform to the angle of the valve-seat, of a valve adapted to be guided in said removable sleeve, and having its face on an inclined plane that conforms to the angle of the valve-seat, the line of motion of said valve being constantly in a vertical direction, but inclined in respect to the plane of the valve-seat, substantially as herein specified.

3. In a screw-valve, the combination, with a valve-casing, A, containing a transverse partition, a^3, arranged in an inclined position, as herein described, a valve-seat, B, removably attached to the inclined partition a^3, and a removable sleeve, C, provided with guiding-grooves c', and adapted to secure the valve-seat B in place, as herein set forth, of the valve D, having its face set to conform to the angle of the valve-seat B, and having wings *d*, that are adapted to engage in the guiding-grooves c', as and for the purpose herein specified.

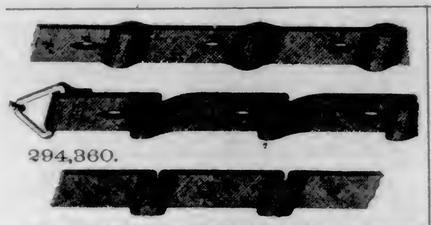


294,358. WINDOW-SHADE FIXTURE AND ROLLER. DAVID BLOCH and PETER E. MALMSTROM, New York, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—1. In an automatic spring curtain-roller, the arbor *b*, provided with the spring *g* and toothed wheel *a*, in combination with the shaft *e*, longitudinally grooved and formed with the truncated prismoidal end, the pinion *c*, carried by said shaft and pawl, and the roller B, provided with the cap-piece K, for clutching the end of shaft *e*, substantially as shown and described.

2. In an automatic spring curtain-roller, the roller B, provided with the cap-piece K, in combination with the grooved shaft *e*, and pawl for engaging in said groove, the cap-piece and shaft being provided, respectively, with interlocking elongations, as shown and described.

294,359. FLUID-ACTUATED VALVE. WILLIAM BOORMAN, Philadelphia, Pa., assignor, by direct and mesne assignments, to Charles Bernhard Behrens and Thomas Sherman, both of same place, and Sigmund Behrens, New York, N. Y. Filed Oct. 17, 1883. (No model.)



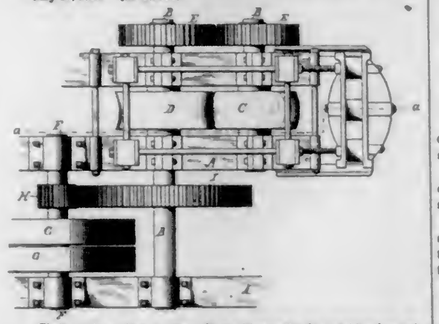
Claim.—1. In a valve-chest, a slide-valve controlling the induction and eduction ports of the main cylinder, to which said valve-chest is applied, in combination with an auxiliary valve fitted to reciprocate in said valve-chest, and provided with ports and a relief-valve, substantially as described.

2. In combination, the main cylinder, the auxiliary cylinder, the reversing-chamber, the slide-valve, the auxiliary valve, the relief-valve, and the reversing-valve, all arranged, constructed, and operating substantially as hereinbefore set forth.

3. In combination with the auxiliary cylinder, the air-chamber, substantially as and for the purposes specified.

4. The combination of the auxiliary cylinder, the reversing-chamber, inlet-ports communicating between corresponding extremities of said cylinder and chamber, and an air-chamber, all substantially as set forth.

294,360. FIRE-ESCAPE. NICHOLAS H. BORGFELDT, New York, N. Y. Filed Apr. 28, 1883. (No model.)



294,360.

Claim.—1. As a new article of manufacture, a fire-escape composed of a flexible flat band, A, provided with lateral enlargements, which do not exceed in length the width of said band, and which are placed at intervals along the surface of said band, substantially as and for the purposes herein shown and described.

2. The band A, having slits *h h*, and lateral enlargements between said slits, substantially as herein shown and described.

294,361. CRUSHING-ROLL. WILLIAM H. H. BOWERS, Salt Lake City, Utah, assignor of one-half to Stephen P. M. Tasker, Philadelphia, Pa. Filed July 16, 1883. (No model.)

Claim.—As an improvement in crushing-rolls, the combination, substantially as and for the purposes described, of two oppositely-placed or opposing rolls, one of which is convex as to its peripheral or acting face, and the other of which is correspondingly concave as to its peripheral or acting face, and both of which are isodiametric as to the central portions of their acting faces and travel at the same rate of speed, and means for occasioning the reverse rotation of the said two rolls.

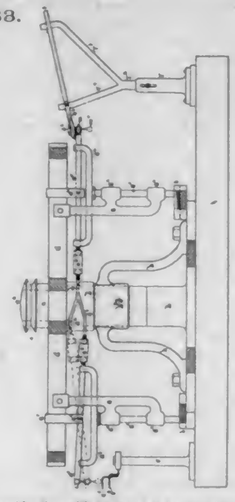
294,362. VEGETABLE PARER AND SLICER. WILLIAM E. BROCK, Dunellen, N. J., assignor to George E. Brinckerhoff, Brooklyn, N. Y. Filed Oct. 11, 1883. (No model.)

Claim.—A parer and slicer having a handle, A, and a guide, B, formed from one continuous piece of wire, said wire being bent spirally to form said handle, and extended longitudinally to form said guide, and a knife, C, secured to said handle A at one end and to said guide B at its other end, as shown and described.

294,363. MACHINE FOR WEIGHING AND ASSORTING CARTRIDGES. PAUL BUTLER, Lowell, Mass. Filed Oct. 13, 1883. (No model.)

Claim.—1. The combination of the stationary sleeve D, provided with the circumferential groove *d*, having two branches, d^2 d^3, with the moving scale-beam c^4, having its end traversing in said groove, substantially as described.

2. In combination with the rotary moving scale-beam c^4, the fork *m*, having its tines projecting forwardly with relation to the path it moves in, substantially as described.



3. In combination with the moving scale-beam, the fork *m*, and the feeding-chute adapted to feed the cartridges thereto one at a time, substantially as described.

4. In combination with the moving fork *m*, the feeding-chute adapted to feed the cartridges thereto one at a time, and formed of side bars, *s s'*, bent so as to conduct the cartridges in an angular or curved path, substantially as described.

5. In combination with the moving fork *m*, the feeding-chute composed of the parallel bars *s s'* for cartridges, and the retaining-spring s^2, substantially as described.

6. In combination with the moving fork *m*, the chute for cartridges composed of the parallel bars *s s'*, and the spring s^2, substantially as described.

294,363.

7. In combination with the moving fork *m*, the chute for cartridges composed of parallel bars *s s'*, and the springs s^2 s^3, substantially as described.

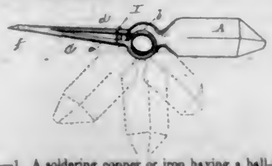
8. In combination with the cartridge-feeding chute, the scale-beam c^4 and pivoted fork *m*, mounted at the end thereof, substantially as described.

9. In combination with the cartridge-feeding chute, the fork *m*, scale-beam c^4, vertically-moving arm c^5, supporting the scale-beam, and track *i*, connected therewith by suitable mechanism to raise and lower the same, substantially as described.

10. In combination with the rotary disk C, the scale-beam c^4, fork *m*, and cartridge-feeding chute, substantially as described.

11. In combination with the rotary disk C, the scale-beam c^4, fork *m*, supporting-bar c^5, piston-rod c^6, and circular track *i*, substantially as described.

12. In combination with the rotary disk C, the scale-beam c^4, fork *m*, and cartridge-tripping finger c^7, adjusted to discharge the cartridge from the fork, substantially as described.



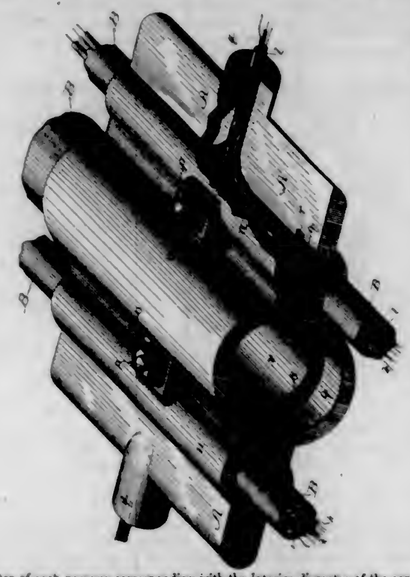
13. In combination with the rotary disk C, the scale-beam c^4, provided with fork *m*, the groove *d*, having branches d^2 d^3, and the cartridge-tripping fingers c^7 c^8 adjusted, respectively, to discharge the cartridges while the scale-beam is traversing either of said branches, substantially as described.

14. In combination with the rotary disk C, a scale-beam, c^4, provided with cartridge-holder *m*, an automatic cartridge-feeding device therefor placed at one point of the rotation of said disk, and an automatic cartridge-discharging device placed at another point in said rotation, substantially as described.

15. In combination with the scale-beam c^4, the groove *d*, with branches d^2 d^3, the supporting-arm c^5, rod c^6, and track *i*, substantially as described.

16. In combination with cartridge-carrier *m*, the cartridge-feeding chute provided with the rod r^2, and sleeved post *r*, provided with a set-screw for adjusting and fixing the height of the same, substantially as described.

294,364. SOLDERING-IRON. WILLIAM B. CROATE, Aurora, Ill. Filed Nov. 2, 1883. (No model.)

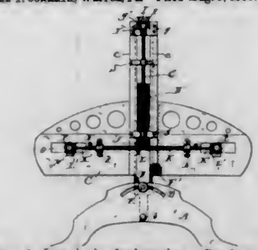


Claim.—1. A soldering copper or iron having a ball-head, in combination with a spring-shank adapted to grip and hold such head, and to permit its adjustment therein.

2. In combination, the iron made with a ball-head, the shank C, having the described arms *d* and *e*, united at one end, and each having its other or gripping ends made annular, and a slide, A, on said shank, all substantially as set forth.

294,365. CONDUIT FOR UNDERGROUND ELECTRIC WIRES. HENRY B. COHB, Wilmington, Del. Filed Nov. 24, 1883. (No model.)

Claim.—1. A coupling for conduit-sections in underground systems of electric wires, comprising a metal body divided longitudinally into separable parts, and having one or more passages through it to receive the ends of the conduit-sections and form continuations thereof, the diame-



ter of each passage corresponding with the interior diameter of the conduit-sections which enter it, and being enlarged where the conduit-sections enter it to the extent of the thickness of the metal of the said conduit-sections, substantially as described, and for the purpose set forth.

2. A conduit-coupling comprising the separable parts A and A', provided with three longitudinal passages, *u u* and *v*, each having a diameter equal to the interior diameter of the conduit-sections which enter it, and enlarged where the conduit-sections enter it to the extent of the thickness of the metal of the said conduit-sections, and provided, also, with lateral passages *t*, leading from the passages *u*, substantially as described.

3. A coupling for conduit-sections, comprising a metal body formed of the separable parts A and A', with mechanism for securing said parts together, and having one or more longitudinal passages through it to receive the ends of the conduit-sections and form continuations thereof, and provided with annular recesses *s* near the ends of the passages, to receive flanges *r* on the ends of the conduit-sections, and having the passages from the said recesses to the ends made larger than elsewhere, whereby the inner surfaces of the conduit-sections and coupling may be flush with each other, substantially as described.

294,366. DEVICE FOR LOWERING COFFINS INTO GRAVES. GEORGE T. CONRATH, Warren, Pa. Filed Aug. 3, 1883. (No model.)

Claim.—1. In a device for lowering coffins into graves, the combination of the supporting-frame adapted to rest upon the ground, the lowering mechanism mounted thereon and adjustable to a longitudinal level position, and devices which lock said mechanism in a level position, substantially as set forth.

2. In a device for lowering coffins into graves, the combination of the supporting-frame adapted to rest upon the ground, the lowering mechanism mounted thereon and adjustable to a transverse level position, and devices which lock said mechanism in said level position, substantially as set forth.

3. In a device for lowering coffins into graves, the combination of the supporting-frame adapted to rest upon the ground, the lowering mechanism mounted thereon and adjustable to both a longitudinal and a transverse level position, and devices which lock said mechanism in both of said level positions, substantially as set forth.

4. In a device for lowering coffins into graves, the combination of the foot-pieces A and A', provided with curved slots D D', a frame carrying the lowering mechanism supported upon pivots *b b'*, and the set-screws which pass through said slots, substantially as set forth.

5. In a device for lowering coffins into graves, the combination of the foot-piece A', a frame for supporting one end of the lowering mechanism attached to said foot-piece, the foot-piece A, a vertical post attached to foot-piece A, and a cross-frame sliding upon said post and carrying the other end of the lowering mechanism, substantially as set forth.

6. The combination of the foot-pieces A A', the frames C C', carrying the lowering mechanism, the post B, upon which the frame C slides vertically, and the rack and pinion for elevating and lowering said frame, substantially as set forth.

7. The combination of the foot-pieces A A', the frames C C', carrying the lowering mechanism, the post B, upon which the frame C slides vertically, and having recess B' in its outer face, for the purpose described, and mechanism for elevating and lowering frame C upon the post B, substantially as set forth.

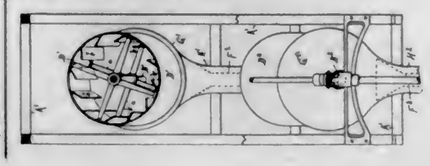
8. The combination of the supporting-frame adapted to rest upon the ground, the frames C C', mounted upon said supporting-frame, the vertical post B, upon which slides the frame C, the strips *c*, carried by frame C, adapted to prevent displacement of post B, and mechanism for elevating and lowering the frame C upon the vertical post, substantially as set forth.

9. In a device for lowering coffins into graves, the combination of the supporting-frame adapted to rest upon the ground, and the lowering mechanism mounted upon said frame and adjustable to suit coffins of various widths, substantially as set forth.

10. In a device for lowering coffins into graves, the combination of the supporting-frame adapted to rest upon the ground, and the lowering mechanism mounted upon said frame and adjustable longitudinally and transversely, to suit coffins of various sizes, substantially as set forth.

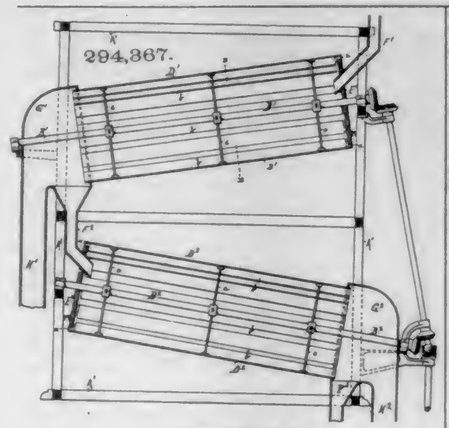
11. In a device for lowering coffins into graves, the combination, with the supporting-frame, of the longitudinal shafts mounted thereon and carrying gear-wheels, a transverse shaft carrying gear-wheels engaging with the wheels on the longitudinal shafts, and mechanism for rotating said shafts, substantially as set forth.

12. In a device for lowering coffins into graves, the combination, with the supporting-frame adapted to rest upon the ground, of the longitudinal shafts carrying the straps R, the transverse shaft, the gear-wheels between said shafts, the upright shaft G, the gear-wheels between said shaft G and the transverse shaft, and means for rotating all of said shafts and wheels, substantially as set forth.



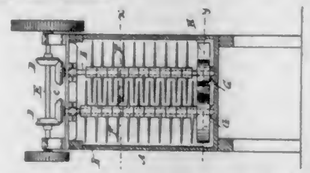
13. In a device for lowering coffins into graves, the combination, with the supporting-frame, of the transverse extensible shaft K K' K', the longitudinal shafts movable toward and from said transverse shaft, bevel-wheels between said shafts, and mechanism for rotating said shafts, substantially as set forth.

14. In a device for lowering coffins into graves, the combination, with the supporting-frame, of longitudinal extensible shafts M M', a transverse shaft, bevel-wheels between said shafts, and mechanism for rotating said shafts, substantially as set forth.



15. In a device for lowering coffins into graves, the combination, with the supporting-frame, of the longitudinal extensible shafts M M', the transverse extensible shaft K K' K', the bevel-wheels between said shafts, the vertical shaft G, bevel-wheels between said shaft G and the transverse shaft, and devices for rotating said mechanism, substantially as set forth.

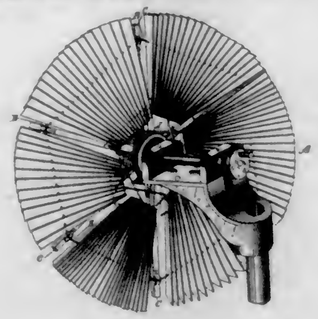
294,367. GRAIN-DRIER. SHELDON PAUL COOK, Minneapolis, Minn. Filed July 2, 1883. (No model.)



Claim.—The combination of cylinder D', adapted to be revolved, and provided with angular wings *b*, hot-air pipe H', and stationary head E', with hot-air exits *a* between said head and said cylinder, substantially as and for the purpose set forth.

294,367.

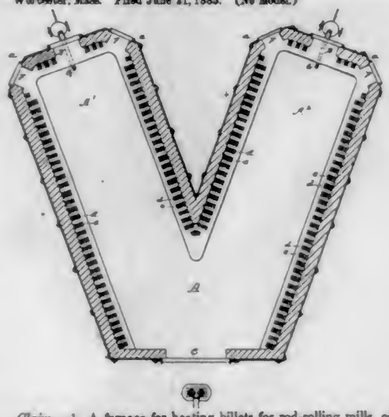
294,368. BRICK-MACHINE. ANTHONY CRAMER, Detroit, Mich. Filed Sept. 18, 1883. (No model.)



Claim.—1. A pug-mill provided with two vertical shafts revolving in opposite directions, and carrying interacting wipers set at right angles to each other, the end of one acting in close proximity to the rear face of the other, whereby both are kept free from and prevent the clay clogging each other, substantially as specified.

2. In a brick-machine, a pug-mill provided with two vertical shafts revolving in opposite directions, and having interacting cutting-blades, and provided with interacting wipers at their lower ends set at right angles to each other, substantially as specified.

3. In a brick-machine, a pug-mill provided with two vertical shafts revolving in opposite directions, and having interacting cutting-blades F and wipers G, set at right angles to each other, the outer end of one wiper approaching close to the hub of the other, in combination with a rectangular-shaped casing having a discharge-opening, H, in its lower end, substantially as and for the purpose described.



4. In a pug-mill, in combination with the casing having a discharge-opening, H, at its lower end, of two oppositely-revolving vertical shafts mounted therein, and carrying interacting cutters and interacting wipers, said wipers set at right angles to each other, as specified, bevel-pinions G, secured to the upper ends of said shafts, and meshing with bevel-pinions D, secured to the horizontal main shaft E, all constructed, arranged, and operating as specified.

294,369. WIND-ENGINE. CHARLES H. CRAMER, Lake Mills, Wis. Filed Mar. 5, 1883. (No model.)

Claim.—The combination of the windmill-hub D, provided with lugs *a*, shaft E, collar F, provided with recesses *b* and arms G, chain O, spiral spring N, radial arms C, rods H, and sections A, said lugs *a a* being adapted to move in the recesses *b b*, and said chain being adapted to be wound upon said collar, and said spiral spring extended as the motion of said collar F is resisted by the action of the brake, while said sections A are thrown from a vertical into a horizontal position out of the wind as said wheel moves forward by the action of said rods H, said collar being moved forward, and said sections brought into the vertical position by the said spring when the resistance of the brake is removed, all for the purpose and substantially as specified.

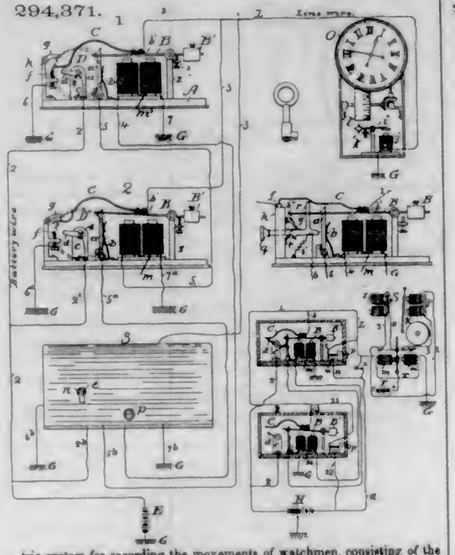
294,370. FURNACE FOR HEATING BILLETS. FRED H. DANIELS, Worcester, Mass. Filed June 21, 1883. (No model.)

Claim.—1. A furnace for heating billets for rod-rolling mills, constructed, substantially as shown and described, with two heating-sections, A' A^2, adapted for receiving long billets, which sections converge and unite in a manner to permit the withdrawal of the billets at the delivery end at a single place of discharge, as set forth.

2. A furnace for heating long billets for wire-rod-rolling mills, provided with feeding-in doors at one end and a discharging-door at the other, and having auxiliary thereto the doors F, located in the angles formed at the divergent ends of the furnace, substantially as shown, and for the purpose set forth.

294,371. WATCHMAN'S ELECTRIC TIME-RECORDING SYSTEM. GEORGE W. DAVIS, Freeport, Me. Filed Dec. 17, 1883. (No model.)

Brief.—The operation of sending a signal from one post sets the instrument at the next post. As it cannot be used without this previous setting, the watchman is compelled to visit his posts in a prearranged order.



Claim.—1. The combination, substantially as hereinbefore described, in an electric signaling system for watchmen, of a main-line circuit extending outward to a recording-instrument, and inwardly terminating in a series of branch circuits, one of which is normally grounded, a ground-wire for each branch circuit, a battery and normally-open battery-wire, means, as indicated, for sending the signal by connecting the battery to the main-line circuit, and simultaneously severing the line from the normal ground, and other means, whereby the act of sending the signal grounds the line through another of the said branch circuits, for the purposes described.

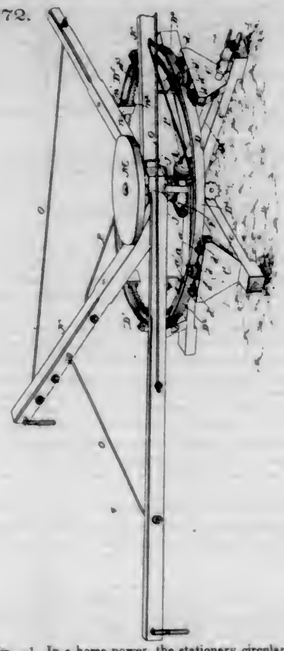
2. An electric signaling system for watchmen, consisting of a recording-station and a recording-instrument located thereat, two or more signaling-stations, a signaling-instrument at each signaling-station, provided with devices for setting the succeeding instrument, a connecting-line circuit extending between the said recording and signaling stations, and having a separate branch to each signaling-instrument, a normally-open battery-circuit branching to each signaling-instrument, and a normally-open controlling-circuit extending from each signaling-instrument to the electro-magnet of the next in order, and adapted to be closed by the act of sending the signal, whereby the next instrument to be operated may be automatically set in operative position, substantially as hereinbefore described.

3. In a system of electric signaling for watchmen, the method of preventing false signals from being sent to line, which consists in causing the act of sending the legitimate signal from any given signaling-instrument to ground or short-circuit the main line at the next station, substantially as described.

4. A signaling-instrument adapted to form one of a series in an electric system for recording the movements of watchmen, consisting of the following instrumentalities: an arbor carrying a revolving arm, and adapted to be manually rotated in sending a signal, the said arbor being connected with a battery; a ratchet-wheel fixed upon and adapted to be rotated with the arbor, and a pawl engaging therewith to prevent retrograde movement; a ground-terminal; an electro-magnet in a local circuit normally open at a point external to the instrument, an armature and detent therefor, and a contact-spring in electric connection with a main-line circuit, supported by but insulated from the said armature, and adapted, when the armature is in its forward position, to rest on the said ground-terminal in the path of the revolving arm, and a normally-open circuit-wire connected with the armature-detent and leading to the electro-magnet of the succeeding instrument, all in combination and for the purposes specified.

294,371.

5. The combination, in a signaling-instrument for an electric watch-box system, of a main line, a battery-line, a ground-wire, a normally-open local circuit leading to another instrument, and means, as indicated, for disconnecting the line from its ground-wire and connecting it momentarily with the battery-wire, and for connecting the said battery-wire immediately thereafter to the normally-open branch circuit, whereby the signal is sent and the succeeding instrument set, for the purposes specified.



6. A series of watchmen's signaling-instruments, adapted, when manipulated, to send electric signals to a recording-instrument, each of the series being connected with a line branch, a ground-wire, a battery branch, and a normally-open circuit leading to the next instrument, and provided with an electro-magnet, adapted, when energized, to ground the main line, and each provided with devices for manual operation, so arranged that the act of sending the signal successively breaks the main-line ground from its own instrument, sends the signal to line, and closes the circuit of the succeeding electro-magnet, whereby the next instrument is put into operative position.

7. The combination, in an instrument for use in a system of electric signaling for watchmen, of a signaling-instrument, an inclosing-case therefor, and circuit-closers attached thereto, and a main battery having its ground or return wire connected as hereinbefore described, whereby the proper manipulation of the signal-instruments causes currents of definite direction to flow to line and work the recorder, and whereby an attempted removal of the case causes reversed currents to flow to line for the purpose of sounding an alarm, substantially as specified.

8. The combination, in a system of electric signaling apparatus for watchmen, of a recording system consisting of a polarized relay and a local recorder and alarm-bell adapted to be actuated thereby, a series of signaling-stations to be visited in turn by the watchman, a main battery, a signaling-instrument of the character described at each station, and connections whereby when the regular signal is transmitted currents of definite direction are sent to line, operating the recorder, and if the signal-box is tampered with currents of opposite direction are sent, operating the alarm, substantially as described.

294,372. HORSE-POWER. JOSEPH DICK, Jr., Canton, Ohio. Filed Aug. 16, 1883. (No model.)

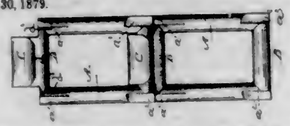
294,372.

Claim.—1. In a horse-power, the stationary circular rack, toothed on its lower face, in combination with the traveling pinion engaging therewith, and a bevel-wheel concentric with said rack and actuated therefrom, substantially as described.

2. In a horse-power, a circular rack composed of sections cogged on their lower faces, in combination with and supported by stationary uprights, to which they are secured, substantially as described.

3. In a horse-power, the stationary circular rack or ring toothed on its lower face, in combination with the traveling shaft geared thereto and a bevel-gear arranged below the plane of and geared to said traveling shaft, substantially as described.

4. In a horse-power, the frame of the machine, consisting of radial arms, a central flanged or socketed hub, the uprights secured to said arms, and a stationary circular rack, made in sections toothed upon their lower surfaces, and secured to and connecting said uprights, substantially as described.

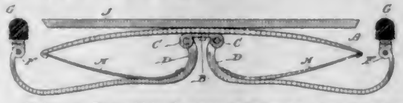


5. The circular rack made in sections, each provided with flanged and semi-conical projections, in combination with the supporting-standard, the socketed cap-pieces, and the through-bolts for uniting said sections to each other and to the radial arms of the frame, substantially as described.

6. The combination of the circular rack, the central bevel-gear, and the connecting traveling shaft, said rack and bevel-gear being geared to the traveling shaft, the rack above and the bevel-gear below the horizontal plane thereof, and both on the same side of the axial center of the bevel-wheel, substantially as described.

7. The stationary circular rack, in combination with the sweep for actuating the traveling pinion and the draft-rod connecting said sweep with the pinion-shaft bearing, in the manner and substantially as specified.

8. The stationary circular rack, toothed on its lower face, in combination with a traveling shaft and its pinion, and a sliding shoe upholding said pinion in engagement with the lower surface of the rack, and forming a bearing for the shaft thereof, substantially as described.



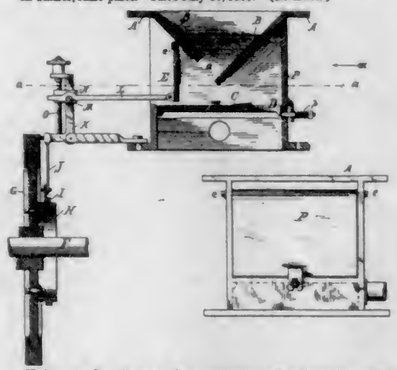
294,373. DRIVE-CHAIN. WILLIAM H. DICKEY, Jackson, Mich. Filed Sept. 30, 1879.

Claim.—A chain-link having an end bar, D, which is flattened upon its upper face, as at *d*, with an open hook projecting therefrom, having

at its opposite end an end bar adapted to enter a similar hook upon an adjacent link, and having side bars recessed at one end, as at d' d', to the plane of the flattened part d of the end bar, or thereabout, provided with stops a' a' and recesses a^3 a^3, to receive the stops when the links are turned into an unusual relative position for coupling or uncoupling.

294,374. VEHICLE-SPRING. WILLIAM H. DOYLE, Bantam Falls, Conn. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a vehicle, the upper spring, upon which the bolster rests, in combination with two lower springs, pivoted independently to said spring, and the intermediate or auxiliary springs, secured at one end to the lower springs, and the other extremities resting in sockets in the upper springs, substantially as set forth:



2. The springs D, having their inner ends formed with eyes E, in combination with the plate B, secured to the spring A, and provided with ears C, and intermediate springs, H, substantially as described.

3. The spring A, with sockets I, as described, in combination with the springs H and springs D, substantially as and for the purpose set forth.

4. In combination with the spring A, having sockets I, and the lower springs, D, pivoted to said spring, the auxiliary or intermediate springs, H, resting within said sockets, and secured upon said lower springs, whereby the strain is distributed throughout all the springs and a uniform and positive action had, substantially as hereinbefore shown and described.

5. In combination with the upper spring, A, the spring H, secured on the upper surface of the lower spring, D, whereby the greater the weight placed upon the upper spring the longer will be the line of contact between the lower and the intermediate springs, substantially as set forth.

294,375. HOPPER FOR PULVERIZING-MACHINES. HERMANN BERNHARD FELDMANN, Philadelphia, Pa., assignor of one-half to Stephen P. M. Tucker, same place. Filed July 16, 1883. (No model.)

Claim.—1. In a hopper, the combination of an inclosing-casing, a diaphragm or floor therein provided with a discharge-opening, chutes or kindred devices adapted to direct the deposit of material fed into the casing upon the diaphragm, an oscillatory feed-plate adapted to occasion the feed of a predetermined quantity of material deposited upon the diaphragm to the discharge-opening therein, and means for occasioning the oscillation of the feed-plate, substantially as set forth.

3. The combination, with an inclosing-casing containing convergent chutes, and a diaphragm provided with a discharge-opening, substantially as set forth, of an oscillatory feed-plate, a link, a bell-crank lever, an eccentric yoke, and an eccentric, all substantially as set forth.

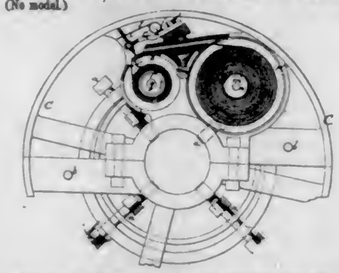
3. In combination with a casing for a hopper provided with the inclined convergent chutes and the horizontal diaphragm and the oscillatory feed-plate, the spring-controlled door, substantially as and for the purpose set forth.

294,376. CANOPY-HOLDER FOR CHILDREN'S CARRIAGES. ADDEN S. FITCH, New York, N. Y. Filed Aug. 2, 1883. (No model.)

Claim.—1. The combination, with the supporting-rod B, of the leaf-spring holder A, having the loop *a* to grip the rod, and the parallel ends *a'*, with the button *c* on the canopy-ferrule C, adapted to be gripped by said ends *a'*, as and for the purpose specified.

2. The combination, with the supporting-rod B, of the leaf-spring holder A, the wide middle portion of which forms the rod-gripping loop

294,376.



a, and the narrowed ends of which are parallel to each other and form a grip for the button *c* on the canopy-ferrule C, substantially as and for the purpose set forth.

3. The combination, with the supporting-rod B, of the leaf-spring holder A, having the rod-gripping-loop *a*, and the ends *a'*, recessed at a^3, together with the ferrule C, having button *c*, with convex opposite sides *c'*, as and for the purpose specified.

4. The combination, with the supporting-rod B, of the leaf-spring holder A, having the rod-gripping loop *a* and extended parallel ends *a'*, on the bearing-face of one of which are the radial depressions a^3, together with the ferrule-button *c*, having the rib c^3 across one side, and arranged to operate as and for the purpose described.

5. The combination, with the rod B, of the leaf-spring holder A, having the loop *a* and the extended parallel ends *a'*, together with the ferrule C, having the shank c^4, carrying the button *c* and the pin c^3, all arranged to operate as and for the purpose specified.

294,377. DYNAMOMETER. FRANKLIN A. GLEASON, Brooklyn, assignor of one-half to John H. Swartz, Oyster Bay, N. Y. Filed June 15, 1883. (No model.)

Claim.—1. The combination of the dynamometer-wheel C with the lever D and mechanism, substantially as described, for recording the movements of the lever D on a tape, and with the lever E and the lugs *e e* on the actuating-pulley B, all arranged for the purpose of balancing the apparatus, substantially as specified.

2. The combination of the dynamometer-wheel C with the two levers D E and the two springs F F, and with the actuating-wheel B and its lugs *e e*, that bear against both of said levers, substantially as described.

3. The combination of the dynamometer-wheel C, having annular flange *u* and notch *v* therein, with the loose ring I, lever J, having pin *w*, pawl *s*, and ratchet-wheel *r*, all arranged for converting the continuous rotation of the wheel C into intermittent rotation of the ratchet-wheel *r*, substantially as described.

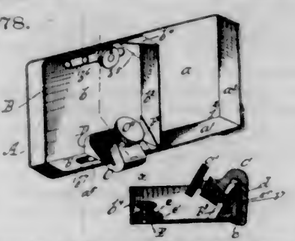
4. The combination of the dynamometer-wheel C, having notched flange *u*, with the ring I, lever J, pin *w*, spring *x*, pawl *s*, ratchet-wheel *r*, intermediate gearing, a^2 b^2 d^2, and shaft f^2, upon which the registering-tape is wound, substantially as specified.

5. The combination of the dynamometer-wheel C, having notched flange *u*, with the loose ring I, lever J, having pin *w*, pawl *s*, ratchet-wheel *r*, spool *p*, and mechanism, substantially as described, for conveying the motion of said ratchet-wheel *r* to the spool *p*, and with the lever D, elbow-lever G, pencil-holder *i*, and spring F, substantially as herein shown and described.

6. The slotted pencil-holder *i*, combined with the plug or slide *k*, sustaining-lever G, and spring *l*, substantially as described.

7. The spool *p*, combined with the spring g^2 and pin k^2, for the purpose of clamping the end of the tape H, substantially as specified.

8. The combination of the box l^2 and drum *m*, contained therein, with the cover j^2, spring i^2, and plug l^2, substantially as described.



9. The combination of the dynamometer-wheel C, having toothed projection m^2, with the slotted plate J^3, having series of teeth on one side and one tooth, n^3, on the other side, and with the lever D, having notches wherein to receive the tooth n^3, substantially as described.

10. The dynamometer-wheel C, made in two parts, which can be fastened onto a shaft already hung, in combination with the connecting-bolts p^2, substantially as specified.

294,378. COMPOSING-STICK. WILLIAM H. GOLDING, Chelsea, Mass. Filed Feb. 24, 1883. (Model.)

Claim.—1. A gage or knee for a composing-stick, formed of a single piece of sheet metal and having integral re-enforcing flaps at its

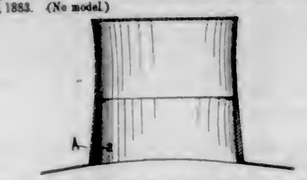
294,378.

ends, constructed as and for the purpose of triangular braces to the wall of the knee, substantially as specified.

2. A gage or knee for a composing-stick, formed of a single piece of sheet metal and having a triangular bracing re-enforcing flap at its outer end, substantially as specified.

3. A gage or knee formed of a single piece of sheet metal, and having a re-enforcing flap integral with its back and secured to its end, and a re-enforcing flap integral with its end and secured to its bottom, substantially as specified.

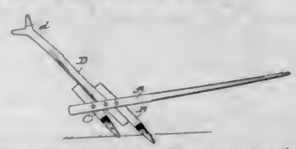
4. The combination of a stick, a knee, and a self-adjusting corner-block with suitable clamping mechanism, substantially as specified.



5. The combination of a knee provided with slots in its bottom, a stick provided with holes in the bottom thereof, registering with said slots, and suitable clamping mechanism terminating flush with the outer surface of the bottom, substantially as specified.

6. A blank for a sheet-metal composing-stick, comprising a bottom, a back, and an end-forming portion, the latter portion having an integral triangular re-enforcing flap, substantially as specified.

7. The blank for a composing-stick, consisting of the back portion, *a'*, and margin a^3, integral with the bottom portion, *a*, an end-forming portion, a^2, integral with the back-forming portion, and provided with an integral re-enforcing flap, a^4, and with a margin, a^5, and flap a^6, separated from each other and from the margin a^3, substantially as shown and described.

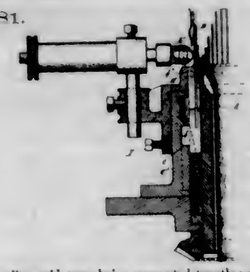


8. The blank for a knee, consisting of the bottom *b*, back *b'*, end b^2, and re-enforcing flaps b^3 b^4 b^5, substantially as shown and described.

294,379. HAT. ROBERT D. GREENLEES, Watertown, N. Y. Filed July 16, 1883. (No model.)

Claim.—The hat described, consisting of a single structure separated at one point to form the main body portion A, having the usual rigidity and stiffness, and the auxiliary body portion *a*, having a yielding capacity at any point, as described.

294,380. LIFTING-JACK FOR STARTING CARS. HENRY GRIMM, Quincy, Ill. Filed Aug. 2, 1883. (No model.)



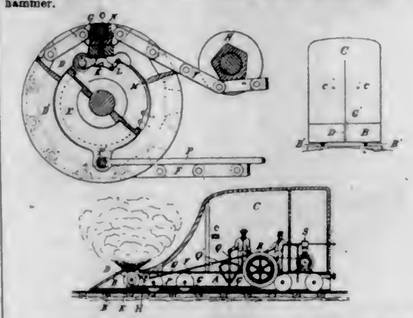
Claim.—The combination of the lever, pivoted standards adapted to grip or take hold of the track or way, and the arm B, pivoted to the lever between the standards, and adapted to bear against the car, substantially as described.

294,381. KNITTING-MACHINE. LEWIS T. GROSS and JOSEPH ADAMS, Philadelphia, Pa. Filed May 17, 1882. (No model.)

Claim.—1. In a knitting-machine, the combination of needle-head A, provided with grooves *b'*, bearded needles B, provided with needle-jack *b*, cam-cylinder C, provided with camway *c*, plate H, presser-wheels E, and looper-wheels D, supported and carried by said plate H, substantially as shown.

2. The combination of a rotating circular needle-bed, a series of bearded needles carried by said needle-bed, a series of cams to recipro-

294,381.



cate said needles, said cams being connected together to form a continuous guideway, a series of looper-wheels, a series of presser-wheels, said cams and looper and presser wheels being equal in number, and a single circular and adjustable supporting-plate to which said looper-wheels are secured, whereby the said looper-wheels may be removed or adjusted about said needles without changing their relative position, as shown.

3. The combination of needle-bed A, provided with vertical guide-slots *b'*, bearded needles B, circular plate H, arranged about said needle-bed, but held stationary, and adapted to close the outer openings of slots *b'*, presser-wheels E, and looper-wheels D, secured to said plate H, and adapted to be all removed or adjusted simultaneously about said needle-bed, substantially as shown and described.

294,382. SNOW-PLOW. GEORGE A. GUNTHER, New Utrecht, and H. WILBUR HUBBARD, Brooklyn, N. Y. Filed Oct. 9, 1883. (No model.)

Brief.—A snow-plow provided with a chain having receptacles for torpedoes or cartridges which are fired by an automatically-operating hammer.

Claim.—1. A snow-plow combined with a chain provided with pockets or mortars for receiving cartridges or torpedoes, substantially as specified.

2. A snow-plow combined with a chain provided with mortars for receiving cartridges or torpedoes, and a firing-wheel over which the said chain passes, substantially as specified.

3. The combination, with a snow-plow, of a chain provided with mortars for receiving torpedoes or cartridges, and a toothed wheel over which the chain passes, the wheel being provided in its periphery with a recess for receiving the mortars successively, substantially as specified.

4. The combination, with a snow-plow, of a chain provided with mortars for receiving cartridges or torpedoes, a firing-wheel over which the said chain passes, and a firing mechanism, substantially as specified.

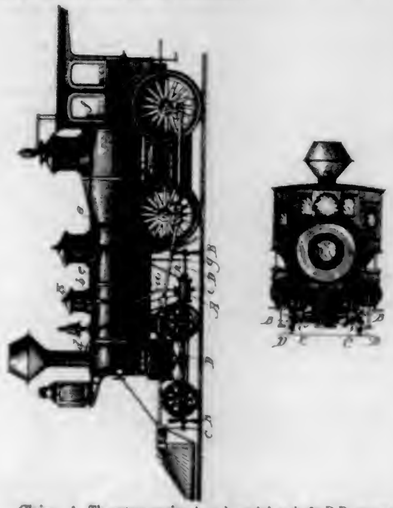
5. The combination, with a snow-plow having a slot in its top, of a wheel journaled below the slot, a chain passing over the wheel and provided with mortars for receiving cartridges or torpedoes, and a mechanism for firing the cartridges or torpedoes, substantially as specified.

6. The combination, with a snow-plow, of a wheel, a chain passing over the said wheel and provided with mortars for receiving cartridges or torpedoes, a firing-pin held loosely in the rim of the wheel, and a mechanism for forcing the pin against the cap or fulminate of cartridges held in the mortars in the chain, substantially as specified.

7. The combination, with a snow-plow, of a wheel, a chain passing over it and provided with mortars for receiving cartridges or torpedoes, a firing-pin passing loosely through the rim of the wheel, a spring-hammer adapted to strike the pin, and a cam-disk for operating the hammer, substantially as specified.

8. The combination, with a snow-plow, of a wheel, D, the chain F, provided with mortars *G*, the firing-pin N, held loosely in the rim of the wheel D, the hammer I, pivoted to the wheel, the spring M, connected with the free end of the hammer and fastened to the wheel, the finger K

on the hammer, and the cam-disk E, mounted loosely on the shaft of the wheel D, and provided with a shoulder, E', in its track, substantially as specified.

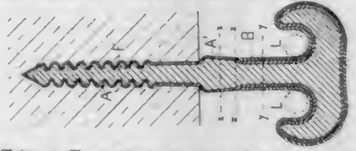


9. The combination, with a snow-plow, of the wheel D, the chain F, provided with mortars G, the firing-pin N, held loosely in the rim of the wheel D, the hammer I, pivoted to the wheel, the spring M, acting on the hammer, the disk E, having a cam-track provided with a shoulder, E', the finger K on the hammer I, the connecting-rod P, and the lever Q, substantially as specified.

10. The combination, with a snow-plow, of a wheel, a chain passing over the same and provided with mortars for receiving cartridges or torpedoes, a firing mechanism for firing the torpedoes, a cam-disk for operating the firing mechanism, and means for adjusting the cam-disk according to the desired direction of the force of the explosion of the cartridges or torpedoes, substantially as specified.

11. The combination, with a snow-plow, of a wheel, a chain passing over the wheel and provided with mortars for receiving cartridges or torpedoes, a firing mechanism, and a steam-engine for operating or driving the chain, substantially as herein shown and described.

294,383. SNOW-PLOW ATTACHMENT TO LOCOMOTIVES. FREDERICK HAINSWORTH, Chicago, Ill. Filed Mar. 12, 1883. (No model.)



Brief.—Twisted fan-wheels and knife-cutters are rotated through a rotary engine carried upon the locomotive.

Claim.—1. The rotary engine A, and revolving shafts D D, arranged alongside of boiler, provided with twisted-shaped fan-wheels B B, in combination with a locomotive, as and for the purpose shown.

2. The rotary engine A, revolving shafts D D, arranged alongside of locomotive-boiler, the twisted-shaped fan-wheels B B, and knives C C, in combination with a locomotive, as and for the purpose shown.

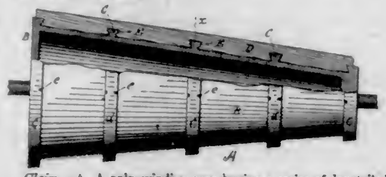
294,384. INSULATOR FOR ELECTRIC CONDUCTORS. ALBERT W. HALE, Plainfield, N. J. Filed May 29, 1883. (No model.)

Claim.—1. The combination herein described of the metallic support for the wire, the insulating-glaze, and the outer re-enforcing jacket of metal or alloy, arranged and operating as and for the purposes set forth.

2. As a new article of manufacture, glazed metallic supports for electric conductors, having the coating of glaze re-enforced by a coating of metal or alloy, substantially as and for the purposes set forth.

294,385. BRACKET. EUGENE S. HERRENWAY, Boston, Mass. Filed Oct. 19, 1883. (No model.)

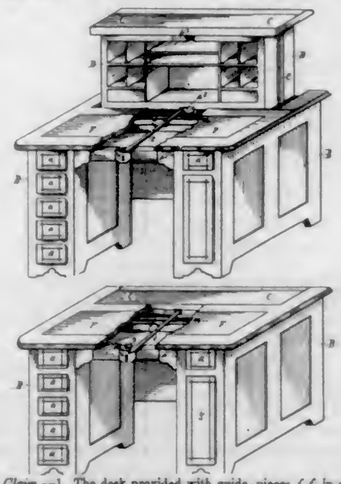
Claim.—1. A window-curtain bracket provided with a slot or opening in the end portion, A, and having the penetrating portion B and right-angle portion C provided with a point, E, substantially as described.



2. The sheet-metal bracket A, provided with the attaching portion B, of uniform size, having a bevel point, and right-angle portion E, provided with the point C, as and for the purposes set forth.

294,386. WIRE BALE-TIE. WM. HEWITT, Trenton, N. J., assignor to the Trenton Iron Company, same place. Filed Dec. 12, 1883. (No model.)

Claim.—As an improvement in wire bale-bands, a plate provided with a hole at one extremity and a slotted hole or opening at the other, in combination with a wire band, one end of which is twisted to form a loop, which is engaged within the slotted hole or opening of the plate, and the other end of which is first inserted through the hole in the plate, and then within the slotted hole or opening, substantially as and for the purposes set forth.



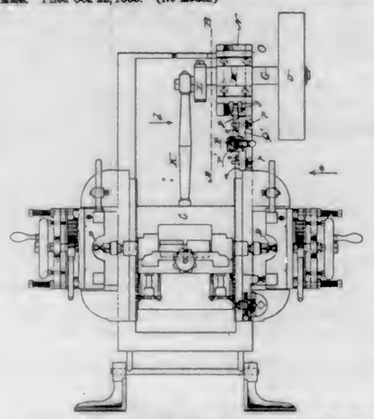
294,387. METHOD OF SECURING THE KNIVES IN PAPER-PULP-GRINDING ENGINES. JOHN HENRY HORNE, Lawrence, Mass. Filed Dec. 19, 1883. (No model.)

Claim.—1. A pulp-grinding cone having a series of dovetailed annular ribs cast therewith or shrunk thereon, each rib being recessed on the same longitudinal line, so as to leave its external width at that point no greater than the width of its base or line of junction with said cone, substantially as set forth.

2. A series of bars for the knives of a pulp-grinder, each bar being provided with a series of dovetailed or inwardly-flaring slots or recesses, in combination with a grinding device having a series of dovetailed annular ribs corresponding, respectively, in position to said slots, each rib being recessed on the same longitudinal line, so as to leave its width at that point uniform from the outside to the base, said width corresponding to the width of the neck of corresponding slot or recess in the bars, substantially as set forth.

294,388. DESK. NICHOLAS A. HULL, Peru, Ind. Filed Apr. 14, 1883. (No model.)

Claim.—1. The desk provided with guide-pieces *f f*, in combination with movable pigeon-hole case having guide-bars *e* fitting between said guides, in combination with yokes *u*, said yokes having slotted bearings C' C', supporting pulleys P, with cord and weights, the said yokes *u* being attached to the guides *f f*, as described, for the purposes specified.



2. In a desk having a vertically-moving pigeon-hole part, the combination of the stationary part having guides *f f*, the yokes *u*, attached thereto, as described, said yokes having horizontal slotted bearings C' C', supporting pulleys P, with the movable pigeon-hole part, cords, and weights W W, the cord T passing through the arms *x* of the movable case, and secured thereto by screws or bolts *g g*, in the manner and for the purposes set forth.

3. In a desk having a movable pigeon-hole case balanced by cords and weights, the combination of the case C, having stop a^2 and lug a^3, engaging with pivoted bar *t*, said bar being pivoted to the under side of the fixed top F, the outer end of said bar engaging with the bolt *o* of the lock *h* in the drawer *d'*, substantially as and for the purposes set forth.

4. In a desk having a movable pigeon-hole case suspended by weights, cords, and pulleys, as set forth, the drawer *d'* and series of drawers *a*, in combination with the locking mechanism consisting of the pivoted bar *t*, lock *h*, transverse bar *r*, coil-spring *n*, hinged bar *v*, having lugs *s'*, engaging with the prongs *i* upon the drawers *a*, the stop a^2, and lug a^3, attached to the case C, the whole when arranged and combined for the purposes set forth.

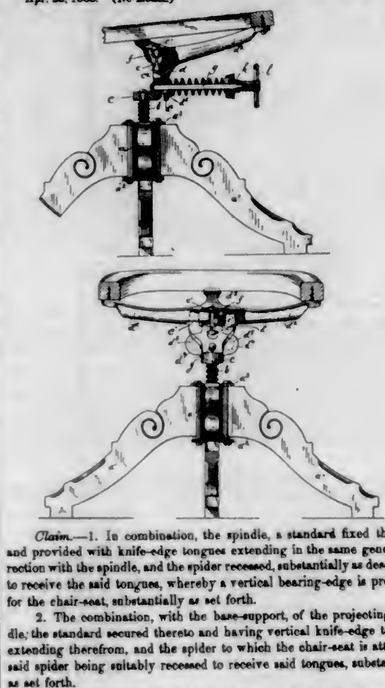
5. In a desk having a movable pigeon-hole case balanced by weights and pulleys, as set forth, the bracket *n'*, attached to the case C, as specified, in combination with the pulleys *b b*, strap R, and handle *h'*, said strap being attached in the manner specified, for the purposes set forth.

294,389. MORTISING-MACHINE. EDWARD J. HUMPHREYS, Millbury, Mass. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a mortising-machine, the combination, with the carriage C, upon which are mounted boring-bits D, operated substantially as described, the connecting-rod K, and crank L, of the crank-shaft G, having an adjustable bearing, M, and means, substantially as described, for adjusting said bearing M longitudinally upon the bed O of the machine, all constructed and operated substantially as shown, and for the purpose stated.

2. In a mortising-machine, the crank-shaft G, having a sliding and adjustable bearing, M, and means for operating the same, substantially as described, in combination with the carriage C, upon which are mounted the boring-bits D, operated substantially as described, in connection with rod K and crank L, all constructed and operated substantially as shown and described.

3. The combination, with the crank-shaft G and sliding bearing M, of a suitable connecting-rod, *g*, bed O, fixed segmental bearing Q, and suitable operating-lever, P, substantially as and for the purposes set forth.



4. In a mortising-machine, the combination, with the bed O, way N, and fixed segmental bearing Q, of crank-shaft G, adjustable bearing M, connecting-rod *g*, and suitable operating-lever, P, all constructed and operated substantially as shown, and for the purposes stated.

294,390. WATCH-CASE SPRING. EVANS H. JENKINS, Richmond, Ind. Filed Aug. 13, 1883. (No model.)

Claim.—A lifting-spring for watch-cases, consisting of a single strip of suitable metal, provided at one end with a raised curved lug, C, and the opposite end terminating in a fish-tail bearing, *m*, when said spring is provided with a loop or bracket, *f*, and is made tapering vertically from the bracket or loop *f* in the direction of the lug C by being cut away on the lower edge, and the opposite tapering from the loop or bracket *f* toward the fish-tail bearing *m* by being cut away from both edges, as herein set forth and described.

294,391. TILTING CHAIR. JOSEPH W. KENNA, Chicago, Ill. Filed Apr. 23, 1883. (No model.)

Claim.—1. In combination, the spindle, a standard fixed thereon, and provided with knife-edge tongues extending in the same general direction with the spindle, and the spider recessed, substantially as described, to receive the said tongues, whereby a vertical bearing-edge is produced for the chair-seat, substantially as set forth.

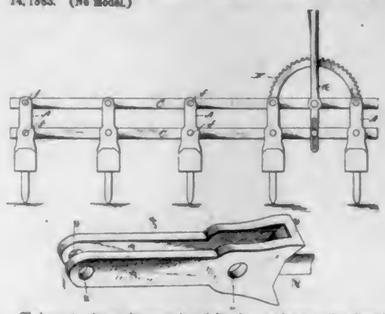
2. The combination, with the base-support, of the projecting spindle, the standard secured thereto and having vertical knife-edge tongues extending therefrom, and the spider to which the chair-seat is attached, said spider being suitably recessed to receive said tongues, substantially as set forth.

3. The combination, with the base-support, of the projecting spindle, the standard secured thereto and having vertical knife-edge tongues extending therefrom, the recessed spider to which the chair-seat is attached, and the retaining-bolt which holds said standard and spider together, substantially as described.

4. The combination, with the base-support, of the spindle, the standard secured thereto and having vertical knife-edge tongues extending therefrom, the recessed spider, the retaining-bolt, and the tie-plate co-operating therewith to hold said standard and spider in position, substantially as described.

5. The combination, with the base-support, of the projecting spindle *b*, the standard *c*, secured thereto and having vertical bearing-edges *c'*, the recessed spider *d*, the retaining-bolt *e*, and adjustable spring mechanism, substantially as described, co-operating with said standard and spider to return the latter to position when tilted about the vertical bearing-edges, substantially as set forth.

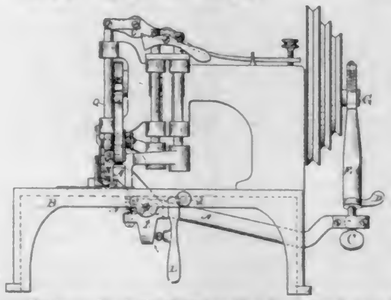
6. The combination, with the base-support, and with the projecting spindle *b*, of the standard *c*, secured thereto, the spider *d*, provided with a dependent portion, as described, and tilting about said standard, the rod *g*, extending from the standard and through the dependent portion of the spider, the sliding plate *h* and adjusting-wheel *l*, mounted on said rod, and the double recoil-springs *i*, retained between the sliding plate and the dependent extension of the spider, substantially as set forth.



294,392. CLAMP FOR ATTACHING ROPES. CHARLES KORTÜM, Berlin, Germany. Filed Aug. 18, 1882. (No model.)

Claim.—1. The combination, with a rope, conical box, and two or more keys, *k*, of the ring *i*, the material of the rope being unlaid and caused to inclose the ring and the keys *k*, substantially as herein specified.

2. The combination, with a rope, conical box, and two or more keys, *k*, of the ring *i* and the external keys, *k'*, joined to the internal keys, *k*, by engaging the irregular surfaces, substantially as herein specified.



294,393. HARROW. JOHN L. LAUGHLIN, Louisville, Ky. Filed Nov. 14, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the described connecting-link, consisting of the perforated parallel side arms, the web with the octagonal sides on the under side thereof, and the screw-threaded bolt, all united together, substantially as described.

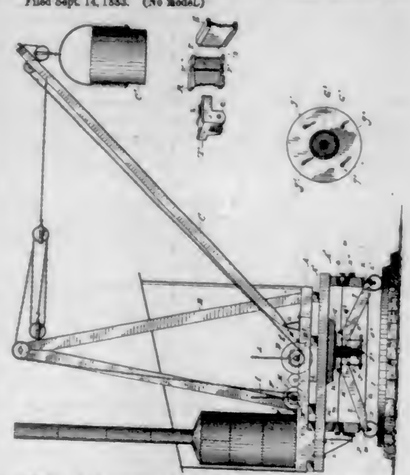
2. In a harrow, the combination of a plurality of tooth-bars, with the connecting-links constructed as described, each link having the parallel arms to receive and connect pivotally the parallel adjusting-bars, a web with octagonal sides to fit the angle-surfaces of the tooth-bar, and the screw-threaded bolt passed vertically through the tooth-bar, substantially as described.

294,394. LEATHER-FOLDING MACHINE. RICHARD H. LUPKIN, Chelsea, Mass. Filed Jan. 7, 1884. (No model.)

Claim.—1. In a leather-folding machine, the combination of a fold-presser and means, substantially as described, whereby the effective operation of such presser may, at will, be suspended and restored while the machine is in operation, as and for the purposes set forth.

2. In a leather-folding machine, a pressure-lever, A, mounted upon movable centers, combined with means for moving its pivotal centers, and means, substantially as described, for vibrating such lever, substantially as and for the purposes specified.

3. The combination of rock-bar I, pivoted to the bed-plate, fold-presser A, pivoted to the rock-bar, locking-lever L, also pivoted to said rock-bar, and arranged to secure the bar in position, and counteracting-spring N, all substantially as and for the purposes specified.



4. In a leather-folding machine, a cutting mechanism composed of a fixed cutting-block and a coacting reciprocating cutter, combined with means, substantially as described, whereby the effective operation of the cutting devices may at will be suspended and restored by a separation of the block from the reciprocating cutter while the machine is in active operation, substantially as and for the purposes specified.

5. In a leather-folding machine employing pressing and cutting devices, substantially as described, the combination therewith of means, substantially as described, whereby the effective operations of such cutting and pressing devices may be conjointly suspended and restored, as and for the purposes specified.

6. The reciprocating cutter S, cutting-block T, arranged to slide as described, lever *a*, pivoted to the bed and connected with said block, rod *c*, jointed to said lever and supported in a horizontal position by the bed, and the counteracting-spring *h*, combined and arranged to operate together substantially as and for the purposes specified.

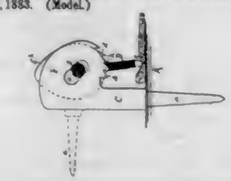
7. The combination of the pressing devices, comprising rock-bar I, fold-presser A, lever L, and spring N, the cutting devices comprising the cutter S, cutting-block T, lever *a*, rod *c*, and spring *h*, and means whereby said cutting and pressing devices are connected and conjointly operated, as and for the purposes specified.

294,395. STEAM-DERRICK. CHESTER C. LYMAN, Cleveland, Ohio. Filed Sept. 14, 1883. (No model.)

Claim.—1. A revolving derrick, a double friction-gear mechanism, and brake-shoes, in combination with the mast-blocks and ropes and the boom-arm, for the purpose of raising, holding, and lowering said boom-arm, substantially as and for the purpose described.

2. In a steam-derrick, the braces I I, in combination with hub G^2 and flange H', substantially as and for the purpose set forth.

3. The circular collar H, in combination with the hub G^2, substantially as shown and described.

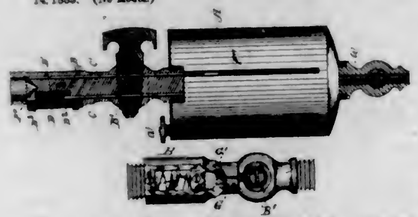


4. The adjustable step G^2 and rods and nuts *g'*, in combination with the step-journal, substantially as and for the purposes described.

294,396. SUSPENDERS. MORRIS MARCUS, Chicago, Ill. Filed Jan. 7, 1884. (No model.)

Claim.—A securing device provided at the desired point to form a button-hole with the double parts forming a reach of suitable material for a suspender-end, said securing device comprising a strand or wire passed transversely through the interior of each of the doubled parts, and having a stop formed at each end, substantially as described, and for the purpose set forth.

294,397. CARPET-FASTENER. JOHN A. MARKOE, St. Paul, Minn. Filed Aug. 13, 1883. (Model.)

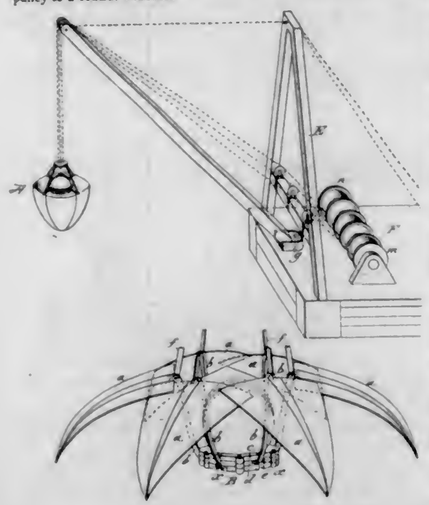


Claim.—A carpet-fastener composed of a fixed bar, C, provided with means *a* for attaching it to the floor or base-board, and with a forwardly-projecting head, *b*, having a slot, *c*, therein and teeth *d* on its under edge, and a movable jaw, D, having ears E' E^2 pivoted to the bar C in the said slot *c*, and clamp-teeth *e e* on its lower edge, operating substantially as and for the purpose herein specified.

294,398. LIFTING-JACK. JOHN T. MASON, Streator, Ill. Filed Apr. 26, 1883. (No model.)

Claim.—In a lifting-jack, a suitable base provided with standards, a ratchet-bar, and guides, in combination with a lever adjustably connected to the standards, and having connected to it a suitable bar adapted to engage with the ratchet-teeth, substantially as and for the purpose set forth.

294,399. LUBRICATOR. CHARLES B. MCALVAY, Jackson, Mich., assignor of three-eighths to Charles H. Christopher, same place. Filed Dec. 14, 1883. (No model.)

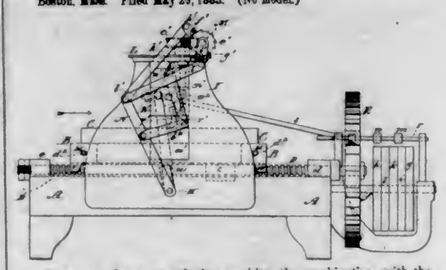


Claim.—1. In a lubricator, the combination of the reservoir A, having screw-plug *a'*, petcock *a*, casting B, having screw-threaded upper end and apertures C and C', double-apertured plug B', chamber D, having duct or passage F and mirror D', glass D^2, secured in frame D^2, and pipe or duct F', substantially as shown, and for the purpose described.

2. A lubricator consisting of a reservoir, A, having opening therein a petcock, *a*, and screw-plug *a'*, casting B, having ducts C and C', plug B', registering mechanism, and a screw-threaded upper end chamber, D, having duct or passage F, mirror D', glass D^2, and pipe or duct F', substantially as shown, and for the purpose described.

294,400. DREDGING-MACHINE. SOLOMON MEAD, New Haven, Conn. Filed Oct. 9, 1883. (No model.)

Brief.—A clam-shell formed of like sections of a hollow ellipsoid, the arms of the alternate sections of which are pivoted in different planes, is operated by two hoisting-chains running over pulleys on a derrick, enabling the swinging of the derrick to the right or left as the right or left chain is the more drawn, the closing-chain running over a central pulley to a central windlass.

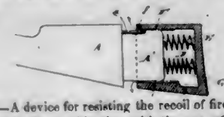


Claim.—1. A dredging-bucket consisting of like sections of a hollow ellipsoid, provided with arms which are pivoted to the lower sheave-block, B.

2. A dredging-bucket consisting of like sections of a hollow ellipsoid, provided with arms which are pivoted alternately in different planes to the sheave-block, to prevent any interference of the overlapping sections in opening the bucket.

3. In a dredging-machine, three chains—two hoisting-chains and a closing-chain—in combination with an ellipsoidal form of bucket, as described, and with the winding-drums and the derrick, all the said parts constructed and combined substantially as set forth.

294,401. MACHINE FOR DRESSING STONES. FRANCIS MEISEL, Boston, Mass. Filed May 29, 1883. (No model.)

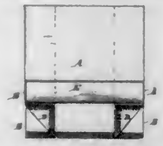


Claim.—1. In a stone-planing machine, the combination, with the reciprocating carriage B, for supporting the stone to be planed, of the oscillating cutter-stock P, pivoted to the cross-head K, and provided with a pair of cutters, *q' r'*, adapted to be alternately brought into contact with the stone at opposite ends of its traverse, the toothed segments *i' l'*, shaft *u'*, lever a^2, rod b^2, lever N, and means, substantially as described, for oscillating the said lever N at each traverse of the carriage, all constructed to operate substantially in the manner and for the purpose described.

2. In a stone-planing machine, the combination, with the vertically-movable cross-head K, sliding in slots in the standards I, and provided with an oscillating cutter-stock, P, having a pair of cutters, *q' r'*, adapted to be alternately brought into contact with the stone at opposite ends of its traverse, of the screw-shafts *b'*, adapted to support the cross-head, and provided at their upper ends with worm-gears *c'*, rotated by worms d^2 on the horizontal shaft M, located above the cap-piece L, the ratchet-wheel *e'* on the shaft M, rotated by the pawls *f' g'* on the levers *k' i'*, oscillating upon the shaft M, and connected by rods *k' l'* with the lever N on the rock-shaft H, the lever *u* on the said shaft H, and the projections *v w* on the carriage B, adapted to vibrate the lever *u* alternately in opposite directions, all constructed and arranged to operate substantially in the manner and for the purpose described.

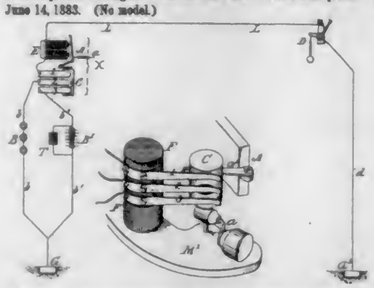
3. In a stone-planing machine, the combination, with a rocking cutter-stock, P, supported within the cross-head K, of the two cutters *q' r'*, extending transversely across the entire width of the carriage B, and each made adjustable vertically at different portions of its length by means of screws e^2, whereby each cutter can be adjusted to a perfect level transversely with the carriage, substantially as set forth.

4. In a stone-planing machine, the combination of the reciprocating carriage B, the oscillating cutter-stock P, pivoted to the cross-head K, and provided with the cutters *q' r'*, means, substantially as described, for oscillating the cutters, the shaft H, connected with the mechanism for oscillating the cutters, and operated by the projections *v w* on the carriage B, the lever *t*, secured to the shaft H, and provided with a slot, 15, the connecting-rod *s*, bar *r*, sliding in standards above the pulleys *g* and *h'*, and belt-shippers *m n*, secured to the sliding bar *r*, all constructed and arranged to operate substantially in the manner and for the purpose described.



294,402. RECOIL MECHANISM FOR FIRE-ARMS. JOHN P. ONDERDONK, Philadelphia, Pa. Filed Apr. 20, 1883. (No model.)

Claim.—A device for resisting the recoil of fire-arms and ordnance, which consists in the combination, with the gun, of an air-chamber provided with an air-vent in such manner that the recoil of the gun is resisted by the air in said chamber and controlled by its gradual escape through said vent to the atmosphere.



294,403. PAPER BAG. JOHN P. ONDERDONK, Philadelphia, Pa. Filed June 13, 1883. (No model.)

294,403.

Claim.—A paper bag having inward bellows-folds in which the four outer bottom corners of the bellows-folds are cut, substantially as shown and described, and one part of each of said corners is turned inwardly and pasted to the walls of the tube.

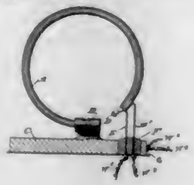
294,404. AUTOMATIC ELECTRICAL CUT-OUT. CHAS. S. PINKHAM, Philadelphia, Pa., assignor of one-half to James J. Seal, same place. Filed June 14, 1883. (No model.)

Claim.—1. The combination of an open-circuit line and an open-circuit battery with a constant battery and an automatic switch, substantially as described, whereby on the continued grounding or closure of the circuit the open-circuit battery will be cut out and the constant battery thrown into circuit, substantially as set forth.

2. The combination of an open-circuit line and its working-battery with a constant battery, an electro-magnet in the circuit, and a switch controlled by the electro-magnet to throw the working-battery out of and the constant battery into circuit on the continued closure of the circuit, substantially as described.

3. The combination of an open-circuit line and its working-battery with a constant battery, an electro-magnet in the line-circuit, its armature, a switch controlled by the armature, and a retractor for the armature, whereby the open-circuit battery is thrown out and the constant battery is thrown into circuit on the continued closure of the circuit, and the normal arrangement restored automatically on the reopening of the circuit.

4. The combination of an open-circuit line and its working-battery with a constant battery, an electro-magnet in the circuit, its armature, a commutator operated by the movement of the armature, and contacts for the commutator, substantially as described, whereby on the continued closure of the line-circuit the working-battery will be thrown out and the constant battery thrown into circuit.



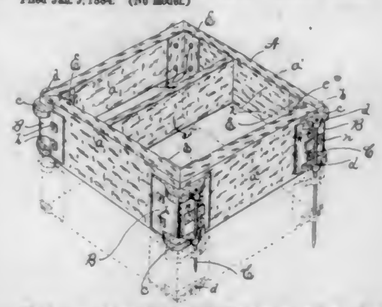
5. The combination of an electro-magnet, armature, and a switch operated by the armature and a retractor with a fan geared to the switch to retard the action of the armature.

6. The combination of the electro-magnet, armature, commutator operated thereby, and contacts with a retractor and a fan geared to the commutator, substantially as set forth.

7. The combination of an electro-magnet and armature with a retractor, contacts, a commutator-cylinder mounted in bearings and operated by the said armature, and carrying a quadrantal rack, and a fan having a pinion gearing into said rack, all substantially as described.

8. The combination of an open-circuit line and open-circuit battery with a constant battery, an automatic switch to cut out the open-circuit battery and put the constant battery into circuit, and a signal operated by the switch, substantially as set forth.

294,405. THERMOSTAT. ALEXANDER KIRK RIDER, Walden, N. Y. Filed Nov. 13, 1883. (No model.)

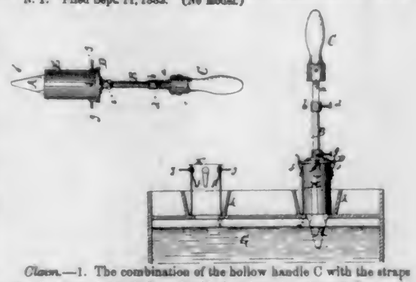


Claim.—1. A thermostat consisting, essentially, of a flattened metallic tube filled or partly filled with an expanding fluid, the said tube being bent or coiled into a suitable shape and secured at one end to a base, and provided at its opposite end with a contact-pin, which is adapted to be moved into contact with a pin secured to the base.

2. In a thermostat, the combination, with a tube partly or wholly filled with an expansible or volatile liquid, one end of the said tube being rigidly secured to a base made of conducting material, the opposite end thereof being free and provided with a contact-pin, of two separate contact-pins secured to the base, but insulated therefrom and from each other, the said pins being brought into electrical connection with the said tube by the expansion thereof, substantially as set forth.

3. The combination, with the base and the curved flattened tube secured at one end thereto, and provided at its free end with a contact-pin, the said tube being filled or partly filled with an expansible or volatile liquid, of the plug F, spring-contact pins, and the wires W', W^2, W^3, and W^4, all of the above parts combined and adapted to operate as described.

294,406. MOLDER'S FLASK. SAMUEL P. ROBINSON, Plainfield, Conn. Filed Jan. 9, 1884. (No model.)



Claim.—1. In combination with the sides or walls of a flask for molders' use, a series of right-angular metallic corner-pieces, and a corresponding series of washer-plates, E, on the inner side of the flask, the plates E, the sides of the flask, and the metallic corner-pieces being clamped firmly together by bolts and nuts, as described, said corner-pieces being provided with strengthening-ribs *c*, for the purpose of retaining the flask in its rectangular form, as described.

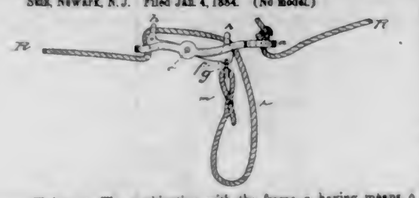
2. In combination with the walls of a flask for molders' use, a series of right-angular metallic corner-pieces having strengthening-ribs *c*, perforated, as at *d*, to receive guide-wires, whereby the upper and lower flasks, or a series of flasks, may be held in vertical alignment, as and for the purpose specified.

3. In combination with the walls of a flask, the angular corner-pieces B, with perforated strengthening-ribs, and the guide-wire C, held firmly in place by wedges entered between the body of the guide-wire and the plate of the corner-piece, said angular corner-pieces being clamped to the walls of the flask by bolts and nuts as and for the purpose specified.

294,407. SOLDERING-IRON. CHARLES FREDERICK SCHWARZ, Corona, N. Y. Filed Sept. 11, 1883. (No model.)

Claim.—1. The combination of the hollow handle C with the straps *a*, ring *b*, screw *d*, shank B, and soldering-iron A, substantially as and for the purpose specified.

2. The combination of the soldering-iron A with the movable sleeve E, which is adapted to surround a portion of the soldering-iron, but not the soldering-point thereof, substantially as described.



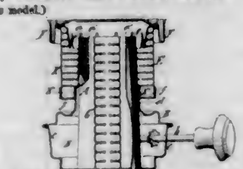
3. The combination of the soldering-iron A with the movable sleeve E and movable flange D, substantially as herein shown and described.

4. The combination of the soldering-iron A with the movable sleeve E and retaining-springs *f*, substantially as described.

5. The combination of the soldering-iron A with the movable sleeve E, retaining-springs *f*, and projecting pin or pins *g*, substantially as herein shown and described.

6. The combination of the soldering-iron A and its removable sleeve E with the acid-pot G, having funnel-like projection h and supporting-flange *i*, substantially as specified.

294,408. AUTOMATIC ROPE-BUCKLE. SIMON SEIB and FRANK SEIB, Newark, N. J. Filed Jan. 4, 1884. (No model.)

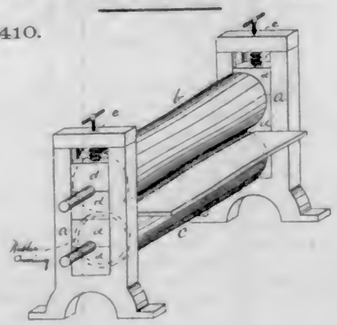


Claim.—1. The combination, with the frame *a*, having means, *o*, thereon to receive the rope, of a plate, *b*, working therein, having bearings *d d'* lying adjacent to bearings *e e'* on the frame, and having means, as *f g*, adapted to open the plate against the draft of the rope, substantially as shown and described.

2. In combination, the frame *a*, having means *o* therein or thereon, and open to receive the plate *b*, and having bearings *e e'*, and said plate pivoted in said frame and provided with bearings *d d'*, means *f g*, and loops *h h*, all said parts being arranged and operating substantially as and for the purposes set forth and shown.

3. In combination, the frame *a*, having means, *o*, to receive one end of the rope, roller *e''*, and bearing *e'*, the plate *b*, pivoted in said frame, having the roller *d* and bearing *d'*, and having means, *f g*, to receive the opposite end of the rope, and loops *h h*, all said parts being arranged and operating substantially as and for the purposes set forth.

294,409. BURNER. IRA W. SHALER, Brooklyn, N. Y. Filed July 2, 1883. (No model.)



Claim.—1. The combination, with a burner, of a deflector having a central opening conforming in shape to the tip of the burner-tube, and a flange or petticoat extending downwardly therefrom, and provided with notches or openings, substantially as specified.

2. The combination, with a burner, of a deflector having a central opening conforming in shape to the tip of the burner-tube, and a flange or petticoat extending therefrom downwardly and toward the burner-tube, and provided with notches or openings, substantially as specified.

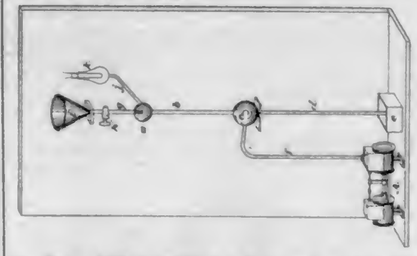
3. The combination, with a burner, of a deflector having a central opening conforming in shape to the shape of the tip of the burner-tube, a flange or petticoat extending downwardly therefrom, and provided with notches or openings, and a cylinder or shell which the deflector surmounts and which is perforated around the tip of the burner-tube, substantially as specified.

4. The combination, with a burner, of a vertically-adjustable deflector having a central opening conforming in shape to the tip of the burner-tube, and a flange or petticoat extending downwardly therefrom, and provided with notches or openings, substantially as specified.

294,410.

294,410. APPARATUS FOR PREPARING HIDES. TRAFTON SHAW, Bangor, Me., assignor of one-half to Hinckley & Egery Iron Company, same place. Filed Feb. 23, 1883. (No model.)

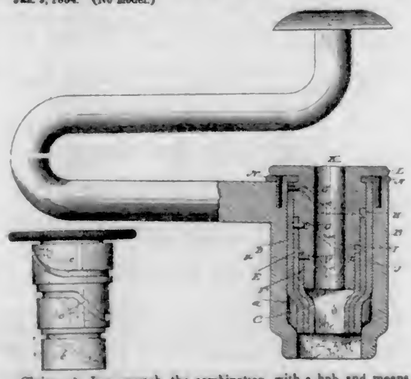
Claim.—In a machine substantially of the class described for expressing the water from and equalizing the thickness of tanned and drenched hides, the pressure-rolls *b c*, one having a hard or unyielding surface, smooth upon its surface, and the other an elastic covering, as herein set forth.



294,411. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Dec. 17, 1883. (No model.)

Claim.—1. A sheet-metal button-fastener consisting of the base and the hook integral therewith, the said hook projecting from the cut edge *c* of the base, and having the semicircular bend *d* and straight free end below the said bend *d*, the said straight free end being substantially parallel with the post of the hook below the said curve and with the base, the point or extremity of the hook passing beyond the upper cut edge, *c*, of the base, substantially as shown and described, and for the purpose set forth.

2. The herein-described one-piece sheet-metal button-fastener, consisting, essentially, of the base *a* and hook *b*, the said hook projecting from the cut edge *c* of the base and bent upon itself, with its free end opposite to and substantially parallel with one side of the base *a*, and its point or extremity slightly below the bottom line of said base *a*, all as shown and described, and for the purposes set forth.



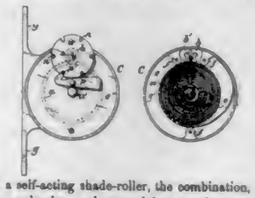
294,412. AIR-PUMP. WILLIAM STANLEY, Jr., Englewood, N. J. Filed Apr. 27, 1882. (No model.)

Claim.—1. The combination, in an apparatus for exhausting globes for electric lamps and other vessels, of a mercurial air-pump with a common exhaust-pump arranged to operate simultaneously, whereby the mercurial pump will exhaust into the partial vacuum produced by the operation of the common exhaust-pump, substantially as described.

2. The combination, substantially as described, in an apparatus embracing a mercurial air-pump and a common exhaust-pump, of an air-chamber, *c*, connected above with a mercury-supply and a vessel to be exhausted, and with a barometrical tube, *d*, and an exhaust-tube, *f*.

294,413. WRENCH. JUDSON A. STANTON, Sauk Rapids, Minn. Filed Jan. 9, 1884. (No model.)

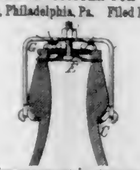
Claim.—1. In a wrench, the combination, with a hub and means for operating the same, of a series of vertically-sliding sleeves moving therein and increasing in size, a spindle or chuck disposed within the



hub, and devices whereby as the spindle is operated the sleeves are caused to descend successively into position, as set forth.

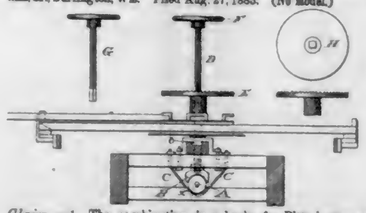
2. In a wrench, the combination, with a hub having a series of vertically-sliding sleeves moving therein and increasing in size, of a spindle or chuck disposed within the hub, pins projecting from the sleeves and entering grooves in the spindle or chuck, and means for operating the hub, as set forth.

3. In a wrench, the combination, with a hub and means for operating the same, of a series of vertically-sliding sleeves increasing in size and moving therein, a spindle or chuck disposed within the hub, means for guiding and limiting the descent of the sleeves, a projecting rim or flange at the upper end of the spindle, and a washer-plate interposed between the rim and the top of the hub, as set forth.



4. In a wrench, the combination, with a hub having a series of vertically-sliding sleeves increasing in size and moving therein, of a spindle or chuck disposed within the hub and formed with bands increasing in size in proportion to the sleeves, grooves formed in the bands to receive pins projecting from the sleeves, said grooves having an angular or inclined portion, and means for operating the hub, as set forth.

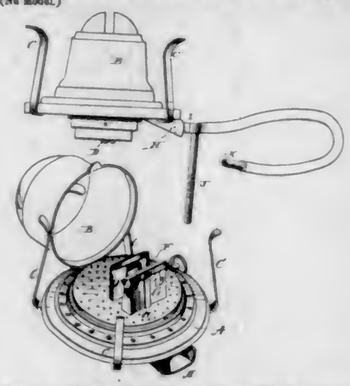
294,414. SHADE-ROLLER. DAVID R. STEDMAN, Elizabeth, N. J., assignor of one-half to Robert J. Bowen, same place. Filed Nov. 6, 1883. (No model.)



Claim.—In a self-acting shade-roller, the combination, with spring or other motive mechanism and a pawl for arresting and locking the roller, of the wheel w, having its periphery indented by the series of notches n, the intervening spaces between said notches being formed into convex sections or segments of a circle of which the axis of said wheel forms the center, substantially as herein shown and described.

294,415. AUTOMATIC STOPPER FOR BOTTLES, JARS, &c. STEPHEN P. M. TASKER, Philadelphia, Pa. Filed Dec. 11, 1883. (No model.)

Claim.—As an improvement in stoppers or covers for bottles, jars, and other vessels, the combination, with a bail secured to the vessel, of a cover composed of a flexible diaphragm, a ring resting thereon, a disk or rest for the inner arms of the levers, a threaded stem connected with the disk and projecting above the bail, a nut screwing upon the stem above the bail, and bell-crank levers or cams pivoted to the bail and resting as to their inner extremities upon the disk, and as to their outer extremities upon the ring, the construction being such that the cover as an entirety is seated externally upon the neck of a bottle or vessel, and is held in place thereon by screwing down the nut on the stem, and by the pressure of the bottle's contents, substantially as set forth.



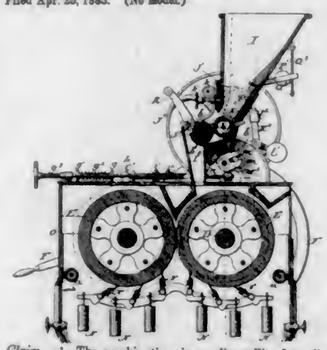
294,416. FRICTION-BRAKE FOR HARVESTERS. HUBERT WAGNER, Sr., Burlington, Wis. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination, in a brake for Pitts horse-power, of a friction-yoke, B, and a friction-strap, C C, with a friction-wheel, A, being the method by which I obtain a double friction, all substantially as set forth.

2. In a brake for Pitts horse-power, the combination of a perpendicular brake-rod, D, with a screw cut on its end, which enters a screw-thread cut into a friction-yoke, B, the brake-rod D having two shoulders upon it, so as to prevent its working up or down upon being revolved, and the thread cut in such a manner that upon the brake-rod D being revolved the friction-yoke will be forced down upon or lifted from the friction-wheel A, as substantially specified.

294,417. LAMP-BURNER. CHARLES GRIFFIN WEBBER, Flushing, N. Y., assignor to Sarah A. Webber, same place. Filed Aug. 10, 1883. (No model.)

Claim.—1. The combination, with the wick-tube of a lamp-burner, of a blow-tube provided with a valve and mouth-piece, substantially as set forth.



2. The combination, with the wick-tube of a lamp-burner, of a blow-tube provided with a valve and flaring mouth-piece, and a blow-pipe adapted to be inserted into said mouth-piece, substantially as set forth.

3. The combination, with the wick-tube of a lamp-burner, of a blow-tube whose upper end is inclined to form a valve-seat, a valve pivotally supported upon the upper end of said blow-tube, and a mouth-piece secured to the lower end of the blow-tube, substantially as set forth.

4. The combination, with the wick-tube of a lamp-burner, of a blow-tube whose upper edge is flush with the upper edge of the wick-tube, and an inclined mouth-piece adapted to guide the draft in an upward direction, substantially as set forth.

5. The combination, with a wick-tube and a blow-tube provided with a pivoted valve and a mouth-piece, of a blow-pipe adapted to be inserted into said mouth-piece and provided with a handle, substantially as set forth.

294,418. ROLLER-MILL. FRIEDRICH WEBMANN, Zurich, Switzerland. Filed Apr. 25, 1883. (No model.)

Claim.—1. The combination, in a roller-mill, of a roller-adjusting mechanism, a feeding mechanism, a valve or gate arranged in the feeding-hopper and receiving the weight of the grain or material to be operated upon, and intermediate connecting devices, substantially such as described, between said parts, whereby the rolls are spread and the feed cut off whenever the quantity of material in the hopper falls below a certain predetermined point.

2. In combination with a feed-hopper, a feed-roll at the discharge-opening thereof, a driving-wheel detachably connected with said feed-roll, a valve or gate within the hopper, and an intermediate connection, substantially such as shown and described, between the valve or gate and the driving-wheel of the feed-roll, whereby the movements of said valve

or gate are caused to effect the connection and disconnection of the driving-wheel and feed-roll.

3. The combination of roll E, adjustable roll E', swinging arms C', hand-lever R, shaft or journal m, cross-shaft M', arms M, and slotted blocks M^3, secured upon said cross-shaft, and tension rods or frame L, and a locking device to hold the lever R in a fixed position, substantially as shown.

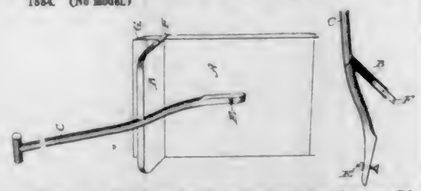
4. In combination with the hand-lever R, provided with cam or incline W, the feed-roll shaft J, pulley J^2, clutch U, and fork S, all combined and operating substantially as described.

5. In combination with a roll-adjusting lever, R, the dog or catch R', provided with arm R^3, gate K, shaft P, weighted arm Q^2, rigidly attached to said shaft, weight Q^4, dog or arm Q, and rod Q^3, all combined and operating substantially as described.

6. In combination with the gate K, rod or shaft P, weighted arm Q^2, weight Q^4, catch Q, rod Q^3, lever R, provided with cam or incline W, dog R', provided with arm R^3, and weight l', feed-roll shaft J, band-wheel J^3, clutch U, and fork S.

7. The combination of a gate or board arranged to receive the weight of the grain or material to be operated upon, feeding mechanism to deliver the material to the reducing apparatus, a driving-pulley for said feeding mechanism, and intermediate connections, substantially such as shown, for causing the driving-wheel to be disconnected from the gearing when the feed becomes low.

8. The combination of a gate or board arranged to receive the weight of the grain or substance to be operated upon, two grinding or reducing rolls, adjustable bearings for one of said rolls, and intermediate connections, substantially such as shown and described, between the gate or board and the adjustable bearings, whereby the rolls are caused to be separated when the feed becomes low in the hopper.



9. The combination of a gate or board arranged to receive the weight of the grain or substance to be operated upon, feeding mechanism arranged to deliver the material to reducing-rolls, a driving-pulley for the feeding mechanism, two reducing-rolls, adjustable bearings for one of said rolls, and intermediate connections, substantially such as shown, connecting the gate or board with the driving-pulley of the feed mechanism and with the adjustable bearings of the roll, whereby a diminution of the feed below a certain point is caused to simultaneously stop the feeding mechanism and separate the reducing-rolls.

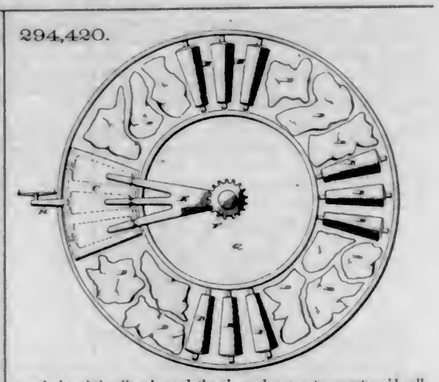
10. In combination with roll E and its bearings, roll E', mounted in swinging arms C', pressure-springs g^3, arranged to bear against the outer side of the arms, and a second pair of springs bearing against the inner sides of the arms, substantially as and for the purpose set forth.

11. In combination with roll E and its bearings, and with roll E' and its supporting-arms C', frames L L' L^2, springs g^3, screws g^2, telescopic rods i', nuts i, springs A^2, and arms M, bearing against the cross-heads L^2, all substantially as shown and described.

12. In combination with a stationary roll, an adjustable roll, and movable supporting-arms for the latter, springs arranged to bear against the movable arms and to press the movable roll toward the fixed roll, telescopic rods bearing against the supporting-arms at one end, fixed supports at the opposite ends of said rods, springs encircling said rods, nuts screwed upon said rods, and arranged, substantially as shown, to support one end of the encircling-springs, and a frame, substantially such as shown and described, carrying the rods and springs, and serving to keep them in place.

294,419. SHOVEL. HENRY J. WELCH, Carthage, N. Y. Filed Jan. 7, 1884. (No model.)

Claim.—1. In a snow-shovel, the combination of the reversible blade and the head-block with the handle, the securing-bolt E, and strap F, substantially as described.



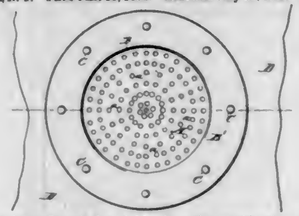
2. In a snow-shovel, the blade A, having double edges G G and central perforation, and adapted to be reversed, substantially as described.

294,420. APPARATUS FOR TANNING. WALTER S. WELLS, New York, N. Y. Filed Mar. 8, 1883. (No model.)

Claim.—1. An apparatus for tanning, consisting, essentially, of a trough, a bed or flat surface within the trough, on which the hides are spread, rollers located in said trough, and means to actuate said rollers for compressing the hides between said bed or supporting surface and the rollers, substantially as set forth.

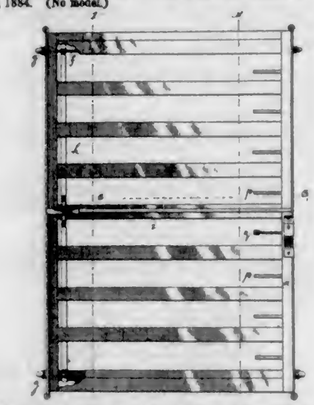
2. An apparatus for tanning, consisting, essentially, of an annular

294,420.



trough, beveled rollers located therein, and means to actuate said rollers in compressing the hides or other skins which are spread upon the bottom of the trough, substantially as set forth.

3. An apparatus for tanning consisting, essentially, of an annular trough, beveled rollers mounted in cars located in the trough, and means to actuate the said cars, substantially as set forth.

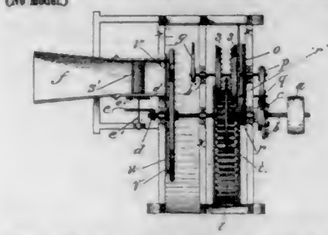


4. An apparatus for tanning, consisting, essentially, of an annular trough, beveled rollers located therein, a vertical shaft located in the center of the space inclosed by the trough, connections between the shaft and rollers, and means to rotate the shaft, substantially as set forth.

294,421. VENTILATOR FOR FEED-BAGS. FRANK WHEATON, Brooklyn, N. Y. Filed June 13, 1882. Renewed July 21, 1883. (No model.)

Claim.—In a feed or fodder bag, the combination, with the bag portion D, of the perforated bottom or plate A, having the raised surrounding rim B, provided with a horizontal apertured flange, B', substantially as shown and described, and for the purpose set forth.

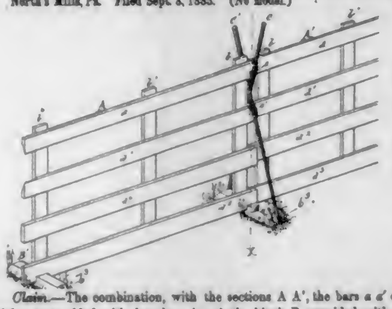
294,422. POOL-RACK. LOUIS WIDMAYER, Chicago, Ill. Filed Jan. 30, 1884. (No model.)



Claim.—1. A pool-rack formed of iron, and provided with removable wooden cross-pieces or ball-supports, as described.

2. The combination, with a pool-rack, of a vertical rod provided with a series of arms, and adapted to force all the balls from the rack simultaneously, as described.

3. The combination, with a pool-rack, of a rod provided with arms adapted to close the orifices of said rack, and means for locking the parts together, as described.

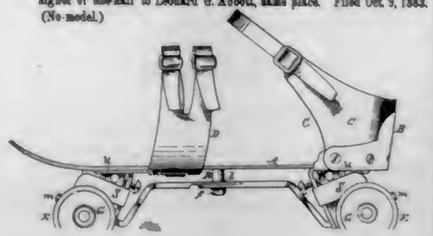


4. The combination, with a pool-rack constructed as described, of a spring-lock, *r*, and a rod, *o*, provided with arms *p*, one of which is formed with an enlarged hollow end, *q*, as described.

294,423. COMBINED FODDER-CUTTER, CORN-SHELLER, AND FEED-MILL. ISAAC P. WOODARD, Richmond, Ind. Filed Nov. 23, 1883. (No model.)

Claim.—The herein-described apparatus, comprising the supporting-frame, the main power-shaft, a rotary fodder-cutter, a corn-shelling wheel, *t*, a feed-mill having its rotary parts mounted upon said shaft, fodder-feeding devices, a counter-shaft mounted parallel to said main shaft, and carrying rotary devices constructed to co-operate with said wheel *t* as a corn-sheller, suitable power-transmitting devices connecting said shafts, and an elevator and spouts arranged to deliver the shelled corn from the sheller to the feed-mill, substantially as set forth.

294,424. FENCE. WILLIAM F. ZAENDER and GEORGE M. ZAENDER, North's Mills, Pa. Filed Sept. 3, 1883. (No model.)



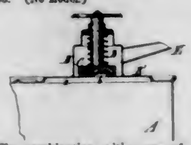
Claim.—The combination, with the sections A A', the bars *a a'* of which are provided with bevels *c c'*, and the block B, provided with a recess to receive the bars a^2 a^3, which overlap each other, the block being also provided with grooves b^2, of the stakes O O', passing between the bars *a a'*, bearing against bevels *c c'*, and resting in the grooves b^2 of the block, substantially as set forth.

294,425. MANUFACTURE OF LINSEED-OIL. ALBERT J. ADAMS, Cleveland, Ohio. Filed Apr. 26, 1883. Renewed Jan. 19, 1884. (No specimens.)

Claim.—1. In the manufacture of linseed-oil, the soaking or moistening of flaxseed in neutral oil previous to grinding, substantially as and for the purpose set forth.

2. The herein-described process of extracting linseed-oil from flaxseed by moistening the seed in neutral oil, grinding the moistened seed, and pressing and filtering the oil from the ground seed, substantially as and for the purpose set forth and described.

294,426. ROLLER-SKATE. SAMUEL W. ALWARD, Boston, Mass., assignor of one-half to Leonard G. Abbott, same place. Filed Oct. 9, 1883. (No model.)

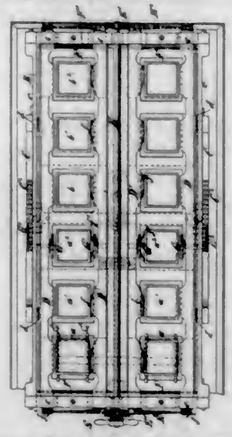


Claim.—1. In a roller-skate, the sliding box S, provided with the elastic cushion T, in combination with the rocker J, and means for forcing said cushion against the rocker, substantially as set forth.

2. In a roller-skate, the combination of the following instrumentalities, to wit: a pair of trucks, an axle for the trucks, a journaled rocker, a rubber cushion, a box or slide for the cushion, a wedge, proper ways for the slide and wedge, and a screw, the screw being adapted to force the box or slides against the cushion and the cushion against the rocker, substantially as and for the purpose set forth.

3. In a roller-skate, the trucks E, axle G, bar H, rocker J, pin P, cushion T, box S, wedge U, screw *p*, and flanges K L, constructed, combined, and arranged to operate substantially as specified.

4. In a roller-skate, the pins P Q, respectively provided with the holes *q*, for inserting and removing the screws *p*, substantially as specified.



294,427. CAN-NOZZLE. ROBERT C. ANDERSON, Bayonne, N. J. Filed Sept. 1, 1883. (No model.)

Claim.—The combination, with a can, of a stationary chamber attached thereto, an opening establishing communication between the chamber and can, a spout or nozzle extending from the side of the chamber, a valve arranged in the chamber, for controlling the opening between the chamber and the can, and provided with means extending outside the chamber, where they can be reached to open the valve, and a spring for closing said valve, arranged in said chamber between the valve and the top of the chamber, substantially as herein described.

294,428. CAN-SOLDERING MACHINE. ROBERT C. ANDERSON, Bayonne, and FREDERIK WINTERHALTER, Bergen Point, N. J. Filed Feb. 5, 1883. (No model.)

Brief.—A can is inserted into the first receptacle, which contains acid; the clamps are brought together, gripping the can; the carriage and carriage-supports are raised by the treadle and the carriage moved along, moving the can over the second receptacle, which contains molten solder; the carriage is lowered, the can released, and the carriage returned to its first position and another can inserted in the first receptacle. The next forward movement of the carriage moves the cans from the first and second receptacles to the second and third, respectively, the third receptacle containing wet cloths to cool the seam. The carriage is moved back again, and a third can inserted in the first receptacle and the above operations repeated. After passing the third receptacle, the cans are reversed and the other head soldered.

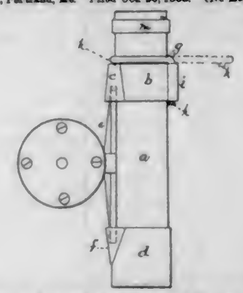
Claim.—1. In a machine for soldering cans, a bed containing a series of receptacles, a carriage, devices upon the carriage for gripping cans, means for releasing the gripping devices, supports whereon the carriage may be reciprocated forward and backward above said receptacles, and means whereby said supports may be raised and lowered for the purpose of raising and lowering the carriage, all being so combined and organized that cans arranged in the receptacles may be gripped by the gripping devices on the carriage, that the carriage may be raised for the purpose of taking the cans out of the receptacles, that the carriage may then be moved forward to bring the cans over receptacles in advance of those from which they were taken, and that the carriage may be subsequently lowered, the gripping devices released from the cans, and the carriage moved back to its original position, substantially as specified.

2. In a machine for soldering cans, a bed containing a series of receptacles, a carriage, devices upon the carriage for gripping cans, and rotary clamps carried by said gripping devices, means for releasing said gripping devices and for rotating said clamps, supports whereon the carriage may be reciprocated forward and backward above said receptacles, and means whereby said supports may be raised and lowered for the purpose of raising and lowering the carriage, all being so combined and organized that cans arranged in the receptacles may be gripped by the said gripping devices, that the carriage may be raised for the purpose of lifting the cans out of the receptacles, that the carriage may then be moved forward to bring the cans over receptacles in advance of those from which they were taken, that the carriage may be subsequently lowered, the gripping devices released from the cans, and the carriage moved back to its original position, and that the rotary clamps, after the soldering of the cans at one end, may be turned during the forward movements of the carriage to reverse the cans end for end, substantially as specified.

3. The combination, with a bed, A, provided with a series of receptacles, of a carriage, B, bars D D', and means for operating the latter, substantially as specified.

4. The combination, with a bed, A, provided with a series of receptacles, of a carriage, B, bars D D', spring-fingers *f*, and means for operating the bars, substantially as specified.

5. The combination, with a bed, A, provided with a series of receptacles, of a carriage, B, bars D D', the rock-shaft E, pulleys E', cords or bands E^2, and pulleys f^2, substantially as specified.



6. The combination, with a bed, A, provided with a series of receptacles, of a carriage, B, the bars D D', the frames C C, and the lever H, substantially as specified.

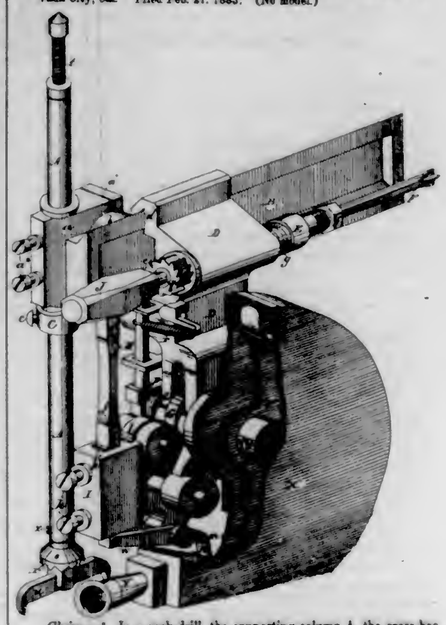
7. The combination, with a bed, A, of a carriage, B, the bars D D', means for causing the bars to grip cans, the clamping-pieces G G', and means for rotating the latter, substantially as specified.

8. The combination, with a bed, A, of a carriage, B, the bars D D', means for causing the bars to grip cans, the clamping-pieces G G', the sectors G^2, and the racks C^2, substantially as specified.

9. The combination, with a bed containing a series of receptacles, of a carriage adapted to travel along the said bed, means for gripping cans, guide-rods for the cans, and means for raising the carriage and simultaneously depressing the guide-rods, substantially as specified.

294,429. REEL-FASTENING FOR FISHING-RODS. GILBERT L. BAILEY, Portland, Me. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a reel-fastening for a fishing-rod, a loose or sliding band having a raised receptacle for one end of a reel-plate on one portion of its surface, and a groove struck from the inside on an opposite portion, in combination with a cam working in said groove, having a lever attached, and adapted to fasten said band over said reel-plate, and a metal reel-seat adapted to surround the butt of a fishing-rod, and having a raised receptacle for the other end of said reel-plate, fixed thereto, substantially as and for the purpose herein set forth.

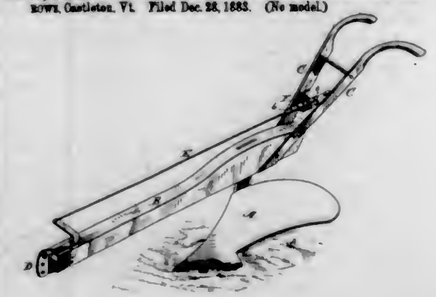


2. In a reel-fastening for a fishing-rod, a loose or sliding band having a raised receptacle for one end of a reel-plate on one portion of its surface, and a groove struck from the inside of an opposite portion, in combination with a cam working in said groove, having a lever attached, and adapted to fasten said band over said reel-plate, and with the butt of a fishing-rod, having a raised receptacle for the other end of said reel-plate, fixed thereto, substantially as and for the purpose herein set forth.

3. In a reel-fastening for fishing-rods, a loose or sliding band having a raised tapering receptacle for one end of a reel-plate, and a groove struck from the inside, in combination with a cam to work in said groove, having a lever attached adapted to tighten said band upon and release it from said reel-plate, substantially as and for the purpose herein described.

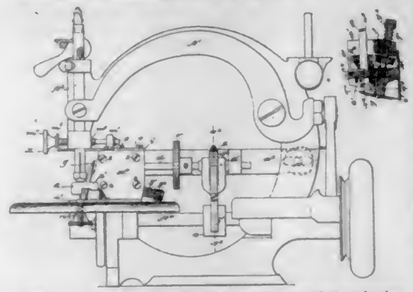
4. In a reel-fastening for fishing-rods, a loose or sliding band having a groove struck from the inside for the reception of, and in combination with a cam to work in said groove, having a lever attached adapted to tighten said band upon and release it from a reel-plate, substantially as and for the purpose herein described.

5. The combination of sliding band *b*, with its raised portions *c* and *i*, lever *g*, with its cam *h*, and tube *a*, provided with receptacle *f*, substantially as herein described.



294,430. ROCK-DRILL. CHAS. O. BARLOW, Nevada City, and GEO. T. EMERY, San Francisco, assignors of one-fourth to Joseph W. Sprague, Nevada City, Cal. Filed Feb. 27, 1883. (No model.)

Claim.—1. In a rock-drill, the supporting-column A, the cross-bar B, and connecting means, substantially as described, whereby the cross-bar is adapted to be adjusted vertically and to any desired inclination, in combination with the body-bar D and cross-head *d*, for suspending the body-bar from the cross-bar, the arbor or drill-holding spindle *e*, the hammer-holder I, hinged to the base of the body-bar, and having roller *l* in its front, the hammer J, having handle *j*, secured in the holder, and the means for oscillating said hammer-holder, consisting of the spring K, the cam G, and shaft H, the several parts arranged to operate substantially as herein shown and described.



2. In a rock-drill, the column A, cross-bar B, and means whereby said bar is adapted to be adjusted vertically and to any desired inclination, and trunnion *b*, journaled in a box, *a'*, in combination with the sharp-pointed screw *d* in its top, the collar C, set by a screw, *e*, the corrugated flange *s*, and the removable swiveled crow-foot *u* at its bottom, substantially as and for the purpose herein shown and described.

294,431. CLEVIS FOR REVERSIBLE PLOWS. FRANCIS A. BARROWS, Castleton, Vt. Filed Dec. 28, 1883. (No model.)

Claim.—A pivoted plow-clevis provided with a laterally-extending arm and a lever-rod connected thereto, and having at its rear end a series of holes or perforations, in combination with an angle-plate provided with a guard and a transversely-adjustable pin adapted to enter one of the series of holes or perforations in the rod, substantially as and for the purpose specified.

294,432. SEWING-MACHINE TRIMMER. WILLIAM F. BEARDSLEE, Boston, Mass. Filed July 16, 1883. (No model.)

Claim.—1. The combination, with an organized sewing mechanism, of the two cutting-disks *b* and *g*, rotated positively and in unison by gearing and their shafts *b'* and 3, placed at an angle with relation to each other, as set forth, whereby the edge of disk *g* is enabled to pass the edge of disk *b*, and a spring to keep the edges of the disks together, the two disks having a common cutting-point located at a point substantially diametrically opposite the needle and stitching-point, as shown and described, whereby the stitching and cutting operations are essentially simultaneous and the disks kept sharp, as specified.

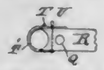
2. In a sewing-machine, the rotating cutting-disk *b*, having its face arranged substantially parallel with relation to the acting face of the feed or the work-support, and the rotating disk *g*, having its face set at an angle with relation to disk *b*, combined with the presser-foot and the smoother adapted to bear upon the material above the disk *b*, as and for the purpose set forth.

3. The combination, with stitch-forming mechanism in a sewing-machine, of a rotating cutting-disk, *b*, adapted to rotate in a plane substantially parallel with the acting face of the feed or the face of the work-support, a rotating disk, *g*, adapted to rotate in a plane angular thereto, an attachment-frame to support the shafts of the said disks, and means to adjust the said frame horizontally while the machine is in operation, substantially as described.

4. The combination, with stitch-forming mechanism in a sewing-machine, of a rotating cutting-disk, *b*, adapted to rotate in a plane substantially parallel with the acting face of the feed or the face of the work-support, a rotating disk, *g*, adapted to rotate in a plane angular thereto, an attachment-frame to support the shafts of the said disks, and means to adjust the said frame backward and forward with relation to the feed of the material, substantially as described.

5. The combination, with stitch-forming mechanism in a sewing-machine, of a rotating cutting-disk, *b*, adapted to rotate in a plane substantially parallel with the acting face of the feed or the face of the work-support, and a rotating disk, *g*, adapted to rotate in a plane angular thereto, an attachment-frame to support the shafts of the said disks, and means to adjust the said attachment-frame both laterally and lengthwise with relation to the direction of the feed, substantially as described.

6. The combination, with the stitching mechanism of a sewing-machine, of a rotating disk, *b*, having its face arranged substantially parallel with the cloth-support, a cutting-disk, *g*, having its face placed at an angle thereto, and an attachment-frame supported above the cloth-plate, leaving a space between the trimming mechanism and the cloth-plate, substantially as described.

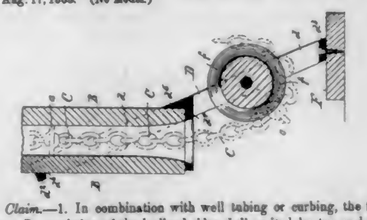


7. In a sewing-machine, the combination, with stitching mechanism and two rotating cutters, *b g*, having their faces placed at an angle with relation to each other, as shown and described, of a presser-foot and a smoother to hold at both sides of the disk *g* the material being sewed and trimmed, substantially as described.

8. The stitch-forming mechanism of a sewing-machine, combined with two cutting-disks, *b g*, and means to positively rotate them, the said disks having their faces inclined with relation to each other, and having a common cutting-point located at a point substantially diametrically opposite the needle and stitching-point and in close proximity thereto, as shown and described, whereby the stitching and cutting operations are essentially simultaneous, as set forth.

9. The stitching mechanism and cloth plate or support and attached lifting-plate, combined with the attachment frame and its two rotating cutting-disks *b g*, arranged as described with relation to each other and the cloth-plate, substantially as set forth.

10. A sewing-machine combined with a trimming mechanism for attachment thereto, the latter comprising two cutting-disks and means to positively rotate each, one of such disks having its face substantially parallel with relation to the acting face of the feed or work-support, while the face of the other disk is arranged at an angle thereto, so that the meeting edges of such disks constitute a common cutting-point located at a point substantially diametrically opposite the needle and stitching-point, as shown and described, whereby the stitching and cutting operations are essentially simultaneous, as set forth.

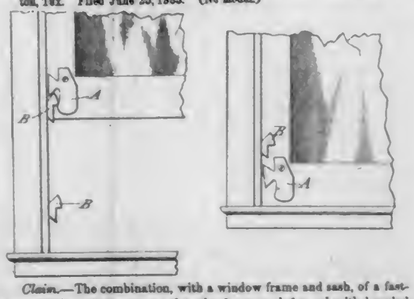


294,433. CHAIR. WILLIAM H. BEARDSLEY, Hamilton, Ohio, assignor of one-half to James E. Campbell, same place. Filed Mar. 27, 1883. (No model.)

Claim.—1. The combination of legs A, having brace-notches 1, legs B, fabric O, and brace D, having joint E and short length engaging end H, substantially as specified.

2. The combination of the legs A B, the stretchers connecting the legs, the braces D, fabric O, linked extensions R S, pivoted together and to the front stretcher of the chair, said links being pivoted together, as described, and left free to flex either upward or downward while in use, and brace V, adjustably engaging the foot-stretcher of legs B and pivoted to the outer section, S, of the linked extension, substantially as described.

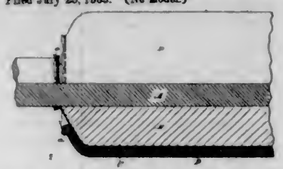
294,434. CHAIN-PUMP. AUGUST BECKMANN, St. Louis, Mo. Filed Aug. 17, 1883. (No model.)



Claim.—1. In combination with well tubing or curbing, the foot-support D, consisting of the inclined sides *d d'*, united by top and bottom cross-frames, d^3 d^3, and central cross-frame, d^4, having the vertical face d^5, also the inner face of the top cross-frame, being a vertical face, d^6, by means whereof the said curbing can be kept supported, in the manner and for the purposes set forth.

2. In combination with the foot-support D, consisting of the inclined frames *d d'*, top and bottom cross-frames, d^3 d^3, and central cross-frame, d^4, said top and central cross-frames having the vertical faces at d^3 d^5, the ring or collar *g*, projecting from the central cross-frame, substantially as and for the purposes set forth.

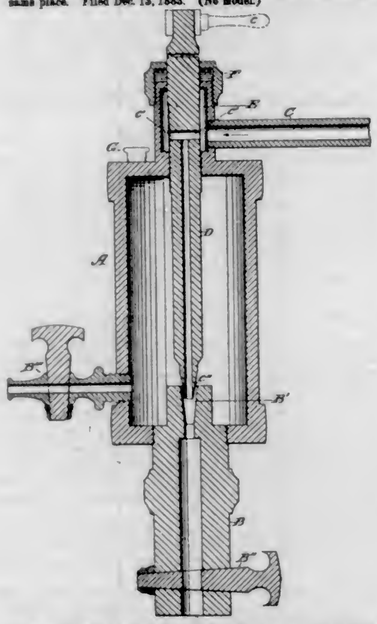
3. In combination with the foot-support D, consisting of the inclined frames *d d'*, top and bottom cross-frames, d^3 d^3, central cross-frame d^4, and the vertical faces at d^3 d^5, the sheave or pulley-wheel *f*, substantially as and for the purposes set forth.



4. The combination, with the well-tubing and endless chain in chain-pumps, of the foot-support D, consisting of the incline frames *d d'*, having top, bottom, and central cross-frames, d^3 d^3 d^4, and the vertical faces at d^3 d^5, the sheave *f* and ring or collar *g*, to operate in the manner and for the purposes set forth.

294,435. SASH-FASTENER. NAPOLEON BONAPARTE BENDT, Galveston, Tex. Filed June 25, 1883. (No model.)

Claim.—The combination, with a window frame and sash, of a fastener consisting of stops secured to the frame and formed with beveled ends and a shoulder, as shown, and a button, A, pivotally secured to the sash and recessed to form a triangular projection, and a finger-piece extension, which latter serves also as a weight to effect an automatic fastening as the window is lowered, substantially as shown and described.

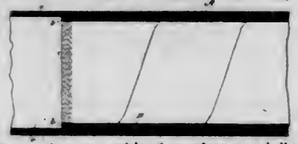


294,436. PRINTER'S DAMPING-ROLLER. JOHN H. BINGHAM, Hartford, Conn., assignor to John and Edmund McLoughlin, New York, N. Y. Filed July 25, 1883. (No model.)

Claim.—1. A wetting-roller for printers, comprising a core or cushion of the ordinary roller composition formed or molded on the stock, an exterior felt covering to form the roller-face, and a covering of rubber interposed between said felt and composition to prevent the water from getting at and injuring the composition core, substantially as herein shown and described.

2. A wetting-roller for printers, comprising a stock, a core or cushion of the ordinary roller composition molded or formed on the stock, a protective covering of rubber placed over said composition core and drawn down and secured to the stock, so as to protect the ends of said core, as shown, and an exterior covering of felt, all arranged substantially as set forth.

294,437. LUBRICATOR. DANIEL BAKER BRINDLE, Martinsburg, W. Va., assignor of two-thirds to John Fitz and David H. Bowers, both of same place. Filed Dec. 13, 1883. (No model.)

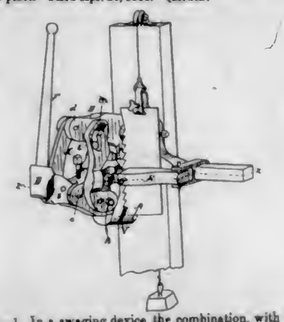


Claim.—1. The method of supplying oil to steam-valves which consists in conducting steam through the chamber of the oil-reservoir to a point near the bottom of the same, and then discharging it intermingled with oil in a continuous current therefrom.

2. The combination, with an oil-supplying vessel, of a steam-discharging pipe which is so adjustable within the oil-reservoir as to prevent the outflow of oil.

3. The combination, with an oil-supplying cup, of a discharge-pipe which is connected to the bottom thereof, and a steam-pipe which leads into the oil-cup and downwardly from the top thereof within the same, and which is adjustable to or from the orifice of the discharge-pipe, and by which oil may be either forcibly ejected through the discharge-pipe or prevented from entering the same.

4. The combination, with an oil-supplying vessel, of a steam-pipe which is adapted to conduct steam to the discharge-orifice of the vessel, and which is also adapted either to prevent or to permit or to compel the discharge of oil from the vessel through such orifice.



294,438. SHELL OR COVER FOR PRINTERS' ROLLERS. ANDREW CAMPBELL, Brooklyn, assignor to John and Edmund McLoughlin, New York, N. Y. Filed July 30, 1883. (No model.)

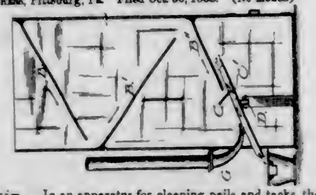
Claim.—1. As a new article of manufacture, a shell to form the cover of a printer's roller, comprising an exterior cover of leather and a lining of linen or other similar material glued to the inside of the said leather, and the whole formed into a cylindrical shell, substantially as set forth.

2. As a new article of manufacture, a shell to form the cover of a printer's roller, comprising an exterior cover of leather, cut away at *c*, an inner lining of linen or other like fabric glued to the inside of the leather, and the band *b*, secured to the inside of the tubular shell at its end, substantially as set forth.

294,439. SAW-SWAGING MACHINE. PASCAL B. CHARBONEAU, Bay City, Mich., assignor of two-thirds to H. A. Fraser and J. B. Barber, both of same place. Filed Apr. 26, 1883. (Model.)

Claim.—1. In a swaging device, the combination, with the stay M and the lever R, of the cam-lever O, constructed to operate said stay M and lever R, and provided with means for operating the same, substantially as described.

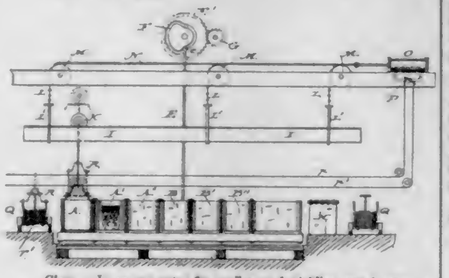
2. In a swaging device, the power-lever B, connected with lever D, and means for actuating the same, in combination with stay M, lever R, and the cam-lever O, constructed to operate the said stay M and lever R, substantially as described.



3. In a swaging device, the power-lever B and means, as C D, for operating the same, cam-lever O, and side stay, M, in combination with the clamping-jaw R, all combined and constructed as and for the purposes specified.

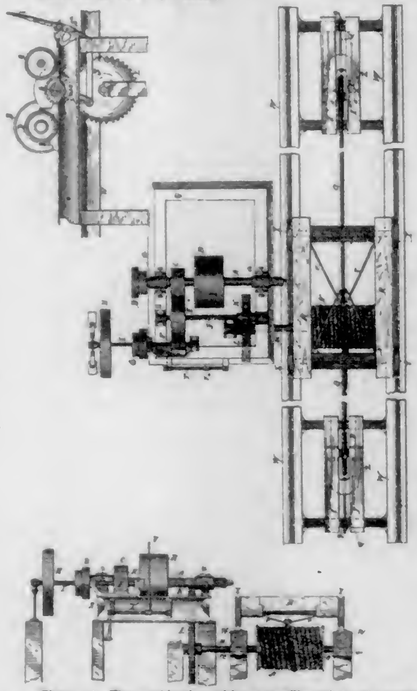
4. In a swaging device, the bed-tool J, constructed substantially as described, and secured obliquely in the body of the device, as set forth.

5. In a swaging device, the obliquely-seated bed-tool J, in combination with the obliquely-seated spring-stop K, substantially as and for the purpose set forth.



6. In a swaging device, the combination of a reversible swaging-tool with a reversible bed-tool, substantially as and for the purpose described.

294,440. DEVICE FOR CLEANING NAILS AND TACKS. HARVEY B. CRESS, Pittsburg, Pa. Filed Oct. 30, 1883. (No model.)



Claim.—In an apparatus for cleaning nails and tacks, the inclined planes B B' B'' and bridge C, in combination with the vibrating chute C'' and an air-blast nozzle, G, all constructed to operate substantially as and for the purpose described.

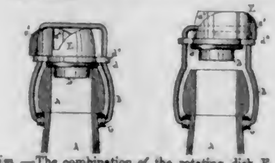
294,441. APPARATUS FOR SCALING AND PICKLING METAL PLATES. HENRY CHESE and HARVEY R. CHESE, Pittsburg, Pa. Filed Nov 2, 1883. (No model.)

Claim.—In an apparatus for scaling and pickling metal plates, a series of rigidly-clamped tanks, in combination with the track I, traveler K, chains L, stirrups L', pulleys M, and rod N, with suitable mechanism for operating the rod, substantially as and for the purpose set forth.

294,442. CIRCULAR SAW MILL. WILLIAM P. CLARK, Belmont, N. Y. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination, with a saw-mill carriage, of a revolving drum and a rope connected with the carriage and passing over pulleys at the opposite ends of the track, and having its ends connected with the drum, substantially as described.

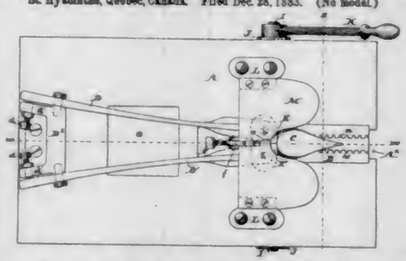
2. The combination, with a saw-mill carriage and a rope connected therewith and passing over a pulley at each end of the track, of a spirally-grooved revolving drum having the ends of the rope made fast at its opposite ends, substantially as described.



3. The combination, with a saw-mill carriage, of a rope connected therewith and passing over a swinging pulley at each end of the track, and of a revolving drum having the opposite ends of the rope connected thereto, substantially as described.

4. The combination, with a saw-mill carriage, of the pulleys P, mounted in yokes, as Z, constructed to be adjusted lengthwise of the ways, the drum N, and the rope O, connected to the drum and carriage and passing over the pulleys P, all substantially as shown and described.

5. In a rope gig and feed works of a saw-mill, the rope O, connected to the carriage and passing around pulleys P and drum N, said drum being connected with the saw-arbor by gearing, substantially as described, constructed to give the drum and rope different speeds in opposite directions, in combination with the fly-wheel H, arranged on the shaft I of the feeding-pulley, whereby the momentum of said fly-wheel prevents the slipping of the friction and belts, substantially as described.



6. The combination, in a saw-mill, of the rope O, connected to the log-carriage and running over the pulleys P and wound around the drum N, said drum being connected by its shaft M and gearing K L with the friction-wheel E, mounted on the shaft J, carrying gear K, and adapted to be alternately thrown into contact with the friction-wheel C on the saw-arbor, and with the friction-wheel F, running on the shaft I, and the fly-wheel H, mounted on said shaft, substantially as and for the purpose specified.

294,448. BOTTLE-STOPPER. GEORGE D. COREY, Lowell, MASS., assignor of one-half to Woods, Sherwood & Co., same place. Filed July 3, 1883. (No model.)

Claim.—The combination of the rotating disk E, having slot e^2, with cam-shaped walls, the plate d^2, having holes d^3 d^3, surrounding the bail-wire, and the bail B, having its ends sprung into holes in neck-band C, with the latter, substantially as described.

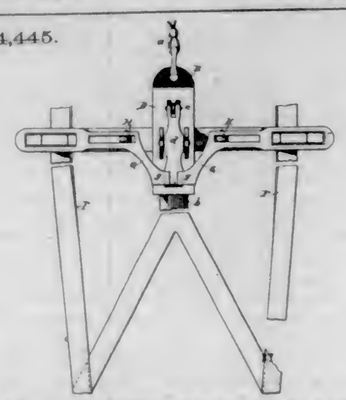
294,444. HEEL-STIFFENER-SHAPING MACHINE. LOUIS COTE, St. Hyacinthe, Quebec, Canada. Filed Dec. 28, 1883. (No model.)

Claim.—1. In a machine for shaping heel-stiffeners for boots and shoes, the combination of a heel-shaped former having its sides and rear end molded or shaped to present different contours or outlines when cut transversely at different points, and a pair of yielding pressure-rolls arranged to revolve about their axes toward each other, and to move in the same direction as said former, and having their exterior surfaces molded or shaped to conform to the varying curvature of the surfaces of said former, substantially as and for the purposes described.

2. The combination of the former C, the rolls E and E', and the springs D and D', all constructed, arranged, and adapted to operate substantially as and for the purposes described.

3. The combination of the former C, the yielding pressure-rolls E and E', the gear-wheels F and F', the racks *a* and *a'*, and mechanism for imparting to said former and racks a reciprocating motion, substantially as described.

4. The combination of the reciprocating former C, the yielding pressure-rolls E and E', the gear-wheels F and F', the racks *a* and *a'*, and the flange-turning plate M, all constructed, arranged, and adapted to operate substantially as and for the purposes described.

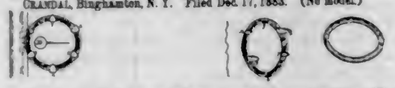


5. The combination of the reciprocating former C and racks *a* and *a'*, the yielding pressure-rolls E and E', the gear-wheels F and F', the flange-turning plate M, and the stiffener-discharging pawl N, all arranged and adapted to operate substantially as and for the purposes described.

294,445. HORSE-CHECKER. DANIEL O. COX, Marysville, N. Y. Filed Nov. 1, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 287,419, dated October 30, 1883.

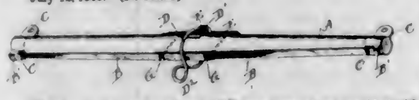
294,445.



Claim.—1. The combination, with the check-rein-holding device C, of the levers G, as shown and described.

2. The combination, with the check-rein-holding device C, having the clip E and spring stop-pin *c*, of the strap *b*, bifurcated, and having its bifurcated ends secured to the reins, as described.

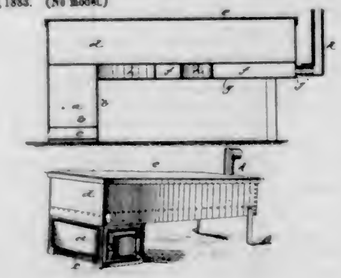
3. The combination, with a check-rein-holding device having the clip E, spring-pin *c*, and lever *d*, of the levers G and the spring *f*, as shown and described.



294,446. MEANS FOR PROTECTING BUTTON-HOLES. GEORGE L. CRANDAL, Binghamton, N. Y. Filed Dec. 17, 1883. (No model.)

Claim.—1. In a button-hole protector, the combination, with the ring C, of the ring B, made with three (more or less) teeth or projections, *z*, on the outside edge, and three (more or less) teeth or projections, *y*, on the inside edge, substantially as described.

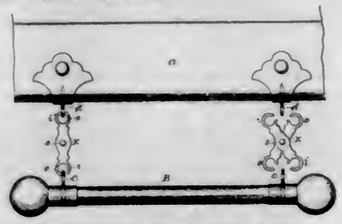
2. In a button-hole protector, the combination, with the two rings B and C and teeth *x y*, of a carriage-curtain or other fabric having made therein a button-hole, said button-hole being surrounded and protected by said rings B and C, and the teeth *x y*, after passing through the fabric, being clinched down from opposite directions on the ring C, substantially as described.



294,447. NECK-YOKE. MONTGOMERY DAKIN, Leslie, Mich. Filed July 12, 1883. (No model.)

Claim.—1. In a neck-yoke or whiffletree, truss-plates provided with end hooks, and ferruled having offset to admit the plates, as specified, in combination with bolts whereby said plates are secured to the whiffletree, substantially as set forth.

2. The plates E and F, having the depressions adapted to receive the ring D, as specified, in combination with the ring D, having the depression D' and right-angled twist D^2 substantially as described, and for the purpose set forth.



294,448. BOILER. ALFRED E. DALLEY, Quincy, Mich. Filed June 30, 1883. (No model.)

Claim.—1. The improved boiler consisting of a furnace, *a*, pan *d*, and cover *e*, the said pan having a flue, *f*, under the bottom, through which the heat products from the furnace pass, and in which two or more oblique partitions, *h*, are arranged, to cause the heat to traverse the bottom of the pan crosswise and backward, substantially as described.

2. The furnace *a*, arranged under one end of the pan, and the flue *f*, extending from said furnace along under the pan to the other end, and having two or more diagonal partitions, *h*, arranged in said flue, substantially as described.

294,449. WINDOW-SHADE PULL. JOHN DAY, Brooklyn, N. Y. Filed Jan. 9, 1884. (No model.)

Claim.—The combination, with the bar and screw-eyes in a shade-pull, of a connecting-link having two hooks, that stand in opposite directions and grasp the eye when closed, substantially as set forth.

294,450. TOY PISTOL. ALBERT H. DEAN and CHARLES A. HOTCHKISS, Bridgeport, Conn., assignors to Ives, Blakeslee & Co., same place. Filed Dec. 29, 1883. (No model.)

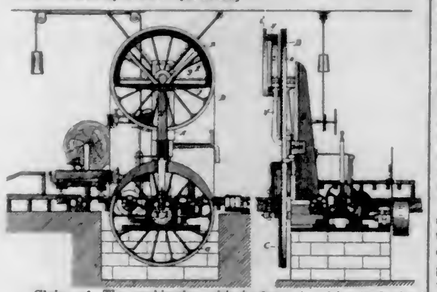
Claim.—1. In a toy, the combination of a receptacle representing an egg, or a barrel or analogous article, a cover therefor, a device representing a bird or other object, a hammer-like contrivance for forcing the said device forward, so that it will open the cover and protrude, and a trigger, substantially as specified.

2. In a toy, the combination of a receptacle representing an egg, a barrel, or analogous article, a cover therefor, a device representing a bird or other object, a hammer-like contrivance, and a shank on the device for connecting it with the hammer-like contrivance, so arranged that the device may receive a reciprocating motion lengthwise of the receptacle to open the cover.

294,451. BANJO. HENRY C. DOBSON, New York, N. Y. Filed Jan. 18, 1883. (No model.)

Claim.—1. A banjo or other parchment-head instrument, the main rim of which, composing the body of the instrument, is made of an annular metallic tube forming a sounding-box, substantially as set forth.

2. In a banjo or other parchment-head instrument, the combination of a rim made of an annular metallic tube forming a sounding-box, a parchment head strained over said rim, a series of standards fixed to said rim, a straining-ring for stretching said head, and tightening devices engaging said standards for drawing down said ring, substantially as set forth.



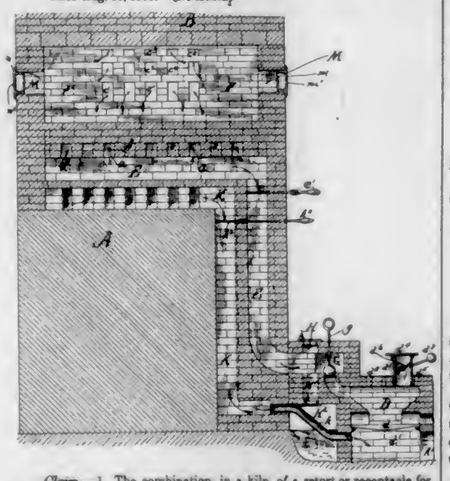
3. A banjo or other parchment-head instrument, the main rim of which, composing the body of the instrument, is tubular and made from sheet metal, stiffened by a hoop of wood extending around it and within the hollow of said tube, substantially as set forth.

4. A banjo or other parchment-head instrument, the ring or rim of which consists of an annular tube of sheet metal provided with apertures or sound-holes *c c*, affording communication between the annular hollow or cavity thereof and the external air, substantially as set forth.

5. A banjo or other parchment-head instrument, the ring or rim of which is formed of sheet-metal in tubular form, the annular tube being built up of two or more rings of sheet metal with annular seams, substantially in the manner set forth.

6. The ring or rim of a banjo or other parchment-head instrument, built upon three rings of sheet metal, two of which have outer and inner flanges and intermediate swelled or convex portions to form the top and bottom of the rim, while the third is of cylindrical shape to form the outer periphery of the rim, substantially as set forth.

294,452. BAND-SAW MACHINE. WALLACE H. DODGE, Mishawaka, Ind. Filed July 5, 1883. (No model.)



Claim.—1. The combination, with the frame A and band-wheels of a band-saw machine, of a stationary catcher, E, located near the upper band-wheel of said machine, to catch the saw if it runs off said wheel, substantially as and for the purpose described.

2. In a band-saw machine, the frame A and the band-wheels mounted thereon, combined with the catcher-plate E, slightly smaller in radius than said band-wheels, and permanently attached to the saw-frame or band-wheel bracket.

3. The frame A and band-wheels mounted thereon, combined with the flanged semicircular plate E, mounted upon the arms *f g*, and attached to the band-wheel bracket H, so as to stand close to the band-wheel B, for the purpose of catching and supporting the saw when it shall run off said wheel.

294,453. KILN AND FURNACE. JOHN DRUBEKER, Chicago, Ill. Filed Aug. 13, 1883. (No model.)

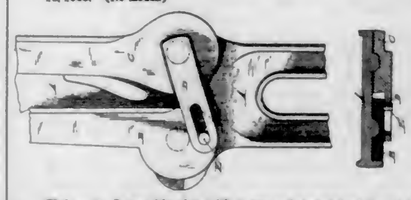
Claim.—1. The combination, in a kiln, of a retort or receptacle for holding the material to be baked or burned, with a gas producer or furnace, a separate secondary chamber surrounding said retort, and a passage for conducting the gas from the gas-producer to the secondary chamber, and an air-passage for conducting hot air from the gas-producer to the secondary chamber, substantially as specified.

2. The combination, in a kiln, of a retort, with a gas producer or furnace, a secondary chamber surrounding said retort, and having ports leading into the same, a gas-passage leading from said producer to said chamber and subdivided into a number of small passages or branches, and an air-passage leading from said gas-producer and subdivided into a number of small passages or branches, substantially as specified.

3. The combination, in a kiln, of a retort, with a gas-producer, a secondary chamber surrounding said retort, and having a series of ports leading into said retort, and provided with a series of air and gas inlet ports distributed over its interior, of separate air and gas passages connecting said air and gas inlet ports with said gas-producer, and provided with dampers or valves for regulating and controlling the supply of gas and air, as may be required, substantially as specified.

4. The combination, in a kiln, with a retort, C, of fire-box D, grate *d*, ash-pan *d'*, gas-passage E, gas-reservoir G, valve *g*, for closing said passage E between said reservoir and fire-box, secondary chamber F, and air-passage K, leading into said secondary chamber from the ash-pan *d'*, said secondary chamber F being provided with a graduated series of ports, *c'*, *c²*, and *c³*, the smaller series of said ports being arranged above the others, substantially as specified.

5. The combination, in a kiln, of a retort or receptacle for holding the material to be baked or burned, with a secondary mixing recuperator or regenerator chamber surrounding said retort, and having a graduated series of ports opening into said retort, and provided with a series of air and gas inlet ports distributed over its interior, said air and gas inlet ports being deflected toward each other at their mouths in pairs, a gas producer or apparatus for converting the fuel into gas, and air and gas passages connecting said air and gas inlet ports with the gas-producer, substantially as specified.



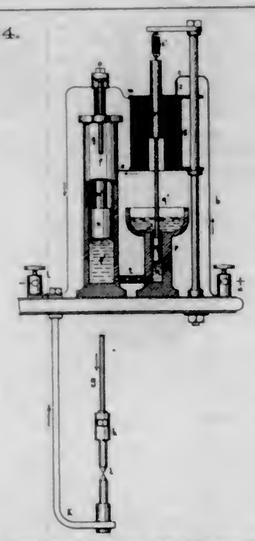
6. The combination, in a kiln, of a retort, with a gas-producer, a secondary chamber surrounding said retort, and having ports opening into the same, and provided with a series of air and gas inlet ports distributed over its interior, separate air and gas passages connecting said air and gas inlet ports with said gas-producer, said gas-passage being provided with a supplemental gas-reservoir for regulating and rendering uniform the supply of gas to said secondary chamber, substantially as specified.

7. The combination, with retort C, of secondary chambers F F, surrounding said retort, and provided with ports *c'*, *c²*, and *c³*, leading into said retort, and air-inlet ports *b'*, and gas-inlet ports *a'*, gas-producing chamber or fire-box D, gas-passage E, provided with damper *e*, and branches *a*, connecting said chambers F F with said fire-box D, ash-pan *d'*, and air-passage K, provided with damper k^3, and branches *b*, connecting said ash-pan *d'* with said chambers F F, said air and gas branch passages *a* and *b* and inlet-ports *a'* and *b'* being arranged alternate with each other, substantially as specified.

8. The combination, with gas-producing chamber or fire-box D and grate *d*, of fuel-hopper d^3, cap d^4, pivoted dumper d^5, provided with lever d^7, substantially as specified.

9. The combination of retort C with a gas-producer, a secondary chamber surrounding said retort, and provided with ports opening into said retort, and air and gas inlet ports connected with said gas-producer by means of separate air-passages and gas-passages, and a door, P, at the bottom of said retort, through which additional air may be admitted to said retort, substantially as specified.

294,454. OPERA-CHAIR. EDWARD G. DURANT and ELI SHUPE, Racine, Wis.; said Shupe assignor to THOMAS KANE, Chicago, Ill. Filed July 11, 1883. (No model.)



Claim.—1. In combination with a supporting-standard, a seat-arm and a back-arm pivoted thereto, one of said arms provided with a stud, and the other arm provided with a rigid slotted projection mounted upon said stud, as described and shown.

2. The combination of the standard A, the seat-arm B, pivoted thereon and provided with the stud E, and the back-arm C, also pivoted to the standard and provided with the rigid slotted extension D, loosely engaging the stud, as shown, whereby the two arms are caused to move simultaneously and positively in both directions.

294,455. ELECTRIC-ARC LAMP. HARDMAN ARTHUR EARLE, London, England, and EWALD GOLDSTEIN, Hanover, Prussia, Germany. Filed Dec. 4, 1883. (No model.)

Claim.—1. In an electric-arc lamp in which one of the carbons is carried by a piston, *s*, working in a cylinder, *f*, containing a liquid, the combination, with the said cylinder, of a regulating-cylinder, *p*, having the channel *u'* of *s* piston, *q*, working in *p*, and of means adapted to operate according to the variations in the strength of the current on the piston, so that it will be pushed inward within the cylinder *p* when the lamp is switched into circuit, substantially as and for the purpose described.

2. The combination, with the cylinders *f* and *p*, containing liquid, reservoir *q'*, pistons *s* and *q*, and means for operating the piston *q* according to the variations in the strength of the current, of a channel establishing communication between the reservoir *q'* and the space occupied by the liquid in *f* and *p*, and of a valve adapted to close the said channel, substantially as and for the purpose specified.

294,456. BURIAL-CASKET. FRANKLIN A. FIELD, Everett, assignor to Henry C. Miller, Cambridge, and Allen F. Miller, Winchester, Mass. Filed Dec. 13, 1883. (No model.)

Claim.—A casket-body provided externally with one or more longitudinal grooves, *b*, and a cloth or flexible covering applied to the said body, combined with cords applied outside the flexible covering and drawn into the said grooves, the said cords being retained by the said grooves from vertical movement on the said body, all substantially as and for the purposes described.

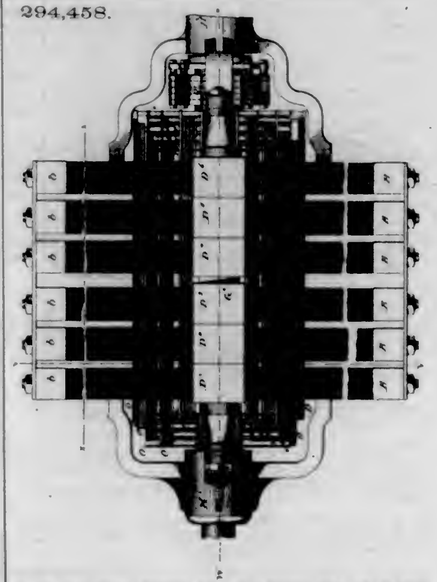
294,457. COMPOSITION FOR ELECTRICAL INSULATION. JOHN FOTTERELL, Philadelphia, Pa., assignor to Thomas S. Leigh, Trustee, same place. Filed Jan. 7, 1884. (No specimens.)

Claim.—1. Metallic soap for the purposes of electrical insulation, substantially as described.

2. A composition for electrical insulation, consisting of metallic soap, benzine or its equivalent, linseed-oil, and varnish.

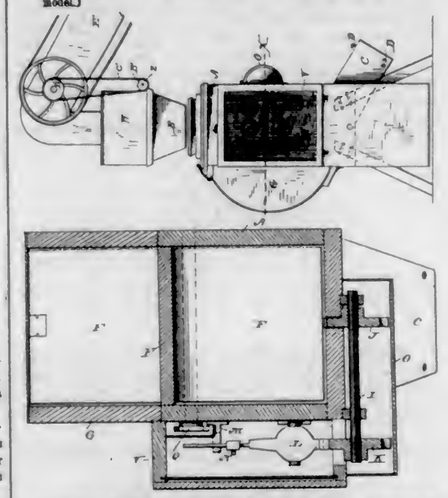
3. Metallic soap benzine or its equivalent, linseed-oil, and varnish, in combination with a thickening material, substantially as and for the purpose set forth.

294,458. DYNAMO-ELECTRIC MACHINE. GEORGE W. FULLER, Norwich, Conn. Filed Feb. 19, 1883. (No model.)



Claim.—1. In a dynamo-electric machine having stationary field-magnets and a cylindrical armature, a rotating system of induction-bars, arranged in the form of a cylindrical cage and loosely surrounding a stationary cylindrical iron core.

2. In a cylindrical armature for a dynamo-electric machine, provided with longitudinally-circumposed groups of induction-bars, a series of nests of insulated connecting-rings at each end of the armature, for effecting the appropriate electrical connections of the induction-bars with each other, substantially as described.

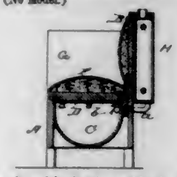


3. A cylindrical armature for a dynamo-electric machine, having an internal iron core loosely mounted upon the armature-shaft, and a rotating system of induction bars or coils independent of the said iron core and appropriately connected with each other and with the commutator-strips, and supported upon the peripheries of two or more wheels fastened to and revolving with the armature-shaft.

4. In a dynamo-electric machine, substantially such as described, in which the cage of induction bars or coils is rotated around a cylindrical iron core loosely mounted upon the armature-shaft, one or more sleeves, *h h'*, each provided with the oil-supply hole *s'*, extending through the upper part of the sleeve and terminating at its lower end in the oil-cavity S, formed in the interior surface of the sleeve and containing a strip of suitable material for absorbing oil, in combination with the enlarged part of the shaft H, which the sleeve surrounds, as and for the purposes set forth.

294,458.

294,459. AUTOMATIC GRAIN MEASURE, REGISTER, AND SACKER. JOHN M. FULTON, Roanoke, Ind. Filed May 23, 1883. (No model.)



Claim.—1. The combination of the casing having a hopper at its upper end and an inclined chute at its lower end, the four-winged wheel or paddle journaled in the rear part of the said casing, the horizontal shaft having a centrally-located ratchet-wheel adapted to support one of the wings which forms a temporary floor of the casing, a correspondingly-toothed ratchet-wheel at the outer end of the said shaft, and a suitably-poised scale-beam arranged to act as a detent against the said outer ratchet-wheel, substantially as set forth.

2. The combination of the casing, the revolving four-winged wheel or paddle, a horizontal shaft having a ratchet-wheel arranged to support the wing which forms at the time a temporary floor of the casing, a correspondingly-toothed ratchet-wheel at the outer end of said shaft, a suitably-poised scale-beam arranged to act as a detent against the said outer ratchet-wheel, a wheel at the outer end of the paddle-shaft, and a registering mechanism arranged to be actuated by the said sprocket-wheel, as set forth.

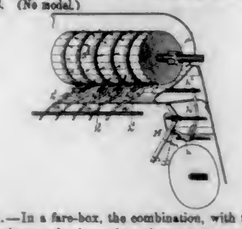
3. The combination, with the casing having the revolving paddle-wheel, the shaft of which is journaled in the rear part of the said casing, of the hinged bulging door which provides room for the said paddle-wheel to revolve, and affords access to the same, substantially as and for the purpose set forth.

294,460. COMBINED SOFA AND BATH-TUB. GILBERT E. GA NUN, Mount Kisco, N. Y., assignor of one-half to Asa Young, same place. Filed Mar. 19, 1883. (No model.)

Claim.—1. A sofa and bath-tub combined, wherein the bath-tub is located and supported in the body-frame of the sofa, and the seat thereof forms a cover for the bath-tub, concealing it from view, substantially as specified.

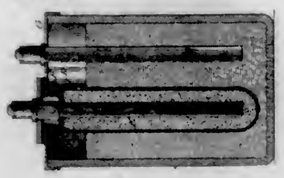
2. The combination, with a sofa having a bath-tub in its body portion, and a removable seat, of a water tank or reservoir attached to the back of the sofa, substantially as specified.

3. The combination, with a sofa having a bath-tub and water-tank provided with a faucet extending into the tub, of a water-heating attachment, substantially as specified.



294,461. TIRE FOR WAGON-WHEELS. PETER GENDRON, Toledo, Ohio, assignor to the Gendron Iron Wheel Company, same place. Filed Aug. 1, 1883. (No model.)

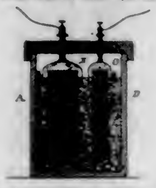
Claim.—1. The method herein described of making a rubber-tired wheel, which consists in first securing to the spokes a thin-edged metallic tire having said thin edges extending outwardly, then putting the rubber tire around the metal tire, and finally pressing the edges of the said metallic tire against the sides of the rubber tire, substantially as described.



2. A carriage-wheel provided with a thin metal tire, and a supplemental tire formed partly of soft and partly of hard rubber, and held in place by turning the edges of the metal tire against the hard rubber, substantially as described.

294,462. FARE-BOX. JAS. F. GOODRIDGE, Boston, Mass. Filed June 14, 1883. (No model.)

Claim.—In a fare-box, the combination, with the ticket feed-roll and its actuating mechanism, of an alarm, a stop to prevent the alarm from sounding, and means, substantially as described, by which the passage of a ticket will remove the stop and allow the alarm to sound, substantially as and for the purposes set forth.

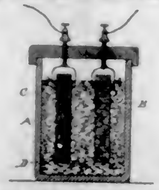


294,463. BATTERY. ALFRED HAID, Rahway, N. J. Filed Sept. 12, 1883. (No model.)

Claim.—1. An electrode for galvanic or secondary batteries, consisting of a carbon rod or plate, in combination with a mixture of Prussian blue, or its described equivalent, and carbon, as described.

2. The combination, in a battery, of an acid or equivalent solution, a zinc pole, and a carbon rod or plate in a porous jar containing a mixture of Prussian blue and carbon, all as set forth.

294,464. SECONDARY BATTERY. ALFRED HAID, Rahway, assignor, by direct and mesne assignments, to Haids Electrical Storage Company, Newark, N. J. Filed Feb. 17, 1883. (No model.)



Claim.—1. In a battery, the combination, with the electrodes, of an acid solution containing a metallic salt—such as sulphate of zinc—and a metallic salt capable of forming under electrolytic action a depolarizing substance or compound on the positive electrode, substantially as described.

2. In a battery, the combination, with a carbon and metal electrode, of an acid solution containing a salt of a metal electro-positive to carbon and a metallic salt capable of forming under electrolytic action a depolarizing substance or compound on the positive electrode.

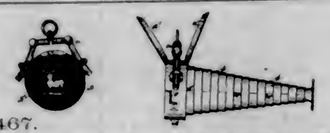
3. In a battery, the combination of a carbon plate, an amalgamated-zinc plate or its equivalent, and a solution containing sulphuric acid, sulphate of zinc, and sulphate of manganese or its equivalent, substantially as described.

294,465. SECONDARY BATTERY. ALFRED HAID, Rahway, assignor, by direct and mesne assignments, to Haids Electrical Storage Company, Newark, N. J. Filed Mar. 21, 1883. (No model.)

Claim.—1. The method of preparing lead plates for secondary batteries, which consists in coating them with zinc, and then dissolving said coating prior to forming the plates by the action of a current, as described.

2. The method of preparing lead plates for secondary batteries, which consists in coating them by an electric current with zinc, and then removing such coating by reversing the current, substantially as set forth.

294,466. WATCH-WINDING DEVICE. C. WESLEY HARMAN and HORACE G. SKIDMORE, Cincinnati, Ohio. Filed Nov. 21, 1883. (No model.)



Claim.—1. A winding attachment for watches, consisting of a short winding-pipe having a retaining-flange, a recess in one side of the pipe, a handle fitted in the upper end of the pipe, whose shank occupies the recess when folded, and pin to hinge the handle to the pipe, as set forth.

2. The combination, with a winding-arbor having a guard-plate to form a funnel surrounding the arbor and an inner back having an orifice, of a short pipe having a flange to occupy the funnel and retain the pipe in the inner back, and a handle hinged directly to the short pipe on the outside of the inner back, as set forth.

3. The winding attachment consisting of a short winding-pipe, F, having a flange, *f*, and a handle, H, hinged within the pipe, in combination with a winding-arbor, an inner back having an orifice around the pipe, and a washer, G, having an orifice snugly fitting the pipe and securing the latter to the inner back, as set forth.

294,467. CHARM-TELESCOPE. CARL HOLBEIN, Pforzheim, Baden, Germany. Filed Sept. 18, 1883. (No model.) Patented in England Oct. 13, 1883, No. 4,870, and in France Oct. 16, 1883, No. 145,702.

294,467.

Claim.—1. A charm consisting of a locket having secured therein a telescope capable of being extended (when the locket is opened) without removing it from the locket, substantially as and for the purposes specified.

2. A charm having a supporting-ring and a lid and a telescope capable of extension and connected to said ring, the lid securing the telescope, when closed, from extension, substantially as and for the purposes specified.

3. A charm having a supporting-ring and front and rear lids and a telescope capable of extension secured to said ring, and, when closed up, inclosed by the said supporting-ring and the closed front and rear lids, substantially as and for the purposes specified.

4. A charm having a supporting-ring and rear and front lids, in combination with a telescope consisting of sections and secured to the supporting-ring of the locket by a bayonet-joint, substantially as and for the purposes specified.

5. A charm consisting of a locket having a supporting-ring and a rear lid, in combination with a telescope, B, consisting of a number of sections, *b b'*, said telescope being secured in the locket by means of a bayonet-joint, and the rear lid shutting over the ocular end of the telescope when closed, substantially as and for the purposes specified.

6. A telescope having the sections *b*, each provided on one side with a pin, *e*, and on the other side with the slit *e'*, the pin of one section engaging the slit of an adjacent section, substantially as and for the purposes specified.

7. A telescope having the sections *b*, each interior section being as narrow as its encircling section, each section having a pin, *e*, and slit *e'*, the pin of one section engaging the slit of an adjacent section, substantially as and for the purposes set forth.

8. The combination of section *b'* and the sections *b*, each of the latter being provided with pin and slit, substantially as and for the purposes hereinbefore mentioned.

294,468. SLEEVE-BUTTON, &c. STEPHEN C. HOWARD, New York, N. Y. Filed May 19, 1883. (No model.)

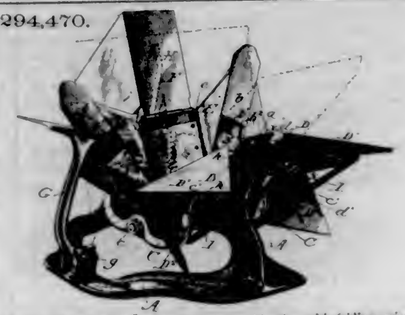
Claim.—1. In a button, a non-metallic exterior plate and a flanged metal lining placed within the same, combined with a separate center plate to fill in the face of the opening in the said non-metallic exterior plate, substantially as described.

2. In a button, the non-metallic exterior plate, its metal lining, center plate, and back, combined with the said holder to confine the back and its attached parts in the said exterior plate, substantially as described.

3. In a button, a non-metallic exterior plate, an independent center plate held within said plate, and a back, combined with a shank and pivoted shoe, substantially as described.

294,469. SLEEVE-BUTTON. STEPHEN C. HOWARD, New York, N. Y., and JOHN C. SCHOTT, Providence, R. I. Filed Oct. 12, 1883. (No model.)

Claim.—A button shank, back, shoe, and frame, *d*, and stone or other ornamental panel or plate, combined with a supplemental frame supported above the level of the frame *d*, and a stone or other ornamental panel or plate therein, all substantially as described.



294,470. WRAPPER-FOLDING MACHINE. WARREN R. HOWE, Chicago, Ill. Filed Jan. 2, 1883. (Model.)

Claim.—1. In a folding-machine, the V-shaped female die B, in combination with the hinged triangular gage G, arranged and operating substantially as described and shown.

2. In a folding-machine, the female die B, V-shaped in cross-section, and provided with adjustable slides *a a'*, as and for the purposes specified, substantially as shown and described.

3. In a folding-machine, female die B, provided with adjustable slides *a a'*, in combination with cap F, hinged to the adjustable slide *a'*, substantially as shown and described.

4. In a folding-machine, cap F, in combination with female die B, arranged substantially as described, in combination with folding-wings E E and D D, operating to form and press the finishing-flaps of the wrapper, substantially as shown and described.

294,470.

5. In a folding-machine, cap F, provided with handle *f''* and lug *j*, in combination with spiral spring *i*, and adjustable slide *a'*, arranged so as to operate as and for the purposes specified, substantially as described.

6. In a folding-machine, the cams C C and means for pivoting and operating the same, substantially as described and shown, in combination with folding-wings E E and folding-wings D D, as and for the purposes shown and described.

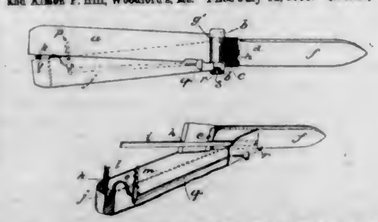
7. In a folding-machine, the folding-wings D D, provided with rigid folding-blades D^2 D^2, as and for the purposes specified, substantially as described and shown.

8. In a folding-machine, the folding-wings D D, provided with blades D' D' and rigid folding-blades D^2 D^2, substantially as described, as and for the purposes specified.

9. In a folding-machine, folding-wings D D, provided with rigid folding-blades D^2 D^2, and hinged to ends of female die B, and so arranged as to operate, in combination with folding-wings E E, to crease and press the end folds of the wrapper, substantially as described and shown.

10. The folding-wings D, folding-blades D^2, and folding-wings E, in combination with die B, arranged, substantially as described, to form, crease, and press the end folds of the wrapper.

11. The folding-wings D, blades D^2 and D', and die B, in combination with folding wings E and cap F, arranged, substantially as described, to form, crease, and press the end folds and crease and press the finishing flaps of the wrapper.



12. In a folding-machine, folding-wings E E, provided with adjustable slides b^2 b^2, hinged to folding-blades *b b* at *b' b'*, in combination with female die B, and hinged to it, so as to operate in forming and pressing the finishing folds of the wrapper, and also at the same time to operate in combination with cap F, in forming and pressing the finishing flaps of the packet, substantially as described.

13. In a folding-machine, the combination of frame A, die B, gage G, cap F, folding-wings D D, folding-wings E E, stop H, cams C C, and means for operating the same, substantially as described and shown.

14. In a folding-machine, folding-wings D D, provided with adjustable blades D' D' and folding-blades D^2 D^2, substantially as described, as and for the purposes specified.

15. The folding-wings D, blades D^2 and D', and die B, in combination with folding-wings E, cap F, and folding-blades *b b*, arranged, substantially as described, to form, crease, and press the end folds and crease, press, and fold the finishing flaps of the wrapper.

294,471. POCKET-KNIFE. ORSON HUFF, Lyman, assignor to himself and ALMON F. HILL, Woodford's, Me. Filed July 12, 1883. (Model.)

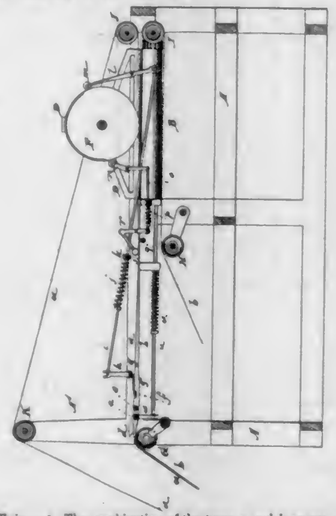
Claim.—1. A knife-handle formed of two hollow sections, *a j*, the upper one having collar *b*, with pin *s* and projections *p*, and the lower one having rear pin, *k*, surrounded by a spiral spring, a pivoted spring-pressed and notched locking-plate, *m*, an operating-rod, *q*, and a perforated projection, *r*, as shown and described.

2. In a hollow knife-handle, the front collar, *b*, carrying a pivoted

spring-pressed cap, *c*, in its recess *g'*, and a stud, *d*, on the cap *c*, in combination with a loose blade, *f*, having a socket, *e*, in its shank, whereby the blade may be securely held inside or outside the handle, as described.

3. A hollow handle having the bevel-edged plate *i*, pivoted at its front end, in combination with a loose blade, *f*, having the dovetailed groove *h*, whereby the blade may slide in or out of the handle without striking its edge, as described.

294,472. METALLIC BAND FOR TRANSMITTING POWER. ANTHONY JAROLIMEK, Hainburg-a-Donau, Austria-Hungary, assignor of one-half to John G. Avery, Spencer, MASS. Filed May 5, 1883. (No model.)



Claim.—1. In a flat driving-band of spirally-spun wire, the combination of a series of spirals, *f f*, having open coils, and a series of spirals, *g g*, crossing the former on diagonal rows of coils, and interlocking therewith to unite said spirals *f f* with each other, side by side, substantially as hereinbefore specified.

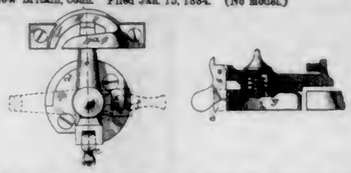
2. In a flat driving-band of spirally-spun wire, a series of open-coil spirals to form the tractional face of the band, arranged diagonally, as shown and described, to render their coils at the face of the band transverse with reference to the length of the band and the direction of tractional strain, substantially as hereinbefore specified.

3. The improved flat driving-band of spirally-spun wire, composed of a series, *f f*, of diagonally-arranged open-coil spirals united by a similar series, *g g*, of diagonally-arranged open-coil spirals crossing the former on diagonal rows of coils, and interlocking therewith at each coil, as hereinbefore specified, for the purposes set forth.

294,473. PAPER-FOLDING MACHINE. CONRAD KAHLER, Chicago, Ill. Filed Apr. 16, 1883. (No model.)

Claim.—1. The combination of the tapes *a* and *b*, means, substantially as described, for dividing two sheets advancing between the tapes, a plate, *f*, arranged between the tapes, and vibrating fingers *g'*, arranged above the plate to catch the rear edge of the upper sheet and detain it until the under sheet passes thereunder, as and for the purpose set forth.

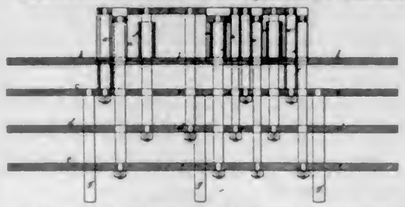
2. The combination of the divider *c d*, roller *e*, plate *f*, and detaining-fingers *g'* with the tapes *a b* and roller *s*, substantially as and for the purpose described.



3. The combination, with tapes *a* and *b*, of means, substantially as described, for dividing two sheets entering between the tapes, the plate *f*, arranged between the tapes, vibrating fingers *g'*, arranged above the plate for catching the rear edge of one sheet and detaining it until the succeeding sheet passes under it, the rock-shaft *g*, to which the fingers are attached, the arm A on the shaft, the rod *i*, the spring *j*, the lever *l*, and cam-disk F, essentially as and for the purpose set forth.

4. The combination, with the tapes *a* and *b* and divider *c d*, of the roller *e*, plate *f*, detaining-fingers *g'*, rock-shaft *g*, arm A, rod *i*, spring *j*, lever *l*, and cam-wheel F, arranged for operation substantially as and for the purposes described.

5. The combination of the divider *c d*, roller *e*, plate *f*, detaining-fingers *g'*, and roller *s* with the tapes *a b* and folding-rollers B, substantially as and for the purpose specified.



6. The combination of the divider *c d* and roller *e* with the tapes *a b*, plate *f*, and the detaining-fingers *g'*, substantially as described.

294,474. WINDOW AND DOOR BUTTON. ELEAZER KEMPSHALL, New Britain, Conn. Filed Jan. 15, 1884. (No model.)

Claim.—The combination of the notched or shouldered plate, the sweep pivoted on said plate and provided with a gravity-latch, and the sweep-spring, substantially as described, whereby the gravity-latch is firmly held against its shoulder when said sweep occupies its locked position.

294,475. MANUFACTURE OF MOSAIC AND OTHER TILES. JEAN LARMANJAT, Paris, France. Filed Dec. 12, 1883. (No model.) Patented in France Mar. 27, 1876, No. 112,794, and Sept. 13, 1878, No. 126,514; in England Dec. 23, 1876, No. 5,021, and in Belgium Mar. 1, 1880, No. 50,691.

Claim.—1. In the manufacture of tiles and other ceramics, the process of brightening the colors, consisting in treating the material or cement with a solution of soap previous to baking the tiles, substantially as set forth.

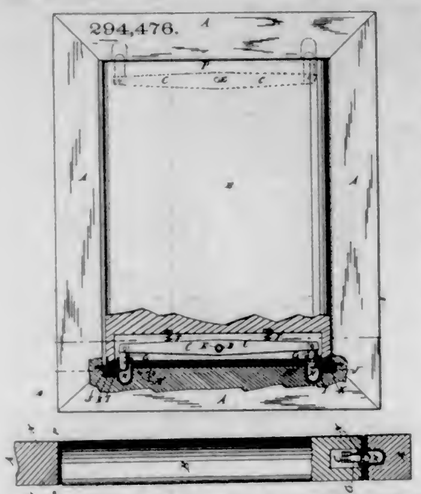
2. In the manufacture of tiles and other ceramic ware, the process of brightening the colors, consisting in moistening the powdered materials or cements with a solution of soft soap to oppose the efflorescence of the salts of lime contained in the powdered material or cement, substantially as set forth.

3. In the manufacture of tiles and other ceramic ware, the process of brightening the colors, consisting in moistening the powdered material or cement with a solution of soft soap, and treating the tiles after they have been molded and while they are yet porous with a solution of soft soap, and then removing the excess of soap, whereby the free alkali potash in the soap displays a portion of the lime of the opaque insoluble salt in the cement.

4. In a machine for molding tiles and other ceramics, a mold-plate composed of series of separate parts, forming a continuous and practically unbroken surface, each series of said separate parts being vertically adjustable independently of the other, substantially as set forth.

5. In a machine for molding tiles and other ceramics, a mold-plate composed of a series of separate parts adjustable independently of each other by means of independently-operated vertically-sliding rods, substantially as set forth.

6. In a machine for molding tiles and other ceramics, a mold-plate composed of a series of separate parts adjustable independently of each other by means of independently-operated vertically-sliding rods mounted in plates beneath the mold, said rods being provided with tubes or sleeves between the plates to limit their vertical movement, substantially as set forth.



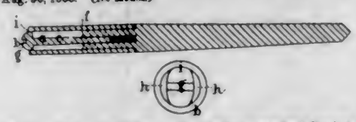
7. In a machine for molding tiles and other ceramics, a mold-plate composed of a series of separate and independently-operated parts and a series of metallic forms corresponding in shape to the parts of the mold, mounted on a plate beneath the said parts of the mold, and extending up flush with the upper surface of said mold parts, substantially as set forth.

294,476. HANGING DOORS. ALEXANDER H. P. LEUF, Brooklyn, N. Y. Filed Aug. 4, 1883. (No model.)

Brief.—A pivoted spring-actuated cross-bar is located in a recess in each end of the door, and is provided at its ends with grooved pivot-pins engaging alternately its socket in the casing, said pins being engaged in turn by a spring-bolt.

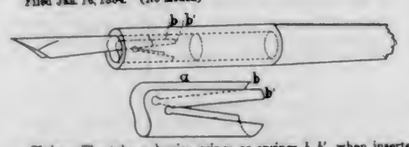
Claim.—1. The combination, with the door B, having recessed ends,

294,476.



and the door-casing A, of the pivoted cross-bars C, hinged pivots G, and the sockets H, substantially as herein shown and described, whereby the said door can be opened in either direction and from either edge, as set forth.

2. The combination, with the door B, having recessed ends, and the pivoted cross-bars C, of the springs F, substantially as herein shown and described, whereby the said cross-bars, when left free, will be held in horizontal positions, as set forth.



3. The combination, with the pivoted bar C, provided with the pivots G, having grooves M, and the sockets H, of the bolts I and the springs K, substantially as herein shown and described, whereby the said pivots, when serving as hinges, will be locked in their sockets, as set forth.

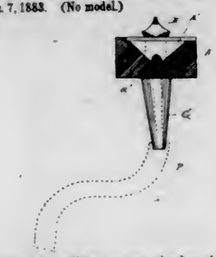
294,477. PEN-HOLDER. FREDERIC M. LIBBY, Portland, Me. Filed Aug. 30, 1883. (No model.)

Claim.—The combination, with a hollow pen-stock having a solid portion to receive the screw *a*, of the screw *a* and head *b*, the said head being shaped as herein set forth.

294,478. PEN-HOLDER. FREDERICK MATTHIAS LIBBY, Portland, Me. Filed Jan. 16, 1884. (No model.)

Claim.—The tube *a*, having wings or springs *b b'*, when inserted into the hollow of a pen-stock, as herein set forth, and secured as described, for the purposes specified.

294,479. APPARATUS FOR ADMINISTERING ANÆSTHETIC GASES. AMOS M. LOWE, Monroe, Mich. Filed June 6, 1883. (Model.)

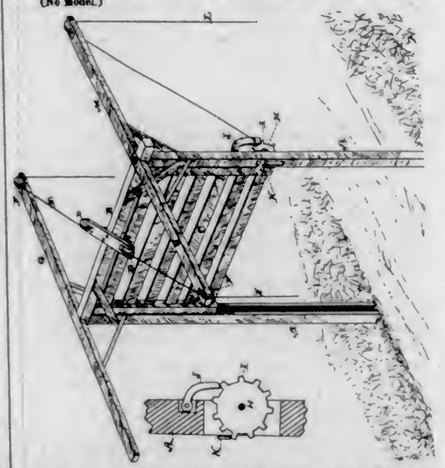


Claim.—1. In an apparatus for administering anæsthetic gases, the combination of gas-holder A, floating partition A^3, having a central opening for supply or inlet pipe, and packing, shown and described, whereby the gas is separated from the water, substantially as set forth.

2. In an apparatus for administering anæsthetic gases, the combination of a gas-tight floating partition, A^3, opening *g*, inlet-pipe A^2, gas-holder A, and cistern B, whereby the gas is kept from contact with the water, substantially as set forth and described.

3. In an apparatus for administering anæsthetic gases, the combination of cistern B, gas-holder A, weight-seat and weights, floating partition A^3, packing S, opening *g*, supply-pipe A^2, and detachable open-bottomed floats A^4, substantially as and for the purposes set forth.

4. In an apparatus for administering anæsthetic gases, a gas-holder having detachable chambers A^4 secured to the lower inner surface of holder, said chambers being open at the bottom and acting as floats, substantially as set forth.

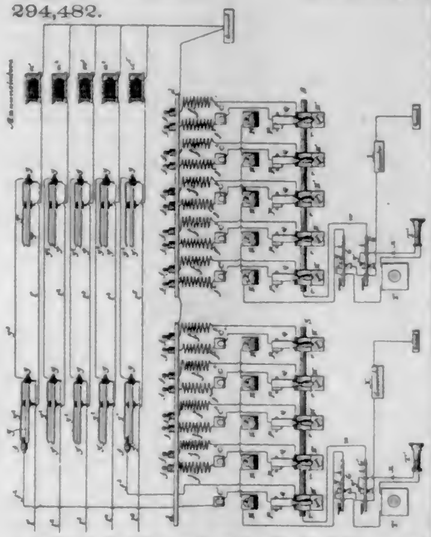


294,480. LUBRICATOR. WILLIAM ALONZO LOVELIS, Bingen, Ark. Filed Dec. 7, 1883. (No model.)

Claim.—1. In an oil box or cup, the box A, having oil-receptacle A', openings *a* and C', in combination with an oiler-plug, B, having oil-passages C D, substantially as described, and for the purposes set forth.

2. In an oil box or cup, the box A, having sliding cover F, oil-receptacle A', openings *a* C', and oiler-plug B, having passages C D, in combination with pipe G, substantially as described, and for the purposes set forth.

294,481. GATE. JOHN R. LOWE, Anderson, Cal. Filed Aug. 4, 1883. (No model.)



Claim.—1. A vertically-sliding gate moving between guide-posts, and having an arm, K, projecting alongside one of the posts, in combination with a toothed wheel journaled to the post, so that the arm may engage the projecting teeth, and a pawl which engages the teeth upon the opposite side and prevents the wheels turning back, substantially as herein described.

2. A vertically-sliding gate moving between guide-posts, and having an arm which engages the teeth of a spur-wheel journaled upon one of the posts, and a swinging pawl upon the opposite side of the post by which the wheel is prevented from returning, in combination with the cords E, attached to the gate, and the cords L, attached to the pawl, substantially as herein described.

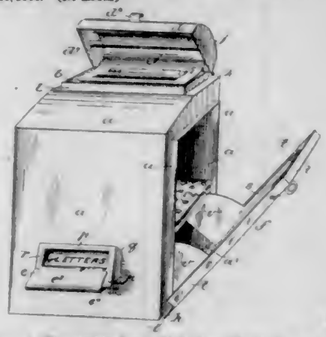
294,482. TELEPHONE CENTRAL-OFFICE APPARATUS. FELTON M. LITTLE and JOHN A. MCCOY, Baltimore, Md., assignors to Henry B. Lytle, Boston, Mass., Trustee. Filed Sept. 25, 1883. (No model.)

294,482.

Claim.—1. The combination, with a series of pairs of connecting-cords arranged to connect subscribers' lines, and two signaling-keys, each having a contact-point connected with a generator, of a series of switches arranged to connect either of the pairs of connecting-cords with said two signaling-keys, respectively, substantially as described.

2. The combination, with the series of pairs of connecting-cords arranged to connect subscribers' lines, and two signaling-keys having contact-points, with which they are normally in contact, connected to the opposite terminals, respectively, of a circuit including a telephone, and opposite contact-points, each connected with a generator, of a multiple looping-in switch and connections, arranged to place the cords of any pair separately in connection with said two keys, respectively, substantially as described.

3. The combination, with the series of pairs of connecting-cords, of the multiple looping-in switch, having a separate jack or movable metallic part connected with one cord of each pair, a resilient contact-point in connection with the other cord of each pair, a common conductor arranged to make contact with said resilient contact-points when the latter are not in contact with the jacks, and to break contact therewith when in contact with said jacks, the opposite contact-points electrically connected together, the two keys connected to said opposite contact-points and the common conductor, respectively, and the generator, arranged for connection with both of said signaling-keys, substantially as described.



4. The combination, with a pair of connecting-cords provided with metallic plugs and arranged for connecting subscribers' lines, of an electro-motive instrument—as, for instance, the operator's receiver—and a testing-battery arranged for operative intermediate connection with said cords and a switch for effecting such connection, whereby, when such connection has been made and one of the cords plugged to a calling-line, the other cord is properly connected for testing another line, substantially as described.

5. The combination of one or more pairs of connecting-cords, a telephone, a testing-battery connected with said telephone, and a switch and connections arranged to connect said telephone and testing-battery simultaneously in circuit between the two cords of a pair, substantially as described, and for the purpose set forth.

6. The combination, with a series of switch-boards or switch-board sections, each provided with subscribers' line-terminals and pairs of connecting-cords, a multiple looping-in switch, two signaling-keys arranged for connection with the cords, and telephone-instruments, as described, of the chief operator's apparatus having a series of switches and a set of telephone-instruments arranged to be connected by said switches with the telephone-instruments of the switch-board operators, respectively, substantially as described.

7. The combination, with a series of switch-board apparatuses, each provided with pairs of connecting-cords and a multiple looping-in switch, two signaling-keys, and telephone-instruments, connected as described, of the chief operator's apparatus, provided with a multiple looping-in switch, having jacks connected in loops with the switch-board operators' telephones, hooked spring-arms connected also in said loops, and the opposite spring-arms, and a conducting-rod connected with the opposite terminals of a circuit including chief operator's telephone, substantially as described.

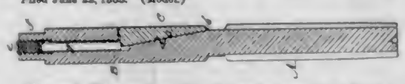
294,488. LETTER-BOX. CHARLES F. MAHR, Philadelphia, Pa. Filed July 20, 1883. (No model.)

Claim.—1. The combination, with the box *a*, having an opening, *b*, and hinged lid *d* therefor, of the guard *j*, hinged to the box *a*, and the rod d^4, fixed to lid *d*, for operating the guard by the lid, substantially as shown and described.

2. A letter-box having the outer flange, *u*, and a door hinged thereto at *g*, said door being extended below the hinge to form a ledge, *h*, whereby the door may be held open, as shown and described.

3. The combination, with the box *a*, having an opening, *b*, and lid *d*, fitted with a rod, d^4, or equivalent devices, of the guard *j*, hinged to the box *a* at *k*, and having a slot, *m*, in its lower portion, j^3, substantially as shown and described.

4. The combination, with the box *a*, provided with opening *b*, lid *d*, fitted with bar d^4, and the guard *j*, of the pendent plate *n*, substantially as shown and described.



5. A mail-box divided by a horizontal partition, *o*, into an upper and lower compartment, a' a^2, having a single outlet-door, *f*, at one end for both compartments, and two inlets—one on the top and the other on the lower half of the front of the box—said inlets having covers, as shown and described.

6. The door *f* and mail-box *a*, provided with the flanges *t u*, upwardly inclined toward each other, and the flange *t*, overlapping flange *u* to produce a water-proof joint, as described.

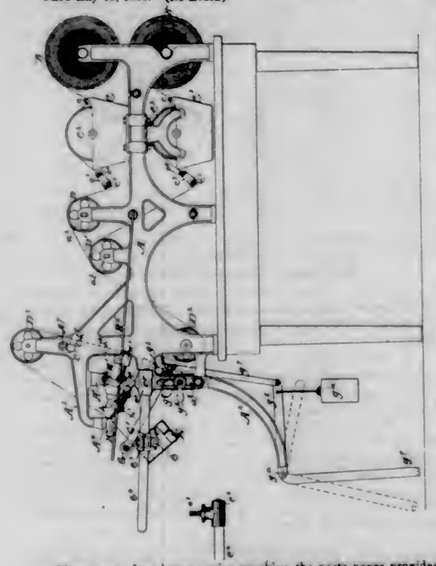
7. The hood *p*, constructed with a flared top, *q*, a front apertured at *r*, and falling inward at the top, and a lid, *e*, arranged to close the opening *r* by gravity, and at the inside of the hood front, substantially as shown and described.

8. The combination, in a letter or mail box, of the compartment a', having an opening, *b*, lid *d*, and guard *j*, and the compartment a^2, having an opening, *c*, and hood *p*, apertured at *r*, and fitted with an inwardly-opening and self-closing lid, *e*, substantially as shown and described.

294,484. REAMER. CHARLES H. WALMSLEY, New Bedford, Mass. Filed June 22, 1883. (Model.)

Claim.—1. The combination, with a reamer having its shank constructed to form a gage, of an adjustable cutter arranged in said shank, substantially as herein shown and described, whereby provision is made for making a hole as determined by the gage after the reaming portion proper has become worn below the size, as set forth.

2. The combination, with a many-edged reamer having its shank constructed to form a gage, of an adjustable cutter arranged in a longitudinal slot in said shank, and extending below the lower end of the gage, substantially as herein shown and described, whereby the cutter is presented to the work in advance of the shank, as set forth.



3. In a reamer, the combination, with the many-edged reaming portion A, and its slotted shank B, constructed to form a gage, of the cutter C, the pin *g*, and screw *e*, substantially as herein shown and described.

294,485. PROCESS OF MAKING COPIES OF TRACINGS. PHILIP H. MANDEL, Astoria, N. Y. Filed June 26, 1883. (No specimens.)

Claim.—1. The process of copying a tracing, drawing, or other illustration delineated on transparent material, consisting in applying to a pane of glass a sensitive material composed of bichromate of ammonia, gum-arabic, sugar, and water, or the equivalent of such material, which when not exposed to the light is tacky or sticky, but which when exposed to the light loses its tackiness or stickiness; in laying the illustration over the said sensitive material; in exposing the illustration to the light; in subsequently removing the illustration; in applying lamp-black or analogous material outside the sensitive material; in subsequently applying a sheet of material on which the copy is to be made, and in finally stripping off the material on which the copy was to be made, and the said sensitive material with it, substantially as specified.

2. The process of copying a tracing, drawing, or other illustration delineated on transparent material, consisting in taking a pane of glass, in applying to one side thin collodion; in next applying over the collodion a sensitive material composed of bichromate of ammonia, gum-arabic sugar, and water, or the equivalent of such material, which when not exposed to light is tacky or sticky, but which when exposed to light loses its tackiness or stickiness; in subsequently applying the illustration to be copied over the sensitive material; in subsequently exposing the illustration thus applied to the light; in subsequently removing the illustration; in then applying lamp-black or analogous material outside the sensitive material; in subsequently applying a thin collodion; in afterward applying a sheet of material on which the copy is to be made, and in finally stripping off this sheet of material, and the said sensitive material with it, substantially as specified.

294,486. BOX MAKING AND COVERING MACHINE. CHARLES HENRY MANNEK, Brooklyn, N. Y., and WILLIAM WITTE, New Haven, Conn. Filed May 19, 1883. (No model.)

Claim.—1. In a box-covering machine, the paste-cores provided with an acute edge and a roll, c^2, in advance thereof, with roll-carrying arms c^3, adjustably secured to each paste-box by the screws c^4, forming the pivots for said arms, substantially as and for the purpose described.

2. The combination of the side frames, provided with slots a^2 for the passage of roll-bearing screws *a*, and paper-carrying roll D, with bearing-screws *a* at each end of said roll, and jam-nuts a' upon said screws to regulate the height of each end of said roll, substantially as and for the purposes set forth.

3. The combination of the side frame of the machine, the angularly-adjustable rod c^7 and adjustable clamp c^8 thereon, with shaft *e* and expansive box-block formed of pieces E, substantially as and for the purpose described.

4. In combination with a box-block, the bottom presser, composed of a disk, f^3, upon the end of the presser-rod *f*, adapted to slide in bearings F^1, connected with the frame of the machine, the sleeve f^4, having tapering chamber f^5 and spring-latch f', substantially as and for the purpose described.

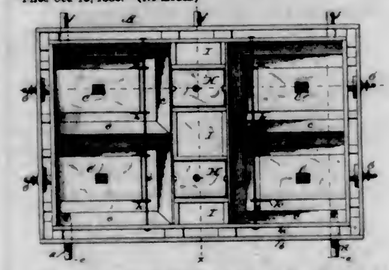
5. The combination of the side frame, rod F, projecting therefrom, rod F^2, adjustably secured thereto, sleeve F^4 thereon, provided with latch-pin f^{12}, presser-rod *f*, and spring-latch f', provided with notch to engage with latch-pin, substantially as and for the purpose described.

6. The combination of presser-rod *f*, sleeve F^4 thereon, and spring-latch f' with disk f^3, adapted to revolve upon the end of the presser-rod, adjusting-nuts f^6, and sleeve f^4, substantially as and for the purpose described.

7. The combination of the rubbing-roller G, its supporting-arms G', and pivot-pin *g* with adjustable bearing g', rocking arm g^9, and shaft g^8, retained in bearings vertically adjustable upon the frame, substantially as and for the purpose described.

8. The combination of the vertically-adjustable shaft g^8, rocking arm g^9, arm G', and roller G with crank g^{10}, connecting-rod g^{11}, and bell-crank lever g^6, provided with swinging treadle g^5, substantially as and for the purpose described.

9. In combination with the ledger-blade, transverse rods H and A^7, and sleeve H', carrying the shaft of the revolving cutter, the arm H^2, secured to said sleeve, and rod A^8, carrying a coiled spring, substantially as and for the purpose described.

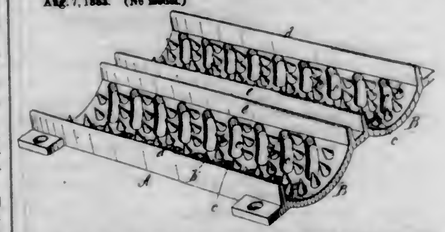


10. In combination with sleeve H', carrying the shaft of the rotary cutter, the shaft A, provided with slots A^{14} and screws A^{15}, secured to said sleeve and entering loosely within said slots, substantially as and for the purpose described.

11. In combination with the shaft of the rotary cutter, provided with slots in the sides thereof, the sleeve H', shaft-retaining screws A^{15}, secured thereto, and supporting-screw A^{13} in the rear thereof, substantially as and for the purpose described.

12. The combination of the shaft of the rotary cutter, stud A^{16}, secured thereto, and operating-rod H^7, connected with said stud, the shaft-supporting sleeve provided with a slot, A^{17}, to receive said stud loosely, substantially as and for the purpose described.

13. In combination with a series of paste-rolls, a paste-box provided with a tubular passage-way, *i*, extending upward from the bottom of the box through the paste therein, substantially as and for the purpose described.

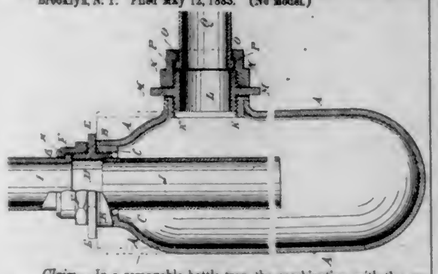


294,487. MILK-COOLER. ALEXANDER H. MARTIN, Oskaloosa, Iowa. Filed Oct. 13, 1883. (No model.)

Claim.—1. A creamery provided with two rows or series of milk-tanks, between which are arranged a series of ice-tanks and a series of compartments for a non-conducting material, said ice-tanks and compartments alternating, and the former being on a line opposite the inner ends of the milk-tanks, substantially as and for the purpose set forth.

2. In a creamery, the combination, with false inclined bottom having inclined sides, as shown, to form vats for containing the milk-tanks, of a central row of ice-tanks and compartments for a non-conducting material, the two alternating with each other, and the ice-tanks being on a line opposite the inner ends of both series of milk-tanks, substantially as and for the purpose described.

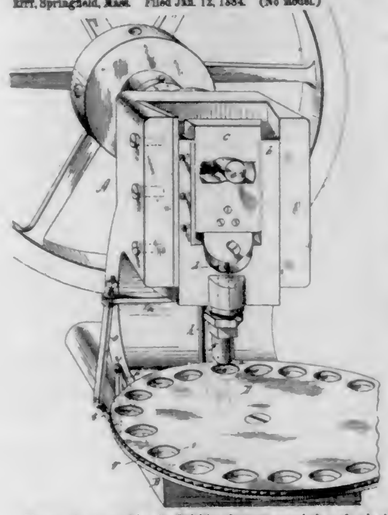
294,488. CORN-SHELLER. LUTHER MATTHEWS, Paris, Tex. Filed Aug. 7, 1883. (No model.)



Claim.—1. A corn-shelling plate or bed-piece having duplicate shelling-concaves B B, arranged side by side, with a longitudinal protector, *e e*, for the hands between them, substantially as specified.

2. A corn-shelling plate or bed-piece constructed with duplicate shelling-concaves B B, having a longitudinal protector, *e e*, for the hands between them, isolated shelling-teeth on their upper surfaces, and clearance-openings in or through them for the shelled corn, essentially as specified.

3. The combination, in a stationary corn-shelling plate or bed-piece, of the duplicate shelling-concaves B B, arranged side by side, and hav-



ing opposite side rows of reversely-inclined clearance-openings c c in them, the isolated teeth *b b*, arranged in similarly-inclined rows between said openings, and the longitudinal protector *e e*, for the hands of the operator, between the concaves, substantially as shown and described.

294,489. REMOVABLE BOTTLE-TRAP. GEORGE M. MCCLOSKEY, Brooklyn, N. Y. Filed May 12, 1883. (No model.)

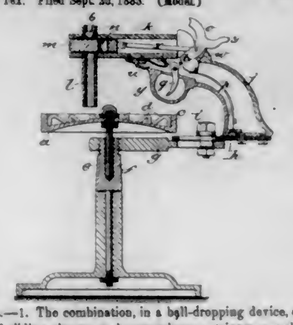
Claim.—In a removable bottle-trap, the combination, with the cylindric cup having its mouth spun into a neck which is provided with a female-screw tube, of the tubular male screw having an external circumferential flange, and coupling-ring to receive the inlet-pipe, substantially as and for the purpose set forth.

294,490. MACHINERY FOR AND PROCESS OF FINISHING BUTTONS. HENRY W. MERRITT, MORTIMER G. MERRITT, and CHARLES E. MERRITT, Springfield, Mass. Filed Jan. 12, 1884. (No model.)

Claim.—1. A machine for finishing buttons, consisting of a double-acting press, substantially as described, a hollow punch having a perforated face, a punch operating within the latter, and having thereon a series of small punches passing through said perforated face, and a button-seat having perforations coinciding with those in said hollow punch, combined and operating substantially as set forth.

2. A machine for finishing buttons, consisting of a double-acting press, substantially as described, a hollow punch having a perforated face, and having on the latter projecting cone-shaped collars surrounding its perforations, and thread-slot bars between the latter, a punch operating within said hollow punch, having thereon a series of small punches passing through the said perforated face, and a button-seat having perforations coinciding with those in said hollow punch, and having projecting cone-shaped collars surrounding its perforations, combined and operating substantially as set forth.

3. A machine for finishing buttons, consisting of a double-acting press, substantially as described, a hollow punch having a perforated face, a punch operating within the latter, and having thereon a series of small punches passing through said perforated face, a perforated button-seat having an intermittent reciprocating movement before the ends of said punches, by means substantially as described, and suitable feeding devices for depositing button-blanks one by one between said punches and button-seat, combined and operating substantially as set forth.



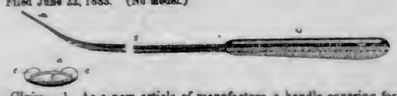
4. A machine for finishing buttons, consisting of a double-acting press, substantially as described, a hollow punch having a perforated face upon which is engraved or otherwise formed an ornamental design, a punch operating within said hollow punch, having thereon a series of small punches passing through the perforated face of the hollow punch, and a button-seat having perforations coinciding with those in the latter, combined and operating substantially as set forth.

5. The combination, with a double-acting press, substantially as described, of the hollow punch *f*, having a perforated face, the interior punch, *d*, having thereon the series of small punches *a*, and the movable button-seat *w*, having therein perforations coinciding with those in the hollow punch, substantially as set forth.

6. The process of perforating and embossing buttons, which consists in pressing a button-blank between a design-bearing punch and a seat, and while so pressed forcing one or several thread-hole-forming punches through the blank, all substantially as described.

7. The process of perforating, thread-slotting, and embossing buttons, which consists in pressing a button-blank between a design-bearing punch having slotting-bars thereon and a seat, and while so pressed forcing one or several thread-hole-forming punches through the blank, all substantially as described.

294,491. PISTOL-GAME APPARATUS. JOHN RENI MESTIER, Corpus Christi, Tex. Filed Sept. 25, 1883. (Model.)



Claim.—1. The combination, in a ball-dropping device, of the barrel *k*, tube *l*, sliding plunger *m*, hammer-lever *o*, trigger *q*, and springs *p* and *u*, said devices being arranged and operating substantially as described.

2. The combination, in a ball-dropping device, of the barrel *k*, tube *l*, sliding plunger *m*, hammer-lever *o*, trigger *q*, and springs *p* and *u*, said devices being arranged on a supporting-stock, *j*, and a fixed base-plate, *A*, substantially as described.

3. The combination, with a revolving table, *a*, having an arched top and partitions, *d*, to form stalls to receive the ball, of the ball-dropping apparatus, consisting of the barrel *k*, tube *l*, sliding plunger *m*, hammer-lever *o*, trigger *q*, and the springs *p* and *u*, said devices being arranged on a supporting-stock, *j*, and said stock being supported on a bracket of the revolving-table stand, and also being adjustably connected to said stand, substantially as described.

294,492. HANDLE-COVERING. HENRY C. MILLIGAN, South Orange, N. J., assignor to the Iron Clad Manufacturing Company, New York, N. Y. Filed June 22, 1883. (No model.)

Claim.—1. As a new article of manufacture, a handle-covering for pan-handles and like articles, composed of wood or other non-conducting material, and having the surface of one side cut away to form recessed flanges, substantially as set forth, for the purposes described.

2. The combination, with a pan-handle, of a handle-covering, c, having the edges of one side shaped to form flanges *e e*, with a recess or groove between each flange and the body of the handle-covering, whereby the attachment of the handle-covering to the handle may be obtained without riveting or soldering, substantially as herein shown and described.

294,493. FENCE-POST. ELIJAH DANIEL MINER, Dayton, Wash. Filed Nov. 28, 1883. (Model.)

Claim.—1. In a fence-post, the pointed, spirally-flanged, screw-threaded, and shouldered metallic ground-section *a*, in combination with an upper section, *g*, substantially as described.

2. In a fence-post, the pointed, spirally-flanged, screw-threaded, shouldered, and headed metallic ground-section *a*, in combination with an upper section, *g*, substantially as described.

3. The improvement in fence-posts, consisting of a tubular upper

294,493.

section having a portion removed to form two bearing-surfaces for the wire, and slotted in the back of the remaining portion for the reception of clamping-bolts to secure the wires, substantially as described.

4. The combination of hook-headed clamping-bolts *m* and nuts *n* with the wires *l* and the longitudinally sectioned and slotted upper tubular section, *g*, of a fence-post, substantially as described.

5. The longitudinally sectioned and slotted tubular upper section, *g*, of a fence-post having the undercut lip *i*, in combination with an L-shaped clamping-bolt, *p*, and board *o*, substantially as described.

6. In a fence-post, the upper portion of semi-tubular form in cross-section, with a short closed tubular section at each end of said upper portion, and a longitudinal slot at the back of the semi-tubular portion, substantially as described.

7. In a fence-post having a semi-tubular upper portion with tubular upper and lower ends, the upper tubular portion formed with a downwardly-projecting lip, substantially as described.

8. The improved fence-post consisting of a tapering spirally-flanged base and a semi-tubular upper section having tubular ends, and also having a longitudinal slot at the back of the semi-tubular portion, substantially as described.

294,494. SPRING SHADE-ROLLER. ABBOTT MORGAN, Philadelphia, Pa. Filed Apr. 2, 1883. (No model.)

Claim.—1. In a spring shade fixture or roller, a circular or true spindle-disk, E, having tapering recess *e*, elongated tapering cam F, and roller A, substantially as set forth.

2. In a spring shade-roller, a circular or true spindle-disk, E, having tapering recess *e*, elongated tapering cam F, and washer C, substantially as shown and described.

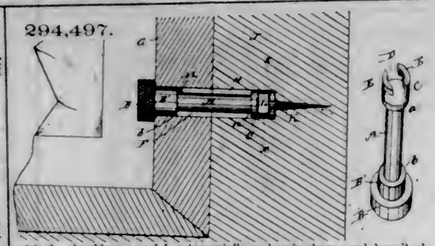
294,495. BUTTON OR STUD. NELS NELSON, Providence, R. I., assignor to Hiram Howard, same place. Filed Aug. 21, 1883. (No model.)

Brief.—Improvement on Reissued Letters Patent No. 9,931, dated November 15, 1881.

Claim.—1. In a button or stud, a post having notches and shoulders 2 2 at its edges, turned backward at its outer end, and provided with one or more teats, combined with a shoe composed of a face-plate, a slotted back-plate having elongated recesses or chambers, and an anchor-plate provided with one or more recesses for the reception of the said teat or teats, the shoulders 2 2 traveling along in the recesses of the back-plate as the shoe is turned on the post, substantially as described.

2. In a button, the post provided with the shoulders and with a teat, combined with the face-plate, the slotted back-plate, and the spring anchor-plate, provided with a recess which receives the teat, substantially as shown and described.

294,496. BUTTON OR STUD. NELS NELSON, Providence, R. I., assignor to Hiram Howard, same place. Filed Oct. 29, 1883. (No model.)

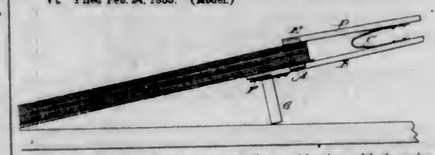


Claim.—In a button, the post B, having its end turned back, and provided with the notches *b* and wide shoulders 14, combined with the slotted back-plate c^3, having the elongated recess c^4, the anchor-plate having the notches 10, the face-plate, and the spring *s*, to operate all substantially as described.

294,497. WINDOW-BEAD FASTENER. HORACE F. NEUMEYER, Macungie, Pa. Filed Jan. 4, 1884. (Model.)

Claim.—1. A device for fastening window-beads, consisting of a bolt provided at its inner end with two hook-shanks, substantially as herein shown and described.

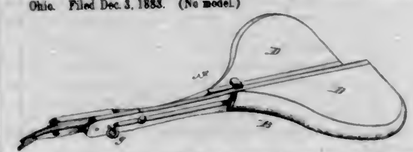
2. In a device for fastening window-stop beads, the bolt A, provided with the milled head B and the head C, having two hooks, E, and



294,497.

with the shoulders *a* and *b*, substantially as herein shown and described.

3. The combination, with a screw-held in the end of an apertnre in the sash-frame, and provided with a cross-head, of a bolt passed through the bead, which bolt is provided at its inner end with two hooks, substantially as herein shown and described.



4. The combination, with a screw, K, having a head, I, and held in the end of the apertnre in the window-casing, of the bolt A, provided with hooks E at its inner end, and with shoulders *a b*, and of the brad or pin M, passed through the bead G, substantially as herein shown and described.

294,498. BOOK HOLDER AND REST. EDWIN V. PARKER, Strafford, Vt. Filed Feb. 24, 1883. (Model.)

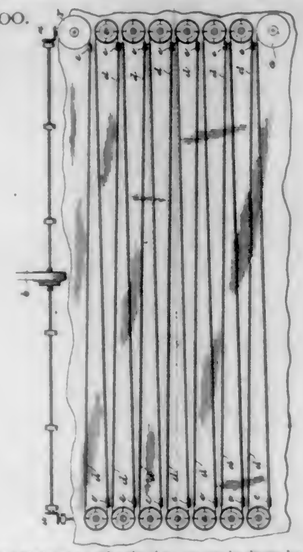
Claim.—In a book holder and rest, the combination, with the strips B D and their cross-pieces A E, of the spring C, the spring-clip F, attached to the under side of the strip B, and of the U-shaped standard G, passed in between the bottom of the strip B and the clip F, substantially as herein shown and described, and for the purpose set forth.

294,499. EMBROIDERY-MACHINE. JOSEPH L. PARKS, Wauseon, Ohio. Filed Dec. 3, 1883. (No model.)

Claim.—1. As an improvement in embroidering-machines, the section A, provided with the bar C, formed with an elongated slot, *b*, and button-opening *c* and adjustable flat spring *e*, the section B, provided with bar C', having headed stud *h*, elongated slot *i*, and adjustable flat needle *m*, and a connecting-screw for coupling the lower ends of the bars C and C', substantially as and for the purposes set forth.

2. In an embroidery-machine, the combination, with the needle-bar C', provided with a flanged recess, *k*, in its inner face, at its lower end, in which the needle is secured, said flanges projecting above the needle, of the bar C, having the flat spring *e*, curved inwardly, so that it enters between the flanges *k*, whereby the flat spring will be guided and lateral movement of the same prevented, substantially as specified.

294,500. APPARATUS FOR DRAWING TELEGRAPH-CABLES INTO PIPES. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 28, 1883. (No model.)



Claim.—1. The combination of capstans arranged in rows with mechanism for driving the same uniformly, and friction devices upon the different capstans, whereby the core may be drawn simultaneously through several sections of pipe without danger of breaking the conductors, substantially as and for the purpose specified.

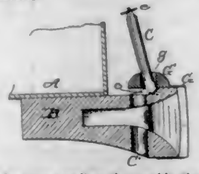
2. The combination, with the whelps or sections of the described barrel, of links, a collar, and lever for turning said collar, whereby the circumference of the barrel may be decreased, substantially as and for the purpose specified.

3. The combination, with the beveled barrel composed of sections or whelps, of pins radiating from the hub, which guide the sections, and means for varying the diameter of the barrel, substantially as and for the purpose specified.

4. The combination, with the shaft provided with a duct for oiling the bearings, of the friction-cone keyed to and resting upon the bearing, the hub loose upon the shaft, and means for adjusting the friction between

294,500.

the hub and friction-cone, whereby the core may be drawn into the pipe without injuriously straining the conductors, as and for the purpose specified.



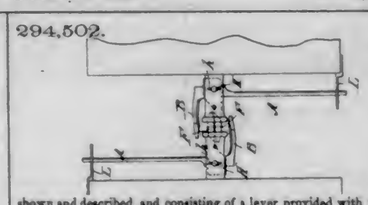
5. Adjustable holders for the different sections of pipe, whereby said sections are held tangent to the capstans, substantially as and for the purpose specified.

6. The capstans and driving mechanism, combined with means for holding the sections of pipe substantially tangent to the capstans, respectively as and for the purpose specified.

7. The combination, with capstans arranged in rows, of mechanism for driving the same uniformly, whereby a core may be drawn simultaneously through several sections of pipe, substantially as specified.

8. The combination, with series of capstans arranged in rows and mechanism for driving the same uniformly, said capstans being adapted to draw a core simultaneously through several sections of pipe, of means for reducing the diameter of each of said capstans, whereby the said core may be removed from said capstans successively, and the ends of the respective sections of pipe brought together over said core, substantially as set forth.

294,501. CAR-COUPLING. THOMAS HOWARD PEGRAM and JOHN HENRY KEISTER, Winston, N. C.; said Keister assignor to said Pegram. Filed June 4, 1883. (No model.)



Claim.—1. In a car-coupling, the combination of the draw-head B, having the seat *c* for the coupling-pin at its top portion, band G, encompassing or passing entirely around the front portion of the draw-head and projecting from the front edge of the same, guide-rods H, attached at each side of the band, and springs I, mounted upon said rods and acting to keep the band in a forward position, with the coupling-pin adapted by suitable means to be held in a vertically-suspended position above the pin-hole, substantially as and for the purposes described.

2. In a car-coupling, the combination, with the draw-head B, having seat c in its top position, and band G, encircling the front portion of the draw-head and projecting from the front edge of the same, of the lever O, pivoted to the end of the car, and attached to the band, whereby said band may be operated by hand at the side of the car, for the purpose set forth.

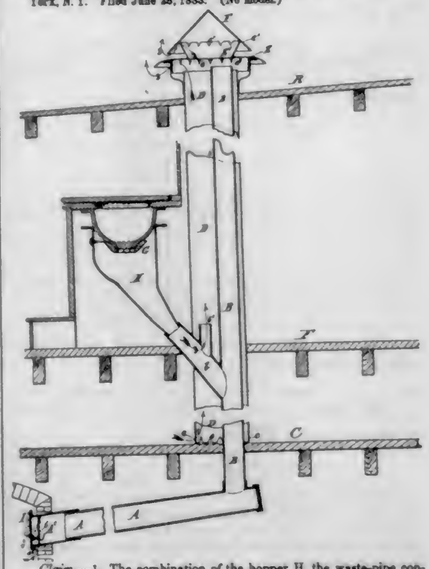
294,502. CAR-COUPLING. EDWARD F. PENDEXTER, Milford, Mass. Filed Sept. 19, 1883. (No model.)

Claim.—1. A car-coupling device made substantially as herein

294,502.

shown and described, and consisting of a lever provided with two prongs at its inner end, one of which prongs is provided with a lug on the outer end, substantially as herein shown and described, and for the purpose set forth.

2. In a car-coupling, the combination, with the lever A, provided at its inner end with a curved prong, B, having its end C beveled, of the prong D, secured on the lever A at the outer end, and provided on the under surface of its outer end with a lug, F, substantially as herein shown and described, and for the purpose set forth.



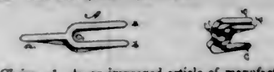
3. In a car-coupling, the lug F, having a rounded front side and bottom tapered toward the point of the prong D, which lug is provided with a lever, G, at its inner upper corner, substantially as herein shown and described, and for the purpose set forth.

4. In a car-coupling, the combination, with the lever A, having a prong, B, of the prong D, provided with an aperture, E, at the inner end, and a lug, F, at the outer end, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with a car, of a lever, A, suspended from the draw-head, the prongs B D, formed on the lever, the lug F on the end of the prong D, and of the V-shaped frame L, secured to the side of the car, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with a car and its draw-head, of the pin H, provided at the lower end with a head, K, having a beveled upper edge, the lever A, having prongs B D, of which the latter is provided at its inner edge with an aperture, E, and at its outer edge with a beveled lug, F, and of the V-shaped frame L, secured to the side of the car, substantially as herein shown and described, and for the purpose set forth.

294,503. WASTE-PIPE VENTILATOR. JOHANNES PERSSON, New York, N. Y. Filed June 28, 1883. (No model.)



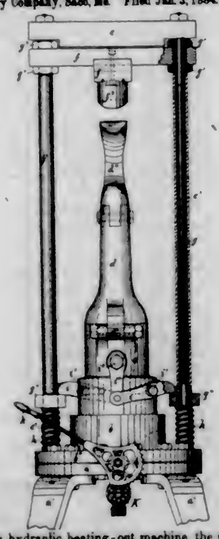
Claim.—1. The combination of the hopper H, the waste-pipe connection *b*, provided with the upwardly-projecting open pipe *b'*, the waste-pipe B, and the air-pipe D, inclosing the said pipes B and *b'*, the said pipe D being open at its upper end, and having also openings c at its lower end, substantially as and for the purpose set forth.

2. In combination with the waste-pipe B and drain-pipe A, the flanged joint A', provided with the end valve, I, and the valve J, pivoted inside of the said joint A', the said valve J being provided with means i, operating against the valve I to open the latter simultaneously with the former, substantially as and for the purpose set forth.

3. The hopper H, having a laterally-inclined discharge-leg entering into and in a straight line with the waste-pipe, in combination with the pipe *b'*, waste-pipe B, and surrounding air-pipe D, all constructed and arranged substantially as and for the purpose set forth.

294,504. BUTTON-FASTENER. GEORGE W. PRENTICE, Providence, R. I. Filed Dec. 6, 1883. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described button-fastener, formed from the blank A, having a portion thickened at a central line, from which the prongs *a b* are gradually reduced in thickness outward to their extremities, and which are bent at right angles, substantially as and for the purpose specified.

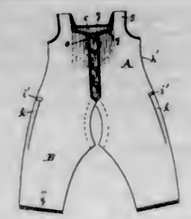


2. The blank A, formed as described, with a portion thickened at a central line, from which the prongs *a b* are gradually reduced in thickness outward to their extremities, substantially as and for the purpose specified.

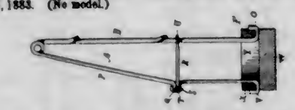
294,505. BAG-HOLDER. ALEXANDER ROBINSON, Benicia, assignor to Baker & Hamilton, San Francisco, Cal. Filed Nov. 5, 1883. (No model.)

Claim.—A bag-holder comprising suitable devices for its support, a sliding fork, E, shaft B, provided with hooks, and the lever or arm C, and the inclined plane D, substantially as set forth.

294,506. BEATING-OUT MACHINE FOR BOOT OR SHOE SOLES. JOSIAH W. ROGERS, Beverly, Mass., assignor to the Winslow Beating-Out Shoe Machinery Company, Saco, Me. Filed Jan. 3, 1884. (No model.)



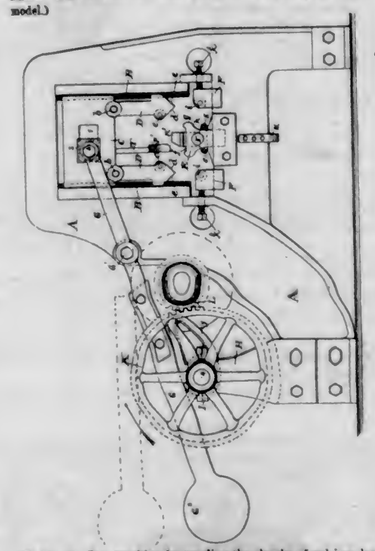
Claim.—In a hydraulic beating-out machine, the stationary cylinder *b* and movable plunger c, carrying the jack *d'''*, combined with the movable head *f*, carrying the former *f'*, and suitable connecting mechanism, substantially as described, between them, for the purpose of causing the said jack and former to move from opposite directions toward each other by the hydraulic pressure, as set forth.



294,507. UNDER-GARMENT. SOPHIE ROSENTHAL, Baltimore, Md. Filed Dec. 26, 1883. (No model.)

Claim.—A garment for underwear, consisting of a chemise and drawers made of one integral piece of fabric, having in the body part a cut-out directly under the arms, the edges of which form a vertical seam, and the horizontal bottom edge of which is formed into a plait at the lower end of the said seam, whereby the desired fit is produced about the body and the requisite fullness about the hips, as shown and described.

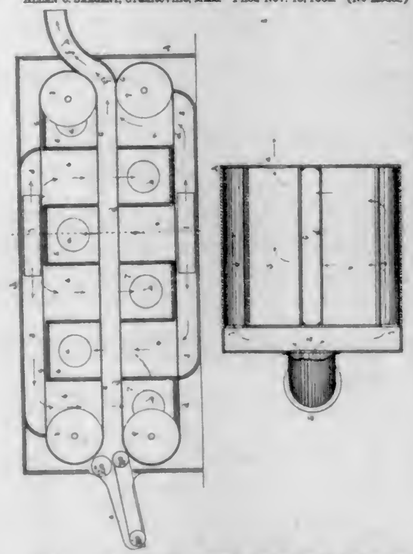
294,507.



294,508. FENCE-POST. JAMES B. ROSE, Union City, Ind. Filed July 28, 1883. (No model.)

Claim.—The combination of the wire-post, comprising a main portion and a brace portion, each portion having a right-angular foot at its lower end, the bottom section of the base, on which these feet are rested, and the removable top section of the base, having the elongated slot receiving the ends of the main and brace portions of the post, and rested on the horizontal portions of the right-angular feet, substantially as set forth.

294,509. MACHINE FOR BENDING SHANKS OF SAD-IRON HANDLES. JOHN SABOLD, Jr., Little Oley, Pa. Filed Aug. 20, 1883. (No model.)



Claim.—1. In a machine for bending the shanks of sad-iron handles, the combination, substantially as set forth, of a stationary mandrel having a sunken surface, *f*, to receive the grasp part of the handle, a raised shoulder, *f''*, at each end of said surface, and sides which curve first outward near said shoulders, and are then hollowed inward, and means to bend both shanks about the mandrel at once.

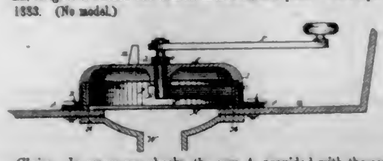
2. In a machine for bending the shanks of sad-iron handles, the combination, substantially as set forth, of a mandrel, vertical guides, a large head, C, to move in the guides, two shank-formers, D, pivoted by their upper ends to the head, and each having a V-shaped lower end, and laterally-adjustable block-guides F at each side of the mandrel.

3. In a machine for bending the shanks of sad-iron handles, the combination, substantially as set forth, of a mandrel, vertical guides, a large head, C, to move in the guides, means to bend both shanks about the mandrel, a pusher, *s*, adapted to reciprocate across the top of mandrel, and attached to a head, *s'*, having a downward-inclined side, *p*, and a vertically-movable rod, T, having its upper end connected to the said large head, and provided on its lower end with an upwardly-inclined face, *p'*.

4. In a machine for bending the shanks of sad-iron handles, the combination, substantially as set forth, of a mandrel of requisite form, a head moving in vertical guides, and having a horizontal slot, I, provided with a slide-block, 2, two shank-formers, D, to bend both shanks about the mandrel, a pivoted lever, G, having one end pivoted to the said slide-block and the other end weighted, and a rotary shaft provided with a cam to move the weighted end of the lever.

294,510. FIBER-DRYING MACHINE. FREDERICK G. SARGENT and ALLAN C. SARGENT, Graniteville, Mass. Filed Nov. 13, 1882. (No model.)

Claim.—1. In combination with the moving screen-surfaces c and d, the alternate air-passages 4 5 and 6 7, adapted to convey the air-blast in opposite directions through the fiber, substantially as described.

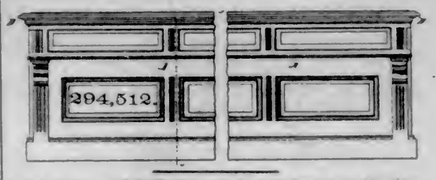


2. In a wool-drying machine, the combination, with two moving screen-surfaces, c d, placed far enough apart to allow the fiber to lie loosely between them, of the air delivery and escape passages 4 and 5 above and below said screen-surfaces, substantially as described.

3. In combination with screens c d, the passages 6 7 and 4 5, and passages 3 3 and 2, leading from the air-pipe G, substantially as described.

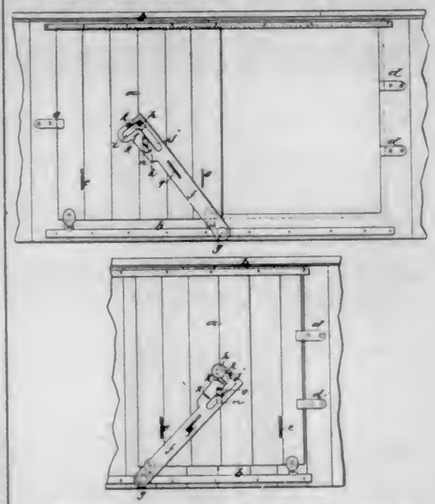
4. In combination with the screens c d, having a space between them, and passages 6 7 and 4 5, the feed-apron e, and air stop-roll E'', substantially as described.

5. In combination with the screens c d, the tube f, having its edges arranged to doff the fiber from the screens, substantially as described.



294,511. SEWER-GAS CHECK. CHAS. ANDREW SCHEFFLER, Chicago, Ill., assignor to himself and SAMUEL H. ADAMS, same place. Filed Apr. 17, 1883. (No model.)

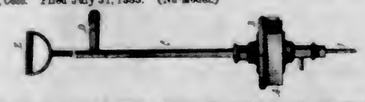
Claim.—In sewer-gas checks, the case A, provided with the semi-circular flange a, an opening, D, and an annular seat, I, in combination with the sliding gate B C, post E, and lever F, the gate having an upper bearing on the guide I, a bearing on the vertical part of the case, and a lower bearing on the sink-bottom, as specified.



294,512. GLASS-TOP COUNTER FOR STORES. SAMUEL SCHUTZ, New York, N. Y. Filed Sept. 26, 1883. (No model.)

Claim.—An improved stationary sales-counter, constructed with a continuous transparent top of plate-glass, supported upon an extended fixed frame, constituting the edges of the counter, and covering a receptacle in the top of the counter, closed at front and ends by its solid casing and in the rear by suitable drop-panels, all substantially in the manner and for the purpose herein set forth.

294,513. CAR-DOOR LOCK. JAS. SHARKEY, Honey Creek, Ind. Filed Aug. 18, 1883. (No model.)



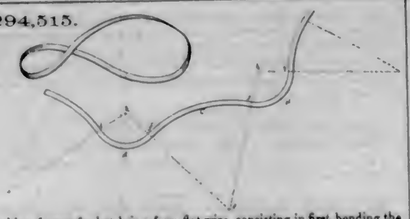
Brief.—A latch-bar pivoted under the lower back corner of the door-opening is connected to the middle of the sliding door by a stud-pin on the door engaging an angular slot in the end of the bar. The stud-pin is held in the end of the slot by a sliding bolt on the latch-bar held by a pivoted link secured over a staple on the sliding bolt.

Claim.—1. The combination, with a sliding door, of a latch-bar, f, pivoted to a permanent support at the lower back corner of the door and connected to the door at the middle, or thereabout, by a stud-pin, h, in the door and the angle-slot i j in the bar, said bar being inclined, so that it gravitates to a rest at the upper end of slot j on the stud h, and thereby forms a latch to fasten the door shut, substantially as described.

2. The combination of a slide-bolt, l, having staple m for a lock, p, with the latch-bar f, having staples k and link n, pivoted to a support and connected to the door, as shown and described, the said staples k and bolt l being located between the part i of the slot and the stud h, to lock said stud in the upper end of part j of the slot, substantially as described.

294,514. ROTARY DRILLING-ENGINE. ELIHU L. SHARPNECK, Denver, Colo. Filed July 31, 1883. (No model.)

Claim.—1. A rotary engine having its revolving and operating cylinder provided with journals at its opposite sides, one of which has a socket for a drill and the other a conical center bearing, substantially as described.



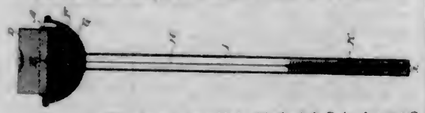
2. The combination, with a rotary engine having an elongated journal, forming a bearing for a socket for a drill, of the rod C, provided with the handles D and E, substantially as described.

3. The combination, with the casing A, of the head B, provided with a step, I, and socket h, the rod C, handles D E, cylinder F, having center H, drill J, and pistons P, all constructed and arranged substantially as shown and described.

294,515. WIRE FRAME FOR HAT-BRIMS. GEORGE E. SHERMAN, Danbury, Conn. Filed Dec. 26, 1883. (No model.)

Claim.—1. The herein-described improvement in the method of

294,515.



making frames for hat-brims from flat wire, consisting in first bending the wire edgewise to give it a downward curve from the center sides toward the front and rear to the quarter-points, and from those quarter-points reversely curved without changing the plane of the wire throughout its length, substantially as described.

2. The herein-described frame for hat-brims, consisting of a flat wire bent edgewise without turning the wire from its natural flat plane to give the droop to the front and rear, the flat surface of the frame being vertical at all points, substantially as described.

3. A frame for hat-brims, consisting of a flat wire bent edgewise without turning the wire from its natural flat plane, the bend alike on both sides from the center toward the front and rear, and around the front and rear the curve in the opposite direction to that of the sides, and upon a shorter radius, substantially as described.

294,516. AUTOMATIC CHALK-HOLDER FOR BILLIARD-TABLES. WILL SHERWOOD, Chicago, Ill. Filed Feb. 7, 1884. (No model.)

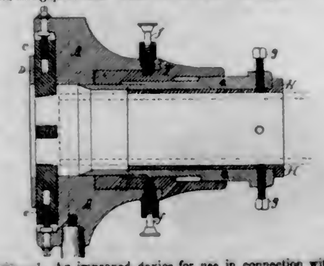
Claim.—1. The clamp A, provided with the bolt B, having nut C, as and for the purpose set forth.

2. The clamp A, having bolt B, with angular bend b' and nut C, as set forth.

3. The combination, with the clamp A, chalk-cube D, and cord H, of the rubber bumper E, as and for the purpose set forth.

4. The combination, with the clamp A, bolt B, and rubber bumper E, of the cord H and cup G.

5. The clamp A and bolt B, bumper E, and cord H, in combination with the cup G, tube I, and spring K, as and for the purpose set forth.

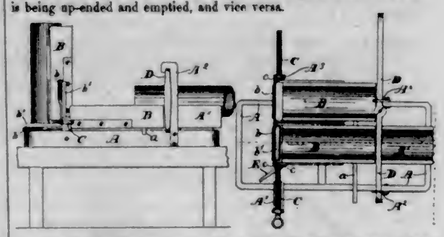


6. The combination, with a billiard or pool table having a chalk-receptacle, G, of the spring K, cord H, rubber bumper E, clamp A B, and chalk-cube D, as and for the purposes set forth.

294,517. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Jan. 16, 1884. (No model.)

Claim.—A sheet-metal button-fastener consisting of a table, with a prong or prongs at opposite sides of the table and integral therewith, and bent at or about at right angles thereto, with one of said prongs having an unbent portion contiguous to the table and in the same horizontal plane, and adapted to carry a shank-button, substantially as specified.

294,518. GAGE FOR PIPE-THREADING MACHINES. GEORGE F. SMITH, Bridgeport, Conn. Filed Feb. 21, 1883. (No model.)



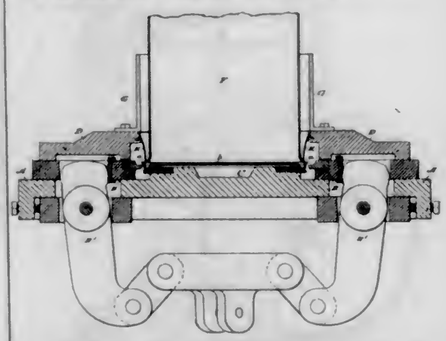
Claim.—1. An improved device for use in connection with pipe-threading machines, consisting of a gage having a series of steps of different diametrical distances, arranged to be inserted between the thread-cutters and to distance the same for operation upon pipes of different circumferences, substantially as described.

2. The combination, with a thread-cutting machine constructed and operating substantially as herein described, and having its stock-front provided with a series of holes, of a gage consisting of a cylinder provided with a series of steps of different diameters, and a supporting-cylinder for said gage provided with a series of pins or projections arranged to enter the holes of the stock-front, substantially as described.

3. The combination, with the threading-machine herein described and its stock A, provided with the holes a, of the gage e', provided with the steps e², and the supporting-cylinder E, provided with the pins a' and slots e², and a series of adjusting-pins passing through said slots and into the said gage, as set forth.

294,519. TABLE FOR TILE-MILLS. JOHN S. SMITH, Jackson, Mich., assignor to Michael Nolan, Rushville, Ind. Filed May 21, 1883. (No model.)

Brief.—Two receiving-troughs are alternately brought to register with the forming-nozzle, one receiving the issuing tile while the other is being up-ended and emptied, and vice versa.

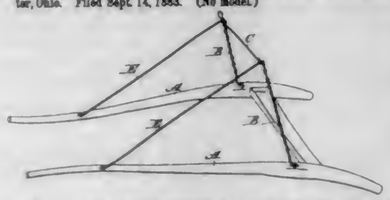


Claim.—1. The combination, in a tile-mill, of two or more wings for receiving the column of clay as it issues from the mill, and a shaft on which said wings are mounted and adapted to be moved, substantially as described, and for the purposes specified.

2. The combination, in a table for tile-mills, of two or more wings arranged side by side and adapted to be moved transversely across the track of the advancing column of clay, thus bringing first one and then the other into position to receive a tile, substantially as set forth.

3. The combination of a table for tile-mills, consisting of a wing or wings, B, and a frame-work, on which the same are mounted, a reciprocating cut-off, and a lever for operating the same, extending from said cut-off to the opposite end of said wings, whereby the operator is enabled to do any part of his work in connection with such table from either end of said wings, substantially as set forth.

294,520. CAN-SEAMING MACHINE. THOMAS L. SMITH and WILLIAM S. DOIG, Brooklyn, N. Y. Filed Aug. 1, 1883. (No model.)

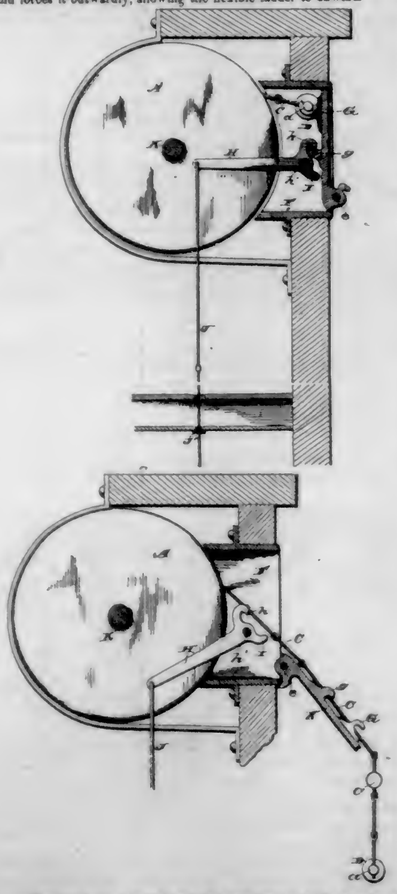


Claim.—1. In a can-seaming machine, as a means for squaring the body of the can and guiding it into the channel in the head, the elastic hopper-like guide E, constructed and arranged substantially as set forth.

2. In a can-seaming machine, as a means for squaring the can-body and guiding it into the channel formed in the head, the hopper-like guide E, formed of thin elastic metal with a roll, a, formed on its pendent edge, and arranged to operate substantially as set forth.

3. The combination, with the seaming-jaws of a can-seaming machine, and the die on which the can-head rests, of the bed-frame D, and the guide E, constructed substantially as described, and attached thereto, all arranged to operate substantially as set forth.

4. In a can-seaming machine, the combination, with the bed-frame D and guide E, of the auxiliary guide G, all constructed and arranged to operate substantially as set forth.



294,521. REIN-GUARD. CHARLES WILLIAM SPEARS, Canal Winchester, Ohio. Filed Sept. 14, 1883. (No model.)

Claim.—A rein-holder consisting of a wire frame bent and twisted to form the standards B, rein-rest C, and braces E E, as shown and described.

294,522. FIRE-ESCAPE. JEREMIAH STEVER, Bridgeport, Conn., assignor, by direct and mesne assignments, to the Bridgeport Automatic Safety Ladder and Hardware Company, same place. Filed Feb. 24, 1883. (No model.)

Brief.—A trip-lever engages the catch on the inside of the door, and, when unlocked, an arm on said lever engages directly with the door and forces it outwardly, allowing the flexible ladder to unwind.

Claim.—1. In a fire-escape, the combination, with an outwardly-swinging door provided with a catch, and with jaws on its inner side, and a trip-lever constructed with a holding-jaw that engages the catch on the door, and provided with an arm or projection that directly engages with the door and forces it outwardly when unlocked, of a flexible ladder provided with a weight on its free end, and having arms adapted to engage the jaws on the door and close it, and a drum for supporting the ladder, substantially as set forth.

2. In a fire-escape, the combination, with an outwardly-swinging door and a flexible ladder adapted to engage the door and close it, of a trip-lever constructed to engage a catch on the door, and provided with an arm or projection that directly engages the door and forces it outwardly when unlocked, substantially as set forth.

294,523. FIRE-ESCAPE. JEREMIAH STEVER, Bridgeport, Conn., assignor to the Bridgeport Automatic Safety Ladder and Hardware Company, same place. Filed June 14, 1883. (No model.)

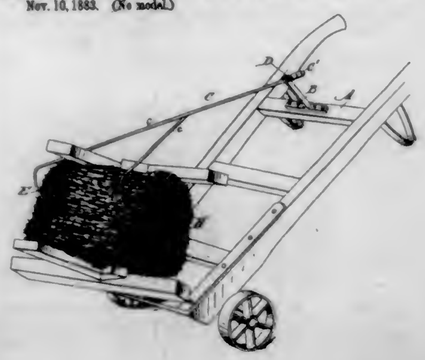
Brief.—The ladder, when unwinding, passes out through a stationary chute opening downward and provided with a counterweighted door.

Claim.—1. The combination, with a flexible ladder and means for operating it, of a stationary chute opening downward, and a counterweighted valve or door constructed and arranged to close the lower and open end of the chute, substantially as set forth.

2. The combination, with a flexible ladder and means for operating it, of a stationary chute having a downwardly-curved outer end, the lower end being open, and a counterweighted valve or door constructed to be self-closing and to be opened by the ladder, substantially as set forth.

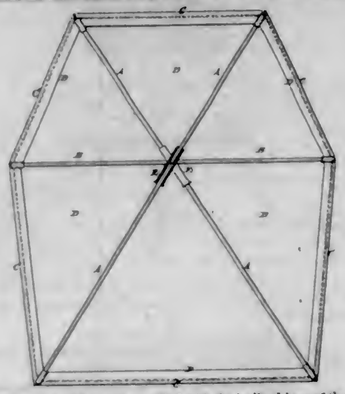
3. The combination, with a flexible ladder and means for operating it, of a stationary chute, and a balanced valve suspended from the bottom of the chute and arranged to normally close it and to be opened by the free end of the ladder, substantially as set forth.

4. The combination, with a flexible ladder and means for operating it, of a stationary chute, and a balanced valve arranged to normally close the chute and be opened by the free end of the ladder, and provided with an adjustable weight, substantially as set forth.



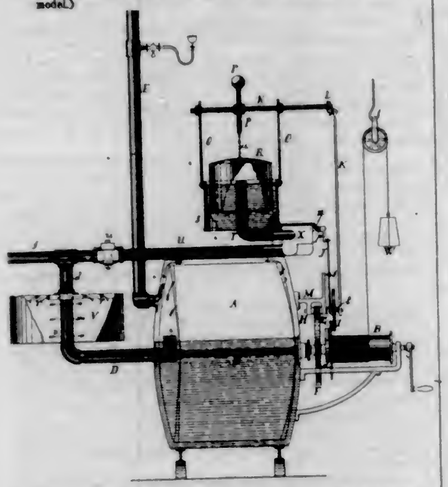
5. The combination, with a flexible ladder and means for operating it, of a stationary chute, a valve adapted to normally close it, and ribs depending from the bottom of the chute and arranged to deflect water away from the valve, substantially as set forth.

294,524. CAPPED WOOD-SCREW. EDWARD STIENKE, Milwaukee, Wis. Filed May 12, 1883. (No model.)



Claim.—A capped wood-screw consisting of the screw A, having slotted head and screw-threaded hole *b*, and the screw-cap C, provided on its upper surface with wrench-holes *c c*, and on its lower surface with a downward-projecting screw, *d*, substantially as and for the purpose specified.

294,525. HAND-TRUCK. CHARLES F. STRIEBEL, Cresco, Iowa. Filed Nov. 10, 1883. (No model.)



Claim.—The combination, with a truck and the standard B, having an aperture in its upper end, and rigidly secured to the cross-bar A of the truck, of the rod C, provided with the prongs *c*, having hooks E at their ends, and the flattened end C', having apertures *a*, and serving as a handle for operating the rod and the pintle D, substantially as herein shown and described.

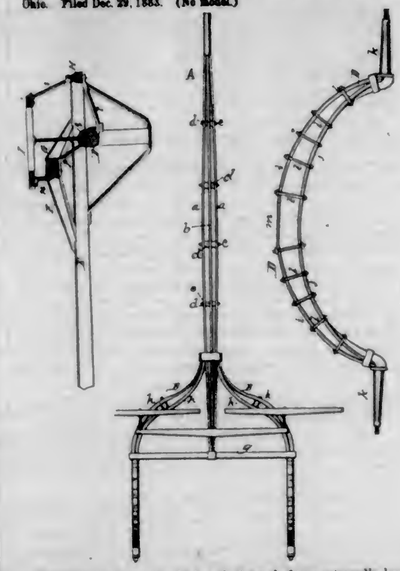
294,526. FOLDING KITE. JOB STUMPF, Brooklyn, N. Y., assignor to himself and JAMES SMITH, same place. Filed Nov. 26, 1883. (No model.)

Claim.—A folding kite provided with the inclined bars of the frame made in two parts and connected at their adjacent ends by independent sliding tubes, whereby the kite may be folded without detaching the connecting-cord by simply sliding the tubes along the bars until their joints are uncovered, substantially as set forth.

294,527. CARBURETING-MACHINE. OAKES TERRILL, New York, N. Y., and JAMES P. WILSON, Newark, N. J. Filed Jan. 16, 1883. (No model.)

Claim.—1. In a gas-machine, the combination of a generator, a pump for inducing a current through the generator, and a regulator having a movement under control of the pump, substantially as specified.

2. In a gas-machine, the combination of a generator, a pump connected with the generator, so as to draw gas therefrom, a pipe or conduit, through which the pump draws air from the atmosphere, and a regulator having a movement controlled by the pump and serving to govern the quantity of air which passes through the air pipe or conduit, substantially as specified.



3. In a gas-machine, the combination of a generator, a pump connected with the generator, so that it will draw gas from the generator, a pipe or conduit, through which the pump will draw air from the atmosphere, a regulator serving to govern the quantity of air passing through the air pipe or conduit, a rotary disk deriving motion from the pump, and means for transmitting motion from the disk to the regulator, substantially as specified.

4. In a gas-machine, the combination of a generator, a pump connected with the generator, so that it will draw gas from the generator, a pipe or conduit, through which the pump will draw air from the atmosphere, a regulator serving to govern the quantity of air passing through the air pipe or conduit, and having a reciprocating part or parts, and also having valves, devices connecting the pump with the valves of the regulator, and means whereby the stroke of the reciprocating part or parts of the regulator will be controlled, substantially as specified.

6. In a gas-machine, the combination of a generator, a pump connected with the generator, so that it will draw gas from the generator, a pipe or conduit, through which the pump will draw air from the atmosphere, a regulator serving to govern the quantity of air passing through the air pipe or conduit, and having a reciprocating part or parts, and also having valves, devices connecting the pump with the valves of the regulator, and means whereby the stroke of the reciprocating part or parts of the regulator will be varied in length, substantially as specified.

7. In a gas-machine, the combination of a generator, a meter-wheel pump, A, connected with the generator, so that it will draw gas from the generator, a pipe or conduit, through which the pump will draw air from the atmosphere, a regulator, R S N P, provided with valves and serving to govern the quantity of air passing through the air pipe or conduit, the cam-disk I, the arm L, the rod K, the rock-shaft *n*, for operating the valves of the regulator, the arm *p* on the rock-shaft *n*, and the lever J, substantially as specified.

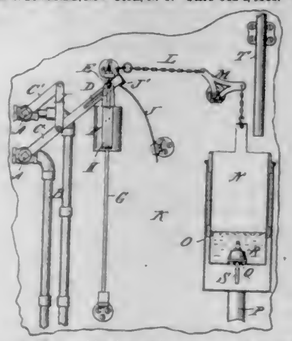
294,528. TWO-WHEELED VEHICLE. SAMUEL TOOMEY, Canal Dover, Ohio. Filed Dec. 29, 1883. (No model.)

Claim.—1. A trussed vehicle-pole formed of two outwardly-bowed strips and a middle strip, for the purpose herein specified.

2. A trussed vehicle-pole formed of two outward strips and a middle strip made wide at the middle and narrow at the ends, for the purpose specified.

3. In combination with a vehicle-pole, hounds trussed in the part forward of the cross-brace, substantially as and for the purpose herein specified.

4. An arched axle trussed with two arches of different degrees of curvature, substantially as set forth.



5. The T-shaped brace *n*, in combination with the cross-bar F and seat I, for the purpose specified.

6. The combination of the brace *n*, braces *o o*, cross-bar F, and seat I, substantially as and for the purpose herein specified.

7. The combination of the braces *n p r s*, cross-bar F, axle D, cross-bar H, and seat I, substantially as and for the purpose herein specified.

294,529. AUTOMATIC DEVICE FOR STOPPING STEAM-PUMPS.

THOMAS C. TOWNSEND, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, with a cock, of a lever secured to the same, a sliding weight held on the free end of the lever, a spring for holding the lever raised, and a vessel connected with the spring and adapted to be weighted by the overflow-water of a tank, substantially as herein shown and described.

2. The combination, with a cock, of the slotted lever C, the sliding weight F, provided with a pin passing into a slot of the lever C, the spring J, the elbow-lever M, the chain L, and a vessel suspended from the lever M, which vessel is adapted to be filled from the overflow-pipe of a water-tank, substantially as herein shown and described.

3. The combination, with a cock, of the slotted lever C, the sliding weight F, the spring J, having a shoulder, J', the chain L, the elbow-lever M, the sliding vessel N, having a valve, R, in its bottom, and of the vessel O, substantially as herein shown and described.

4. The combination, with a cock provided with a lever, a spring for holding it, and a weight connected with the lever, of a vessel, N, connected with the spring, the vessel O, the valve R on the bottom of the vessel N, the valve R having a stem, S, the inlet-pipe P, and the tell-tale pipe T, substantially as herein shown and described.

294,530. ART OF MANUFACTURING STARCH.

WILLIAM W. UNDERHILL, Brooklyn, N. Y. Filed Jan. 2, 1884. (No specimens.)

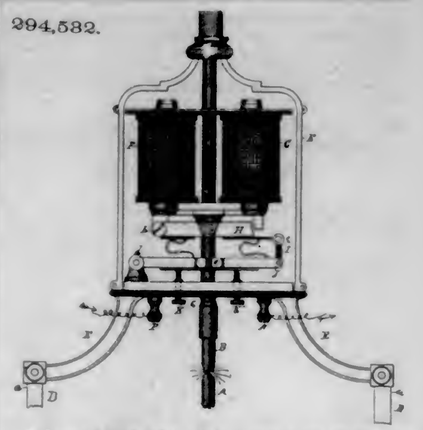
Claim.—1. The improvement in the art of manufacturing starch, consisting in the introduction into the starch-liquor or starch-water, after its separation by sieving from the bran and coarser parts of the grain, of a sufficient quantity of sulphurous acid to produce an acid reaction, substantially as and for the purpose herein described.

2. The improved method of manufacturing starch, consisting in first bringing the starch-water or starch-liquor which has been sieved from the bran and coarser portions of the soaked and ground grain to a density of 3° to 6°, then adding sufficient sulphurous acid to obtain an acid reaction, and afterward obtaining the subsidence of the starch from the said starch-water or starch-liquor, substantially as herein described.

294,531. ART OF MANUFACTURING STARCH.

WILLIAM W. UNDERHILL, Brooklyn, N. Y. Filed Jan. 9, 1884. (No specimens.)

Claim.—1. The improvement in the art of manufacturing starch, consisting in the antiseptic treatment, with sulphurous acid, as herein described, of the tailings or water from which starch has been obtained by subsidence.

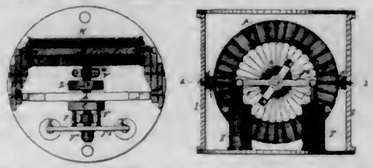


2. The improvement in the art of manufacturing starch, consisting in the addition to starch which has been collected from the starch-water by subsidence of sufficient water to bring it to a proper density, then adding and stirring with it sufficient sulphurous acid to produce an acid reaction, and afterward separating the starch from the water by subsidence, substantially as herein described.

294,532. ELECTRIC-ARC LAMP.

CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Dec. 15, 1881. (No model.)

Claim.—1. In an electric-arc lamp, the combination of an electro-magnet of relatively low resistance located in the main circuit, and having its armature connected to the carbon-rod clutch, and automatic vibrating circuit-breaking devices in circuit with an electro-magnet of high resistance located in a shunt around the arc, adapted to operate said circuit-breaking devices continuously, whereby the current passing through the main or feed-controlling magnets is rendered pulsatory, as set forth.



294,532.

2. In an electric-arc lamp, a lifter, J, made of two separate parts joined together at their middle by means of an elastic band or plate, substantially as described.

294,533. ELECTRIC LAMP.

CHARLES J. VAN DEPOELE, Chicago, Ill. Filed May 15, 1883. (No model.)

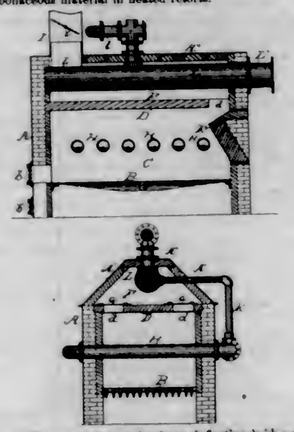
Claim.—1. In an electric-arc lamp, a circular armature provided with iron extensions from its core, between which extensions the wire is wound and acted upon by a fixed field-magnet having contracted poles, said armature and field-magnets being energized by the main current, the circuits in said armature and field-magnet to be a derivation one from the other, and their respective coils having an equal resistance, in combination with suitable mechanism to produce the feed of the carbons in an electric-arc lamp, as described and set forth.

2. In an electric-arc lamp, and in combination with the carbons thereof, a field-magnet having contracted fixed poles acting upon a revolving circular armature provided with an iron core, and both provided with proper circuits, and means, substantially as described, for altering the point of entering and leaving of the current through the coils of the armature, so as to displace the polarity upon the circumference of the same with regard to the fixed poles of its field-magnet, and thus to produce the feed of the carbons by the action of the revolving armature, substantially as described.

3. In an electric-arc lamp, a fixed field-magnet having contracted poles and a circular armature capable of oscillating or revolving between the same, the armature being provided with a commutator and properly-insulated contact-brushes, said field-magnet and armature reacting upon one another at their polar extremities, in combination with means for automatically changing the position of the brushes upon the commutator above mentioned before the motion of the armature has occurred, in order to displace the polarity of the circular armature with regard to the fixed poles of its field-magnet, and thus cause said armature to revolve or oscillate either to the right or left to produce the feed of the carbons, substantially as set forth.

4. The herein-described method of regulating the feed of carbon in an electric-arc lamp, which consists in raising or lowering the same by the rotation of an annular armature in which the polarity is shifted automatically by reason of the varying resistance of the arc, the upper carbon being attached to a band wound upon the axis of said armature, as set forth.

5. In an electric-arc lamp, a fixed field-magnet provided with fixed contracted poles between which is mounted a circular armature capable of an oscillating or rotary motion, in combination with an oscillating beam carrying properly-insulated brush-holders and brushes bearing upon the commutator of said armature, said beam being connected to and operated by a solenoid located in a derivation between the poles of the lamp, so arranged that whenever the carbons are close together said beam shall first be drawn down toward the said solenoid, and thereby move the brushes to such points on the commutator as will cause the armature to revolve and separate the carbons; and, second, when the proper arc is obtained, the beam to move the brushes to the median magnetic line, so that the armature will be prevented from revolving either way; and, third, on the arc growing longer by oscillating in the opposite direction, to place the brushes upon such points of the commutator that the armature shall be caused to revolve to feed the carbons and restore the normal arc, substantially as described.



6. In an electric-arc lamp, the combination, with a rotating armature and a pulley, D, attached to the axis thereof, of a copper ribbon, L, attached to said pulley and provided with a carbon-holder, O, from which the carbon hangs down above the lower carbon of said lamp, as described and set forth.

7. In an electric-arc lamp, the feed mechanism of the same, consisting of a field-magnet, M, and circular armature A and connections, substantially as described, whereby proper currents circulate therethrough when the same are in operation, in combination with a pivoted balance or beam, F², brush-holders and brushes F and F', all operated by an electro-magnet, E', in a derivation between the poles of the lamp, and an electro-magnet, E, in the main circuit, or an equivalent therefor, counteracting E', substantially as described.

294,534. APPARATUS FOR MANUFACTURING GAS.

BURHANS VAN STEENBERGH, Goshen, N. Y. Filed Oct. 23, 1883. (No model.)

Brief.—Gas is made by the decomposition of steam and oil in contact with carbonaceous material in heated retorts.

Claim.—1. The retort-furnace having a deflecting-bridge projecting from its rear wall, in combination with the connected series of retorts, arranged as and for the purpose described.

2. The retort-furnace having the deflecting-bridge projecting from an end wall, and also having a horizontal partition provided with openings at one end, dividing the furnace into two chambers, in combination with the retorts, arranged as described.

3. The horizontal series of retorts extending transversely across the furnace, and connected outside the walls by return-bends, and having supply-pipes for steam and oil connected with one or more of the retorts, in combination with the fixing-retort, a connecting-pipe, and the horizontal partition, having passages and separating the first series of retorts from the fixing-retort, for the purpose described.

4. The furnace A, constructed with deflecting-bridge E, partition D, having openings *d* at one end, the chimney I at the opposite end of the furnace, and with slanting crown-plates A', in combination with the connected generating-retorts H and the fixing-retort L, as and for the purpose described.

294,535. SPEAKING-TUBE ANNUNCIATOR.

JOSEPH WALTER, New York, N. Y. Filed Jan. 22, 1884. (No model.)

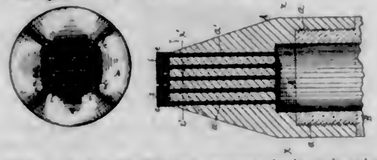
Claim.—1. In an annunciator for speaking-tubes, the combination of a main tube having an enlargement at one end, a valve pivoted to the enlarged end, said valve being smaller than its enlarged end, a striker, C, attached to the outer end of the valve-pivot, and a gong secured to the main tube A, substantially as set forth.

2. The combination of a tube, A, having a mouth-piece, A', at one end and an enlargement, A², at the other end, a valve, B, pivoted to the enlarged end, an exterior striker, C, attached to the pivot of the valve, a gong, D, attached to the tube A, and means whereby the striker C is stopped in either direction, substantially as specified.

3. The combination, with a main tube, A, having a mouth-piece, A', at one end and an enlargement, A², at its opposite end, a valve, B, pivoted to the enlarged end, a striker, C, attached to the pivot of the valve, a gong, D, secured to the tube A, a pivoted indicator, E, operated by the striker, and a stop or rest, *e'*, for the indicator, substantially as set forth.

294,535.

294,536. COMPOUND ELECTRIC CABLE.



RICHARD S. WARING, Pittsburg, Pa. Filed July 20, 1883. (No model.)

Claim.—1. A compound electric cable having an integral homogeneous body or covering of lead, with insulated wires inclosed in separate passages therethrough, such wires being arranged in two rows, the adjacent wires of the two rows being in closer proximity than the adjacent wires of either row, substantially as set forth.

2. A compound electric cable having an integral homogeneous body of metal covering, with insulated wires inclosed in separate passages therethrough, such wires being arranged in two rows, the adjacent wires of the two rows being in closer proximity than the adjacent wires in either row, and the wires of one row alternating in order of position with those of the other row, substantially as set forth.

294,537. MANDREL FOR CABLE-PRESSES.

RICHARD S. WARING, Pittsburg, Pa. Filed July 20, 1883. (No model.)

Claim.—1. A mandrel, A, for a cable-press, having at its point a series of nipples, *e e'*, arranged in one or more pairs of rows, the nipples in one row of such pair or pairs alternating in order of succession with the nipples in the other or companion row of the pair, substantially as set forth.

2. A mandrel, A, having its nipples *e e'* arranged in one or more pairs of rows, the successive nipples in each row being separated a greater distance than adjacent nipples in a pair taken across the rows, substantially as set forth.

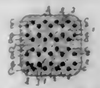
3. A mandrel, A, for a cable-press, having thereon tubular nipples *e e'*, arranged in pairs of rows, the two rows of a pair being in closer proximity than the adjacent rows of successive pairs, substantially as set forth.

4. A mandrel for a cable-press, having nipples thereon arranged in pairs of rows, the nipples in the two rows composing a pair alternating in order of succession, and the nipples in adjacent rows of successive pairs corresponding to each other in order of position, substantially as set forth.

5. A mandrel for a cable-press, having nipples *e e'* thereon, such nipples being arranged in pairs of rows, with the nipples in the two rows of a pair alternating in order of succession, and the two rows of a pair being in closer proximity than the adjacent rows of successive pairs, substantially as set forth.

6. A mandrel, A, for a cable-press, having groups of tubular nipples thereon, with grooves or channels *c* crossing the mandrel between groups, such grooves or channels being of greater depth than the nipples, substantially as set forth.

7. A mandrel, A, having nipples *e e'* thereon, arranged in pairs of rows, with channels *c* of greater depth than the nipples formed in the mandrel-body between pairs of rows, substantially as set forth.



8. A mandrel, A, having separate wire-passages *d* therethrough, such passages emerging at the point in two or more distinct groups, with grooves or channels *c* formed in the body of the mandrel across the point between groups of wire-passages, substantially as set forth.

294,538. COMPOUND ELECTRIC CABLE.

RICHARD S. WARING, Pittsburg, Pa. Filed July 20, 1883. (No model.)

Claim.—1. An electric cable having a body or protective covering of soft ductile metal or equivalent alloy with tubular passages therethrough inclosing insulated conducting-wires, such wires being arranged in pairs of rows, the two rows composing a pair being in closer proximity than successive pairs, substantially as set forth.

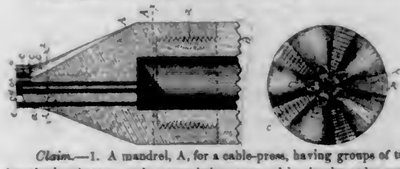
294,538.

2. An electric cable having a body of soft ductile metal or alloy with passages therethrough inclosing insulated conducting-wires, such wires being arranged in pairs of rows, the two rows composing a pair being in closer proximity than successive pairs, and the adjacent wires taken across the two rows of a pair being in closer proximity than adjacent wires taken in the same row, substantially as set forth.

3. An electric cable having a body of soft ductile metal or alloy with passages therethrough inclosing insulated conducting-wires, such wires being arranged in pairs of rows, the two rows composing a pair being in closer proximity than successive pairs and the wires in one row of each pair alternating in order of position with those of the other row of the pair, substantially as set forth.

4. An electric cable having a body, A, of soft ductile metal or alloy, with passages *a* therethrough inclosing insulated conducting-wires *c c*, such wires being arranged in pairs of parallel rows, the two rows of a pair being in closer proximity than the adjacent rows of successive pairs, the wires *c* in one row of a pair alternating in order of positions with the wires *c* of the companion row of the pair, and the wires in the adjacent rows of successive pairs having the same order of succession and occurrence, substantially as set forth.

5. An electric cable having a body of soft ductile metal or alloy, with passages therethrough inclosing insulated conducting-wires, such wires being arranged in pairs of rows, the two rows of a pair being in closer proximity than successive pairs, the individual wires in the two rows of a pair alternating in order of succession, and the adjacent wires taken in different rows of a pair being in closer proximity than adjacent wires taken in the same row, substantially as set forth.



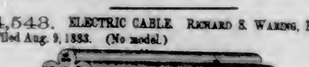
294,539. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. A mandrel, C, for a cable-press, having a tapered body with separate wire-passages therethrough, and longitudinal grooves *c'*, extending between the lines of wire-passages to the point, and having shallow cuts or channels *e* in the end, connecting the grooves between the openings of the wire-passages, substantially as set forth.

2. A tapering mandrel, C, for a cable-press, having three wire-passages therethrough, emerging at the point in close proximity, and in positions corresponding to the angles of a triangle, with longitudinal grooves *c'* extending along the exterior surface of the mandrel between wire-passages to the point, and cuts or channels *e*, crossing the point between the passage-openings, substantially as set forth.

294,540. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. A mandrel, A, for a cable-press, having groups of tubular nipples thereon, such groups being arranged in circular order around a central group, and having grooves *c* in its side, such grooves extending longitudinally between successive groups of nipples, substantially as set forth.

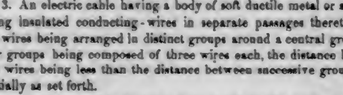


2. A mandrel, A, for a cable-press, having wire-passages therethrough, terminating at the point in separate groups of nipples, such groups being arranged in circular order around a central group, the outer circle of groups being divided one from another by grooves cut radially between them, such grooves being extended in depth at the point of the mandrel to or within its central group of nipples, substantially as set forth.

3. A mandrel, A, having wire-passages therethrough, such passages terminating at the point in separate groups arranged in circular order around some central group, with grooves *c*, separating the groups of the outer circle, smaller grooves *c'* between the individual passages of each group, and channels *c²*, connecting the grooves *c'* across the ends between passages, substantially as set forth.

4. A mandrel for a cable-press, having passages therethrough, terminating at the point in separate tubular nipples, such nipples being arranged in groups of three around some central group, with surface-grooves on the mandrel extending to its point between the outer groups of nipples, substantially as set forth.

5. A mandrel for a cable-press, having wire-passages therethrough, terminating at the point in separate groups of nipples, such groups being arranged in circular order around and in the radial lines of the nipples of a central group, with surface-grooves on the mandrel, dividing the several outer groups one from another, and extending in depth within the circle of nipples of the inner group, substantially as set forth.



294,541. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. An electric cable having a body of lead having passages therethrough at intervals around and in close proximity to its solid center, the thickness of metal wall between wires being less than the thickness of covering surrounding such wires, substantially as set forth.

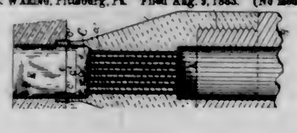
2. An electric cable having a body, *a*, of lead, such body inclosing three separate insulated conducting-wires, *c*, arranged at equal intervals around and in close proximity to the solid core a^3 of the body, the thickness of metal walls between wires being less than the thickness of exterior metal covering, substantially as set forth.

294,542. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. A mandrel for a cable-press, having separate passages therethrough for insulated conducting and for strengthening wires, such passages terminating at the point in tubular nipples, the nipples for conducting-wires being grouped at the center, and the nipples for strengthening-wires surrounding such central group, with grooves in the surface of the mandrel extending to the point between the nipples for strengthening-wires, substantially as set forth.

2. The mandrel A, having wire-passages therethrough, terminating at the point in separate nipples, three of such nipples *e* being near the center and surrounded by double the number of nipples *e'*, arranged in circular order, with grooves *c* in the surface of the mandrel, extending in depth between the outer nipples, *e'*, to the inner group of nipples, *e*, substantially as and for the purposes set forth.

294,543. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)



Claim.—1. An electric cable having a body of soft ductile metal or metallic alloy inclosing insulated conducting-wires, each in its appropriate passage through the body, such wires being arranged in distinct groups at intervals around a central group, the distance between adjacent wires of a group being less than the distance between the successive groups composing such outer circle, substantially as set forth.

2. An electric cable having a body of soft ductile metal or metallic alloy inclosing insulated conducting-wires, each in its appropriate passage through the body, such wires being arranged in distinct groups in circular order around a central group, the central group being composed of wires arranged in circular order around a common center, the wires of such circle occurring in the radial lines of the surrounding groups, substantially as set forth.

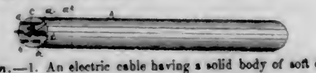
3. An electric cable having a body of soft ductile metal or alloy inclosing insulated conducting-wires in separate passages therethrough, such wires being arranged in distinct groups around a central group, the outer groups being composed of three wires each, the distance between such wires being less than the distance between successive groups, substantially as set forth.

4. An electric cable having a body of soft ductile metal or alloy inclosing insulated conducting-wires in separate passages therethrough, such wires being arranged in distinct groups arranged in circular order around a central group, with grooves made longitudinally in the exterior surface of the body, between the groups composing the outer circle, substantially as set forth.

294,544. MANDREL AND DIE FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. A mandrel for a cable-press, having separate wire-passages therethrough, and a recess therein at the point, into which the passages open, substantially as set forth.

2. A mandrel for a cable-press, having wire-passages therethrough, with a rim extension at the point surrounding the ends of the passages, and openings in the sides of the rim to admit lead to the rim-inclosure, substantially as set forth.



3. The mandrel A, having separate passages *a'* therethrough, opening into a recess, C, in the point, such recess having openings c^2 in its side walls for admitting lead-supply to the recess, substantially as set forth.

4. The mandrel A, having separate passages *a'* therethrough, opening into a recess, C, at the point, such passages being arranged in one or more rows, substantially as set forth.

5. A mandrel for a cable-press, having a recess at the point, into which the wire-passages open, in combination with a die co-operative with the walls of the recess in shaping the exterior of the cable, substantially as set forth.

6. The mandrel A, having recess C and rim extensions *c'*, in combination with die E, having recesses *e'* therein, adapted to receive the extensions *c'*, substantially as and for the purposes set forth.

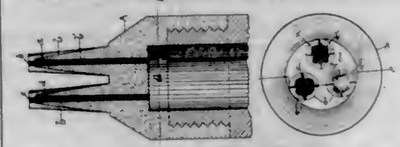
294,545. ELECTRIC CABLE. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)

Claim.—1. An electric cable having a solid body of soft ductile metal or metallic alloy, inclosing insulated conducting-wires, each in its appropriate passage through the body, such wires being arranged in close proximity around the solid core or center of the body, with a series of strengthening-wires inclosed within the soft-metal body, such strengthening-wires being arranged in circular order around the conducting-wires, substantially as set forth.

2. An electric cable having a solid body of soft ductile metal or metallic alloy, inclosing three insulated conducting-wires, each in its appropriate passage through the body, such wires being arranged in close proximity at intervals around the solid core or center of the body, with a series of strengthening-wires inclosed within the soft-metal body, such strengthening-wires being arranged at intervals around the conducting-wires, substantially as set forth.

3. An electric cable having a body, A, of soft ductile metal or alloy, inclosing three insulated conducting-wires, *c*, each in its appropriate passage through the body, such wires being placed in triangular relationship and in close proximity around the solid metal center a^3, with a series of strengthening-wires, *e*, inclosed in the body of soft metal, such strengthening-wires being double the number of conducting-wires *c*, and arranged around the latter wires on either side of radial lines produced through the conducting wires, substantially as and for the purposes set forth.

294,546. MAKING JOINT-CONNECTIONS IN ELECTRIC CABLES. RICHARD S. WARING, Pittsburg, Pa. Filed Aug. 9, 1883. (No model.)



Claim.—1. The method herein described of making branch or loop connections in lead-covered electric cables, consisting in removing the metal covering of and exposing the wire at the side of the cable-body, severing such wire and connecting its ends by metallic contact with the exposed ends of the wires of a branching cable, re-covering the exposed wire surfaces with insulating material, and finally inclosing the wire connection thus made in a plumber's wiped joint of solder, making solid union thereby between the side of the main cable and the branching cable, substantially as set forth.

2. A cable, A, having a soft-metal body inclosing insulated conducting-wires therein, having one or more such wires severed and exposed at the side of the cable, in combination with branching cable C, the same being metal-covered, and having its wires connected electrically with the exposed ends of the severed wire or wires of the main cable, insulating covering *i*, and a plumber's wipe, E, of solder, inclosing the connected wire ends and making solid connection between the metal covering of the branching cable and the side of the main cable, substantially as set forth.

3. A cable, A, having a soft-metal body inclosing insulated conducting-wires therein, with one or more such wires exposed and severed at the side of the cable, in combination with metal-covered cable C, having its wire ends connected with the exposed wire ends of cable A, an insulating covering, *i*, and a metal covering, c^2, for each wire connection, and a plumber's wipe, E, of solder, inclosing such wire connections and making a solid union between the metal covering of the branching cable and the side of the main cable, substantially as set forth.

294,547. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Sept. 27, 1883. (No model.)

Claim.—1. A mandrel, A, for a cable-press, having a teat or projection on its end, with separate wire-passages through both the mandrel and teat, the outside wire-passages extending beyond the central wire-passage, the teat having the longitudinal grooves *d* extending between the outside wire-passages to the point, and having the channels *e* connecting the grooves with the central recess, *f*, substantially as set forth.

2. A mandrel, A, for a cable-press, having a tapered body and a teat or projection on its end, with five separate wire-passages through both the tapered body and teat, and arranged in positions corresponding to the intersection and ends of the diagonals of a square, the teat having grooves *d* extending between the outside wire-passage to the point, the channels *e* connecting the grooves with the recess *f*, and the central recess, *f*, in its end, substantially as set forth.

294,548. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Sept. 27, 1883. (No model.)

Claim.—1. The core A for a lead-press, having three or more teats, *a*, with passages therethrough, in combination with a die having an equal number of openings, substantially as set forth.

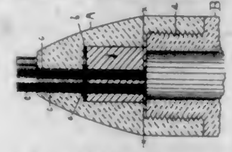
2. The mandrel A for a lead-press, having three or more teats, a^3, with a passage through each teat, and having the incline guiding-surface a^4, substantially as set forth.

3. The mandrel A for a lead-press, having the inclined guiding-surface a^4, and provided with three or more teats, a^3, each teat having a wire-passage, a^2, and an incline guiding-surface, a^4, substantially as set forth.

4. The mandrel A for a lead-press, having three or more teats, a^3, each teat having a wire-passage therethrough and an inclined guiding-surface, a^4, in combination with a die, B, having a like number of openings, *b*, provided with flaring sides, substantially as set forth.

294,549. REPAIRING DEFECTS IN THE CONDUCTORS OF LEAD CABLES. RICHARD S. WARING, Pittsburg, Pa. Filed Oct. 24, 1883. (No model.)

Claim.—1. The method herein described, which consists in uncovering one of the conductors of a lead-covered electric cable having two or more conductors inclosed in separate passages in the lead covering, severing the conductor, electrically uniting the severed ends, covering said union with insulating material, and re-covering the union with lead, substantially as set forth.



2. The method herein described of repairing the conductors of a lead-covered electric cable having two or more conductors inclosed in separate passages in the lead covering, which consists in uncovering one of said conductors, removing the defective part of said conductor, electrically uniting the severed ends of said conductor, covering said union with insulating material, and re-covering the union and exposed parts of the conductor with lead, substantially as set forth.

3. The method herein described of repairing the conductors of a lead-covered electric cable having two or more conductors inclosed in separate passages in the lead covering, which consists in removing the lead covering from around one of said conductors, removing the defective part of the conductor, electrically uniting the severed ends by any suitable coupling, covering said coupling and exposed parts of the conductor with insulating material, re-covering the insulated coupling and conductor with a piece of lead, and soldering said piece of lead to the body of the cable, substantially as set forth.

4. In a lead-covered electric cable having two or more conductors inclosed in separate passages in the lead covering, one of whose conductors is so severed that the several ends will not meet, the combina-

tion of the spiral coupling *c*, in which the severed ends of the conductor are soldered, the insulating-covering *d*, and the flap *e*, securely soldered over the coupling, substantially as set forth.

294,550. MANDREL FOR CABLE-PRESSES. RICHARD S. WARING, Pittsburg, Pa. Filed Oct. 24, 1883. (No model.)

Claim.—1. In a mandrel for lead-presses, the combination of the body A, having longitudinal openings therethrough, the removable nipples *e*, forming the passages and the protruding nipples for the wires, and mechanisms described for holding the nipples in place, substantially as set forth.

2. In a mandrel for lead-presses, the combination of the body A, having longitudinal openings therethrough, the removable nipples *e*, provided with a flange at one end thereof, the perforated plug *f*, and the core-bar, substantially as set forth.

3. In a mandrel for lead-presses, the combination of the body A, having openings therethrough, the removable nipples *e*, forming passages for the wires, and having interlocking flanges, as described, the perforated plug *f*, and the core-bar, substantially as set forth.

4. In a mandrel for lead-presses, the combination of the body A, having a series of openings therethrough, arranged as described, the removable nipples *e*, having flanges at one end, the flange of the central nipple having recesses formed in its outer side at intervals around its circumference, the flangee of the outer nipples having a recess formed in their inner sides at one point of their circumference, whereby the central nipple is supported by the outer nipples, and mechanism, as described, for holding the outer nipples in place, substantially as set forth.

5. In a mandrel for lead-presses, the combination of the body A, having a series of openings arranged around and inclined toward a central opening, the removable nipples *e*, having flanges *e'*, the perforated plug *f*, and the core-bar, substantially as shown and described.

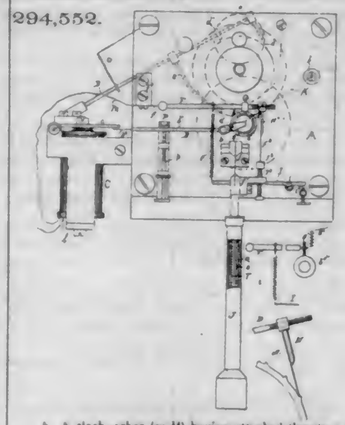
294,551. BALING-PRESS. JAMES WATSON, London, England. Filed Jan. 3, 1884. (No model.) Patented in England Apr. 28, 1883, No. 2,155.

Claim.—1. The doors *e e*, hinged to a fixed piece, *d*, in combination with a frame, *h*, fixed at one end to a center piece, *f*, and with a lashing-plate, *k*, and easing-door *l*, said pieces *h*, *f*, *k*, and *l* being mounted to revolve, so as to be brought into coincidence at one time with a preparatory ram or rams, and at another time with a finishing ram or rams, substantially as and for the purpose set forth.

2. The combination, with the finishing ram or rams *a a*, of the two preparatory rams *b b'*, two sets of preparatory boxes, *c c c' c'*, two pairs of main doors, *e e d' d'*, and two sets of revolving or swinging devices, *f h k l* and *f' h' k' l'*, for swinging the partly-finished bales from the preparatory rams to the finishing ram or rams, substantially as set forth.

294,552. ELECTRIC CLOCK. GEORGE R. WEBB, Newark, N. J., assignor of one-half to Plumb & Marcus, same place. Filed Sept. 7, 1883. (No model.)

Brief.—Swing of the pendulum makes and breaks circuit. Train driven by impulses from an arm attached to the armature-lever.



Claim.—1. In an electric clock, the combination, with an escape-wheel and an actuating-arm of a clock, of a spring click or pawl secured upon said arm, adapted to engage with said wheel, and an auxiliary spring also secured to said arm and bearing against said spring-click to prevent the vibration thereof, substantially as set forth.

2. In combination, a spring-pawl, *d*, an auxiliary spring, H, a clock-wheel, and a stop, *d'*, all as set forth.

3. In a clock, the combination of a spring-pawl, *d*, a toothed wheel, E, a stop, *d'*, and a safety-stop (as *e'*) adapted to engage with the teeth of the wheel when the spring-pawl is disengaged from said wheel, all substantially as set forth.

4. In combination, a spring-pawl, *d*, a toothed wheel, E, a stop, *d'*, a safety-stop, *e'*, and means whereby said stop *e'* and spring-pawl *d* may be operated simultaneously, all substantially as set forth.

294,552.

5. A clock-arbor (as b^4) having attached thereto a contact-wheel, (as b^5,) both of which have a rotary motion, and at the same time at intervals an upward and downward motion, all substantially as and for the purposes set forth.

6. In an electrical clock, the combination of a lever, (as B,) contact-wheel, (as b^5,) spring-piece b^2, and means for regulating the extent of vibration of said lever, all as set forth.

7. In combination, an impulse-arm, F, adapted to carry a contact-point, a spring, f^3, auxiliary spring H, a pendulum, J, provided with an arm, *j'*, and means for depressing said impulse-arm, all substantially as and for the purposes set forth.

8. The combination, with the pendulum of a clock, of a spring, *i'*, impulse-arm F, accommodating-spring f^3, and means for regulating the tension of the spring *i'*, (as I,) all as set forth.

9. In combination, the magnets C, armature *c*, actuating-arm D, means for raising said arm, (as the spring G,) a spring-pawl, *d*, secured to said actuating-arm, and adapted to engage with a toothed wheel, an auxiliary spring, H, and a stop, *d'*, both of which are also secured to said actuating-arm, all as set forth.

10. A clock-arbor having attached thereto a contact-wheel provided with a continuous peripheral surface of conducting material.

11. The combination, with a clock-arbor, b^4, having secured thereto a contact-point, of mechanism whereby said arbor and contact-point may be raised and lowered, all as set forth.

12. In an electrical clock, the combination of co-operating contact-wheels, and mechanism whereby both of said wheels may be rotated automatically and independently, all substantially as and for the purposes set forth.

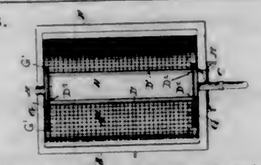
13. In combination, a clock-arbor, a contact-point, a spring, K, and means for raising said contact-point and arbor, all substantially as and for the purposes set forth.

14. In combination, a clock-arbor, a contact-point, a spring, (as K,) and a lever, (as B,) a magnet, C, armature *c*, and means for regulating the extent of the movement of said lever, all substantially as and for the purposes set forth.

15. In combination, a lever, B, contact-wheel b^5, arbor b^4, spring K, impulse-arm F, contact-point *g*, and means for lowering said arm, all substantially as set forth.

16. In a clock, the combination of a pawl, a toothed wheel, E, a stop, *d'*, and a safety-stop (as *e'*) adapted to engage with the teeth of said wheel when the pawl and stop *d'* are disengaged therefrom, substantially as set forth.

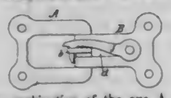
17. In combination, an impulse-arm, automatically-rotating contact-wheels, one of said wheels being attached to a clock-arbor, the other to said impulse-arm, and a pendulum, substantially as set forth.



18. In combination, a pendulum, an automatically-rotating contact-wheel, an impulse-arm, and a contact-point attached to said impulse-arm, substantially as described.

294,553. ROTARY COAL-SIFTER. JOHN WEIKERT, Indianapolis, Ind. Filed Jan. 22, 1883. (No model.)

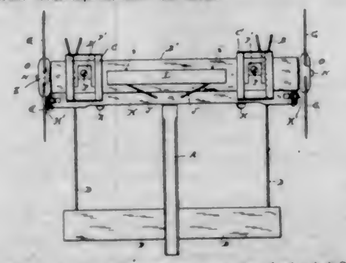
Claim.—1. The combination of a casing, a rotary sieve provided with end journals, a longitudinal opening, and arc-shaped parallel guide-rods secured to the outer periphery thereof, and a sliding door provided with parallel side bars having end perforations, substantially as described, and for the purpose set forth.



2. The casing and a rotary sieve provided with end journals, a longitudinal opening, arc-shaped guide-rods, and a door circumferentially

294,553.

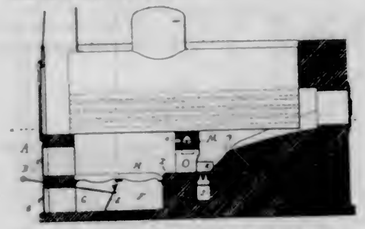
movable on said rods, as specified, in combination with crank C, and means whereby said crank may be secured, substantially as described, and for the purpose set forth.



294,554. HOOK-AND-EYE FASTENING. FRANCIS G. WHELAN, Philadelphia, Pa. Filed Oct. 15, 1883. (No model.)

Claim.—1. The combination of the eye A of the fastening, the hook B, adapted to engage with the end bar, *a*, of the eye, and having a longitudinal opening, *d*, and a retaining device, substantially as described, part of which is carried by the bar *a*, and is adapted to the recess *d* of the hook, as set forth.

2. The combination of the eye A, having a loop *b*, with the hook B, having a central recess, *d*, and pivoted hook *f*, as set forth.



294,555. CHECK-ROW CORN-PLANTER. EMORY B. WHITE, Clarion, Iowa. Filed Sept. 25, 1883. (No model.)

Claim.—1. In a check-row corn-planter, the wheel or hub O, having sharp-pointed metal spokes G, provided with balls F and cams E, in combination with reciprocating bar H, having friction-rollers H' and rods J, adapted to operate sliding bar L, as described, and for the purposes set forth.

2. In a check-row corn-planter, the shaft N, having wheels O, with sharp-pointed metal spokes G, provided with cam E, in combination with reciprocating bar H, having friction-rollers H', rods J, bar L, guide-pins *i*, hoppers C, and feed-wheel P', having adjusting-screws P and holes P'', as described, and for the purposes set forth.

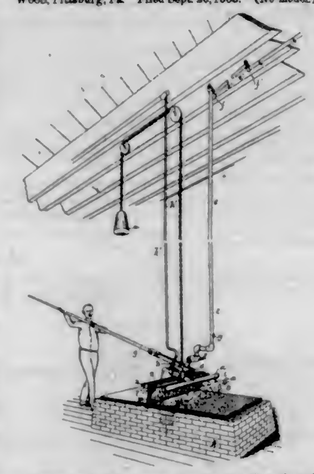
294,556. FURNACE. HENRY C. WILLIAMSON, Michigan City, Ind. Filed Oct. 30, 1883. (No model.)

Claim.—1. The damper E, situated in ash-pit F, and operated as described, in combination with arch M, provided with passage *a* and openings *c*, and communicating with the outer air, as and for the purpose set forth.

2. The combination of damper E, arch M, provided with passage *a* and openings *c*, and communicating with the outer air, and auxiliary ash-pit J and grate K, as and for the purpose set forth.

3. The combination of damper E, arch M, constructed as described, auxiliary ash-pit J and grate K, and inclined floor P, as and for the purpose set forth.

294,557. MANUFACTURE OF MATERIAL FOR ELECTRIC INSULATION. WILLIAM VIRGO WILSON, Jubilee Street, Mile End, County of Middlesex, England. Filed Jan. 4, 1884. (No specimens.) Patented in England July 11, 1883, No. 3,413.



Claim.—The consolidation of wood or vegetable tar by the use of nitro-cellulose softened as hereinbefore set forth, and its application to the purpose of insulating electric conducting-wires.

294,558. KNIFE. CHARLES WINGFIELD, Sheffield, County of York, England, assignor to Joseph Rodgers & Sons, (Limited,) same place. Filed Jan. 5, 1884. (No model.)

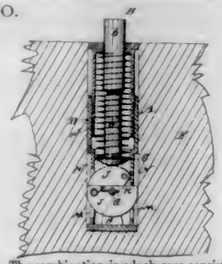
Claim.—The combination, with a knife-blade or analogous article provided with a flat tang, of externally-roughened bolster-pieces adapted to fit close to the sides of the tang and against the heel of the knife-blade or analogous article, and a handle made of plastic material molded or otherwise formed around the tang and bolster-pieces, substantially as specified.

294,559. APPARATUS FOR TREATING SHEET-IRON. W. DEWEES WOOD, Pittsburg, Pa. Filed Sept. 26, 1883. (No model.)

Claim.—1. In an apparatus for treating sheet-iron, the combination of a steam supply and distributing mechanism and a cooling or chilling mechanism, arranged for operation in immediate succession along the surface of the sheet under treatment, substantially as set forth.

2. An apparatus for applying superheated steam to sheet-iron surfaces, having a transverse pipe, *a*, provided with suitable jet-openings, for the uniform distribution of the steam over the surface of the sheet, and a valve, *d*, for turning on or shutting off the steam-supply, in combination with means for opening and closing the valve at will and reciprocating the transverse pipe over the surface of the sheet, substantially as set forth.

3. In an apparatus for treating sheet-iron, the combination of the steam supply and distributing mechanism, a water supply and distributing mechanism, and a mechanism for sweeping off the sheets by frictional contact therewith, arranged for operation along the surface of the sheet under treatment, substantially as set forth.



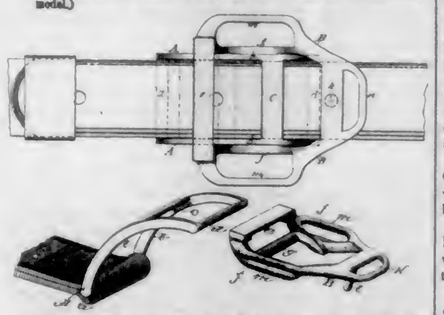
4. In an apparatus for treating sheet-iron, a steam supply and distributing mechanism and a water supply and distributing mechanism connected with the same operating-handle, *g*, in combination with a flexible supply to each, substantially as set forth.

5. In an apparatus for treating sheet-iron, the combination of the transverse pipe *a*, having perforations or nozzles, the pipe *e*, the perforated pipe *o*, and the hose *h'*, substantially as set forth.

6. In an apparatus for treating sheet-iron, the combination of the transverse pipe *a*, having perforations or nozzles, the hinged and ported coupling *d*, the pipe *e*, the perforated pipe *o*, the flexible pipe *h'*, and the handle *g*, substantially as set forth.

294,560. LOCK. RUDOLF E. WOODRICH, New York, and CHARLES LANGBEIN, Brooklyn, N. Y. Filed Apr. 25, 1883. (Model.)

294,560.



Claim.—1. The combination, in a lock-case consisting of two parts—a main case and an extension cylindrical in the direction of the bolt—of the main case having a hole through it crosswise to receive the key, and provided with a screw-thread upon or within its outer end, and the said extension having a screw-thread adapted to engage the said screw-thread of the main case, substantially as described, whereby the whole lock may be inserted into a hole bored into the edge of a door, and the case may be extended or contracted between the key-hole and the edge of the door to adjust a lock-case to different situations.

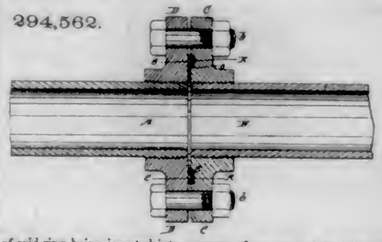
2. The combination, with a lock-case longitudinally extensible between its key-hole and its outer end, of a bolt consisting of two cylindrical parts provided with telescoping screw-threads, whereby the length of the bolt may be adjusted to the length of the lock-case, as described.

3. In a lock, the combination of the case A, the bolt B, the standard H on the bottom of the casing, the pintle G in the standard, and the cam-plates J J, mounted independently and loosely on the said pintle, with the screw K, adapted to unite the two cam-plates, as described, whereby the lock is adapted to be operated at one side independent of the other or to be operated from both sides, as set forth.

4. The combination, with a tubular lock-case, of a bolt having a head at its lower end, a spring forcing the bolt downward, and independently-mounted cam-plates adapted to be screwed together, so as to be both worked from either side, or disconnected, so that each may be locked and unlocked only from its own side, as described.

294,561. HARNESS-BUCKLE. WILLIS A. ALLEN, Palmyra, Wis., assignor of one-half to Nelson Willis, same place. Filed Oct. 22, 1883. (No model.)

Claim.—1. A harness-buckle consisting of a curved loop-link having cross-bars, the lower of which is adapted to receive and hinge a tug or strap, in combination with a tongue-bearing frame, with rear cross-bar and downwardly-curving sides connected by another cross-bar, and thence extending forward with an upward curve, and then again connected by a front cross-bar on substantially the same plane as the rear cross-bar, and above the plane of the intermediate cross-bar, substantially as set forth.

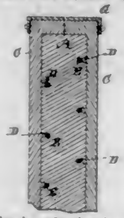


2. In a harness-buckle, the strap-link A, having the curved sides *b b*, the hinging-bar *a*, and pressure-bars *c* and *d*, in combination with the tongue-bearing frame B, having notched sides *f f*, cross-bars *e* and *g*, forming loop A, and cross-bar *k*, with lug *l*, substantially as shown and described, and for the purpose set forth.

294,562. PIPE AND OTHER JOINTS. JAMES A. BALDWIN, Jr., East Jaffrey, N. H. Filed Sept. 14, 1883. (No model.)

Claim.—1. The packing-ring having a plain surface on one side, and an annular groove in its opposite side, substantially as and for the purpose set forth.

2. The packing consisting of the ring with a plain surface on one side, and an annular groove in its opposite side, the plain-surfaced side



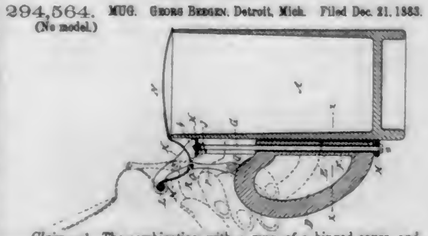
294,562.

of said ring being inserted into a groove of one part of the joint, and the projecting grooved side of said ring bearing against the face of the opposite part of said joint, substantially as and for the purpose set forth.

3. In pipe-joints, the combination of the internally-screw-threaded flanges C D, the bolts *b*, uniting said flanges, the externally-screw-threaded pipes A B, and the copper ring R, having in its projecting face an annular groove, *c*, and partially countersunk within the face of the one of said flanges, substantially as specified.

294,563. INSULATOR FOR ELECTRIC WIRES. WM. W. BEACH, New York, N. Y. Filed June 27, 1883. (No model.)

Claim.—1. An insulator for electric wires, consisting of an insulating-block having grooves to receive the wires and a tongued piece for holding the wires in the grooves, substantially as herein shown and described.



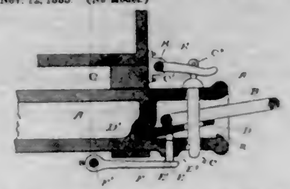
2. An insulator for electric wires, consisting of an insulating-block provided with a series of grooves for receiving the wires, and of a frame adapted to surround the block, and provided with a series of tongues for partly filling the grooves, substantially as herein shown and described.

3. In an insulator for electric wires, the combination, with a block having transverse grooves for receiving the wires, an outer frame formed of two strips provided with tongues fitting in the said grooves, and of devices for holding the ends of the strips together and on the block, substantially as herein shown and described.

4. In an insulator for electric wires, the combination, with the block O, having tongues P, of the transversely-grooved glass strips L, and of wooden strips J, on which the glass strips L are held, substantially as herein shown and described.

5. In an insulator, the combination, with the block O, having tongues P, of the hollow glass strips L, having dovetailed flanges M, and of the wooden strips J, having tongues K and dovetailed grooves N, substantially as herein shown and described.

294,564. MUG. GEORG BERGEN, Detroit, Mich. Filed Dec. 31, 1883. (No model.)



Claim.—1. The combination, with a mug, of a hinged cover, and sliding handle attached to the hinge by a pivoted connecting-rod, substantially as shown and described.

2. The combination of the mug A, ribs B, clips H H, guide-rod G, handle D, having the perforation F in the part E thereof, cover N, hinge K L M, and connecting-rod P, substantially as shown and described.

3. The combination of the mug A, hinged cover N, handle D, adapted to slide vertically on the guide-rod G, and connecting-rod P, pivoted to the handle and to the swinging leaf of the hinge, substantially as shown and described.

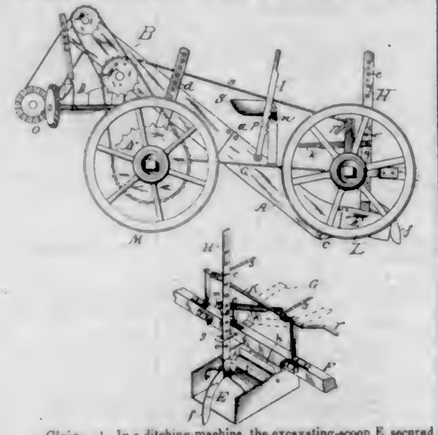
294,565. CAR-COUPLING. WILLIAM A. BENJAMIN, Cleveland, Ohio. Filed Nov. 12, 1883. (No model.)

Claim.—1. In a coupling for cars, the draw-head A, in combination with the plate D, T-pin E, and means, substantially as shown, whereby said pin is elevated, for the purpose set forth.

2. The draw-head A, in combination with the concave plate D, having pivot D', T-pin E, and the shaft F', having arm F, by means of which said pin and plate D, resting thereon, are raised and lowered, substantially as and for the purpose specified.

3. The draw-head A, having boss E' and opening E', in combination with the T-pin E, concave plate D, having pivot D' and central opening, and the shaft F', having arm F, whereby said pin E and plate D are moved vertically, for the purpose set forth.

4. The draw-head A, opening E', and boss E', T-pin E, plate D, having pivot D', arm F, and shaft F', in combination with the link B, pin C, having neck C', and cross-pin C², rod H' and arm H, suitable bearings and handles, H², as set forth.



294,566. PRIMER. THOMAS G. BENNETT, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 31, 1883. (No model.)

Claim.—The herein-described improvement in primers for cartridges, consisting of the anvil constructed for insertion into the cup, with its center closed, and with a recess upon its inner surface at the center, substantially as described.

294,567. DITCHING-MACHINE. WILLIAM T. BENNETT, Newport, Ind. Filed July 21, 1883. (No model.)

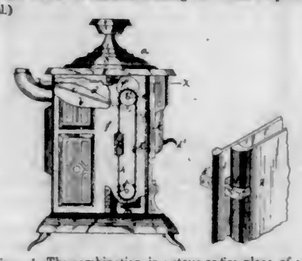
Brief.—The lower hinged section of a two-part elevator-frame has a pivoted rack-bar for locking its upper end, engaging a cross-bar on frame and a supporting perforated standard passing up through a slot in the forked coupling-bar for the rear wheels, and extended forward and down to form a cutter in front of and below the scoop on said section. The upper section is adjusted by a chain run to a windlass on front axle.

Claim.—1. In a ditching-machine, the excavating-scoop E, secured to the elevator-frame and provided with a perforated standard, H, arranged to slide vertically in the slotted end of the coupling G, and having its lower end constructed to form a vertical cutter, *f*, extended downward in front of and below the cutting portion of the scoop, substantially as and for the purposes described.

2. The combination, with the elevator in two sections hinged together, as shown, of a toothed hand-bar pivoted to the forward section, a cross-bar, *n*, supported by the machine-carriage, and a windlass carried by the front axle and connected by cords or chains with the rear section of the elevator, substantially as shown and described.

294,568. REMOVABLE POST FOR HORSE-POWER TRANSMITTERS. FRANK B. BIGWELL, Smyrna, Mich. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination of the post H, plate L, having wings L', the sweep N, and staples I, all suitably united, substantially as described, and for the purposes set forth.



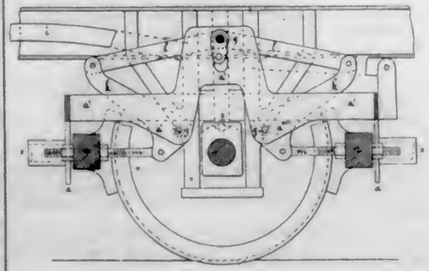
2. The combination of the post H, plate L, having wings L', the staples I, and bolts J K, the staples being secured to the sweep and plate L, in the manner and for the purposes specified.

3. The combination of the post H, provided on its under side with the plate E and stud F, and having the plate A and studs B on its upper end, the plate C, having notches C', and shaft D', substantially as described, and for the purposes set forth.

4. The combination of the post H, provided on its upper end with the curved flanges A' and studs B, the notched plate C, and shaft D', substantially as described, and for the purposes set forth.

5. The combination of the post H, provided with stud F on its under side, and having the circular flanges A' and studs B on its upper side, the plate G, having opening G', the notched plate C, and shaft D', substantially as described, and for the purposes set forth.

294,569. ADJUSTABLE BLOWER FOR FIRE-PLACES AND STOVES. FRANK S. BISSELL, Pittsburg, Pa. Filed July 2, 1883. (No model.)

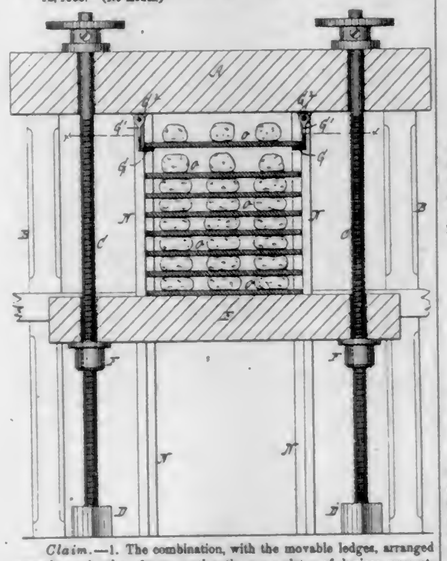


Claim.—1. The combination, in a stove or fire-place, of a vertically-adjustable blower, with counter-weights carried by endless chains mounted and moving vertically on upper and lower sprocket-wheels journaled in the sides of the stove, substantially as and for the purposes described.

2. The combination of the vertically-adjustable blower provided with pins, endless chains having counter-weights and connected to the blower by the pins, a shaft having sprocket-wheels rigidly attached thereto and sustaining the pins, and other sprocket-wheels revolving loosely on stationary bearings, substantially as and for the purposes described.

3. The combination, in a stove or fire-place, of the removable shaft and division-plates having holes to permit the lateral removal of the shaft, substantially as and for the purposes described.

294,570. CAR-BRAKE. ANDRÉ BOLZANO, Markt Redwitz, Bavaria, Germany. Filed Nov. 5, 1883. (No model.) Patented in Italy Dec. 31, 1883, XVII, 15,993, and XXXII, 109.



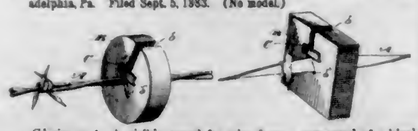
Claim.—1. The combination, in railway-brakes, of the toggle-links *l*, actuating the brake-blocks through elbow-levers K, with a loaded lever, *i*, and bar *q*, so arranged as to cause the toggle-link to apply the brakes when the lever is released.

2. The combination of car-wheels, springs, and brake-levers with a frame, *a*, straps *b*, axle-boxes having pins *z*, and means, substantially as described, for preventing the rotation of the frame.

3. The combination of car-wheels, brake-levers, and brake-blocks with a frame, *a*, having guides *e* for the brake-blocks, substantially as set forth.

294,571. PRESS. GEORGE B. BOOMER, Tarrytown, N. Y. Filed Dec. 12, 1883. (No model.)

Claim.—1. The combination, with the movable ledges, arranged opposite each other, for supporting the press-plates, of devices connecting the said ledges together and positively moving them simultaneously from the press-plates, to permit the latter to descend, substantially as described.



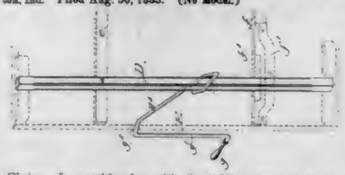
2. The combination, substantially as hereinbefore set forth, of the movable ledges for temporarily supporting the press-plates at a point above the follower, the hinged brackets supporting the ledges, the operating-levers of the brackets, and the intermediate lever and rods connecting such operating-levers together.

3. The combination, substantially as hereinbefore set forth, of the platform arranged on the side of the press to receive the press-plates, and the inclined rails leading from such platform.

4. The combination, substantially as hereinbefore set forth, of the movable ledges for temporarily supporting the press-plates at a point above the follower, and the platform arranged on one side of the press, substantially in the horizontal plane of the ledges, to receive the press-plates which are to be placed on the ledges, or which are removed therefrom.

5. The combination, substantially as hereinbefore set forth, of the movable ledges for temporarily supporting the press-plates at a point above the follower, and the vertical ways adapted to receive and guide the press-plates deposited on the follower by the ledges.

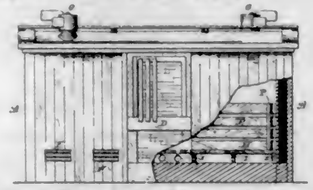
294,572. GUARD FOR WIRE FENCING. ROBERT BOOMER, JR., Philadelphia, Pa. Filed Sept. 5, 1883. (No model.)



Claim.—1. A visible guard for wire fences, composed of a block slotted to admit the strand, and having a key or locking-plate lying across the slot and holding the guard upon the strand, substantially as described.

2. The visible guard composed of the wooden block B, having a slot, *b*, with kerf *b'*, and provided with slots *d d*, cut transversely to the slot *b*, substantially as described.

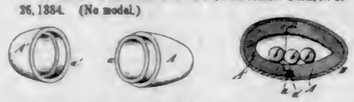
3. The combination, with a fence-strand, of the guard B, having a slot, *b*, to receive the strand, and a kerf, *b'*, at the end of said slot, and the key C, entering slots *d d*, and having its ends bent against the opposite faces of the block, substantially as described.



4. A visible guard for wire fencing, composed of a block of suitable material, slotted radially to receive the wire strand or strands, and having means to confine the wire in the slot, substantially as described.

294,573. FASTENING DEVICE FOR DOORS. JOHN E. BOXELL, Tipton, Ind. Filed Aug. 30, 1883. (No model.)

Claim.—In combination with the folding doors A B and locking-bar D, an operating-lever, E, provided at one end with a handle, *g*, and at the opposite end with a bent portion, which encircles the locking-bar, said lever being provided with bent portions or members g' g^2 g^3, substantially as shown.



294,574. CAR. RICHARD HENRY BRIGGS and CLEVELAND PRICHARD, Whistler, Ala. Filed July 30, 1883. (No model.)

Claim.—1. The combination of the car with sections of flooring which are placed in the ends of the car, and the section of flooring which is placed at right angles thereto, each section being composed of the perforated cross-bars I and the slats J, and the car being provided with the ventilating-openings F B below the level of the sections, substantially as shown.

2. The car A, provided with the ventilating-holes B F, combined with the sections of flooring, arranged at right angles to each other, and provided with the perforated cross-pieces I and the side sections or lattice-work, P, substantially as set forth.

294,575. CANDY. SAMUEL H. BRITTON, Hoboken, N. J., assignor to Albert Green and Willis R. Blackwell, both of New York, N. Y. Filed Jan. 26, 1884. (No model.)

Claim.—1. An egg or egg-shaped candy consisting of a box having a cover detachable from the body, and a casing or shell of candy enveloping the box, substantially as specified.

2. An egg or egg-shaped candy consisting of a box containing small candies and enveloped in a shell or casing of candy, substantially as specified.

294,576. METALLIC SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Dec. 29, 1883. (No model.)

Claim.—1. An improved metallic seal composed of a shackle of flexible wire, having eyes *a b*, formed at its respective ends, and a leaden seal-disk cast fast on one of said shackle ends, a portion of the lead penetrating said eye *a*, so as to permanently secure this end, and constructed with a stud, *c*, on its face, to engage with said eye *b*, substantially as herein specified, for the purposes set forth.

2. The combination, in a metallic seal, of a flexible shackle having eyes *a b* at its respective ends, and a leaden seal-disk cast fast on one of said shackle ends, a portion of the lead penetrating said eye *a*, and constructed with a stud or studs, *c*, on its face, to engage with said eye *b*, and a wall or walls, *d*, to coact externally with that end of the shackle which is provided with said eye *b*, substantially as herein specified, for the purposes set forth.

3. In a metallic seal, a flexible shackle having rounded ends provided, respectively, with eyes *a b*, in combination with a leaden seal-disk cast fast on one of said shackle ends, portions of the lead penetrating said eye *a* and forming a central stud, *c*, to engage with said eye *b*, and a wall or walls, *d*, to embrace that end of the shackle which is provided with said eye *b*, including its extremity, the cast-in end being correspondingly inclosed, substantially as herein specified, for the purposes set forth.

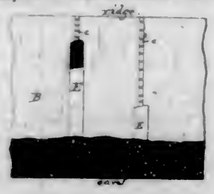
4. In combination with a shackle, S, of flexible wire, having an eye, *b*, formed at one of its ends, the leaden seal-disk D, cast fast on the other end of said shackle, and constructed with a central stud, *c*, on its face, to engage with said eye *b*, and a concentric wall, *d*, to embrace said eye externally, said wall having two or more embrasures, *e*, to provide for different dispositions of the shackle substantially as herein specified, for the purposes set forth.

294,577. METALLIC SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Jan. 15, 1884. (No model.)

Claim.—1. A metallic seal of sheet metal and soft metal combined, having compressible receptacles *a b*, formed at the respective ends of the sheet-metal strip, and its soft-metal part cast fast in one of said receptacles, and constructed with a protruding end adapted to enter the other of said receptacles, and to be secured therein when the seal is pressed, substantially as herein specified, for the purposes set forth.

2. The combination, in a metallic seal, of a sheet-metal strip constructed with bent-up tubular compressible receptacles at its respective ends, and a leaden part cast fast in one of said receptacles and having a protruding end fitted to enter the other, said receptacles being adapted to be flattened upon the lead within them and to receive deep indented press-marks, substantially as herein specified, for the purposes set forth.

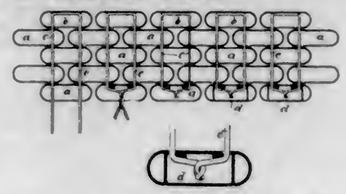
3. An improved metallic seal composed of a sheet-metal strip having its respective ends constructed with bent-up tubular receptacles, and a leaden part cast fast in one of said receptacles, having a protruding end fitted to the other, said receptacles and leaden part forming, when united and unpressed, a loose hinge with its axis transverse to the strip, substantially as herein specified, for the purposes set forth.



294,578. PLOW ATTACHMENT. JOHN O. CALDWELL, Goshen, Ga. Filed Aug. 8, 1883. (No model.)

Claim.—1. As a new article of manufacture, the mold-board attachment B, having an approximately triangular form, and curved, as specified, and provided on the under side, at its inner wider end, with a boss having a notch, of the form specified, to receive a bolt for attaching to a plow, as shown and described.

2. The combination of the attachment B, having a notched boss on its under side, with the shovel A, and bolts for securing the two parts together, substantially as shown and described.



294,579. FELT AND GRAVEL ROOF. WILLIAM HENRY HARRISON CHILDS, Brooklyn, N. Y. Filed Jan. 15, 1884. (No model.)

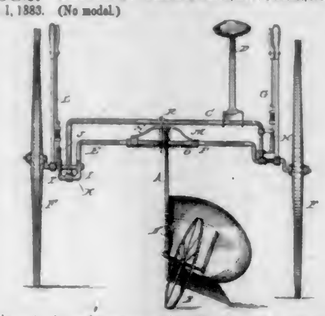
Claim.—1. A roof composed of a sheathing or layer of untarred paper laid on the roof-boards, one or more layers of manufactured felt, substantially such as described, superposed on the sheathing of untarred paper, a layer of bituminous cement, and a layer of gravel embedded therein, as set forth.

2. A roof composed of one or more layers of a manufactured felt, substantially such as described, having the adjoining or overlapping edges secured or joined together by strips of wood or metal disks being nailed down over them, a layer of pitch and a strip of felt or paper secured over the wooden strips, and superposed layers of pitch and gravel, as set forth.

294,580. ORNAMENTAL CHAIN. HENRY A. CHURCH, Providence R. I. Filed Mar. 13, 1882. (No model.)

Claim.—As a new article of manufacture, a chain composed of a series of units, each provided with two apertures at one side and a single aperture at the opposite side, and arranged side by side, and interlapping at their ends with the next series of units, a series of closed units forming one side of the chain, a series of open units forming the opposite side of said chain, a series of staples passing through the middle units, and united to the closed sides of the closed units, and secured by twisting to the open side units, and caps secured within the open units over the twisted ends of the staples, substantially as and for the purposes described.

294,581. MAGAZINE FIRE-ARM. JEFFERSON M. CLOUGH, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 15, 1883. (No model.)



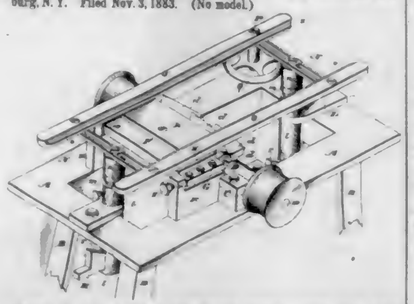
Claim.—1. In that class of magazine fire-arms in which the magazine is located in the butt-stock and opens forward into the receiver, a receiver constructed to receive a butt-stock independent of the fore-end, and with the mouth through which the cartridges are introduced to the magazine, or into which the cartridges are successively forced from the magazine, the rear end of said mouth constructed to form a shoulder, *a*, and with a recess, *c*, in rear of it, and of other than cylindrical shape, combined with a magazine-tube, its forward end constructed of corresponding other than cylindrical shape, so as to fit said recess and abut against said shoulder, whereby said magazine-tube is located in its proper

relation to the mouth, irrespective of the butt-stock into which it extends, substantially as described.

2. The receiver constructed to receive the butt-stock independent of the fore-end, the trigger-guard plate arranged between the two sides of a receiver, and so as to form substantially the bottom thereof, said plate extending rearward and fitted for attachment to the butt-stock, and forward fitted for attachment to the fore-end, the receiver constructed with a mouth through which the cartridges may be introduced to the magazine, or into which the cartridges may be successively forced from the magazine, the rear end of said mouth constructed to form a shoulder, *a*, and with a recess in rear of it, combined with a magazine-tube, its forward end constructed to fit said recess and abut against said shoulder, whereby said magazine-tube is located in its proper relation to the mouth, irrespective of the butt-stock into which it extends, with a shoulder, *g*, on the trigger-guard plate, constructed to engage with a corresponding shoulder, *f*, on the magazine-tube, in rear of its forward end, substantially as described.

3. In a magazine fire-arm, the receiver constructed with the mouth H, through which the cartridges are introduced to the magazine, and into which the cartridges are successively presented from the magazine, said receiver constructed at its rear end to receive the butt-stock, and with a vertical shoulder, *b*, in rear of its forward end, against which the fore-end L will abut, whereby said fore-end extends to a point in rear of the forward end of the receiver, substantially as described.

294,582. SULKY-PLOW. FRANK N. CLUTE, Lee's Summit, Mo. Filed Dec. 1, 1883. (No model.)

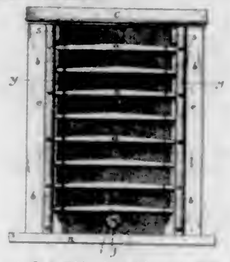


Claim.—1. As an improvement in sulky-plows, the combination of the main frame C, having segmental rack H, arch E, having lever G, adapted to engage with the segmental rack H, bearings I, and segmental rack J, crank-shaped stub-axle K, journaled in the bearings I, and provided with a segmental lever, L, adapted to engage with the segmental rack J, and wheels F F, all constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

2. The improved clip herein shown and described, consisting of the metallic strips N O, collar P, and end piece, S, connected to the arch E by means of a link, Q, as set forth.

3. In a sulky-plow of substantially the described construction, the combination of the arch E, plow A, and clip M, constructed as described, to form a yielding connection.

294,583. BRUSH-TRIMMING MACHINE. THOMAS COLDWELL, Newburg, N. Y. Filed Nov. 3, 1883. (No model.)

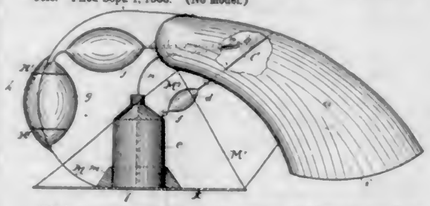


Claim.—1. As a means for holding and guiding a brush while being trimmed, the bars O, provided with the rabbets *o*, made straight or curved longitudinally, and combined and made relatively adjustable toward or from each other by means of the pivoted cross-bars N, substantially as shown and described.

2. In combination with the cross-bars N, the standards M, fitted into and contained within the sleeves *l*, the wedge-bar R, provided with the inclined faces *r*, and having its outer end, *r'*, threaded, the journaled nut S, and the hand-wheel *s*, substantially as and for the purpose specified.

3. The hereinbefore-described machine in which are combined the following elements, to wit: a revolvable cutter with radial longitudinal blades extending in oblique lines inward from each end beyond the middle point of the cutter hub or cylinder, a stationary cutter, means for adjusting it positively toward or from the cutting-edges of said blades, slides for supporting and guiding a brush while being trimmed, and means, substantially as shown, for adjusting said slides to receive brushes of different sizes, and for varying the lengths of the bristles when trimmed, substantially as and for the purpose described.

294,584. POOL-RACK. HUGH W. COLLENDER and STEPHEN DE GAETANO, New York, N. Y.; said de Gaetano assignor to said Collender. Filed Jan. 31, 1884. (No model.)



Claim.—1. In combination with vertical side conduits or passage-ways and suitable supporting means, a set of shelves which are free to be moved up and down, and stationary perforated partitions between said conduits and said set of shelves, all substantially as and for the purpose set forth.

2. In combination with a lifting set of shelves, and means for the discharge of their contents into ball-conduits, as explained, a device for elevating the shelves, all as set forth.

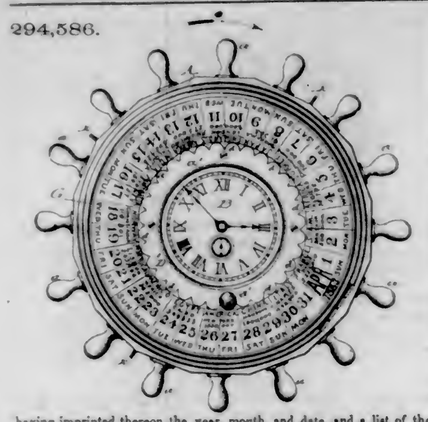
3. In combination with a movable set of shelves and side conduits, as described, a stop or stops to regulate the extent to which the shelves can be lifted to insure the coincidence of the shelves with the openings through which the balls must pass to get from the shelves into the conduits, as set forth.

4. In combination with a vertical conduit or passage-way for the fall of the balls in a pool-rack, a rubber or other cushion to break the fall and render the descent of the balls less noisy, as set forth.

294,585. INHALER FOR ANÆSTHETICS. HENRY COOK, Leadville, Colo. Filed Sept. 1, 1883. (No model.)

Claim.—1. In an inhaler and respirator, the combination of the hood *a*, spray-arrester C, bulb *d*, with stop-cock *f*, and bottle *e*, substantially as shown, and for the purpose described.

2. The apparatus specified for administering the fumes or vapor of an anæsthetic combined with atmospheric air, consisting of the bottle *e*, having tube *n*, bulb *g*, secured to handle by bands H', bulb *j*, hood *a*, spray-arrester C, and bulb *d*, with stop-cock *f*, substantially as shown and described.



3. The combination of the bulbs *g* and *j*, spray-arrester C, bulb *d*, stop-cock *f*, and bottle *e*, having tube *n*, substantially as shown and described.

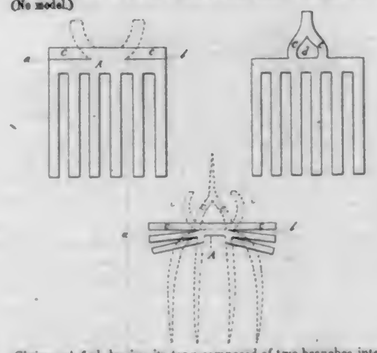
294,586. GAME APPARATUS, CALENDAR, AND CLOCK. WM COOPER, New York, N. Y. Filed Jan. 3, 1884. (No model.)

Claim.—1. In a game apparatus, the revolving cylinder provided with an annular recess to receive a tablet, and an inner groove having notches, in combination with a ball and clock, the whole being secured by a shaft to suitable supports, all substantially as shown and described.

2. In a game apparatus, a cylinder suitably supported and adapted to be revolved, and provided with a groove adapted to receive a tablet

294,586.

having imprinted thereon the year, month, and date, and a list of the principal cities of the world and population, the inner groove provided with notches, in combination with a ball and clock, substantially as shown, and for the purposes described.



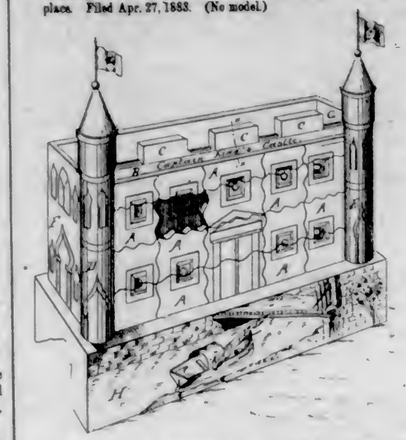
3. In a game apparatus, the revolving cylinder suitably supported, and provided with grooves to receive a tablet and ball, and the clock B, in combination with the door or plate H, having inwardly-extending projections I, whereby the same is secured to the cylinder, substantially as shown and described.

4. In combination with a game apparatus, the cylinder having notches and removable tablets forming a calendar, a ball adapted to enter said notches, whereby the number attained is indicated, substantially as shown and described.

5. In a game apparatus, the cylinder provided with annular grooves, in combination with a clock and tablets, substantially as shown, and for the purposes described.

6. In a game apparatus, a revolving cylinder suitably supported and provided with knobs *a*, the outer annular groove adapted to receive tablets forming calendars, the inner groove provided with notches, the removable door having inwardly-extending projections, whereby the same is secured to the cylinder, in combination with a clock and a ball adapted to rest in the notches, whereby a game may be determined, all substantially as shown and described, and for the purposes set forth.

294,587. HAY-FORK. WARREN H. COWDERY, Ashtabula, Ohio, assignor of one-half to Samuel R. Harris, same place. Filed May 20, 1882. (No model.)



Claim.—A fork having its tang composed of two branches integral with and extending upward from the back of the fork, substantially in line with the tines, then united to form a single tang, leaving an aperture, *d*, between the branches of the tang, as and for the purposes set forth.

294,588. STEREOTYPE-BACKING POWDER OR FILLING. EDWIN COWLES and ALFRED H. COWLES, Cleveland, Ohio. Filed Nov. 23, 1882. (No specimens.)

Claim.—As an article of manufacture, a filling or backing powder for matrices for stereotype-plates, composed of lime and a glutinous substance, substantially as and for the purpose set forth.

294,589. TOY BUILDING-BLOCK. CHARLES M. CRANDALL, Montrose, Pa., assignor to Fred W. Crandall and Benjamin L. Baldwin, both of same place. Filed Apr. 27, 1883. (No model.)

Claim.—1. A toy composed of a series of blocks with scroll-cut edges, and combined with cylindrical tower-blocks D and E and side blocks, F and G, as and for the purpose described.

2. In a toy, the combination of a series of blocks with scroll-cut edges, tower-blocks D and E, and a foundation formed from the box H, ornamented with a design in harmony with said blocks, as and for the purpose described.

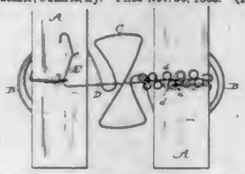
294,590. TOY. CHARLES M. CRANDALL, Montrose, Pa., assignor to Fred W. Crandall and Benjamin L. Baldwin, both of same place. Filed Nov. 23, 1883. (No model.)

Claim.—A toy composed of the foundation B, having a series of houses, *a*, at right angles to the same, each house bearing a given name, and provided at its rear with guides, elastics, and stop-pins, combined with a figure for each house, representing the names on the houses, and adapted to be projected into view from the roofs of the houses by the mechanism hereinbefore described.

294,591. COMBINED RESERVOIR AND PALETTE. FREDERICK S. DELLENBAUGH, New York, N. Y. Filed Dec. 6, 1883. (No model.)

Claim.—1. The combination, with an artist's palette, of one or more reservoirs adapted to contain pigments and permit the exit of the same upon the palette in quantities desired by the artist, substantially by means herein described.

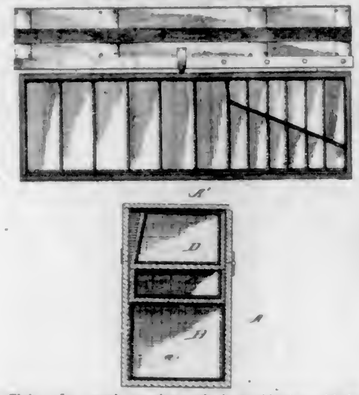
2. The combination, with an artist's palette, of an adjustable reservoir formed with an orifice at or near its base, and provided with means for forcing the pigment contained within said reservoir (or reservoirs) upon the palette in such quantity only as desired by the artist, substantially as set forth.



3. The combination, with an artist's palette, of reservoir A, provided with orifice C, cap D, screw B, and plunger F, all constructed and arranged to operate substantially as and for the purpose set forth.

294,592. MANUFACTURE OF CREAM OF TARTAR. FRANZ DIETRICH, Munich, Germany. Filed Oct. 23, 1883. (No specimens.)

Claim.—1. The process herein described of manufacturing cream of tartar from argols, consisting in treating the dissolved argols with phosphoric acid or its compounds, and then clarifying and decolorizing it, as set forth.



2. The method herein described of manufacturing cream of tartar from argols, consisting in treating the dissolved argols with phosphoric acid or its compounds, boiling the mixture, clarifying it with clay, and finally decolorizing it with animal charcoal which has been previously treated with muriatic acid, as set forth.

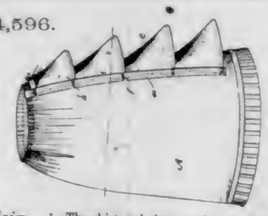
294,593. TWIN-BED-SPRING CONNECTOR. JOSEPH L. DIXON, Falmouth, Ky., assignor of two-thirds to George W. Dawson, same place, and Henry A. Hatcher, Guthrie, Ky. Filed Nov. 30, 1883. (No model.)

Claim.—The combination, with the twin spring united at the top as herein described, and provided with hooks at the bottom, of the coupler consisting of the wire D, provided with loops *d*, and the arm E, curved as described, and for the purpose set forth.

294,594. SALESMAN'S SAMPLE-TRUNK. ALEXANDER DODD, Baltimore, Md. Filed May 23, 1883. (No model.)

Claim.—In a sample-carrying trunk, the combination, with the body A, with its lid or cover A', of a compartment-receptacle, B, the receptacle C, and receptacle D, having the upward-sloping front, substantially as and for the purpose specified.

294,595. ORNAMENTAL CHAIN-LINK. VIRGIL DRAPER, North Attleborough, Mass. Filed Nov. 12, 1883. (No model.)



Claim.—The combination, with the link or loop c and rings *d*, of the staves *a* and the circular caps *b*, fitting over the ends of said staves, as described.

294,596. SKIRT. LOUIS DRYFOOS, New York, N. Y. Filed Mar. 17, 1883. (No model.)

294,596.

Claim.—1. The skirt and the pannier made substantially as described, in combination with means carried by the skirt and pannier, respectively, whereby the two may be detachably connected together, as and for the purposes hereinbefore set forth.

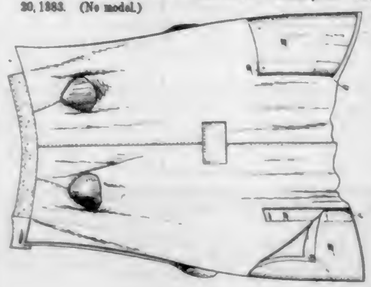
2. The pannier consisting of a backing of fabric, having a series of ruffles or strips arranged as described, in combination with the skirt provided with flaps *a* and buttons and button-holes or their equivalent on the edges of the pannier and the flaps *a*, respectively, whereby the said pannier may be detachably connected to the skirt, substantially as set forth.

294,597. NECKTIE-FASTENER. NATHAN I. DRYFOOS, Fremont, Ohio. Filed Dec. 18, 1883. (No model.)

Claim.—1. A necktie-fastener consisting of metallic clamp A', having wings *b* and *b'*, forming button-holder D, lap B, and lap C, having prongs C', substantially as shown, and for the purpose described.

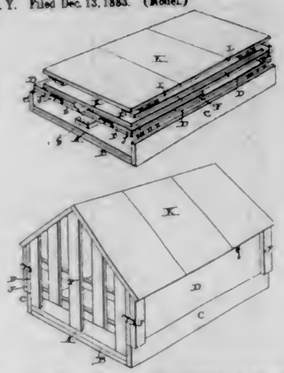
2. In a necktie-fastener, the metallic clamp A', having wings *b* and *b'*, forming button-holder D, and lap C, having prongs C', secured to the stock of the necktie, substantially as shown, and for the purpose described.

294,598. RAILROAD FROG AND SWITCH GUARD. PHILIP S. DURENBURY, Sedalia, Mo., assignor of one-half to W. Z. Baum and A. H. Randall, both of same place. Filed Apr. 4, 1883. (No model.)



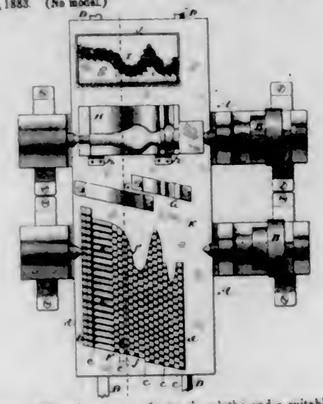
Brief.—A plate provided with shouldered ends and a longitudinal side flange placed between the rails and supported by a spring.

Claim.—1. In a guard for railway-crossings and switch-frogs, the strap D and the plate B, provided with shouldered ends and longitudinal flanges *d*, said plate being placed between the rails and supported by a spring, C, substantially as and for the purpose set forth.



2. In a guard for railway crossings and switches, the combination, with the plate having the end shoulders, *a*, and longitudinal flanges *d*, of the spring C and the strap D, secured at one end to the bed-plate, the opposite end resting on a shoulder of plate B, substantially as and for the purpose set forth.

294,599. OVERCOAT. HENRY EMANUEL, New York, N. Y., assignor to David Heineman and Solomon Lersch, both of same place. Filed Apr. 20, 1883. (No model.)



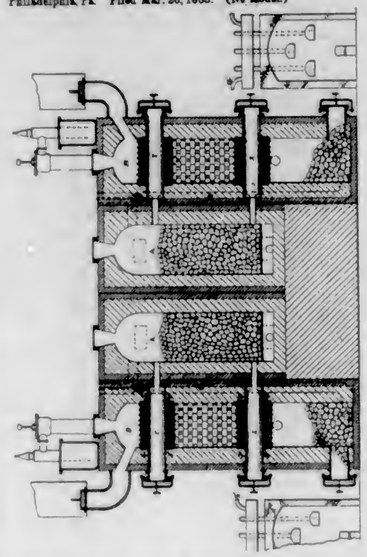
Claim.—A coat provided with open-ended pockets at the bottom of its skirts, said pockets being permanently stitched to the skirts the entire length of one of their edges and for a portion of their length along the opposite edge to leave unattached side portions, and means for attaching the loose upper corner of the pocket-piece to the skirt, substantially as described.

294,600. FOLDING COOP OR KENNEL. HENRY EVERSON, Hempstead, N. Y. Filed Dec. 13, 1883. (Model.)

Claim.—A folding coop or kennel composed of the combination of the bottom piece, A, provided with rigid side strips C, the folding sides D, the hinged piece E, which folds down upon the bottom, in between the rigid side pieces C and end piece or pieces, and the hinged roof K, substantially as shown and described.

294,601. TURNING-LATHE. HENRY W. FARLEY, Oswego, Ill. Filed Oct. 16, 1883. (No model.)

Claim.—1. With the centers of a turning-lathe and a suitable carriage adapted to be reciprocated across the lathe-bed, the combination of a cutting device consisting of a series of cutters, *a b*, arranged upon said carriage, having straight cutting-edges of different lengths, and joining in parallel rows or groups *c*, their cutting-edges in step form gradually inclined vertically to the surface of the carriage from the receiving to the finishing end of said cutter, the rows or groups *c* being of unequal length from their entering ends *f* to their finishing ends, the latter terminating in an ascertained irregular consecutive or continuous forming-line, *f'*, the counterpart of the curved outline or contour of the article produced by said straight-edged cutters, substantially as described.



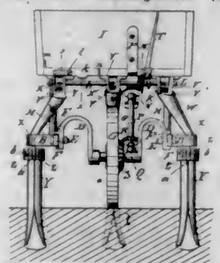
2. The combination, with the centers of a turning-lathe, of a suitable carriage adapted to have a reciprocating movement across the lathe-bed, and a cutting device consisting of a series of cutters, *a b*, arranged upon said carriage in parallel joining rows or groups *c* of unequal length, the cutting-edges whereof being straight and of unequal length, inclined in step form, the said rows or groups terminating in an ascertained irregular consecutive or continuous forming-line, *f'*, the counterpart of the curved outline or contour of the article produced, and one or more knife or saw edge cutters or blades, *d*, arranged at suitable points lengthwise between the said rows or groups of cutters, *a b*, coincident with the inclined cutting-surface thereof, substantially as described, for the purpose specified.

3. The combination, with the centers of a turning-lathe, of a suitable carriage adapted to have a reciprocating movement across the lathe-bed, a cutting device consisting of a series of cutters, *a b*, arranged upon said carriage in parallel joining rows or groups *c* of unequal length, the cutting-edges being straight and of unequal length and inclined in step form, the said rows or groups terminating in an ascertained irregular or continuous forming-line, *f'*, the counterpart of the curved outline or contour of the article produced, and one or more separate cutters or blades, G, having a cutting-edge conforming to the finished article and to the said irregular consecutive terminal forming-line, substantially as described, for the purpose specified.

4. The combination, in a turning-lathe, of a suitable carriage, E, adapted to have a reciprocating movement across the lathe-bed, with a cutting device consisting of rows of reducing and forming cutters F, constructed and arranged substantially as described, a suitable sand-paper block, H, and an oil or burnishing brush, I, all arranged upon said carriage, for operation substantially as described.

5. A lathe for turning forms, comprising a platform adapted to be reciprocated beneath the work, reducing and forming cutters F, arranged thereon in series of different lengths, which gradually increase in height from the plane of the table in step form, the inclined knife or saw edged shoulder-forming cutters *d*, the smoothing blade or blades G, the sand-paper block H, and the finishing oil-brush, all constructed and adapted for operation substantially as described.

294,602. HYDROCARBON-GAS GENERATOR. JOSEPH FLANNERY, Philadelphia, Pa. Filed Mar. 20, 1883. (No model.)



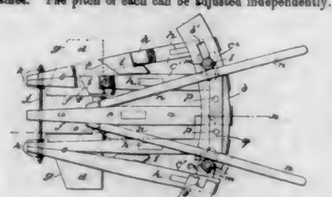
Claim.—1. The combination of a series of gas retorts or generators, a pipe leading therefrom and connecting with the base of the generating-chamber, a steam-jet nozzle, which is placed in the pipe for the purpose of exhausting the gas from the retorts or generators, and the generator-chamber in which fire is made, and up through which fire the commingled steam and gas is made to pass for the purpose of fixing the gas, substantially as shown.

2. The combination of the generator-chamber A and regenerative chamber B, both chambers having a fire made in them, and through both of which fires the gas is made to pass, a passage-way between the two chambers, and suitable retorts which are passed through the chamber B and connected with the chamber A, substantially as described.

3. The combination of the chambers A B, located side by side and connected together, the gas generators or retorts, the pipe G, connected both with the retorts and the chambers, a steam-jet nozzle connected with the pipe for exhausting the steam from the retorts, and the by-pass valves *a*, whereby the gas directly from the retorts may be forced into either the chamber A or B, substantially as set forth.

4. The combination of a retort or chamber with a jacket and a filling of lead or other metal between the jacket and the retort, substantially as specified.

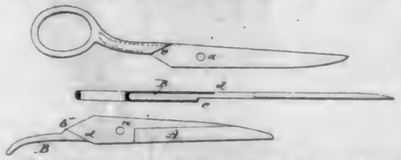
294,603. GRAIN-DRILL. MOSES FRANKLIN FOLEY and THOMAS ALBERT FOLEY, Waveland, Ind. Filed Aug. 6, 1883. (No model.)



Claim.—1. The combination of the median beam, A, split and spread apart as shown, the bent side beams, B B, bolted at their front ends to the spread part of beam A, and the brackets D D, to support all parts of the drill on a median rear wheel, as shown and described.

2. The combination, with the beams B, of the brackets D, provided with lugs F, overlapping the upper and lower sides of said beams, as shown and described.

294,604. COTTON SCRAPER AND CULTIVATOR. SETH HAMPTON FOUNTAIN, Amite City, La. Filed July 17, 1883. (Model.)

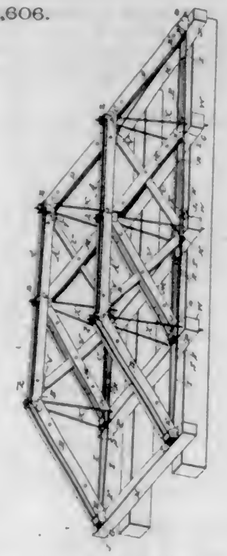


Brief.—Two hilling-plows of differing sizes behind each scraper, the scraper being on the middle beam and the hilling-plows upon the side frames. The pitch of each can be adjusted independently.

Claim.—1. The combination, in a cotton-cultivator, of the two front scrapers, beveled at *g*, and having an open space between them, and two shovels, *i i*, arranged in the rear of each scraper, the scrapers being made vertically adjustable and the plows laterally adjustable, as and for the purpose specified.

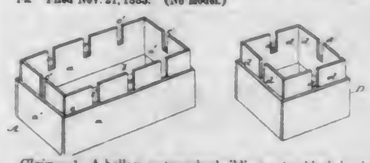
2. The bar *b*, bolt *j*, screw-bolt *s*, and nuts *r r' t t'*, in combination with the beam *a*, handles *n*, and frame *p q*, jointed together to allow the scrapers to be graduated in depth, as described.

294,605. MANUFACTURE OF SCISSORS. JAMES D. FRARY, Bridgeport, Conn. Filed Oct. 22, 1883. (No model.)



Claim.—The herein-described improvement in the manufacture of scissors, consisting in forging the blade and shank complete in one piece, the shank extending from the side of the blade opposite the striking-surface, and offset from the plane of the blade, so as to project beyond the flat surface of the blade, and then casting the soft-metal bow onto the shank, and so as to inclose said shank, substantially as described.

294,606. TRUSS-BRIDGE. MILTON C. FRITS, La Harpe, Ill. Filed Dec. 5, 1883. (No model.)

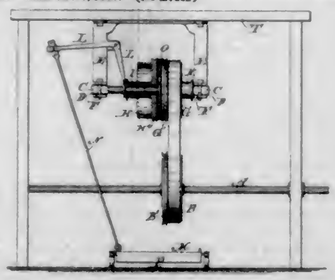


Brief.—Consists of truss-beams having shouldered ends, end struts having shouldered ends, shoes, longitudinal rods, inner struts, shoes bearing against their ends, shorter longitudinal rods, links connecting the inner ends of the longitudinal rods, vertical rods having nuts at both ends, and cross-beams.

Claim.—The combination of the truss-beams having shoulder ends, the end struts having shouldered ends, the shoes, the longitudinal rods, the inner struts, the shoes bearing against their ends, the shorter longitudinal rods, and the links connecting the inner ends of the longitudinal rods, the vertical rods having nuts at both ends, and the cross-beams, all constructed as and for the purpose shown and set forth.

294,606.

294,607. TOY BUILDING-BLOCK. CHARLES W. FROST, Philadelphia, Pa. Filed Nov. 21, 1883. (No model.)



Claim.—1. A hollow rectangular building or toy block having rabbeted edges on opposite sides, the rabbet or edge on one side being slotted, substantially as shown and described.

2. A series of building or toy blocks of whole, half, and quarter sizes, relatively, all the blocks of the series being hollow, rectangular, and rabbeted on opposite sides, the rabbets on one side of each block being slotted for engagement with lapping blocks or blocks of different sizes, substantially as shown and described.

3. Door or window frames for block structures or designs, the same consisting of hollow rectangular blocks having elongated sides, with rabbets or flanges, substantially as shown and described.

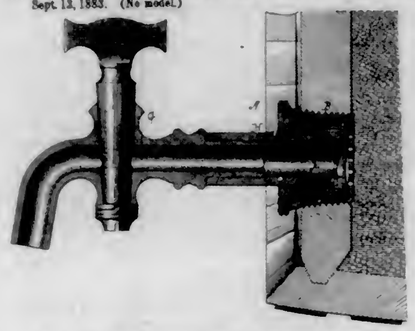
4. The combination, with a series of hollow rectangular building-blocks having slotted rabbeted edges, of sills, cornices, and door and window frames having rabbeted edges, and adapted and designed to engage with said blocks, substantially as shown and described.

294,608. MOTION-TRANSMITTER. HENRY GARDNER, Bordentown, N. J. Filed Dec. 5, 1883. (No model.)

Claim.—1. The stationary shaft C, provided with square ends, in combination with the depending hangers E E, secured to the under side of the table, and provided at their lower ends with the angular open sockets D D, and the bolts F F, for retaining the squared ends of the shaft within the sockets, substantially as set forth.

2. A motion-transmitter consisting of the shaft having its squared ends mounted in the open angular sockets D in the lower ends of the hangers E, and the retaining-bolts F, the stationary shaft also provided with the pulleys G H, between the adjacent faces of which is mounted a flexible disk, and the sleeves I K, on the shaft outside of the pulleys, the former being operated by a forked elbow-lever pivoted to the hanger above the shaft, and the long arm of said lever being in turn connected by a rod, N, to the treadle M, having the weight P on its under rear edge, substantially as set forth.

294,609. BALE-TIE. JOHN W. GARLAND, Allegheny City, and EMIL BECKER, Pittsburg, assignors to the Oliver & Roberts Wire Company, (Limited,) Pittsburg, Pa. Filed Jan. 11, 1884. (No model.)



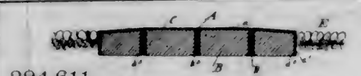
Claim.—1. In a wire bale-tie, a loop bent back upon itself, so as to form a hook and tongue, the extremities of the bent middle portion of the loop being spread so as to be capable of receiving and interlocking with another similar tongue and reflexed loop, substantially as and for the purposes described.

2. In a wire bale-tie, a loop bent back upon itself, so as to form a hook and tongue, said tongue being partially twisted, and the bent middle portions of the loop spread so as to receive and interlock with another similar tongue and reflexed loop, substantially as and for the purposes described.

3. A bale-tie buckle consisting of two reflexed loops and tongues, *b b'*, substantially as and for the purposes described.

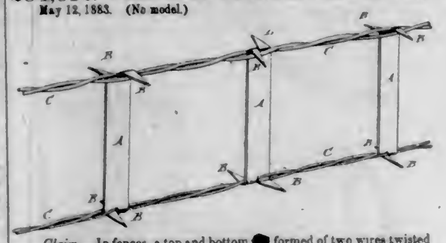
294,610. COMBINED FAUCET AND TAP VALVE. KING C. GILLETTE, New York, N. Y., assignor to Joseph L. Spofford, same place. Filed Sept. 13, 1883. (No model.)

Claim.—1. The combination, with a faucet having notches in its end, of a cup or shell with a perforated bottom, a valve with inclined ways engaging with guides in the interior of the cup or shell, and provided with lugs for engaging with the notches in the faucet, and an elastic ring or washer confined within the cup and adapted to be compressed around the faucet by the forward movement of the valve, substantially as set forth.



2. A tap-valve consisting of a threaded cup with perforated bottom, a removable annular face-plate and elastic ring or washer, and a screw-threaded valve provided with lugs or ears, in combination with a faucet of a conformation to be inserted through the face-plate and elastic ring, and having notches in its end for engaging with the lugs or ears on the valve, whereby the latter may be turned and raised, substantially as set forth.

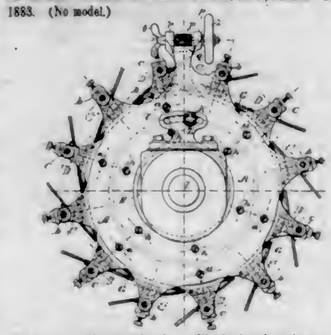
3. The combination, with a cup or shell having a perforated bottom, of the removable annular plate C, the elastic ring F, washer E, screw-threaded valve D, having lugs *g g*, and a faucet provided with notches or slots for engaging with and operating the valve in the manner set forth.



4. The combination, with the shell or cup B, having a perforated bottom, of an annular face-plate, C, an elastic ring or washer confined thereby, a plate or valve having lugs *g g*, and inclined flanges or threads engaging with guides in the cup, and a faucet having a cylindrical shank provided with a groove, *h*, and slots K K, all substantially as herein described.

294,611. IRON PAVING-BRICK. JAMES M. GLENN, Cincinnati, Ohio. Filed June 18, 1883. (No model.)

Claim.—A paving brick or block consisting of a cast-iron shell, as A, and a concrete filling, as B, with yielding stripe, as C, interposed between the cast-iron shell and concrete filling, constructed substantially in the manner and for the purpose described.



294,612. BARBED FENCE. WILLIS K. GORE, Johnstown, Pa. Filed May 12, 1883. (No model.)

Claim.—In fences, a top and bottom [illegible] formed of two wires twisted together, in combination with intermediate vertical plates, A, having at each end two barbs, B B, bent and passing in opposite directions through the twisted wires, as shown and described.

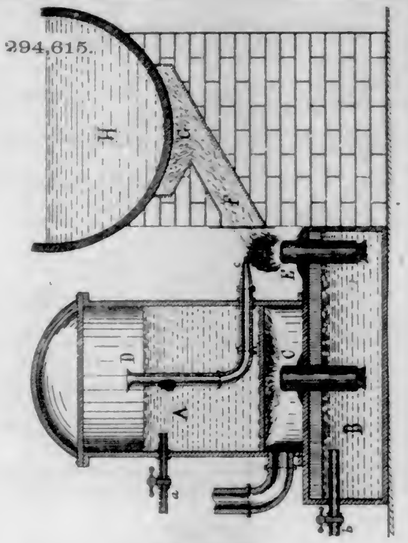
294,613. COMMUTATOR FOR MAGNETO OR DYNAMO ELECTRIC MACHINES. ZÉNOBE THÉOPHILE GRAMME, Paris, France. Filed Dec. 18, 1883. (No model.)

Claim.—1. The combination, with the brush sockets or carriers and the common support therefor, of the devices for shifting the said sockets or carriers and the common support for said devices, substantially as described.

2. The combination, with two or more pairs of commutator-brushes, of mechanism, substantially as described, for simultaneously moving said brushes into and out of contact with the commutator-disk, as set forth.

3. The combination, with brush sockets or carriers, movable to bring the commutator-brushes into and out of contact with the commutator-disk, of a ring or plate movable around the axis of said disk, and connected with said sockets or carriers to shift the same, substantially as described.

4. In combination with the brush sockets or carriers, plates fastened together but insulated from each other, and connected, respectively, with sockets or carriers of unlike sign, substantially as described.



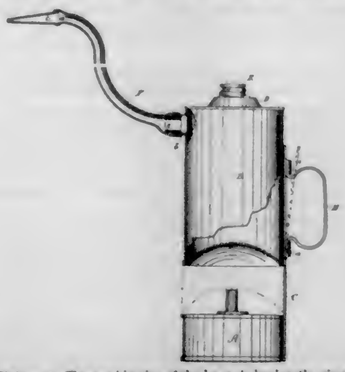
5. The combination, with the brush sockets or carriers, of the two supports connected with said sockets or carriers, said supports being movable with respect to each other to move the brushes toward and away from the commutator-disk, and movable together to adjust the position of the brushes with respect to the neutral and maximum points on the commutator-disk, substantially as described.

6. The combination, with the commutator disk and brushes of an electrical machine, of means, substantially as described, for simultaneously moving the said brushes toward and away from the commutator-disks, and for simultaneously adjusting the position of the brushes with respect to the neutral and maximum points on the commutator-disk, substantially as described.

294,614. HYDROCARBON-BURNER. WILLIAM LAMPAS GREGG, Philadelphia, Pa. Filed June 11, 1883. (No model.)

Claim.—The combination of the oil-tank B, the burners C E, fed therefrom, the receiver A, situated above the burner C, the discharge-pipe D, the nozzle of which is situated over the burner E, and the ignited-gas conducting-flue F, located in line with the nozzle of the pipe D, substantially as and for the purpose set forth.

294,615.

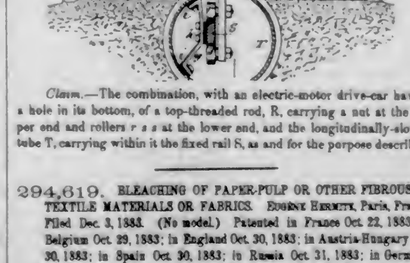


294,615. WIRE-FENCE FASTENER. CHARLES E. GRIFFITH, Storm Lake, Iowa. Filed Sept. 27, 1883. (No model.)

Claim.—1. A fastening for wire fences, consisting of a screw-threaded shank, *a*, and a spirally-curved eye, *b*, having an offset and lapped end to form an outlet from the eye, substantially as shown and described.

2. The combination, with a wire-fence cable or strand, of the fastening A, consisting of a screw-threaded shank, *a*, and a spirally-curved eye, *b*, having an offset and lapped end, substantially as shown and described.

294,616. DEVICE FOR DESTROYING INSECTS. CHARLES J. GUSTAVESON, Salt Lake City, Utah. Filed May 23, 1883. (No model.)



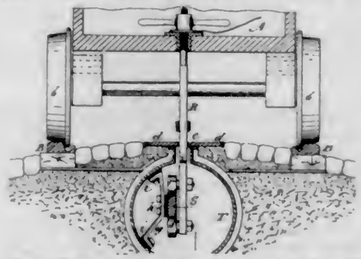
Claim.—1. The combination of the lamp A, having the single bent spring-standard C, with the vessel B, having loops or keepers *a a*, for sustaining and adjusting the vessel above the lamp, as described.

2. The combination, with the lamp A, having standard C, of the vessel B, made adjustable thereon, and adapted to slide down and rest upon the wick-tube to form a cover for the same, as described.

3. The combination, with vessel B, having nipple *b*, of the flexible tube F and internal supporting-wire, *d*, with friction-sleeve *e*, substantially as shown and described.

4. The combination, with the standard C and vessel B, having keepers *a a*, of the curved handle H, having its ends secured along with the standard in said keepers, as shown and described.

294,617. TWO-WHEELED VEHICLE. WILBUR F. HEATH, Fort Wayne, Ind. Filed Apr. 14, 1883. (No model.)

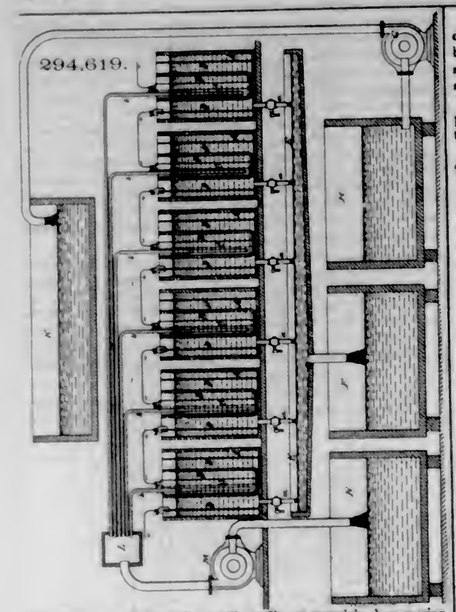


Claim.—1. The combination of the body A, the draft-frame having the cross-bar H, the bars G G, pivoted to the under side of the body, the shackle-bars which connect said bars G G to the cross-bar H, the flat steel springs I, secured to the body directly above the axle, and the shackle-bars, each pivoted at one end to one of the bars G and at the other end to a spring, I, the aforesaid parts being arranged substantially as set forth, to permit the flat spring to be secured as aforesaid between the axle and the seat, and whereby a displacing-strain upon the spring-fastening is avoided.

2. The combination of the draft-frame having the forward part, C C, with downwardly-curved rear ends, and the rear portion, D D, with upwardly-curved front ends rigidly secured to the downwardly-curved parts of the forward portion, C, whereby there is produced a strong two-part draft-frame, which permits the body to be hung low, the rocking bars G, below the body, pivotally secured at the forward ends to the draft-frame, and the flat steel springs fastened to the bottom of the body and pivotally secured to the rear ends of said rocking bars, substantially as set forth.

3. The combination of the body, the draft-frame secured to the axle, the rocking bars G G, pivotally connected to the draft-frame at their front ends, the flat springs I, connected with the rocking bars at their rear ends, and the supplemental springs K, below the springs I, and arranged to support the body when unusual weight is upon it, substantially as set forth.

294,618. GRIP FOR ELECTRIC CARS. JOHN CARLOS HENDERSON, New York, N. Y. Filed July 30, 1883. (No model.)

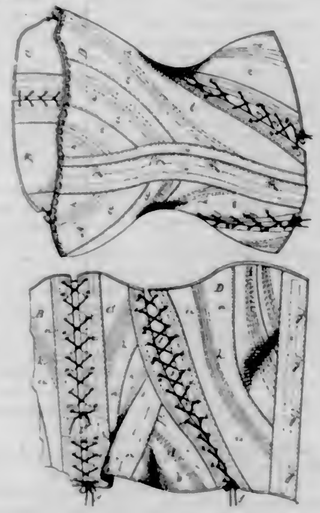


Brief.—Device for increasing friction of car-wheels upon rails of the track. The bar S may serve as electrical conductor.

Claim.—The combination, with an electric-motor drive-car having a hole in its bottom, of a top-threaded rod, R, carrying a nut at the upper end and rollers *r s s* at the lower end, and the longitudinally-slotted tube T, carrying within it the fixed rail S, as and for the purpose described.

294,619. BLEACHING OF PAPER-PULP OR OTHER FIBROUS OR TEXTILE MATERIALS OR FABRICS. EUGENE HERMITE, Paris, France. Filed Dec. 3, 1883. (No model.) Patented in France Oct. 22, 1883; in Belgium Oct. 29, 1883; in England Oct. 30, 1883; in Austria-Hungary Oct. 30, 1883; in Spain Oct. 30, 1883; in Russia Oct. 31, 1883; in Germany Nov. 3, 1883; in Norway Nov. 3, 1883; in Italy Nov. 8, 1883; in Denmark Nov. 8, 1883; in Sweden Nov 10, 1883, and in Portugal Dec. 22, 1883.

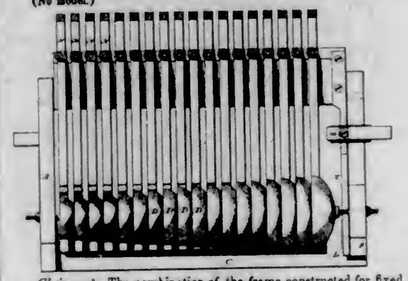
294,619.



Claim.—1. In bleaching textile or fibrous materials, decomposing chlorides of soda or potash by an electric current under such conditions as to cause the formation of an alkali (soda or potash) and a metallic chloride, preferably chloride of lead, substantially as hereinbefore described.

2. In bleaching textile or fibrous materials, decomposing the metallic chloride in the presence of the materials that are to be bleached, and recovering the metal in the metallic state for use in subsequent operations, substantially as hereinbefore described.

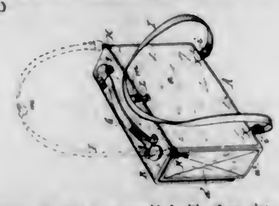
3. In an apparatus for bleaching fibrous materials, the combination of a rag-engine or equivalent apparatus with the above-described devices for simultaneously effecting the electrolysis of the metallic chloride, bleaching the pulp, and recovering the precipitated metal, substantially as set forth.



294,620. CORSET. CHARLES W. HIGBY, Jackson, Mich. Filed Sept. 7, 1883. (No model.)

Claim.—1. A corset composed of four parts, A, B, C, and D, each of said parts consisting of a series of diagonal sections, *a*, with diagonal bones *h* placed therein, the parts being united by lacing-cords *f*, all constructed and arranged in the manner hereinbefore particularly described and set forth.

2. A corset with the four parts A, B, C, and D composed of the pieces *a* and gores, as shown, said parts being adapted to be united by the lacing-cords *f*, as and for the purpose described.



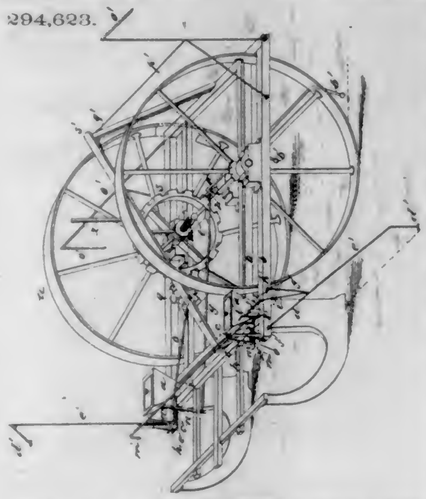
294,621. REED-ORGAN ATTACHMENT. WILLIAM HOPER, New Haven, Conn., assignor to B. Shoninger, same place. Filed June 11, 1883. (No model.)

Claim.—1. The combination of the frame constructed for fixed arrangement within the organ-case, the series of bells D, hinged hammers M, rocker-board F, hung in said frame, levers N, hung upon said rocker-board, one arm extending forward into a position to stand beneath the corresponding key of the organ, the other arm extending rearward to its corresponding hammer-lever, and the stop mechanism, substantially such as described, in connection with said rocker-board, all arranged within and as a part of said frame, and whereby said rocker-board may be turned to bring the forward arm of the levers N into a position to be acted upon by the respective keys, substantially as and for the purpose described, said frame, bells, rocker-board, hammers, and levers constituting a structure independent of the organ itself.

2. The combination of the bells D, hinged hammers M, corresponding keys, the hinged board F, carrying intermediate levers, N, the stop-slide I, and adjusting-screw *m*, substantially as and for the purpose described.

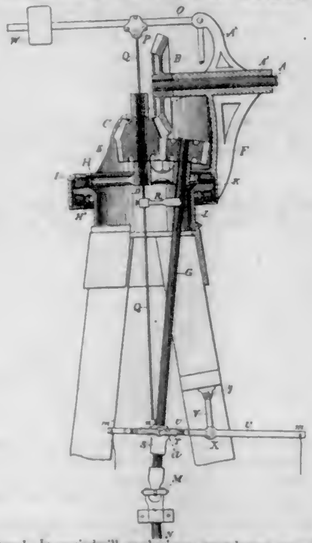
294,622. SCHOOL-BAG. MICHAEL HÖNINGER, Buffalo, N. Y., assignor of one-half to John C. Pickelmann, same place. Filed Oct. 18, 1883. (No model.)

Claim.—1. A school-bag provided with a front plate, *a*, back plate, a^2, cover B, and end plate, *a'*, having vertical ways or grooves *c*, arranged near the back plate, a^2, and adapted to receive a slate, which latter confines the books and papers in the body of the bag when the cover B is opened, substantially as described.



2. In a school-bag, the combination of a body provided with top hooks, H H L, and bottom hooks, K K, and a carrying-strap, I, provided with end rings, *i i*, and a central ring, *m*, substantially as set forth.

294,623. CORN-PLANTER. WILLIAM HOPPER and ISAIAH J. ALLEN, Jefferson, Iowa. Filed Oct. 5, 1883. (No model.)



Claim.—1. The combination, with the dropper-slide, of the transverse rock-shaft *i*, mounted on standards *m m* at the forward end of the frame, and provided with downwardly-projecting arms *h h*, engaging the dropper-slide, and with an arm, *n*, connected with the gear-wheel *q* and the transverse rock-shaft *a'* at the rear end of the frame, to which are attached the denters *b'* by the rods *o y*, whereby the dropper-slide and denters are simultaneously operated, substantially as set forth.

2. The combination, with rock-shaft provided with arms *m' m'* at each end, arms *h h*, and arm *n*, of the dropper-slides, operated by the arms *h h*, the spring-levers *j*, connected with the pointers *d d'* by rods *i'*, and operated by the arms *m' m'*, the denters *b'* on rock-shaft *a'*, connected to arm *n* by rod *y*, and a rod, *o*, connecting the gear-wheel *q* with the arm *n*, whereby motion is imparted to the rock-shaft *i*, and the above-named parts connected therewith, substantially as set forth.

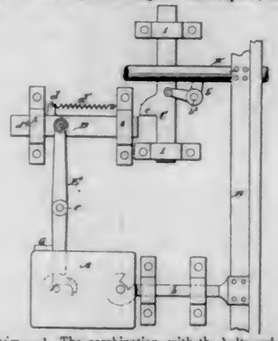
294,623.

294,624. SHIFTING APPARATUS FOR WINDMILLS. LEANDER M. HOSKINS, Evansville, Wis. Filed Aug. 6, 1883. (No model.)

Claim.—1. In a windmill employing a secondary or compensating turn-table, revolving at a different rate of speed from that of the main turn-table, an apparatus for shifting the wind-wheel in and out of the wind, consisting of three sets of devices, of which one connects and revolves concurrently with the main turn-table, another with the secondary or compensating turn-table, and the third is so secured to the tower as to avoid revolution with the turn-tables, the three sets being swiveled so as to act independently of each other, for the purpose set forth.

2. In a windmill employing a secondary or compensating turn-table, and an oblique shaft arranged as described, a sleeve loosely adjusted upon said shaft, and connecting with the compensating turn-table by means compelling it to revolve concurrently therewith, for the purpose set forth.

3. In a windmill employing a secondary or compensating turn-table, and an oblique shaft arranged as described, the combination, with a sleeve loosely adjusted upon said shaft, and revolving concurrently with the compensating turn-table, of a rod connecting said sleeve with the shifting devices attached to the main turn-table, and swiveled to allow of the different rates of revolution of said turn-tables, for the purpose set forth.



4. In a windmill employing a secondary or compensating turn-table, and an oblique shaft arranged as described, the combination, with a sleeve loosely adjusted upon said shaft, and revolving concurrently with the compensating turn-table, of a second sleeve or ring swiveled upon the first-mentioned sleeve and connecting with the shifting devices attached to the tower by means preventing said sleeve or ring from revolving by the revolution of the turn-tables, for the purpose set forth.

5. In a windmill employing a secondary or compensating turn-table, and an oblique shaft arranged as described, the combination, with a sleeve loosely adjusted upon said shaft, and a second sleeve or ring swiveled upon it, of a lever attached to said sleeve or ring and to the tower by means preventing the revolution of said sleeve or ring, and allowing both sleeves to change position according as the position of the oblique shaft varies, for the purpose set forth.

6. In the windmill described, the combination, with the sleeves S and T, the former revolving concurrently with the secondary or compensating turn-table, of the lever U, provided on both sides of its fulcrum with means adapting the sleeves to be actuated either upward or downward from the base of the tower, for the purpose set forth.

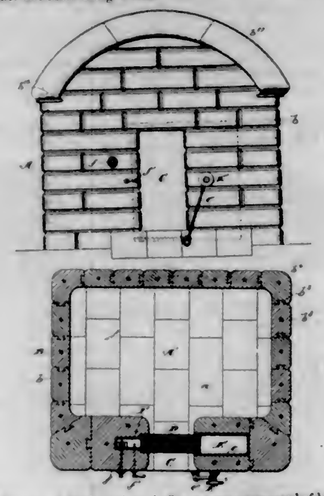
7. In the windmill described, the arm R, rigidly attached to the rod Q, and loosely embracing the oblique shaft G, for the purpose set forth.

294,625. SAFE-LOCK. JOHN T. HOUGH, Chicago, Ill., assignor of one-half to John A. Harper, Pittsburg, Pa. Filed Sept. 18, 1883. (No model.)

Claim.—1. The combination, with the bolts and bolt-work of a safe, vault, or other lock-up, of a vertically-reciprocating lipped or recessed bolt actuated by the movement of the locking-bolts, a spring-actuated safety-bolt adapted to engage with the latter, a detachable lock-bar connected with said bolt and with the lock-spindle, and a notched keeper against which said lock-bar rests, thereby holding the safety-bolt out of engagement with the lipped bolt, substantially as described.

2. The combination, in a safe or vault lock, of the locking-bolts, the bolt-work, the vertically-sliding lipped bolt connected with and actuated by the bolt-work, the horizontally-sliding safety-bolt, the guide-staple for the latter, a pin arranged in an aperture in the safety-bolt and normally projected by a spring to bear against the staple when the safety-bolt is advanced, and a lock-bar connected with the safety-bolt and with the spindle of the lock-bolt, substantially as described.

3. The combination, with the locking-bolts, of a lipped or recessed bolt, a bell-crank lever connecting said parts, by which the lipped bolt is reciprocated by the action of the locking-bolts, and a spring-actuated safety-bolt engaging with said lipped or recessed bolt when the lock is tampered with, substantially as described.



4. The combination of the lock having its spindle projecting from the back thereof, a grooved nut secured on the said projecting end of the spindle, the lock-bar having its lower end forked and engaging the nut, a safety-bolt connected with the upper end of the lock-bar, a vertically-sliding lipped bolt, and the bolt-work connected with and actuating the vertically-sliding bolt, substantially as described.

5. The combination, with the lock A, having spindle *a* and keeper G, of the lock-bar E, the safety-bolt D, having spring *d'*, the lipped bolt C, bell-crank *b'*, and bolts B', substantially as described.

6. The combination of the locking-bolts of a safe or vault, the bolt-work, a vertically-sliding lipped bolt connected with and actuated by the bolt-work, a sliding safety-bolt, a lock-bar connected with the latter and with the spindle of the lock, and means for holding the safety-bolt in engagement with the lipped bolt, and thereby preventing the movement of the bolt-work, substantially as described.

294,626. BANK-VAULT. JOHN T. HOUGH, Chicago, Ill., and JOHN A. HARPER, Pittsburg, Pa. Filed Sept. 18, 1883. (No model.)

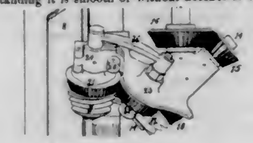
Brief.—Constructed of blocks of hard cast-iron united by tongue and groove on one face, and dovetailed upon the faces at an angle thereto. Rods pass through the blocks and are secured by nuts in pockets in the end blocks. The door moves in a steel-lined recess, and the lock and bolt work is located in a corresponding steel-lined recess in the opposite side of the doorway. The door consists of a solid block of hard iron cast upon a perforated wrought-iron case in the center thereof. The vault has an inner and outer lining of steel.

Claim.—1. A bank-vault or similar structure composed of blocks of hard cast-iron or equivalent material, said blocks being tongued and grooved upon one face and dovetailed upon the faces at an angle thereto, and united by tie-rods, substantially as described.

2. The combination, in a bank-vault, of the blocks jointed in the manner described, the rods binding the several courses together, and nuts set in pockets in the end blocks to receive the ends of the tie-rods, substantially as described.

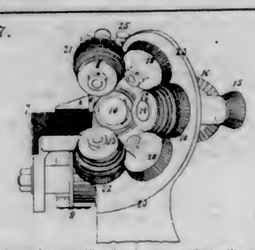
3. The combination, with the walls composed of hard cast-iron blocks united in the manner set forth, of a door moving in a steel-lined recess in the wall, and a lock and bolt-work set within a corresponding steel-lined recess upon the opposite side of the doorway, substantially as described.

4. The combination, with the blocks forming the side wall, of the angular corner blocks, dovetailed to the adjacent blocks upon their vertical faces, and having a tongue-and-groove joint upon the other faces, the outer corners of said blocks being rounded and tie-rods being passed through the whole course, substantially as described.



5. The combination, with the door moving in a steel-lined recess in the body of the thickened wall, having a perforated wrought-iron case in the center, and having friction-rolls supporting it, of a rack-bar attached to the bottom of said door, a pinion engaging therewith, and means for rotating the latter, substantially as described.

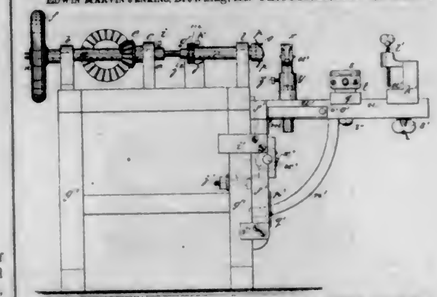
6. The combination, with the recessed wall, of a door moving therein and extending beyond the limits of the doorway in all directions when closed, said door being composed of a solid block of hard cast-iron and a perforated wrought-iron case in the center, upon which the body of the door is cast, substantially as described.



7. The combination, with a bank-vault composed of hard cast-metal blocks jointed together by tongues and grooves and dovetails in the manner set forth, and having tie-rods binding the individual blocks and several courses together, of an inner and outer lining of steel, substantially as described.

294,627. DEVICE FOR DRIVING A HELICAL SEWING-NEEDLE. EDMUND HUNT, Glasgow, County of Lanark, Scotland. Filed Dec. 5, 1883. (No model.) Patented in England July 17, 1878, No. 2,856; in France Jan. 16, 1879, No. 128,474, and in Germany Feb. 11, 1879, No. 9,802.

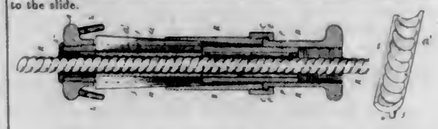
Brief.—The invention relates to sewing-machines of the kind by which a thread is laid in a helical form, passing around the edges of the material to be sewed together. The needle is driven in a positive manner, notwithstanding it is smooth or without notches or teeth.



294,627.

Claim.—A sewing-machine having a needle in the form of a conical helix, and conical helically-grooved pulleys supporting and adapted to drive said needle, substantially as described.

294,628. FELLY-BORING AND SPOKE-TENONING MACHINE. EDWIN MARVIN JENKINS, Browning, Mo. Filed June 20, 1883. (No model.)



Claim.—1. The combination of the rotary hollow mandrel *a*, adapted to carry a tenoning-head or boring-bit, and a hollow cutter and boring-socket, *j*, with a shaft, *g*, arranged to slide in said socket and mandrel and be screw-clamped thereto, having a key-seat along its whole length, and provided with a stop, *n*, as and for the purpose described.

2. The combination, with the table *u*, of the chuck *q s* on a transverse right and left screw, *t*, the clamping-bolt *v*, the rest *w*, held at different adjustments in a socket-post, *y*, by a screw, *z*, and arranged between the spoke-holder and tool, the clamp-lever *x*, pivoted to the top of said rest, the lever *c'*, connected by a cord with lever *x*, and pivoted to the frame at *d''*, and the ratchet *e'*, as and for the purpose specified.

3. The combination, with the chuck *q s* and felly-clamp *k' l'*, of a table, *u*, arranged to shift up and down to determine the relation of said chuck and clamp to the tool-socket, as shown and described.

294,629. FIRE-ESCAPE. GEORGE R. JENKINS, Weston, Ky. Filed May 19, 1883. (No model.)

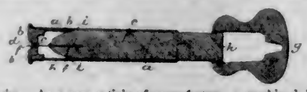
Brief.—The stock is slotted at the top for the insertion of two flanged semi-tubular clamp-sections corrugated on their inner sides. A tubular slide is pushed up on these clamps by a screw-threaded hand-piece moving up on the screw-threaded portion of the stock and coupled to the slide.

Claim.—1. In a fire-escape, the combination, with the tubular stock having the slots and the grippers loosely located therein, of a vertically-playing compressing-cylinder and means for operating it, substantially as set forth.

2. The combination of the semi-cylindrical grippers having the beveled flange, a tubular stock, and means for compressing said grippers, substantially as described and shown.

3. The stock provided with the crown, having the bolt-loops, in combination with the grippers, the compressing-cylinder, and the band-tube, substantially as specified and shown.

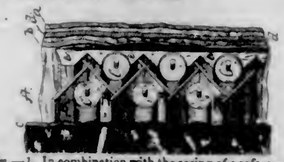
4. In a fire-escape, the combination of the slotted tubular stock having the lower portion threaded, the semi-cylindrical grippers having the beveled flange, the compressing-cylinder having the beveled grooves, the internally-threaded hand-tube flanged at the upper end, and the flanged coupling-collar, all substantially as described and shown.



5. The tubular slotted stock provided with the crown and the in-

ternal thimble, in combination with the grippers, the compressing-cylinder, and the hand-tube, substantially as set forth.

6. The combination of a rope, the semi-cylindrical grippers adapted to grip the rope in its straight vertical position, the compressing-cylinder, and means for operating the same, all substantially as specified and shown.



7. The combination of the tubular slotted stock, the internal thimble, the grippers having the diagonal corrugated semi-cylindrical surface and the compressing-cylinder, and the hand-tube, substantially as set forth.

294,630. CARTRIDGE-LOADER AND CAP-EXPELLER. LOUIS KELLER, New York, N. Y. Filed Nov. 19, 1883. (No model.)

Claim.—As a new article of manufacture, a combined loader and cap-expeller in which the body of the loader is truly cylindrical, and with the expelling-needle at one end thereof, and a handle the recess in which is bell-mouthed, and adapted to receive either end of the loader, substantially as and for the purposes set forth.

294,631. BURGLAR-PROOF SAFE. GEO. W. KENNEDY, Garnaville, Iowa. Filed Dec. 26, 1883. (No model.)

Claim.—1. In combination with the casing of a safe, a series of plates set at an angle between the walls of the casing, and a series of rollers arranged on opposite sides of the plates and in the angle thereof, substantially as described.

2. In combination with the outer and inner walls of a safe-casing, a plurality of metallic plates set between the walls at an angle, a series of rollers arranged on opposite sides of the plates and in the angles thereof, and an elastic filling between the outer casing and the plates and rollers, substantially as described.

3. In combination with the outer and inner walls of a safe-casing, an intermediate partition-wall, an elastic filling between the outer wall and the partition, a plurality of plates set at an angle between the partition and the inner wall, a series of rollers arranged on opposite sides of the plates and in the angle thereof, and an elastic filling between the partition and the plates and rollers, substantially as described.

4. A safe-casing consisting of an inner and an outer wall, an intermediate partition-wall, and elastic filling between the outer wall and the partition, substantially as described.

5. A safe-casing consisting of an outer and an inner wall, an intermediate partition-wall, an elastic filling between the outer wall and the partition, and another elastic filling between the partition and the filling of the inner space, substantially as described.

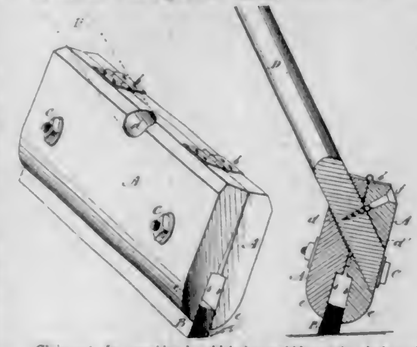
6. A safe-casing consisting of an outer and an inner wall, an intermediate partition-wall, an elastic filling between the outer wall and partition, a plurality of rollers journaled in between the partition and the inner wall, and an elastic filling between the partition and the rollers, substantially as described.

294,632. VEHICLE-AXLE. SIMON KENNEDY, Auburn, N. Y., and SAMUEL G. WARNER, Wilmington, Del., assignors to the Alfred E. Smith and Warner Axle Company, of Delaware. Filed July 24, 1883. (No model.)

Claim.—1. An axle for vehicles, having on its outer end an annular groove and a rounded or curved head projecting beyond the axle-box, in combination with a binding screw-cap having an internal annular groove corresponding with the groove on the axle, a catch or washer to fit said grooves, and attached to said cap by means of a spring, and an axle-box with a screw-threaded end to receive said cap-nut, substantially as described.

2. A binding screw-cap provided with an elastic end bearing for the axle, in combination therewith, when the latter is held within the axle-box by means of a washer or catch, the parts being held together by said cap, substantially as set forth.

3. The combination of the axle A, with or without a grooved end, the axle-box B, with screw-threaded end, and the spring *m*, with catch or washer attached thereto, the latter operating to hold the axle and axle-box together when retained in position by a binding-nut screwed on the end of the axle-box, as set forth.



294,633. TOOL-HANDLE. JOHN A. KING, St. Louis, Mo. Filed June 30, 1883. (No model.)

Claim.—1. A tool having a handle with wooden body for grasping, and a weighted metal cap to adapt it to form a hammer, as set forth.

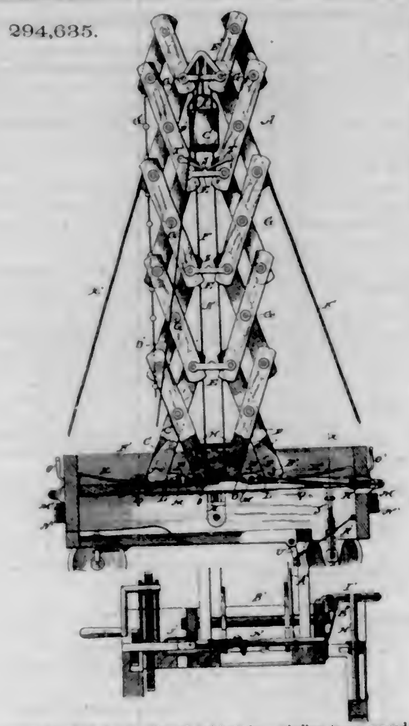
2. A combined hammer and screw-driver having wooden body A, for grasping, and weighted metal cap for driving a screw, as set forth.

294,634. SCRUBBER. PETER O. KING and ANDREW M. CARLSON, Valley City, Dak. Filed Aug. 25, 1883. (Model.)

Claim.—1. In a scrubber in which the scrubbing-surface is formed by a strip of rubber or other analogous material held in place by an adjustable clamp, the combination, with the scrubbing-strip B, of the clamping-jaws or side pieces, A A, constructed to receive the inner portion of said strip within them, the hinges *b b*, by which said jaws are connected together along their tops, and one or more adjusting-screws, C, arranged intermediately of the hinges and scrubbing-strip, substantially as specified.

2. The combination of the hinged jaws or clamping side pieces, A A, of the scrubber, having an oblique hole, *d d'*, in or through both of them for reception of the handle, the adjusting-screws, C, and the yielding or elastic scrubbing-strip B, essentially as shown and described.

294,635. EXTENSIBLE FIRE-ESCAPE. PAUL KINGSTON, Hastings, Minn. Filed May 5, 1883. (No model.)



Brief.—The two pairs of lazy-tongs are connected by cross-rods and connecting-links, having stops with which braces pivoted to the arms of the lazy-tongs engage. The inner lower arms of the lazy-tongs are pivoted on stationary rods, and the outer lower arms are moved on segmental supports on the truck. Guide-ropes carrying a basket are arranged within the structure. A supplemental frame, to which the structure is secured upon the truck, may be tilted at one side to incline it toward the building.

Claim.—1. The combination of the series of lazy-tongs arranged in pairs connected by cross-rods, and the connecting-links E, having stops thereon, and the braces T, adapted to engage with the stops when the device is extended, whereby the same may be rendered rigid and firm, substantially as shown and described.

2. The combination, with the lazy-tongs having the inner cross-bars, H, pivoted on stationary rods I, and the segmental supports K, the outer cross-bars, J, having elbows L, and the rods M, sleeves P, cords O Q, pulleys R, and windlass N, substantially as shown and described.
